and Iambeth. Then, on the north bank of the rivê, are Weftminfter and London, and, on the oppotitc fide, Southwark ; forming together one contimued city, extending to Limeloufe and Deptford; and hence the river proceeds to Greenwich, Erith, Greenhithe, Gray's Thurrock, Gravefend, and Leigh, into the ocean. It receives in its courfe from Dorchefter the rivers Kennet, Loddon, Coln, Wey, Mole, Wandle, Lea, Roding, Darent, and Medway. The jurifdiction of the lord mayor of I.ondon over the Thames extends from Coln ditch, a little to the well of Staines, to Iendal or Yenleet to the eaft, including part of the rivers Medway and Lea; and he has a deputy, named the water-bailiff, who is to fearch for and punith all offenders againgt the laws for the prefervation of the river and its fifh. Eight times a year the lord mayor and aldermen hold courts of confervance for the four counties of Surry, Middlefex, Effex, and Kent. Though the Thames is faid to be navigable 138 miles above the bridge, yet there are fo many flats, that in fummer the navigation weftward would be entirely fopped, when the frings are low, were it not for a number of locks. But thefe are attended with confiderable expence; for a barge from Lechlade to London pays for paffing through them 131.15 s .6 d . and from Oxford to London 121.18 s. This charge, however, is in fummer only, when the water is low; and there is no lock from London bridge to Bolter's lock ; that is, for \(51 \frac{1}{2}\) miles above the bridge. The plan of new cuts has been adopted, in fome places, to thorten and facilitate the navigation. There is one near Lechlade, which runs nearly parallel to the old river, and contiguous to St John's bridge ; and there is another a mile from Abingdon, which has rendered the old ftream toward Culham bridge ufelefs. But a much more important undertaking has lately been accomplifhed; namely, the junction of this river with the Severn. A canal had been made, by virtue of an act of parliament in 1730 , from the Severn to Wallbridge, near Stroud. A new canal now afcends by Stroud, through the vale of Chalford, to the height of 343 feet, by means of 28 locks, and thence to the entrance of a tunnel near Sapperton, a diftance of near tight miles. The canal is \(4^{2}\) feet in width at top and 30 at the bottom. The tunnel (which is extended under Sapperton hill, and under that part of Earl Bathurl's grounds called Haley wood, making a diftance of two miles and three furlongs) is near 15 feet in width, and can navigate barges of 70 tons. The canal defcending hence \({ }^{1} 34\) feet, by 14 locks, joins the Thames at Lechlade, a diftance of above 20 miles. In the courfe of this vaft undertaking, the canal, from the Severn at Froomlade to Inglefham, where it joins the Thames, is a diftance of more than 30 miles. The expence of it exceeded the fum of 200,0001 . of which 30001 . are faid to have been expended in gunpowder alone, ufed for the blowing up of the rock. This new canal was completed in 1789 , in lefs than feven years from its commencement. A communication, not only with the Trent, but with the Merfey, has likewife been effected by a canal from O ford to Coventry ; and an act of parliament has paffed to extend another canal from this, at Braunfton, to the Thames at Brentford. This is to be called The Grand Junction Canal. On the extenfive advantages refulting from thefe navigable communications from the metropolis with the ports of Britol, Liverpool, Hull, Eic.

Thames, and the principal manufacturing towtis in the inland
Thane. parts of the kingdom, it is needlefs to expatiate. The parts of the kingdom, it is needlefs to expatiate. The tide flows up the Thames as high as Richmond, which, following the winding of the river, is 70 miles from the ocean; a greater diflance than the tide is carsied by any otber river in Europe. The water is efleemed extremely wholefome, and fit for ufe in very long voyages, during which it will work itfelf perfectly fine.

Thanes is alfo the name of a river in the fate of Connectrat in America. See the article Connecticut.

THANE, or Thanus, a name given to the mobility in Britain before the time of William the Conqueror. It fignifics a minitter or honourable retainer, from the verb thenian, "to minifter." There were feveral degrees of nobility among the Anglo Saxons; but thofe moft commonly mentioned ate the king's thanes and the alderman's thanes. 'The Ling's thanes feem to have been of three different degrees, according to their different degrees of wealth or favour at court. The alderman's thanes feem to have been of the loweft degree of nobility, and next to them thofe who were promoted to that dignity from their advancement in the church, from their valour, fuces is in agriculture or commerce: for if a ceorl or farmer applicd to learning and attained to priells orders; if he sequitted himfelf fo well as to obtain from a nobleman five hythes of land, or a gilt fword, belmet, and breat-plate, the reward of his valour; cr if by his induftry he had acquired the property of five hythes of land; or if he applied to trade, and made three voyages beyond fea in a hip of his own, and a cargo belonging to himfelf, he was denominated a thane.

The thanes, who were the only nobility among the Anglo Saxons, were a very numerous body of men, comprehending all the confiderable landholders in England, and filling up that fpace in focicty between the ceorls or yeomanry on the one hand, and the royal family on the other; which is now occupied both by the nobility and gentry. In times of war, they conflituted the flower of their armies, and in times of peace they fwelled the trains of their kings, and added greatly to the fplendour of their courts, efpecially at the three great feltivals of Chriftmas, Eafter, and Whitfuntide.
Heary's \(H_{t-}\) Pory of Great Bri: tain, yol. ii. litary, as ald litary, as aldermen, greeves, earls, heretogens, \&c. were taken; and to obtain fome of thefe offices was the great object of their ambition. Before they obtained an office, their lands were their only fupport; and they lived in greater or lefs affluence, according to the extent of their eftates. Thefe they divided into two parts; one of which they called their inlands, and the other their outlands. Their inlands they kept in their own immediate poffeffion, and cultivated them by the hands of their naves and villains, in order to raife provifions for their families; their outlands they granted to ceorls or farmers, cither for one year, or for a term of years; for which they received a cortain Atipulated proportion of their produce annually. Thefe cunoms had long prevailed among their ancefors in Germany, and were adhered to by their polterity in England till the conqueft.

The thanes were under no obligations on account of their lands, except the three following, which were indifpenfably ncceffary to the defence and improvernent of
their country: To attend the king with their followers in military expeditions, to affift in building and defending the royal caftles, and in keeping the bridges and highways in proper repair. To thefe ubligations all proprietors of land (even the churchmen for a long time not excepted) were fubjected; and thefe fervices were confidered as due to their country, rather than to the perfons of their kings; and were agreed to by all as being neceffary to their own prefervation and conveniency.

This title of thane was abolifhed in England at the conqueft, upon the introduction of the feudul fyltem by William. The titles of earl and baron were about the fame period introduced into Scotland by Malcolm Canmore, when the title of thane tell into difule.

THANET, an inland of the county of Kent, furrounded by the fea except on the noth-eaft fide, where it is bounded by the branches of the river Stour, now inconfiderable to what they were formerly. It contains leveral villages, and the fea port towns of Margate and Ramfgate, and has the title of an earldom. It is celebrated for being the fpot through which arts, fciences, and divine knowledge, came into this happy ifle. The Britons called it Richborough, from its vicinity to the city of that name, now only a venerable ruin ; but the Sasons called it Thanct, from fire, having fo many beacons erected on it. It is in the north-ealt part of the county, lies open to the fea on the north and ealt, with the river Wantfum on the weft and fouth, is about 10 miles long from the North Foreland to Sarre. Bridge, Iucombe: and about 8 broad from Weftgate to Sandwich-Feny. Englond's The north part of it is chiefly arable; and the fouth and Gaztiten weft parts confitt of marfi or pafture-lands. The foil is generally very fertile, efpecially in producing the beft barley, of which it is computed above 20,000 quarters are annually fent to London.

THAPSIA, the Deadly Carrot, a genus of plants belonging to the clafs pentandria, and in the natural fyltem ranging under the \(45^{\text {th }}\) order, umbellate. See Botany Index.

THAWING, the refolution of ice into its former fluid flate by the warmth of the air. See Congelation and Frost.

THEA. See TEA.
THEATINES, a religious order in the Romin church, fo called from their principal founder John Peter Caraffa, then bifhop of Theate, or Chieti, in the kingdom of Naples, and afterwards pope, under the name of Paul IV. The names of the other founders were Gaetan, Boniface, and Configlien. Thefe four pious men defiring to reform the ecclefartical flate, laid the foundation of an order of regular clerks at Rome in the year 1524 . Pope Clement V11. approved the inftitution, and permitted the brethren to make the three religious vows, to elect a fupcrior every three years, and to draw up ftatutes for the regulation of the order. 'Ihey were the firt who endeavoured, by their example, to revive among the clergy the poverty of the apoltles and firf difciples of our Saviour, and were alfo the firf who aflumed the title of regular clerks.

THEATRE, a place in which flows or dramatic reprefentations are cxhibited.

For the origin of the dramatic art we always turn our eyes to Greece, the nurfery of the atts and feiences. It may indeed have been known among more ancient nations,

\section*{T H E} to public ridicule.
nations, but no records remain furficient to fupport this opinion. The different fates of Greece afferted their claim to the honour of having given it birth, but the account of the Athenians is moft generally received. It derived its origin from the hymns which were fung in the fellivals of Bacchus in honour of that deity. While thefe refounded in the ears of the multitude, chorufes of Bacchants and Fauns, ranged round certain obfene images which they carried in triumphal proceffion, chanted lafcivious fongs, and fometimes facrificed individuals

This was the practice in the cities; but a flill greater licentioufnefs reigned in the worlhip paid to the fame divinity by the inhabitants of the country, and efpecially at the feafon when they gathered the fruits of his beneficence. Vintagers, befmeared with wine-lees, and intoxicated with joy and the juice of the grape, rode forth in their carts, and attacked each other on the road with grofs farcafms, revenging themfelves on their neigh bours wilh ridicule, and on the rich by publifhing their injuftice.

Among the poets who flourifhed at that time, fome celebrated the great actions and adventures of gods and heroes, and others attacked with afperity the vices and abfurdities of individuals. The former took Homer for their model, and fupported themfelves by his example, of which they made an improper ufe. Homer, the moft tragic of poets, the model of all who have fucceeded him, had in the Iliad and the Odyiley brought to perfection the heroic poem, and in his Margites had employed pleafantry. But as the charm of his works depends in a great meafure on the palfions and motion with which he knew to animate them, the poets who came after him endeavoured to introduce into theirs an action which might excite emotion or mitth in the fpectators : fome even attempted to produce both, and ventured certain rude eflays, which have fince been flyled indifferently either tragedies or comedies, becaufe they unite the characters of thofe two dramas. The authors of thefe fketches have been diftinguihed by no difcovery; they only form in the hiltory of the art a fuccelfion of names which it would be ufelefs to recal to light.

The neceflity and power of theatrical intereft was already known. The hymns in honour of Bacclus, while they defcribed his rapid progrefs and fplendid conquefts, became imitative; and in the contefts of the Pythian games, the players on the flute who entered into competition were enjoined by an exprefs law to reprefent fucceffively the circumitances that had preceded, accompanied, and followed the victory of Apollo over Python.
Some years after this regulation, Sufarion and Ther. pis, both born in a fmall borough of Attica, named Icaria, appeared each at the head of a company of actors, the one on a kind of fage, the other in a cart (A). The former attacked the vices and abfurdities of his time; and the latter treated more noble fubjects, which he took from hiftory.
The comedies of Sufarion were in the fame tafte with
thofe indecent and fatirical farces which were afterwards Theatre. performed in fome of the cities of Greece. 'They were long the favourite entertaimment of the country people. Athens did not adopt this fpecies of exhibition until after it was brought to perfection in Sicily.

Thefpis had more than once feen in the feltivals, in which as yet hymns only were fung, one of the fingers, mounted on a table, form a kind of dialogue with the chorus. From this hint be conccived the idea of intro. ducing into the tragedies an actor who, by fimple recitals introduced at intervals, fhould give relief to the chorus, divide the action, and render it more interefting. This happy innovation, together with fome other libertics in which he had allowed himfelf, gave alarm to the legiflator of Athens, who was more able than any other perfon to difcern the value or danger of the novelty. Solon condemned a fpecies of compofition in which the ancient traditions were difguifed by fictions. "If we applaud falfehood in our public exlabitions (faid he to Thefpis), we flall foon find that it will infinuate itfelf into our molt facred engagements."

The excelfive approbation and delight with which both the city and country received the pieces of Thefpis and Sufarion, at once juftified and rendered ufelefs the fufpicious forefight of Solon. The poets, who till then had only exerciled their genius in dithyrambics and licentious fatire, flruck with the elegant forms which thefe fpecies of compofition began to affurme, dedicated their talents to tragedy and comedy. Soon after a greater variety was introduced in the fubjects of the former of thefe poems. Thofe who judged of their pleafures only from habit exclaimed, that thefe fubjects were foreign to the worhip of Bacchus; but the greater number thronged with fill more eagernefs after the new pieces.
Phrynichus, the difciple of Thefpis, made choice of that kind of verfe which is moft fuitable to the drama, was the author of fome other changes, and left tragedy in its infancy.
Æfchylus received it from his hands enveloped in a rude veftment, its vifage covered with falfe colours, or a mafk incepreffive of character, without either grace or dignity in its motions, infpiring the defire of an intereft which it with difficulty excited, fill attached to the buffooneries which had amufed its infant years, and exprefling its conceptions fometimes with elegance and dignity, but frequently in a feeble and low flyle, polluted with grofs obfcenities.

In his firf tragedies he introduced a fecond actor; and afterward, copying the example of Sophocles, who had juft entered on his theatrical career, he admitted a third, and fonetimes even a fourth. By this multiplicity of perfonages, one of his actors became the hero of the piece, and attracted to himfelf the principal intereft; and as the chorus now held only a fubaltern fation, Æfchylus took care to fhorten its part, and perhaps even carried this precaution too far.
He is cenfured for having admitted mute characters into his drama. Achilles, after the death of his friend, and Niobe, after the deffruction of her children, appear
(A) Sufarion reprefented his frlt pieces towards the year 580 before Chrif. Some years after, Thefpis made his Grft attempts in tragedy, and aEted his Aiceftis in 536.

\section*{THE [ jo8 ] T H E}

Theatre, on the flage, and remain during feveral fcenes motionlefs, with their heads covered with a veil, and vithout uttering a word; but if their eyes had overtlown with tears, and they had poured forth the bittereft lamenta. t:ons, could they have produced a: effect fo terrible as this veil, this filence, and this ab:andonment to grief?

It was not fufficient that the noble and elevated fyle of tragedy hould leave in the minds of the auditors a thong impreflion of grandeur ; to captivate the multitude, it was requifice that every part of the fpectacle thould concur to produce the fame effect. It was then the general opinion that nature, by bestowing on the ancient heroes a more lofy ftatue, had impreffed on their perfons a majelly which procured them as much refpect from the people as the enfigns of dignity by which they were attended. Eccliylus therefore railed lis aciors on high ftilts or bukims. He covered their features, which were frequently difagreeable, with a malk that concealed their irregularity He clothed them in flowing and magnificent 10 bes, the form of which was fo decent, that the prielts of Ceres lave not bluhied to adopt it. The i ferior actors were alfo provided with madks and drefes luited to their parts.

Inftead of thole wretched fcaffolds which were formerly crected in hafte, he obtained a theatre furnifhed with machines, and embellihed with decorations. Here the found of the trumpet was reverberated, incenfe was feen to burn on the altars, the fhades of the dead to arife from the tomb, and the furies to rufh from the gulis of Tartarus. In one of his pieces thefe infernal divinities appeared, for the firt time, with maks of a horrid palenefs, torches in their hands, ferpents intertwined in their hair, and followed by a numerous retinue of dreadful fpectres. It is faid that, at the fight of them, and the found of their terrific howlings, terror leized on the whole affembly, women mifcarried, and children expired with fear; and that the magifrates, to prevent fimilar accidents in future, commanded that the chorus fhould confift only of fifteen actors inftead of fify.

The effect of fo many new objects could not but aftonifh the fpectators; nor were they lefs furprifed and delighted at the intelligence difplayed in the performance of the actors, whom Fefchylus almoft always exercifed himfelf. He regulated their fleps, and taught them to give additional force to the action by new and expreflive geftures.

The progrefs of the art was extremely rapid. Refchylus was born 525 years before Chrift, 11 years after Thefpis had acted his Alceftis. He had for competitors Chcerilus Pratenas, and Phrynichus, whofe glory he eclipfed, and Suphocles, who rivalled his own. Sophocles was born about the year 497 B. C. about \(J_{4}\) years before Euripides. Thefe carried tragedy to the highef perfection to which it attaned among the Grcels. Fichylus painted men greater than they can be, Sophocles as they ought to be, and Euripides as they are.

Invented towasds the \(50 \mathrm{ch}^{2}\) Olympiad (about 580 R. C.), and adapted to the rude manners of the ruftics, comedy ventured not to approach the capital; and if by chance fome companies of actors, who were unconnected with any others, found their way into the city, and performed their indecent farces, they were lefs authorifed than tolcrated by the government. It was not
till after a long infancy that this fpecies of drama began fuddenly to make a rapid improvemeni in Sicily. Irftead of a fucceffion of feenes withont connection or tendency, the philofopher Epicharmus introduced on action, all the parts of which had a dependence on each other; and conducted his fubject, without wandering liom it, through a juf extent to a determinate end. His pieces, fuljected to the fame laws as tragedy, were Enown in Greece, wherc they were confidered as models; and comedy foon thared with her rival the futfrages of the public, and the homage due to genius. The Athenians, efpeciaily, reccived her with the fame tranfports as they would have teflified at the news of a victory : many of their poets exercifed their genius in this novel fpecies of compolition; and their names adorn the numesous lift of writers who have been dillinguifhed in comedy from the time of Epicharmus. Such were, among the more ancient, Magnes, Cratinus, Crates, Pherecrates, Eupolis, and Aritophanes. They all Houxilaed in the age of Pericles.

If we perufe the comic pieces which have come down to us, we fhall be convinced that the fole object of the authors was to pleafe the multitude. The gods and heroes were traveftied, grofs and obfcene language was often employed, and virulent invectives were often thrown out againit individuals of the firft rank for genius and virtue. Towards the end of the Peloponnefian war the licentioufnefs of comedy was reftrained. The chorus was laid afide, becaufe the rich citizens were alarmed, and would no longer contribute money to fupport it, nor provide malks with portraits for expofing individuals.

The poets being thus reftrained from mentioning names of living perfons on the flage, invented falfe names. Ihey ftill expoted real and known characters; and thus gave a more exquifite gratification to the 「pectators, who were bighly amufed with fiuding out the perfons intended. The confequence of the law was only to make that done with delicacy which was formerly done in the molt indecent and fcurrilous manner. Ariftophanes, in fome of his lateft pieces, has given us fome good examples of this kind of comedy, which is fometimes called the mid. dle comedy.

Comedy was ftill liable to abufe, and therefore required farther reformation. As the ufe of real names had formerly been prohibited, real fubjects were alfo forbidden ; and comedy from that time was no longer a fury armed with torches, or a firebrand feattering mifchief, but a pleafing and inftructive companion. This is called the new comedy. The moft eminent among the Grecks in this improved feecies was Menandet. His writings are now loft; but we may form a good eftimate of their merit from the comedies of Terence, which are faid to have been borrowed from Menander, and to have nearly refembled the original, though inferior in that vis comica by which the elegant Grecian was dillinguilhed. The comedy of Menander is that which has been cultivated in modern times.

To give fome idea of a Grecian theatre, we Mall de. fcribe very mortly the theatre of Bacchus in Athens, which was built by the famous architect Philos in the time of Pericles. The part intended for the fpectators was of a femicircular form, at the diameter of which was erceted the ftage. The orchethra occupied the fpace where the pit in modern theatres is fituated, where.
the mufic, the chorus, and the mimi were placed. It was four fect clevated above the ground. 'The fpeetators were arranged in three gallenies round all the fides of the orcheftra except that hext the Rage, each gallery containing eight rows of feats. At the farthcr end of the orcheilra, where the fage is erected in moden theatres, flood the thymele or logeon, but projecting a little towards the audience. It was a little higher than the orcheflra, and did not extend the whole breadih of it. In fome theatres it was only fix feet fuare. Here the principal part of the chorus made their rccitations, and in comical interludes the mimi performed. Behind the thymele appeared the flage or profcenion, confiderably elevated. No part of this theatre was covered except the ftage, and a high gallery called circys fet apart for the women. Ihe Athenians, being expofed to the weather, came ufually wilh great cloaks, to fecure them from the rain or the cold; and for defence againit the fun, they had the fciudion, a kind of parafol, which the Jomans ufed alfo in thair theatres by the name of um. bell:e; but when a finden form arole, the play was interrupted, and the fpectators difperfed.

A fort of tent-work over the entire area of the edifice might have been contrived as a flelter from the rain and a flade from the fun. Such a covering would have obviated the inconveniences of roofed theatres, which obftret the free communication of the air, and of unroofed theatres, which do not keep out the weather. At Athens the plays were always reprefented in the daytime, which made the unroofed theatres lefs inconvenient.

Plays were reprefented only during the three feflivals folennized in honour of Bacchus. The firt of thefe was celebrated at the Pirreus, where fome of Eiripides's pieces were firft performed. The fecond, which lafted only one day, was kept at the end of January or beginning of February. The third, called the greater Diomysia, was celebrated a month after. It continued feveral days, and attracted a great multitude of fpectators. In the feftivals which latted only one day, five or fis dramatic pieces, either tragedies or comedies, were pcrformed. But in the greater Dionyfia, which continued longer, 12 or 15 , and fometimes more, were acted. The performance began early in the morning, and fometimes latted the whole day.

The chorus, according as the fubject demanded, was compofed of men and women, old men or youths, citizens or flives, priefts, foldiers, \&cc. to the number of \({ }_{5} 5\) in tragedy, and 24 in comedy. The chorus came upon the itage preceded by a fllue-player, who regulated their fteps; fometimes one after the other, but in tragedy more frequently three in front and five in deptls, or five in frout and three in depth.

The fame perfons performed both in tragedy and comedy; but, as among ourfelves, it was rare to meet with any who excelled in both. The pay of thofe who liad acquired great reputation was confiderable. Polus gained a talent in two days (equal to 225 . fterling *). Players of eminence were folicited by different actors of Greece to attend their feftivals. If, after making an engagement, they failed, they were obliged to pay a certain fum of money; and if they were abfent during the feftivals of their own republic, they were condemned to a heavy fine.

The actors had labits and fymbols fuited to their
parts. Kings wore a diadem, leancd on a fceptre which lupported an cagle on its top, and wese dreffed in long robes nf purple or other fulendid colours ornamented with gold. Heroes, befides having their llature frequently increafed to fix feet linglifit, and their bull +1 rijs in in proportion, were frepuently covered with the flin of Rash. a lion or a tyger, and armed with fwords, quivers, and ". \(10 \% \%\) clubs. All who luffered misfortuncs wore a black, litho v. brown, or dirty white garment, which frequently hung cap. 7. in tatlers. 'There were various kinds of malks for tragedy, consely, and fatire. Theefe certainly took away the pleafure arifing from the expreffion of the countenance; but at any rate, litule pleafure could be derived from this circumplance in a Grecian theatre, from its immenfe fize, and the great diftance of the audience from the itage.

Dramatic entertainments were introduced at Rome in the year of the city 391. They were called ludi feenci, becaule they were firt acted in a thade formed by the branches and leaves of trees. They were borrowed immediately from Etruria, whence allo they received their firlt players. Thefe Etrurians at firf only danced to a flute, without either finging or acting. The Roman youth foon imitated them at their folemn feftivals, adding raillery in rude verfes, and geflures adapted to the fubject. Thefe verfes were called Fefcennini, from Fefcennia, a city of Etruria. Livius Andronicus was the firtt poet who wrote a regular play in Latin. This happened in the year of liome 512 or 514 , about 160 years after the death of Sophocles and Euripides, and 52 after that of Menander. The Grecian model was afterwards introduced and cultivated much by fucceeding dramatic writers. This was the model of Menander, for the old and middle comedy was unknown at Rome. As the Romans were only imitators of the Greeks in the dramatic art, as well as in moft of the arts and fciences, nothing more is neceffary to be faid in addition to the account which we have already given of the Grecian flage.

The origin of the Englih flage is hid in obfcurity. It was not, however, copied from the Grecian or homan; for it was evidently different in form as well as in matter, and may with more propriety be deduced from a Gothic original. It appears that there were theatrical entertainments in England almoft as early as the conquell; for we are told by William Stephanides or Fitz- GentiteStephen, a monk, who in the reign of Henry II. wrote man's saza his Defrriplio Nobilifimace Civitatis Londonice, that "Lon gazune fos don infled of the common interludes of the theatre, had plays of a more holy kind; reprefentations of the miracles of confeffors, and the fufferings of martyrs. At this time there were alfo certain fets of idle people, who travelled the countries and were called Munmers, a kind of vagrant comedians, whofe exsellence confifled altogether in minickry and humour.

It is probable that, foon after this time, the dramatic reprefentations called Mystcries were exhibited: Thefe myfteries were taken from lcripture-hifory: fome reprefented the creation of the world, with the fall of Adam and Eve; fome the fory of Jofeph; and others even the incarnation and fufferings of the Son of God. Thefe Cibber's Ao pieces were exhibited in a manner fo ridiculous as to fa-pology for vour libertinim and infidelity, as appears by a petition bis Lifo, of the chaunters of St Paul's cathedral to Richard II. in \(137^{8}\), praying, that "fome unexpert people might

\section*{T H E \(\quad 310] \quad\) T H E}

2heatre. be prohibited from reprefenting the hiftory of the Old Teftament to the prejudice of the faid clergy, who had been at great expence to reprcfent it publicly at Chrittmas."

In the year 1390 , the parill clerks of London are faid to have played interludes at Skinner's-well on three fucceffive days in July; and, in 1429, to have acted for eight days fucceffively a play concerning the creation of the world, at the fame place which thence acquired the name of Clerkenwell.

Thefe Myfferies were fucceeded by Moralities, in which there were fome rude traces of a fable and a moral; and fome allo of poetry, the virtues, vices, and other affetions of the mind being frequently perfonified.

After thefe Moralities came what were called Interludes, which made fome approaches to wit and humour. Many of thefe pieces were written by John Heywood, jefter to Henry VIII.

In the time of Henry VIII. one or two pieces had been publifhed under the claffical names of Comedy and Tragedy, but they appear not to have been intended for popular ufe. It was not till the religious ferments had Percy's Re-fubfided that the public had leifure to attend to drama-
in a great number of the moft eminent charaders in Theatred Englifh hiftory are drawn relating their own misfortunes. This book was popular and of a dramatic call; and therefore, as an elegant writer has well obferved, might have its influence in producing hifloric plays. Thefe narratives probably firnifhed the fubjects, and the ancient myfteries fuggefted the plan.

That our old writers confidered hiftorical plays as fomewhat dillinet from tragedy and comedy, appears from numberlefs paffages of their works. "Of late days (fays Stow in his Survey of London), inftead of thofe fage plays have been ufed comedies, tragedies, interludes, and hiftories, both true and fained." Beaumont and Fletcher, in the prologue to the Capiain, fay,

> "This is nor comedy, nor tragedy, "Nor hiflory."

Polonius in Hamlet commends the actors as the beft in the world, either for tragedie, comedie, hiftorie, paftorall, \&c. And Slakefpeare's friends, Heminge and Condell, in the firft folio edition of his plays, in 1623 , have not only intitled their book "Mr William Shakefpeare's Comedies, Hiftories, and Tragedies," but, in their table of contents, have arranged them under thofe three feveral heads; placing in the clafs of hiftories, "King John, Richard II. Henry IV. two parts, Henry V. Henry VI. three parts, Richard III. and Henry VIII."

This diftisction deferves the attention of the critics: for if it be the firft canon of found criticifm to examine any work by thofe rules the author prefcribed for his firf obfervance; then we ought to try Shakefpeare's hiftories by the general laws of tragedy and comedy. Whether the rule itfelf be vicious or not, is another inquiry; but certainly we ought to examine a work only by thofe principles according to which it was compofed. This would fave much impertinent crilicifm.

Not fewer than 19 playhoufes had been opened before the year 1633 , when Prynne publifhed his Hifiriomafix. From this writer we learn that tobacco, wine, and beer, were in thofe days the ufual accommodations in the theatre, as now at Sadlers Wells. With regard to the ancient prices of admifion, the playhoufe called the Hope had five different priced feats, from fixpence to half-a-crown. Some houles had penny benches. The two-penny gallery is mentioned in the prologue to Beaumont and Fletcher's Womatr-hater; and feats of threepence and a groat in the paffage of Prynne laft referred to. But the general price of what is now called the Pit feems to hare been a milling. The time of exhibition was early in the afternoon, their plays being generally acted by day-light. All female parts were performed by men, no adtrefs being ever feen on the public flage before the civil wars. And as for the playhoufe furniture and ornaments, they had no other feenes nor decorations of the ftage, but only old tapeftry, and the ftage flrewed with rufhes, with habits accordingly; as we are affured in a flort Difcourfe on the Englifi Stage, fubjoincd to Flecknoe's Love's-Kingdom, 1674, 12 mo .

(ri) We have been anxious to give as full an account of the ancient Englifh drama as we could: we muft not

\section*{THE}

Theatre. it is given from the late valuable edition of our illuftrious poet's works by Mr Malone. During the whole reign of James \(I\). the theatre was in great profperity and reputation: dramatic authors abounded, and every year produced a number of new plays; it became a fathion for the nobility to celebrate lheir wedding;, birthdays, and other oceafions of rejoicing, with malifues and interludes, which were exhibited with furprifing expence; our great architect, Inigo Jones, being frequently employed to furnilh decorations, with all the luxuriance of his invention and magnificence of his art. The king and his lords, and the queen and her ladies, frequently performed in thefe mafques at court, and the nobility at their private houfes; nor was any public entertainment thought complete without them. This tafte for theatrical entertainments continued during great part of the reign of King Charles I.; but, in the year 1633, it began to be oppofed by the Puritans from the prefs; and the troubles that foon after followed entirely fufpended them till the reftoration of King Charles II. in 1660.
The king, at his reftoration, granted two patents, one to Henry Killigrew, Ef. and the other to Sir William Davenant, and their heirs and afigns, for forming two diflinct companies of comedians. Killigrew's were called the King's Servants, and Davenant's the Duke's Company. About ten of the company called the King's Servants were on the royal houfchold eftablifhment, having each ten yards of fcarlet cloth, with a proper quantity of lace allowed them for liveries; and in their warrants from the lord chamberlain they were ftyled gentemen of the great chamber.

Till this time no woman had been feen upon the Englifh ftage, the characters of women having always been performed by boys, or young men of an effeminate afpect, which probably induced Shakelpeare to make fo few of his plays depend upon female characters, as they mult have been performed to great difadvautage. The principal charafers of his women are inmocence and fimplicity, fuch are Defdemona and Ophelia ; and his fpecimen of fondnefs and virtue in Portia is very hort. But the porver of real and beautiful women was now added to the fage ; and all the capital plays of Shakefpeare, Fletcher, and Ben Jonfon, were divided between the two companies, by their own alternate choice, and the approbation of the court.

The king's fervants feem to have been allowed to be the beft company; and when the variety of plays began to be exhaufted, they drew the greater audiences. Davenant, therefore, to make head againt them, firf added fpectacle and mufic to action, and introduced a new fpecies of plays, fince called dramatic operas; among thefe were, The Tempef, Pfyche, and Circe; which, with many others, were fet of with the moft expenfive decorations of fcenes and habits, and with the beft voices and dancers.

In 1684 the two houfes united, and continued logether for ten years. In 1690 the play began at four o'clock; and, we are told, the ladies of fahion ufed to take the evening air in Hyde-park after the reprefenta.
tion; by which it appears that the exhibsions were in Theatre. fummer too. The principal actors were, Beterton, Montfurt, Kynatton, Sandlord, Nukes, Underhill, and Leigh, commonly called Tomy Leigh; the atreffes were, Mrs Betterton, Barry, Leigh, Butler, Montfort, and Jracegirdle ; and to this company, in this year, old Cibber was admilted as a performer in the loweft rank. It was a rule with the patentees, that no young perfon, who offered himfelf as an actor, flould be admitted into pay till after at leall half a year's probation; and Cibber waited full three quarters of a year before he was taken into a falary of ros, a-week.
In 1695 a new theatre was opened with Mr Congreve's comedy of Love for Love, which had fuch extraordinary fuccefs (fays Cibber) that farce any other play was acted there till the end of the feafon; but when the feafon ended, which appears to have begun in June, he does not tell us, and it is indeed dificult to guefs; for though the company acted in fummer, it feems improbible that they fhould fhut up the houfe in winter, as it is dificult to conceive any reafon for fo doing. Congreve was then in fuch high reputation, that this company offered him a whole fhare (but into how many fhares the whole was divided Colley has not told us) upon condition he would give them a new play every year. This offer he accepted, and received the advantage, though he never fulfilled the condition; for it was three years before he produced the Mourning Bride, and three more before he gave them the Whay of the World.
It is not neceffary that we give in detail the remaining hiftory of the Englifh fage : thofe who are anxious to be aequainted with it may confult Cibber's hiftory of the fage, continued by Victor, under the title of \(A\) Hiftory of the Theatres of London and Dublin from the year 1730 . We fhall only mention a few facts refpecting the Calaries of the players about that period, and the rife of the price of play tickets.

A difference having arifen in 1733 between the managers and actors, moft of the actors fet up for themfelves at the little theatre in the Haymarket. Upon this the managers publifhed the following account of their falaries, to how the public how little room they had to mutiny. To Mr Colley Cibber, from the time of letting his fhare till he left the ftage, 121.125 . per week. Mr The. Cibber 5l. and his wife's whole falary Gentletill her death, without doing the company any fervice man's sicio the greateft part of the winter; and his own alfo, dur- siaine fo: \(_{T}\) ing the time of his being ill, who performed but feldom \({ }^{1733}\). till after Chriftmas. Mr Mills jun. 31. under the fame circumftances with regard to his wife. Mr Mills fen. 1l. per day for 200 days certain, and a benefit clear of all charges. Mr Johnfon 5l. Mr Miller sl. paid him eight wecks before he acted, befides a prefent of 10 guineas. Mr Harper 41 . ard a prefent of 10 guineas. Mr Griffin 4l. and a prefent. Mr Shepard 31. Mr Hallam, for himfelf and father (though the latter is of little or no fervice) 3l. Mrs Heron 5l. raifed from 405. laft winter, yet refufed to play feveral parts affigned
omit, however, to inform our readers what Mr Malone fays of the old plays, viz. that not one play fublifhed before 1592 will bear a fecond reading; and that exclufive of myfteries, moralitics, and tranflations, there are but 34 pieces extant which were publinhed before that period,

\section*{THE[ 312\(]\) T H E}
her, and aged but feldom this fafon. Mrs Butler \(3^{1}\). per week. By there and other falaries, with the incident charges (befides clothes and fcenes), the patentees are at the daily charge of 491. odd money, each aclingday.

Till about the fame time, the prices at the theatre were \(4^{5}\). the boxes, 2 s .6 d . the pit, 1s. 6d. the firt gallery, and 1s. the fecond, except upon the figt run of a new play or pantomime, when the boxes were 5s. the pit \(3^{\text {s. }}\) the firft gallery 2 s . and the fecond is. Bai Fleetwood thought fit to raife the prices for an old pantomime, which was revived without expence. This produced a riot for feveral nights, and at laft a number deputed by the pit had an interview with the manager in the green room, where it was agreed, that the advanced prices fhould be conftantly paid at the doors, and that fuch perfons as did not choofe to flay the entertainment flould have the advanced part of their money returned. This was a very advantageous agreement for the manager; becaufe, when the audience had once paid their money, and were feated, very few went out at the end of the play, and and demanded their advanced money; the few that did it at firft, foon grew tired, and at laft it fettled in the quiet payment of the advanced'price, as at this day.

It has been frequently a fubject of debate, whether the flage be favourable to morals. We do not mean to enter into the controverfy; but we thall make an obfervation or two. It will be allowed by all, that the intention of the players in acting, is to procure money; and the intention of the audience in attending the theatre, is to feek amufement. The players then will only act fuch plays as they believe will an-- iwer their intention. And what fort of plays are thefe? They are fuch as correfpond with the opinions, manners, and tafte, of the audience. If the tafte of the audience be grofs, therefore the plays will be grofs; if delicate and refined, they will be the fame. And if we go back to the time of Shakefpeare, we thall find that this has been uniformly the cafe. The conclufum, then, which we draw, is this, if the tafte of the audience be pure, free from licentioufnefs, the plays will he the fame, and the ftage will be favourable to virtue.

THEBAID, a celebrated heroic poem of Statius, the fubject of which is the civil war of Thebes, between the two brothers Eteocles and Polynices; or Thebes taken by Thefeus.

THEBES, the name of a celebrated city of ancient Greece. It is fuppofed to have been built by Cadmus, about the year of the world 2555. This Cadmus, according to the Greeks, was the fon of Agenor king of Sidon or of Tyre; but the Sidonians allow hin to have been of no ligher quality than his cook, and tell us that his wife was a mufician at court, with whom he ran away into Greece. The Greck writers tells us, that being commanded by his father to go in fearch of his daughter Europa, whom Jupiter in the flape of a bull had carried off, and forbid to return without her, he built, or rebuit, the city of Thebes, after laving long fought her in vain. He was at firft oppofed by the Hyantes and Aones; the former of whom he defeated in battle, and forced to retire into Locris; the latter fubnitted, and were incorporated among his fubjects.

Thole who endeavour to extract fome truth from the multitude of fables in which the early part of the Grecinn hiftory is obfcured, are of opinion that Cadmus was one of the Canaanites expelled by Jofhua; and that he Suppored dit be one of was of the family of the Cadmonites mentioned by Mofes the exiled and Jothua. He is univerfally allowed to have intro Canaanatc duced the Phonician letters into Greece, fet up the firft fchools, and introduced brafs; which, from him, had the name of Cadmean given to it. The government of Theoes continued for a long time monarchical; and the names of a number of its kings have been tranfmitted to us, with fome account of their tranfactions; but very much obfcured by fable.

Though the Thebans had been famed in the early The ilieperiod of their hifory fur their martial atchievements, bans a deyet in procefs of time they feem to have degenerated. generate At the time of the invafion of Xerves, they were the flupid jec firt people in Greece who were gained over to the Per- ple fian intereft. On account of this conduct, they became very obnoxious to the other flates, efpecially to the \(A\) thenians, whofe power and renown increafed every day, and threatened at laft to fwallow them up altogether. The Thebans being in no condition to oppofe fuch a formidable power, put themfelves under the protection Put them of the Spartans, who, out of jealoufy of the Athenians, fetves unreadily forgave them; and fo grateful were the The-der the pr bans for the kindnefs thown them at this time, that du- the Sparring the whole of the Peleponnefian war Sparta had not a more faithful ally. By thefe means they not only recovered the government of Bœotia, of which they had been formerly in poffeffion, till deprived of it on account of their fiding with the Perfians, but their city became one of the firft in Greece. By this profperity the Thebans were fo much elated, that, when the peace of An. talcidas came to be figned, they refufed to agree to it, as they were thus once more deprived of the government of Bootia; fo that it was not without the utmoft difficulty that they were overawed into it by the other The iom flates. Not content with forcing them to give up this of goverre cha point, however, the Spartans undertook to change the ged, and form of the Theban government, which at this time was the citad a democracy, and accomplifhed through the treachery of ficized by thofe who had the care of the citadel.

The Thebans continued under the power of the Spartans for four years; at the end of which term a confpi. The The racy being formed againt them by fome of the princi- bans rece pal people in the city, among whom was a young no- ver their bleman named Pelopidas, the Spartans were maffacted Pelopida and driven out, and the citadel regained. During the tumult Epaminondas, afterwards the celebrated general, with a number of the beft citizens, joined the party of Pclopidas; and the latter having called a general affembly of the Thebans, proclaimed liberty to them, and exhorted them in the ftrongeft manter to fight for their country. 'This fpeech was received with the greateft acclamations; Pelopidas was unanimoufly proclainied the preferver of 'Thebes, and was charged with the management of the war which was then to be declared againh Sparta.

Thefe tranfacions fo much exafperated the Spartans, war wi that they inmediately fent their king Cleormbrotus a-Sjarta. gainft them, though it was then the depth of uinter. The \(\Lambda\) 'henians, in the mean time, who had hitherto affifed the 'Thebans, declined any farther connection, left they flould draw upon themfelies the efentment of

\section*{THE [ 313] T H E}

Thebes. the Spartans. But they were foon after determined to act again on the fame fide, by an attempt which the Spartan general, Sphoduas, had raflly made on the Pyrexus or harbour of Athens. Thus, by means of the Athenians, a powerful diverfion was made in favour of the Thebans, who gradually recovered all the towns of Boeotia, and at length began to act offenfively againft their enemies, and made a powerful invafion in Phocis. They had now many tharp encounters with them; which, though they did not amount to decifive battles, yet did not fail to raile their courage, and deprefs that of the Spartans. In thefe encounters Pelopidas always fignalized himfelf; and in the battle of Tanagra, where the Lacedemonians were entirely defeated by the Athenians and their allies, Pelopidas had a principal flare in the victory, and killed the Spartan general with his orm hand. Soon after this, with a body of only 300 Thebans, he entirely routed and difperfed near 1000 Spartans; which was the greateft difgrace the latter had ever known; for till that time, whether in war with the Greeks or barbarians, they liad never been overcome by an equal, much lefs by fuch an infcrior, number of troops.

Thefe fucceffes of the Thebans greatly alarmed the Athenians, who continually fought to oppofe their ly obnoxious to the Thebans, fo that they at laft came to a refolution to furprife their city. This they accomplifhed, and entirely deftroyed it, logether with Thelpia, another city extremely well affected to Athens. Soon after this, the Thebans, encouraged by their fuccefs, began to think of enlarging their teriitories, and of making encroachments on their neighbours, as they faw other itates had dorie before them. This firit of conqueft is faid to have been raifed by their genera! Pelopidas; in which he was feconded by Epaminondas, a perfon who, though like him endowed with all the necefiary qualities to make a complete captain or patriot, had till then preferred a privatc life, and lived in a conflant courfe of virtue and the fudy of philofophy. He had as yet feldom appeared in public, except to get himfelf exculed from thofe tate employments which were fo eagerly courted by others. This, however, had not hindered him from contracting an intimate friendfhip with Felopidas, which had been daily improved by the correfpondence of their tempers and principles, as well as by that zeal which both difplayed for the good of their country; which laft had made them, even before this time, appear together in astion, and to fuch advantage, that Epaminondar's merit could be no longer concealed, nor indeed fuffer him to continue longer in his beloved retirement: fo that he faw himfelf, at length defervedly placed at the head of the Theban troops; where he gave fuch early proofs of his future prowefs and abilities, as jufly gave him the next rank to Pelopidas. Botls came now to be confidered in the fame light, as generals in the field, as governors at home, and as complete ftatefmen in the council. When the general treaty for veloring peace to Greece came to be propofed by the Athenians, and was upon the point of being executed by the reft of the fates, the Thebans refuted to agree to it, unlefs they were compreizended in it under the name of Bcootians. This demand was as ftrenuoully oppofed by the other contracting powers as Vol. XX. Part I.
infited on by Epaminondas, who was there as ambaflador on the part of the 'Thebans. Agefiluis, in particular, told biin in plain terms, that the lhebans ought to evacuate Bootia, and leave the cities of it free and in-encr with dependent. I'o which it was antwered by him, that Agchiaus the Lacedemonians would do well to fet them the ex-king of ample, by relloring Meffenia to its ancient proprietors, Sparta. and Laconia to its ancient freedom; for that the pretenfions of the city of Thebes to Bocatia were as well founded, at leall, as thofe of Sparta to thofe two countries. After this he went on, and fhowed how far Sparta had aggrandized herfelf at the expence of her neighbours : that peace miglat be indecd obtained, and upon a folid and lafling footing; but that this could not otherwife than by bringing all to an cquality. 'This bold though jult remonftrance, in which not only Thebes, but Greece in gencral was concerned, failed not, however, to exafperaic the haughty Sparian monarch; and the Athenians, who bad till now looked upon the Thebans as deperidents either on them or on the Macedonians, were not a little offended to hear their amhafiadors talk in fuch high terms. The refult of the conference was, that Agefilaus fruck the name of Thebes out of the treaty, and declaeed war againft them, about the year 371 B . C.

The Thebans were in no finill confternation to fee The Spa:themfelves engaged in a war with the powerful Spar-tans declate tans, without any ally to allit them; and the reft of "ar againa the Grecian flates having made peace vith the latter, Thebes. begas to look upon the ruin of the former as unavoidable. However, they refolved to makie the beft defence they could; and put their army under the command of Epaminondas, affigning him, at his own requef, fis: others to aft as counfellors or uftiftants. The Theban arrny couffited at mot but of 6000 men, whereas tha: of the enemy was at lean thrice that number; but E.paminondas trufted mof to his horfe, wherein he had much the advantage both in quality and good management: the reft he endeavoured to fupply by the difpolition of his men, and the vigour of the attack. He even refufed to fuffer any to ferve under him in the engagement, but fuch as he knew to be fully refolved to conquer or die. The two armies met at Leudra, where the Spartans Are entire were defeated with great flaughter, as related under that ly defated article.

The victorious gerieral, defirous to improve this great vi\&tory, fent an herald, crowned with garlands, to communicate it in form to the Athenians, in hopes that this would be an effectual means to reunite them to the Theban intereft But it proved quite therwife A thens \({ }^{14}\) ban intereft. But it proved quite otherwile. Athens, The Athehad then in view the fovereigniy of Grecce, chofe ra- - The of the ther, if they could not wholly obtain it, to Mare it wilh Sparta, than to let the Thebans into the whole; and therefore even decined giving their herald audience. However, the 'likebans took care to frengthen themfelves by alliances; and, befides the Arcadians and Eleans, had got the Phocians, Locrians, Acarnanians, Eubceans, and other flates, under their dependence: fo that 15 they were now in a condition to act offenively againf The Thethe Spartans. Accordingly, under pretence of affiting bans in*are the Arcadians, they entered Peloponnefus with a gallant fins with a army, with Epaminondas and Pelopidas at their head. formidable Fere they we:e joined by the Arcadian and other con-army, but federate fores ; fo that the whole anounted to \(\ddagger 0,000\), are repul-

\section*{THE}
pusbes. Pome lay so,005 men, befides great numbers of thole who fillowed the c.mp, rather for fiunder than fighting, and were compuided about 22,000 moic. Tike army was divided into tour columns, and mored thaight towards Sellatia, the place of sel.oezcous, from which they purfued their joumsy with fire and lsord towands Sparta. Bet here they were repulfed by Agefilaus, who was then returned to that metropolis.

To repair, in fome meature, this difgrace, and at the fame time to leave tome lating munument which fhould redound as much to his glory as to the moztifi cation of the Spartans, Epamiziondas left not their territories till he had rettored the polterity of the old Mellenians to their ancient dommions, out of which they had been banihed near \(3=0\) years; rebuilt their capi-

16
The Meffe nians rettored to their ancient doェมino: tal, and left a ftrong yarrifon for its defence. He was, however, nearly cut off in his return by \(I_{\text {pher }}\) hicrates, whom the Athenians had fent with 12,000 men to intercept him ; but this lalt loitered fo long at Corinth, that the Thebans had palled the defiles of Cenchrex, the chief place where he could lave obfircocted his retreat had lae taken poffeffion of it in proper time. Epaminondas continued his march till he came in full tio w of the city of Corinth. He found the roads choaked up wih trees, rock \({ }^{\text {a }}\), fones, and every thing that couid render them impaffable; and the Corinthians well fortified, and refolute on a fout diefence. But he came fo furioully upon them, notwithftanding a.11 thefe difficulties, that they abandoned all their entrenchments and outworks to the Thebans, and tled into the city. Thither thefe purfured them-fivord in hand, and made an horrid flaughter of them; intomuch that Corinth mult have mavoidably fallen into their hands, had their gercrals thought fit to purfue thefe adrantages; but whether they were afraid of the \(A\) thenians falling upon them, or apprehended forme dangerous embufh in a countiy wih which thcy were bui indifferently acquainted, or wheiher the army was too much weakened through fo many fatigues, or laftly, whether the coldnefs of the fealon, it being then the depth of winter, would not
13 permit them to proceed farther, they immediately math-Eparsinoz- ed towards Beootia. This gave fuch an adrantage to their das and Pe-enemies, that they met with a very mortifying reception lupidas dii- at their return to Thebes, where they were both arThe wosed reite:?, and feized as fate-prifoners, for having prefumed to prolong their command four months longes than the time limited by law, which time took in almort the whole of their expedition from their firt entrance into Peloponnefus. However, at flaf, the judges being afhamed to proceed any farther, they were buth honourably acquitted.

Ilhis profecution had been chicfly carried on and encournged by Mencelides, a difcontented Theban, and a bold and atle feakcr, who, by his attful calumnies at the trial, had fo far prevailcd with the judgres as to get Lipminondas deprived of the goverument of Bumtia for a whole year, though he could not gain the fame advantage engaint l'elopidas, who was a greater favourite of the people, as heing his ienior.

Py this delay the Spartans, with much difficulty, had War re- recovered themfelves from their great defeat at Leuctra, nowed with and fettled their aftiois in as good a pofure as they
Sparta, could lout though they had repulfed the Thebans in
dom of Mcilenia from them, they had fill caufe to fear what their forces might do under two fuch generals; and had accordingly taken due care to ftrengthen them. felves againt them, and to provide themeives with a great number of ausiliaries from other thates, efpecially flem that of Athens, with whom they had renewcd their old treaty, and had agreed that each thould have the command five days alternately. Soon after this treaty the Arcadians renewed the war, and tock. Palleree in Laconia by itcrm, put the garriton to the fivord, and were prefently affifted by the Argives and Eleas,s, and efpecially by the 'Thebans, who fent to them goco foot and 500 horfe under the command of Epammor.das. This io alarmed the Atherians likeuife, that they immediately feat Gobrias with fome forces to oppofe his paffige in gcod carnett; and he to behaved himfelf againt the Thebans, that they were furced to abandon Peloponnefus a fecond time. This ill fuccefs gase frem? The Tl.eoccation to the enemies of Epamirondas to blame his baris requi conduet in the highact terms, notwithtanding the fin. fo gular bravery with which he and his troops had forced the pafs. Even his fiends could not but fufpect him of partiality for the Spartans, in not purfuing his advantage over them, and making a greater flaughter of them when lie had it in his power; whild his enemies made it amount to no le's than treachery to his coun. try: fo that their brave general was once more depriv- daa degrated of the government of Ereotia, and reduced to the ded. condition of a private man. He did not continue long under this difgrace, before an cccafion offered to make his le:vices again of fuch neceffity to the fate, as to give hinn an opportunity to retrieve his fame, and wipe off the flain which lis enemies had thrown upon him.
The Theflalians, who had groaned fome time under the tyranny of the ufurper Alexander, furnamed the Plicrocin, fent an embafty to Thebes to implore their aid and protection; upon which Pelopidas was immediately fent as ambafiador to expofulate with him on their behalf. He was ther in Macedon, from whence he took the young prince Philip, afterwards the celebrated monarch, in order to protect and educate him ; and, upon his retun, marclied directly to Pharfalus in Theffaly, in order to punifh the treachety of fome mercenaries, who had deferted the Thebans in that expedition; but when he cane thithacr, he was furprifed to be met by the tyrant at the head of a numerous amny before that city, whiln bis orn was but as an handiul of men in compaifon of it. However, whether he fuppofed, or would be thought to do fo, that Alexander came thither to jufify himfelf, and anfwer to the complaints alleged againft him, he went, with Ifmenias his colleague, to him unarmed and unattended, not doubting but his character as ambeffador from fo porverful a rcpublic, joined to his own character and authority, would protect them fiom infult or violcnce: but he found himfelf millaken; for Alexander had no fooner got them into his hande, than he caufed them to be feized, and feat prifoners to Pheræa.

The Thebans, highly refenting the indignity offred A theban to their ambaffadors, icnt immediately an army into army fent Theffalv : but the generals werc repulfed with great lofs thim, vefueby the Pheroan ufurper; and it was owing to Epami-feated. nondas, who was among them only as a private centinel, that they wete not totally cut off. For the Thebans, finding

\section*{THE [ 315 ] T HI F.}

Theies. finding themfelves in fuch imminent danger, which they attributed to the incapacity of their generals, had immediately recourfe to him, whofe valour and experience had been fo often tried; and, partly by perluafions and intreaties, and partly by threats, obliged him to take
panmon- the command. This foon gave a different tum to their dusteffered. affairs, and converted their thight into a fafe and regular retreat; for he took the horfe and light armed foot, and placed himfelf at their head in the rear, and charged the enemy with fuch vigour and bravery, that he ubliged them to defill from their purfuit.

However, as the aring had fuffered fuch lofe hefore as not to be able to purfue them in their tura, he was obliged to return with them to thebes, with their pufillaninous generals; where the latter were fined I 2,002 drachuns each, and the former was reinflated in the command, and fent with a new reinforcement to repair the late diflonour, and profecute their revenge. The nervs of his being in full march on this errand greatly alarmed the tyrant; but Epaminondas, preferring the fafety of his imprifoned colleague to all other confiderations, forbore puhhing hoflilities to extremcs, for fear of provoking the enemy to wreak all his fury on him: to prevant which, he contented himfelf for a while hovering about with his army, and now and then with fuch flight dkirmifhes as foould intimidate the tyrant, and bring him the fooner to make fome fatisfactory ofiers. Alexander being fully convinced of the fuperiority of the Theban general, was glad to accept of a truce of 30 days, and to refore Pclopidas and Ifmenias to him; upon which he immediately withdrew his forces, and returned with them to Thebss.

By this time Tliebes was raifed to a fufficient height of reputation and gloyy to begin to aim in carneit at the fovercignty of Greece. The main obllacle to it was, that the other flates grew fo jealous of her prefent greatnefs, as to enter into the firongeft alliances and confederacies to prevent its farther growth; fo that not leing able now to procure many allies at home, they made no difficulty to feek for then abroad; and the lacedxmonians, by leading the van, gave thom a plauriole pretence to follow their feeps, and procure an alliance with Pertia, which at that time they found was ready to accept of the offers on any terms; the only queftion was, which of the three flates hould be preferred, Sparta, Athens, or Thebes. At the fame time, the Thebans propofed to their new confederates to fend likewife proper deputies to the Perfian court, in order to fupport 25 their refpective interefts; which they readily agreed to. Thefe were the Arcadians, Eleans, and Argives; at the head of whofe deputation Pelopidas was fent oa the behalf of the Thebans; which the Athenians being anprif- ed of, appointed two on their part. Thefe being all arrived at the Perilan court, began to purfue each their refpective interefts; but Pelopidas had by that time gained fuch credit there, both for his fingular addercfs and his extraordinary exploits, that he was dilinguilled in a parlicular manner from all the othcr deputies, and was received by the king with manifeft marks of honour and elteem, who freely owned himfelf convinced that the Thebans were the peoplc on whom he could moft fafely depend; and after having greatly applauded the equity of his demands, ratified and confirmed them with great readinefs, to the no fmall mortification of the other Eates. The fubrance of them was, that the liberties
formerly granted to the other towns of Greece mould "Thebes. be confirmed; that Mcfienia, in particular, arould contimue free and independent on the juriddiction of Spata ; that the Athenians fhould lay up their tleet; and that the 'Thebans thould \(b\) : looked upon as the ancient and hereditary fiends of Perfia.

The thebans took adrantage of the diffenfons which prevailed among the Greeks as a pretence for increafing their forces; and Epaminondas thought it a proper \(0,{ }^{0}{ }^{27}\) portunity for his countrymen to malse a bold effort to fane jroobtain the dominion at fea, as they had obtained it in a pole to great mealure at land. He propofed it to them in a pub-buitd a lie aftembly, and encouraged their hopes from the expe. fices. rience of the Lacedemonians, who in Xerxes's time had, with ten thips only at fer, gained the fuperiority over the Athenians, who had no lewer than 200 ; and added, that it would be a difgrace now to 'Thebes to fuffer two fuch republics to cngrofs the empire of fo extenfive an clement, without putting in at lath for their flate of it. The pcople seadily came into his propolal, not without extraordinary applaufe, and immedialely ordered 100 galleys to be equipped; and in the mean while font hins to Rhodes, Chios, and Byzantium, to lecure thofe Rates in their interell, and get what affifance be could from them. His negotiations had all the fuecefs that could be wilhed for, notwithlanding the frenuous uppoftion of the Athenians, and of their admiral Laches, who was fent with a powerful fquadron again't him. But what more effectually thwarted all his meafures, was the work that they found for him at land, and the obliging the Thebans to take part in the quarrels that then reign cd anong their neighbours: fo that whatever projects they had conccricd, proved abortive for the prefent; and the death of Epaminondas, which happened not long after, put an efiectual ftop to them.

During the abfence of that general, and of his colleague Pelopidas, the Orchomenians, being fpirited up by forre Theban fugitives, had formed : defign to change the Theban government into an ariflocracy; and 300 ho:femen of the former had been actually fent to put it in execution. Their project, however, was timely difcovered by the vigilance of the magifrates, who caufed them to 28 be feized, and put inmediately to deaih. They next The city oi fent a fufticient force againft the city of Orchomenos, Orchumewith orders to put all the men to death, and to fell the \({ }^{\text {ros razed. }}\) women and children for Alaves, which was punctually done; after which they razed that noble city to the ground. Pelopidas was then on his way to Clheffaly, at Pelopidas the head of a powerful army, whither he had been fent marches ato affit the Theflalians, who fill groaned under the \(y\)-gaint the ranny of Alexander the Plocixan, and had made feveral Thelfaliaa buave efforts to recover their liberty, but had been fill !yrant. overpowered by that ufurper. Being joined by the Therfalians, he encamped in the face of the enemy, though far fupcrior in number, and confilling of above 20,000 men. A fierce engagement foon enfued, in which both fides fought with uncommon bravery. The place where the battle was fought was called Cynocephala, from feveral little hills on it, between which there san a large plain. Both files endeavoured at firf to poft them?clves on thefe eminences with their foot, whilit Pelopidas ordered his cavalry to charge that of the enemy below; which they did with fuch fuccefs, that they foon put them to the sout, and purfued thein over the plain. This obliged the tyrant to gain the tops of the hills, where he

Rr2
greatly

\section*{T H E}

Theobes. \(\longrightarrow\) greatly annoyed the Theffalians that endeavoured to force thofe afcents; fo that Pelopidas was obliged to give orer his purfuit to come to their relief, This immediately infpired the Theflahans with fref courage, who began again to charge the enemy al leveral onfets; and foon thres them into fuch diforder, that they wele forced to give way. Pelopidas no fooner perceived the advantage, than he began to look about for Alexander, with a defign of engaging him. Having found him out as he was commanding his right wing, and endeavouring to rally his men, he moved directly to him; and being got near enough to be heard by him, challenged him to decide the battle by fingle combat with hinr. Alexander, inftead of accepting the c.ffer, turned about, and with all the fpeed he could ran to fcreen himfelf amongt his guards. Upon this Pelopidas charged him with fuch furious fpeed, that he obliged him to retire farther, and melter himfelf within the thickeft ranks; the fight of which made him attack with frefh vigour, and fight more defperately againft him. He tried iu vain feveral times to break through their ranks to reach him, cutting down great numbers of thofe that came forward to oppore him: his eagernefs at length expofed him fo far to the darts that were fhot at him at a diflance, that fome of them went quite through his armour, and gave him a defperate wound or two, while the reft advanced and flabbed him in the breat with their fpears.

It is fcarcely poffiole for words to eyprefs the grief and defpair which not only his brave Thebans, but likewife the Theffalians and other allies, flowed at the fight of their flain general : fome of the latter, who had perceived the danger he was expofed to, came down the hill with all poffible fpeed to his relief; but when they perceived that they were come too late to fave him, both they and the refl of the litule army thought on nothirg now but to revenge his death. They rallied accordingly, both horfe and faot, as quick as poffible, and began to charge the enemy afrefh, and with fuch defperate fury, that they at length gained a complete victory over them, and killed above 3030 of them in the purfuit, befides a much greater number which they had gain on the field of battle, though they fill looked upon all thefe advantages as vaftly too fimall to compenfate the lofs of their brave general.

The news of his death had no fooner reached Thebes, than the whole city was feen in as deep a mourning as his army. However, they fent a reinforcement to it of jooo foot and 700 horfe, as well to revenge the death of that general, as to improve the victory he had gained over the enemy; by the help of which they fell fo furioufly on them, that they quickly brake and totally defeated the fhattered remains of Alexander's army. Hereupon he was forced to fue for peace, and to accept it on fuch conditions as the conquerors thought fit to impofe. He was at length difpatched in his bed by his wife Thebe, anfiffed by her brothers, about feven years after his defeat. His body was afterwards dragged along the firects, trodden under foot, and left a prey to the dog.

All this while the Thebans were watching to improve cvery commotion that happened, every fuccefs they met with, to the forwarding of their then reigning and \(f_{a}-\) vourite projes, of increafing their power ahove all the rell, and in their turn to give laivs to Greece. Their
late fuccefs in Theffaly, and the rupture between the Arcadiars and Mantinears at the fame time, about fome confecrated money which the former had taken out of the temple of Olympias to pay their troops employed againft the Eleans, and which the latter called a downright facrilege, befides other difcords that reigned in the other ftates of Greece, gave frelh encouragement to Thebes to fet up for arbitrefs in thofe difputes; and fo much the more, as thofe who had embezzled the facred money, and wanted rather to embroil matters than to have them brought to light, fent that republic word that the Arcadians were juit upon the point of revolting to the Spartans, and advifed them to come and put an immediate fop to it. At the fame time they difpatched fome private directions to a Theban officer at 'Tegea, to apprehend feveral of their own people as difturbers of the peace. This was accordingly done, and feveral eminent perions were confined as prifoners of Rate: they were foon after difcharged, and loud complaints were made againt fuch arbitrary and unjut proceedings. The officer was accufed befure the Theban fenate of having intermeddled in their affairs, and endeavoured to interrupt the good correfpendence betwen the two ftates. It was even infitted on by fome of the Tegeans, that he hould be indicted and proceeded againt by his principais; whilf the more moderate fort, who forefas the confequences that were likely to attend fuch appeals, and that it would infallibly bring the Thebans upon them, loudly protened againt their marching into their territories, and did all they could to prevent it. The Thebans, however, weie become too powerful and ambitious to mifs fo fair an opportunity of getting once more footing in Peloponnefus, as they had long ago premeditated; and Epaminondas was fo far from making a fecret of their defign, that he told the Arcadian depu-dasimonties in jullification of it, that as it was on their account fes the that the Thebans engaged in the war, they had acted Greates of treacheroully with them in making peace with Athens without their confent: however, that when he had joined his army on his march into Peloponnefus to affift his friends, he would foon fee what proofs the Arcadians would give of their fidelity. This fpeech did not fail to alarm them greatly; efpecially as it was foken in fuch a magilterial Ryle and threatening tone. Even thofe who were beft affected to the Thebans could not forbear exprefling their diflike of it; and all that had the welfare of Peloponnefus at heart readily agreed with the Mantineans, that there was no time to be loft to ufe all proper means to prevent the impending form.

Athens and Sparta were accordingly applied to, and A combiwere eafily prevailed upon to aflif the Mantineans, and nation to come into a ftrift confederacy againft the Thebans; araint and to prevent all difputes about the command of the army, it was agreed that each ftate mould have it in its own territories; which plainly hows how terrified they all were at the apprehenfion of a frefl invafion of the Thebans: for this was a point which neither the Spartans nor Athenians would have fo readily given up to the Arcadians, though thefe had formerly as Arenuouly infilted t:pon it, even when they were almofl reduced to the latt extremity, and had never been able to obtain it till now. But Epaminondas was then in full march at the head of his Bocotian troops, with forne Euboean ausiliaries, and a body of tout Theffalian horfe; and was moreover to be joined by the Melienians, Argives, and
feveral

\section*{T H E} town edly to its relief, and given him a frelh repulfe.
Thefe two laff defeats greatly exafperated the Theban general, who had never before experienced fuch difafters, and could not but forefee that they would not only lef. fen his reputation with his allies, but, if not timely retrieved, would fully the glory of all his former exploits. What added to his prefent dificulties was, that the time allotted him for his expedition was almoft expired; fo that he had but a thort frace left to undertake fome brave atchicvement, which might recover his and his country's honour, and keep up the fipirits of his auxiliaries and thofe under his protection. He was moreover got very far into his enemy's country, and faw plain enough hovv narrowly they watched all his motions, and how well prepared they were to oppofe him whatever attempt he refolved upon, whether to attack them or to retreat. Under all thefe difficulties, he rightly confidered, that he muft immediately refolve upon a decifive battle; in which, if his prifitine fortune followed him, he might at once rettieve his affairs, and make himfelf mafter of Peloponnefus; or, if that failed hin, as it lately had done, fall honourably in the attempt. In this engagement Epaminondas made the wifch difpofition of his troops, attacked and fought with the moll intrepid courage and condư, and had opened himfelf a way through the Spartan phalanxes, thrown them into the utmoft confufion, and made a terrible flaughter of them, infomuch that the field of battle was covered with their wounded and inain, when, in the heat of the fight, having ventured himfelf too far in order to give them a total overthrow, the enemy rallied again, pouring with their whole fury three voileys of darts at him, fome of which he drew out and returned to them, till at length, being covered with wounds, and weakened with the lofs paninon- of fo much blood, he received a mortal wound from a \({ }^{35}\) kulled. javelin, and was with great dificulty refuued from the enemy by his brave Thetans, and brought alive, though fpeechlef, into his tent. As foon as he had recoveréd himfelf, he aiked his friends that were about him what was berone of his field; and being told that it was
fafe, he beckoncd to have it brought to him, and hified it. He next inquired which fide bad gained the vic. tory; and being anfwered, The Thebans; he replied, Then all is well: and unon obferving fome of his friends bewail his untimely death, and leaving no clildren behind him, he is faid to have anfwered, Yes; 1 have left two fair daughters, the victory of Leuctra, and this of Mantinea, to perpetuate my memory. Soon afier this, upon drawing the point of the javelin out of his body, he expired.

The confequence of this great general's fall, and of this bloody fight in which neither party could boaft any great advantage over the other, but a great lofs of men on both fides, infomuch that Xenophon makes it a drawn battle, was, that both parties agreed on a ceffation of arms, and parted, as it were by confent, to take care of their wounded and nain. The Thebans indced thus far gained the greater fhare of glory, that they renewed the fight, and after a molt defperate conteff, gained the victory over thofe Spartans that oppofed them, and refcued the body of their dying general out of their hands. However, an effectual end was put to this bloody war, and a general peace agreed on by all but Sparta; who refufed it only becaufe the Meffenians were included in it. But as to the Thebans, they had no great realon to Pease \({ }^{40}\) boaft of this dear-bought viftory, fince their fower and cluded. glory began to decline from that very time; fo that it may be truly faid, that it rofe and fet with their great general.

On the death of Epaminondas, the Thebans relapfed State of into their former flate of inactivity and indolence; and Thebes to at lat having ventured to oppofe Alexander the Great, the prefent their city was taken, and thc inhabitants flaughtered for feveral hours, after which the buildings were deftoyed. It was rebuilt by Cafiander, but never afterwards made any confiderable figure among the flates of Greece. About the year 146 B . C. it fell under the power of the Romans, under which it continued till the extinction of their empire by the Turks. It is now called Thive, and is nothing to what it was formerly; yet it is fous miles in circumference, but fo full of the ruins, that there are not above 4050 Turks and Chriftians in it, It is now famous for a fine fort of white clay, of which they make bowls for pipes after the Turkith famion. They are never burnt, but dry naturally, and become as hard as a flone. There are two mofques in Thebes, and a great many Greek churchos. It is feated between two fmall rivers, in E. Long. 23.40. N. Lat, \(3^{8.17}\).

Thebes, in Egypt, one of the moft renowned cities of the ancient world. It was alfo callied Diofpolis, oi: the city of Jupiter, and was built, according to fome, by Oliris, according to others by Bufiris. Its length, aincienit in Strabo's time, was 80 furlongs, or ten miles; but this Hizuerfa: was nothing in comparifon of its ancient extent, before volo to it was ruincd by Cambyles, which, we are told, was no lefs than 420 Atadia, or 52 miles and an half. The wealth of this city was fo great, that, after it had been plundered by the Perfians, whet was found, on burning the remains of the pillage, amounted to above 300 talents of gold and 2300 of filver.
Mr Bruce vifited the ruins of this celebrated city; but informs us that nothing now remaius except four temples, and thefe neither fo entire nor magnificent as fore others at a place called Dendera. Thebes has

\section*{THE [ 318\(]\) THE}

Thebes, been celebrated by Homer for its hundred gates; but Theft.

\section*{\(\xrightarrow{-}\)}

Lerese's
Travels. Mr Bruce informs us, that no vefliges of thefe are now remaining, neither can we difcover the foundation of any wa!l it ever lad; " and as for the horfemen and chariots it is fuid to have fent out, all the Thebaid fown with wheat would not have maintained one half of them. Thebes, at lean the ruins of the temples called Medinet Tabu, are built in a long ilreteh of about a mile broad, molt parfimomioully chofen at the fandy foot of the mountains. The Horti Penfiles, or hanging gardens, were furcly formed upon the lides of thele hills, then Cupplied with water by mechanical devices. The ntmoft is done to fpare the plain, and with great reafon ; for all the fpace of gronnd this ancient crty has had to maintain its myriads of horles and men, is a plain of three quarters of a mile broad between the town and the river, upon which plain the water rifes to the height of four and five feet. All this pretended populoufinfs of ancient Thebes I therefore believe to be fabulous."

Mr Bruce, nfter examining the ground on which Thebes is fuppofed to have food, thinks that it had no Fialls, and that confequently Homer's ftory of its having an hundred gates is mifunderitood. The mountains of the Thebaid fand clofe behind the town, not in a ridge, but fianding fingle, fo that you ean go round eacla of them. A hundred of thefe are faid to be hollowed out for fepulchres and other purpofes. Thefe, he thinlis, were the hundred gates of Homer; in proof of this they are flill ealied by the natives Bceban ef Meluke, ' the por:s or gates of the kings."

All that is faid of Thebes by poets or hiftorians after the days of Homer is meant of Diofpolis, which was built by the Greeks long afier 'Thebes was defroyed, as its name tefifies; though Diodorus fays it was built by Bufiris. It was on the eaf fide of the Nile, whereas ancient Thebes was on the wen, though both are confidered as one city; and Strabo fays, that the river runs through the middle of Thebes, by which he means be. tween Old Thebes and Diofpolis.

THEFT, or Smpre Larcexy, is "the relonious taking and earrying away of the perfonal goods of another." This offence certainly commersed then, h henever it was, that the bounds of property, or laws of merm and tutw, were etablithed. How far fuch an offence can exitt in a flate of nature, where all things are held to be common, is a quettion that may be folved with very little dificulty. The diflurbance of any individual in the occupation of what he has feized to his prefent ufe, feems to be the only offence of this kind incident to Juch a trate. But, unqueftionably, in focial communities, when property is eflablifhed, any violation of that property is fubject to be punilhed by the laws of fociety; though how far that puniflment ftould extend is matter of confiderable doubt.

By the Jewifh law it was only punifhed with a pecuniary fine, and fatisfaction to the party injured; and in the civil law, till fome very late conflitutions, we never find the punifhment capital. The laws of Draco at Athens punifhed it with death: hut his laws were faid to be written with blood; and Sulon aiterwards changed the penalty to a pecuniary mule. And fo the Attic law in general continued ; except that once, in a time of dearth, it was made capital to break into a garden and fleal figs: but this law, and the informers gyainf the offence, grew fo odious, that from them all
malicious informers were fyled fycophonts; a name which we have much perverted from its ongmal neaning. From thefe examples, as well as the tcaton of the thing, many leamed and forupulous men have quelliened the proprietg, if not lawfulnefs, of inticting captai punilhment for fimple theft. And certainly the natural punifhment for injuries to properiy leems to be the 13fs of the offendel's own property; which ought to be univerfally the cafe, were all men's fortunes equal. But as thole who have no propety themelves arc generally the mof ready to attack the property of others, it has been found neceffary, inftead of a pecuniary, to fublitute a corporal punifhment; yet hew far this corporal puniflument ought to extend, is what has occafioned the doubt. Sir Thomas More and the Marquis Reccaria, at the diffance of more than two centuries, lave very fenfibly tropofed that kind of eorporal punifiment which approaches the ncareft to a pecuniary fatisfaction, riz. a temporary impifonment, with an obligation to labour, fritt for the pa:ty robbed, and afterwards for the public, in works of the moft flavill kind; in order to oblige the offender to repair, by his induftry and diligence, the depredations he had committed upon private property and publie order. But, notuithflanding all the remonitrances of feculative politicians and moralilts, the punifliment of theft ftill continues throughout the greaten part of Europe to be eapital: and Puffendorf, together with Sir Matthew Hale, are of opinion that this miun always be referred to the prudence of the legiflature; who are to judge, f. \(y\) they, when crimes are become fo enormous as 10 require fuch fanguina:y refrictions. Yet both thefe writers agree, that fuch punifhment mould be cautionly intlicted, and never without the utmolt neceflity.

The Anglo Saxon laws nominally punifhed theft with denth, if abore the value of tevelvepence: but the criminal was permitted to redeem lis life by a pecuniary ranfom; as, among their anceltors the Germans, by a nated number of cattle. Put in the \(9^{\text {th }}\) year of Henry I. this power of redemption was tahen away, and all perfons guily of harceny above the value of twelvepence werc directed to be hanged; which law continues in force to this day. For though the infenior fpecies of theft, or petit larceny, is only punimed by whipping at common liw, or (by flat. 4 Geo. I.e. 1 I.) may be extended to tranfportation for feven years, as is alfo expretisly directed in the cafe of the Plate-glafs Company ; yet the punifiment of grand larceny, or the ftealing above the value of twelvepence (which fum was the flandard in the time of King Athelnan, 800 years aro), is at common law regularly death: which, confidering the great intermediate alteration in the price or denomination of money, is undoubtedly a very rigorous conftitution; and made Si: Henry Spelman (above a century finee, when money was at twice its prefent rate) complain, that while every thing elfe was rifen in its nominal value, and become dearer, the life of man had continually grown cheaper. It is true, that the mercy of juries will often make them ftrain a point, and bring in larecny to be under the value of twelvepence, when it is really of much greater value: but this, though cvidently juftifable and proper when it only reduces the prefent nominal value of money to the ancient flandard, is otherrife a kind of pious perjury, and does not at all cxaric our common law in this refreet from the imputation of fe-

\section*{T HIE}

Thent verily, but rather flongly confefies the charge. It is likewile true, that by the mercifal extenfions of the benefit of clergy uy our modern itatute-law, a perfon who commits a limple larceny to the value of thisteen pence or thiteen hundred pounds, though guilty of a ca utal offuce, thall be excufed the pains of death; but this is only fur the firtt off: nce. And in many cales of timple larceny the benefit of clergy is taken away by thatuic: as from horle ttealing in the principals and acceffories both bcfore and after the fact; theft by great and notosious thieves in Northumberland and Cumberland; taking woollen cloth from of the tenters, or linens, funtiane, callicoes, or cotton goods, from the place of manufacture (which extends, in the laft cafe, to aiders, aflifters, procurers, buyers, and reccivers); Eelonioully driving away, or othewife tealing one or more theep or other cattle fpecified in the ads, or killing them with intent to fteal the whole or any part of the carcale, or aiding or alfilling therein; thetis on navigable rivers above the whlue of forty fhillings, or being prefent, aiding and affifting thereat; plundering veffels in diftrefs, or that have fiffered dhipwreck; tlealing letters lent by the potl; and al?oftealing deer, hares, and conies, under the pcculiar circumfances mentioned in the Wahlanm black act. Which additional feverity is owing to the great malice and mifchic \(f\) of the thett in lome of thefe inflances; and others, 10 the difficultizs men would otherwife lie under to preferve thofe goods, which are fo eafily carried oif. Upon which lath principle the Roman law punithed more fevere!y that oher thieves the Aliggei or thealers of cattle, and the Balucarii or fuch as thole the cluthes of perfons who were wathing in the public baths; both which conflitutions feern to be borrowed from the laws of Athens. And fo, too, the ancient Goths punithed with unrelenting feverity thefts of catle, or of corn that was reaped and lett in the field: fuch kind of property (which no human indufry can fufficiently guard) being eftecmed under the pecular cuftody of hearen.

TheFt-Bote (from the Saxon theof, i. e. fur, and bate, comperfatia), is the receiving of a man's goods again from a thitf, after fiolen, or other amends not to profecute the felon, and to the intent the thicf may efcape; which is an offence punillable with fine and imprifonment, \& \& c.
THEILGONUM, a genus of plants belonging to the clafs monocia, and order of polyandria; ard in the natural fyllem ranging under the \(53^{\text {d }}\) order, Scabrider, See Botany Index.

THEOCliACY, in matters of government, a fate governed by the imnediate direstion of God alone: fuch ras the ancient government of the Jews befure thie time of Saul.

THEOCRITUS, the father of pafioral poetry, was born at Syracufe in Sicily. Tro of his pooms afcertaia his age ; one addrefied to Hiero king of Syracufe, who began his reign about 275 years before Chritt; and the other to Ptolemy Pi:iiadelphus king of Egypt. Hiero, though a prince difinguifhed in arms and political wifdom, doss not feem to have been a patron of learning. This is fuppofed to have given bith to the 16 th Idyllium. From Syracufe Theocritus went to Alexandriz; where he feems to have found a manificent patron in Ptolemy Philadelphus, if we may judge from the panegyric which he compofed on that prince (the I 7 th Idyllium). It has been faid that Theocritus was itrangled by Hiero, but we have not found evidence of this.

The compofitions of this poet are dittinguifhed, among the ancients, by the name of Idylliums, in order to exprefs the frallineis and variety of their natures: they would now be called MIIfellanics, or Pocms on feveraid Occoficus. The firt nine and the eleventh are confefred to be true paforals, and hence Theocritus has ufually paffed for nothing more than a pattoral post; yet he is manifefly robbed of a great part of his fane, if his other poems have not their proper laurels. For though the greater part of his Idylliums cannot be called the fongs of il.epherds, yet they have certainly their refpective merite. His paltorais ought to be confidered as the foundation of his credit ; upon this claim he will be admitted for the finither as well as the inventor of his art, and will be acknowledged to have excelled all his imitztors as much as originals ufually do their copies.

Fheoctitts The roorks of this poet were firt publined in folio by 1 Aldus Manutius at Venice in 1495. A more elegant and correct edition was printed by Henry Stephens at Paris in 1566 . An edition was publithed at Leipfic in 1765 , with valuable notes by the learned heike. But what will moft highly gratify the admirers of paftoral potry, is an edition publithed in \(17,0,2\) vols 410 , by Mr Thomas Wharton. It is accompanied by the fcholia of the beft editors, and the different readings of 15 MSS.

THEODOLITE, a mathematical inftument for meafuring heights and diftances. See Mesisuration and Surveying.

THEODORE, king of Corfica, Baron Nieuhoff in the county of La Marc in Weftphalia. He had his education in the French fervice, and afterwards went to Spain, where he received fome marks of regard from the duke of Riperda and Cardinal Alberoni ; but being of an unfettled difpofition, he quitted Spain, and travelled into Italy, England, and Holland, in fearch of fome now adventure. He at laft fixed his attention on Corfica, and formed the fcheme of rendering himfelf fovereign of that illand. He was a man of abilities and addrefs; and having fully informed himfelf of every thing relating to Corfica, went to Tunis, where he fell upon means to procure fome monty and arms; and then went to Leghorn, from whence he wrote a letter to the Corfican chiefs Giafferi and Paoli, offering confiderahle affiftance to the nation if they would elect him as their fovereign. This letter was configned to Count Domenico Rivarola, who acted as Corfican plenipotentiary in Tulcany, and he gave for anfwer, that if Theodore brought the aflifance he promifed to the Corficans, they would very willingly make him king.

Upon this he, without lofs of time, fet fail, and landed at Tavagna in the fring of the year 1736. He was a man of a very flately appearance, and the Turkifh drefs he wore added to the dignity of his mein. He had a few attendants with him; and his manners were fo engaging, and his offers fo plaufible, that he was proclaimed king of Corfica before Count Rivarola's difpatches arrived to inform the chiefs of the terms upon which he had agreed. He brought with him about 1000 zequins of Tunis, befides fome arms and ammunition, and made magnificent promifes of foreign affiftance; whence the Corficans, who were glad of any fupport, willingly gave into his fchemes. Theodore inflantly aflumed every matk of royal dignity. He had his guards and his officers of flate ; he conferred titles of honour, and ftruck moncy bath of filver and copper. The filser pieces were few in number, and can now hardly be met with; the copper coins have on one fide T. R. that is, "Theodorus Rex," with a double branch craffed, and round it this infcription, Pro bono pubtico Re. Co. that is, "For the puhlic good of the kingdom of Corfica:" on the other fide is the valuc of the piece; Cingque fulidi, or five fous.

The Gennefe were not a little confounded with this mexpected adventurer. They publifhed a violent manifello againf 'Theodore, treating him with great contempt; but at the fame time thowing they were alarmed at his appoarance. Theodore replied, in a manifefo, with all the calmnefs and dignity of a monarch; but after being ahout cight months in Corfira, percciving that the peuple began to cool in their affections towards him, he al-
fembled his chiefs, and declared he would keep them no Theodor, longer in a ftate of uncertainty, being determined to Theocoret. fee': in perfon the fupport he fo long expected. He fet tled an adminiftration during his ablence, recommended unity in the ftrongeft terms, and left the ifland with reciprocal affurances of fidelity and affection. He went to IIolland, where hie was fo fuccefsful as to obtain credit from feveral rich merchants, particularly Jews, who trufted him with cannon and other warlike ftores to a great value, under the charge of a fupercargo. With thefe he returned to Corfica in 1739 ; but by this time the French, as auxiliaries to the Genoefe, had become fo powerful in the illand, that though Theodore threw in his fupply of warlike fores, he did not incline to venture his peifon, the Genoefe having fet a high price on his head. He therefore again departed ; and after many unavailing attempts ta recover his crown, at length chofe for 1 etirement a country where he might enjoy the participation of that liberty which he had fo vainly endea. voured to give his Corficans; but hisfituation in England by degrecs grew wretched, and he was reduced fo low as to be fcveral years before his death a plifoner for debt in the King's Bench. At length, to the honour of fome gentlemen of rank, a charitable contribution was fet on foot for him in the year 1753. Mr Bofwell obferves, that Mr Horace Walpole generoufly exerted himfelf for the unhappy Theodore, and wrote a paper in The World with great elegance and humour, foliciting a contribution for the unhappy monarch in diftrefs, to be paid to Mr Robert Dodiley bookfeller, as lord high treafurer. This brought him a very handfome fum, and he was fet at liberty. That gentleman adds, that Mr Walpole has the original deed, by which Theodore made over the kingdom of Corfica in fecurity to his creditors, and that he has alfo the great feal of the kingdom. Theodore died in 1756, and was buried in St Anne's cluurchyard, Weftmintler ; where, in 1757 , a fimple unadorned monument of marble was erected to his memory by a gentleman, with an infeription, which, after mentioning fome of the above particulars, concludes with the following lines:
\[
\left.\begin{array}{l}
\text { The grave, great teacher, to a level brings } \\
\text { Herots and beggars, galley-flaves and kings : } \\
\text { But Theodore this moral learn'd ere dead, } \\
\text { Fate pour'd its leffon on his living head, } \\
\text { Beftow'd a kingdom and deny'd him bread. }
\end{array}\right\}
\]

THEODORET, bifhop of St Cyricus in Syria, in the \(4^{\text {th }}\) century, and one of the molt learned fathers of the church, was born in the year 386 , and was the difciple of Theodorus Mopfucftia and St John Chryfoftom. Having received holy orders, he was with difticulty perfuaded to accept of the bithopric of St Cyricus, about the year 420. He difcovered great frugality in the expences of his table, drcfs, and furniture, but fpent confiderable fums in improving and atorning the city of Cyricus. He erccted two large bridges, public haths, fountains, and aqueducts, and laboured with great zeal and fuccefs in his diocefe. Yet his zeal was not confined to his own church : he went to preach at Antioch and the neighbouring towns; where he became admired for his eloquence and learning, and had the lappinefs to convert multitudes of pcoplc. Ife wrote in favour of John of Antioch and the Netorims, againft Cyill's Twelve Anathemas: he afterwards attacked the opinions of Neftorius, and was depured in the fynod beld by the

Kutychians,

Theodoret, Eutychians at Ephefus; but was again reftored by the Theodofius general council of Chalcedon, in which he was prefent, in 45 r . It is thought that he died foon after; though others fay that he lived till the year \(45 \%\). There are fill extant Theodorct's excellent Commentary on St Paul's Epiftes, and on feveral other books of the Holy Scriptures. 2. His Ecclefiaftical Hiftory from the time of Arius to Theodofius the Younger. 3. The Hiltory of the famous Anchorites of his time. 4. Epiltles. 5. Difcourfes on Providence. And, 6. An excellent treatife againt the Pagans, entitled, De Curandis Gracorum Affectibus; and other works. The belt edition of all which is that of Father Siumond in Greek and Latin, in 4 vols folio.

THEODOSIUS I. called the Great, was a native of Spain. The valour he had hlown, and the great ferwices he had done to the empire, made Gratian, when at-
tacked by the Goths and Germans, to admit him as a Theorony, partner in the government. He reccived the purple in Theognis. 379, aged 43. See Constantinorle, n \({ }^{\circ} 77-88\).
'THEOGONY', foom ews, God, and rom, " feed, ofispring," that branch of the heathen theolugy which taught the genealogy of their gods.

Hefiod gives us the ancient theogony in a poem under that title. Among the moft ancient writers, Dr Butue obferves that theogony and cofmogony fignified the fame thing. In effect, the generation of the gods of the ancient Perfians, fire, water, and earth, is apparently \(n o\) other than that of the primary elements.

THEOGNIS, an ancient Greek poet of Megara in Achaia, flourifted about the 59th Olympiad, 144 B. C. We have a moral work of his extant, containing a fummary of precepts and reilcctions, ufually found in the collections of the Greek minor poets.

\section*{T H E O L O G Y}

IS a Greek word (Aiodoyta), and fignifies that fcience which treats of the being and attributes of God, his relations to us, the difperfations of his providence, his will with refpect to our actions, and his purpofes with refpect to our end. The word was filt uled to denote the fables of thole poets and philofophers who wrote of the genealogy and exploits of the gods of Gieece. It was afterwards adopted by the earlieft writers of the Chrillian church, who flyled the author of the Apocalypfe, by way of eminence, : Asodoyos, the Divine.

Although every pagan nation of antiquity had fome tutelary deities peculiar to itfelf, they may yet be confidered as having all had the fame theology, fince an intercommunity of gods was univerfally admitted, and the heavenly bodies were adored as the diï majorum genitum over the whole earth. This being the cafe, we are happily relieved from treating, in the fame article, of the truths of Clriftianity and the fictions of paganifm, as we have elfewhere traced idolatry from its fource, and flewn by what means "the foolifh hearts of men became fo darkened that they changed the glory of the incorruptible God into an image made like to corruptible man, and to birds, and four-footed beafts, and creeping things." See Polytimisis.

The abfardities and inconliftency of the pretended revelation of the Arabian impotor have been fufficiently expofed under the words Alcoran and MahometaNISM; fothat the only theology of which we have to treat at prefent is the Chrifian theology, which comprehends that which is commonly called natural, and that which is revealed in the fcriptures of the Old and New Teffaments. Thefe taken together compofe a body of fcience fo important, that in comparion with it all other fciences fink into infignificance; for without a competent knowledge of the attributes of God, of the feveral relations in which he ftands to us, and of the ends for which we were created, it is obvious that we muft wan. der through life like men groping in the dark, ftrangers to the road on which we are travelling, as well as to the fate awaiting us at the end of our journey.

But if this knowledge be neceffary to all Chriftians, it is doubly fo to thofe who are appointed to feed the Vol.. XX. Past I.
flock of Clarift, and to teach the ignorant what they are to be itheto believe, and what to do, in order to work out their died careown falvation. The wifdom and piety of our anceftors thly by have accordingly founded profefforhips of theology in tended for all our univerfities, where the principles of our religion the fervice are taught in a fyitematic and fcientific manner; and of the the church has ordained, that no man thall be admitted \({ }^{\text {church }}\) to the office of a preaclier of the gofpel who has not attended a regular courfe of fuch theological lectures.

It mult not, however, be fuppofed, that, by merely liftening to a courfe of leftures however able, any man will become an accomplifhed divine. The principles of this fcience are to be fouid only in the word and works of God ; and he who would extract them pure and unfophilticated, mult dig for them himfelf in that exhault lefs mine. To fit a man for this important invelliga- Previous tion, much previous knowledge is requifite. He muft knowledge ftudy the works of God fcientifically before he can per-fequifite ceive the full force of that teftimony which they bear to forcution of the power, the wifdom, and the goodnefs of their au-this itudythor. Hence the neceffity of a general acquaintance with the phyfical and mathematical fciences before a man enter on the proper Rudy of theology, for he will not otherwife obtain juft and enlarged conceptions of the God of the univerfe. See Physics, \(N^{0} \times 15\).

But an acquaintance with the phyfical and mathematical fciences is not alone a fufficient preparation for the fludy of theology. Indeed it is poffible for a man to devote himfelf fo wholly to any of thefe fciences, as to make it counteract the only purpofes for which it can be valuable to the divinc ; for he who is conftantly immerfed in matter, is apt to fufpect that there is no other fubflance; and he who is habituated to the routine of geometrical demonftration, becomes in time incapable of reafoning at large, and eflimating the force of the various degrees of moral evidence. To avert thefe difagreeable confequences, every man, bcfore he enter on the fludy of that fience which is the fubject of the prefent article, fhould make himfelf acquainted with the principles of logic, the feveral powers of the human mind, and the different fources of evidence; in doing which he will find the greate@ affitance from Bacon's Nooum Or -

S f
ganitrs,

Introduce garumn, I.ccke's \(E\).fray on the Human Underfianding, tion. Reid's Efcys on the Intelluctuat and Aetive Puwers of Man, and Tatham's Clart and Scale of Truth. Thefe works will teach him to think jufily, and guard hin againft a thouland errors, which thote who have not laid fuch a foundation are apt to embrace as the traths of God.

The man who propofes to fudy theology ought to have it in vicw, as the ultimate end of his labours, to impart to others that knowledge which he may proci:ic for himelf. "A mongfi the inany marks which diflinguin the Chrifitan pinilofopter from the Pagan, this (fays a learnet writer \({ }^{*}\) ) is one of the molt fryikng-the Pagan fought knowledge in a felfith way, to teciete it for his ows ute; the Ciriffian fecks it with the generous purpofe (firlt in view, th a gh latt in execution) to impart it to others. The Pagan pinilofopher, therefore, having cultivated the art of thimerigs, proceeds to that of feaking, in order to difplay bis sanity in the dexterous ufe of decsit. On the other harid, the Chrifian plilofopher cultivates the art of Jpeaking, for the tule purpofe of difeminating the truth in his office of peeach. er of the gofel."

As every man, before he enters os the proper fludy of theology, receives, at lealt in this country, the retiments of a liberal clucation, it may perhaps be faperfluous to mention here any books as peculinrly proper to teach him the att of tpeaking : we cannot however forbear to recommend to our ifudent the attentive perufal of Quintilian's Infitutions, and Dr Blair's Lectures on Rietoric and the Belles Letercs. A faminar acquaintance with thefe works will enable him, if he be enduwed by nature with talents fit for the eff.ce in which he propoies to engage, to exprcfs his thoughts with correetneis and elegance; " wihout which, it has been well obferved, that fcience, effecially in a clergyman, is but learned lunt,es, a burden to the ormer, and a nuifance to every body clfe."

No man can proceed thus far in the purfuits of gene13l fience without having been at leaft intiated in the learned lenguages; but he who intends to make theology his profeflion fhould devote himfelt more particularly to the fludy of Greck and Hebrew: becaule in thele tongues the original fcriptures are written. He who is incapable of confulting the original fcrjptures, mut ieit lis faith, not on the fure foundation of the word of God, but on the credit of fallible tran!lators; and if he be at any time called on to vindicate revelation againt the forfic of isfidelity, he will have to ftruggle with many difficullies which are cafily folved by him who is maner of the original tongues.
Cantives to is atrend. ing the Ice teres of a protedur.

Le obferved l.

Thine fludent having laid in this flock of preparatory knowledre, is now qualified to attend winh advantage the theological lectures of a leamed profeffor; thut in doing this, he floould be very careful neither !o admit nor rejeet any thing on the bate suthority of his mater. Kight principies in theology are of the utmoit import.

\section*{L O G I.}
ance, and can reft on no abthorioj inferior to that of Introtucthe word of God. O.a this account we have long been of opinion, that a proteflur cannat inder his purils lo much farice by a fyficmatical courfe of lectures, as by directing their ftadies, and pointing out the road in whoh they nay themflves arrive in the fhorlef time at the gerwine ferice of the lacred teriptures. In thas opinion we have the honcur to agrce with the ablett lecturer \({ }^{*}\) in theology that we have cver heard. The aus- * The inte thors of all fyltems are more or lels prejudiced in bcialf lir Camplof fome particulitr and artificial mode of faith. He, bell of -t therefore, who begins with the fludy of them, and afterwards proceeds to the facred volume, fees with a jaundiced exe every text fupporting thee peculiar tenets of his fist mafter, and acts as abfurd a part as he who tries not the gold by the copel, but the copel by the gold. Betore our young divine, therefore, fit down to the ferious perulal of aryy one of thole inflitutes el bodies of theology which abound in all languages, and esen befre he read that which the nature of our work compels us to lay before him, we beg leave to reconmend to his confideration the following

\section*{Prfinminary Directicis for the Stedy of Tilloiggy.}

Curistan: theology is civided into two great parts, Chrifien natural and revealed; the former comprehending that theology which may be known of God from the creation of the disidud in. wer mol to two worla, ter, that which is difcovered to man nowhere but in the facred volume of the Old and Ncw Teftaments.

Concerning the extent of natural theo logy nany opi- Timp prinnions have been formed, whilft fome bave contended ciples of that there is no fuch thing, In'o thefe difputes we theoury mean not at prefent to enter. We believe that one of canamitithem could have had no exifence among foecr and enlightened men, had the contending partics been at ive pains to define with accuracy the terms which they ufcd. Whatever te the origin of religion, which we have erideavoured to afcertain elferhere (fee Religios, \(\mathrm{N}^{n} \mathrm{C}\) 17.), it is obvious, that no man can rective a written book as the word of God till he be convirced by fome other means that God cxiffs, and that he is a Being of power, wifdom, and geodnefs, who watches over the conduct of his creature man. If the progenitor of the human race was infrueted in the principles of religion by the fiuthor of his being (a fact of which it is difficult to conccive how a confiffent theiff can entertain a duubl), he might commenicate to his children, by natural means, much of that knowledge which he himelf could not have difoovered l.ad he toot been fupernatinrally erlightened. Retween illuftrating or proving a truth which is already talked of, and mating a difcovely of what is wholly unknown, creay one perceives that there is an immenfe difference ( \(A\) ).

To bcings whofe natural knowledge originates wholly
(A) The difctiminating powers of Aitlotle will not be queftinned; entl in the following extract made by Cicero from fome of his woiks wich are now lont, he expreffes our fentiments on this important fubject with his ufual preciaon:-" Pruelare ergo Arillotelcs, st essesp, inquit, qui fub lerra femper habitavifent, bonis, et illufribus domiciliis, guxe effint ornata fignis atque 'ichuris, inflructaque relus ii: omnibus, quibus ahundant ii, qui beati

Preliminaty from fenfation, and whofe minds cannot, but by much Prections difeiplinc, advance from lenfe to fcience, a long ieries of revelutions misht be needfary to give them at firt juft notions of Goll and his atriuutes, and to enable them to perceive the relation between the effict and its caufe, fo as to infur by the powers of their own realon the exiltence of the Creator from the prefence of his creatures. Such revelations, however, could be fatisfactory only to thole who immedintely received them. Whenever the Deity has been pleafed by lipernatural mana to communicate any information to man, we may be fure that he has taken cfectual care to fatisfy the perion fo highly favoured that his mendertanding was not under the inthence of any illufion; but fuch a perfon could not communicate to another the knowledge which he had thus received loy any other means than an addrefs to his rational faculties. No man can be sequired to believe, no man indeed can belicve, withont proof, that another, who has no more faculties cither of fenfation or intelled than himfelf, has obtained information from a fource to which he has no pallible arcufs. An appeal to miracles wond in this cale ferre no purpole; for we mut believe in the exiftence, power, wifdom, ond jutice of God, before a miracle can be admitted as evidence of any thing but the power of him by whom it is performed. See Mirages.

It is therefore undeniable that there are fome princi ples of thealogy which may be called natural; for though it is in the highest degree probable that the parents of mankind received all their theological know- ledge by fupernatural means, it is yet obvious that feme parts of that knowledge mult have been capable of a proof purcly rational, otherwife not a fingle religious truth could have been conveyed through the fucceeding generations of the human race but by the iminediate infpiration of each individual. W'e indeed admit many propofitions as certainly true, upon the fole authority of the Jewith and Chrillian \{criptures, and we receive thefe fcriptures with gratitude as the lively oracles of Ged;
but it is folf-erident that we could not do either the cne Prolimiti, ry of the other, were we not convinced by hatural means Jitections. that God cxits, that he is a Being of goodrels, juftice, and power, and that he inlpired with divine widdom the penmen of thefe facred rolumes. Now, though it is very poftible that no man or body of men, i, ft to themfelves from infancy in a defert woold, would ever have made a theological difcovery; yet whatever propoftions relating to the being and attributes of the firll cate and the duty of man, can be demonftrated by human reafon, independent of written revelation, may be called notural cheology, and are of the utnof importance, as being to us the firl principles of all religion. Natural theology, in this fenfe of the word, is the foundation of the Chriltian revelation; for without a pervious knowledge of it, we could liave no evidence that the friptures of the Old and New Teftaments are indeed the word of God.

Our young divine, thereforc, in the regular order of situral his ftucies, ought to make limelf mafter of zatural lieolony to theology before he enter upon the important tafk of be afince the fearching the fcriptures. On this fubject many books duetrincs have been publithed in our own and other languages; of Tuselabut perhaps there is none more worthy of attention than tiun. the lieligion of Nature delineated by Mr Wollatton (B). It is a work of great merit, and bears ample teftimony to its author's learning and acutenefs : yet we think it ought to be read with caution. Mr Wollaflon's theory puls reof moral obligation is fanciful and groundlefs ; and commenswhilt we readily acknowledge that he demonflratesed. many truths with elegance and perfpicuity, we cannot deny that he attempts a proof of others, for which we believe no other evidence can be brought than the declarations of Chrif and his apoftes in the holy fcriptures. To fupply the defects of his theory of morals, we would recommend to the fudent an attentive perufal of Cumberland on the Law of Nature, and Paley's Elements of Moral Philufophy. A learned author * an- * Ifurbur firms of Cumberland, that "he excels all men in fixing \({ }^{\text {ton }}\) S [ 2

\footnotetext{
Numen, et vim Denrum; deinde aliquo tempore, patefactis terræ faucibus, ex illis abditis fedibus evadere in hac loca, quæ nos incolimus, atque exire potuifent : cum repente terram, et maria, cœlumque vidifient : nubium magnitudinem, ventorumque vim cognovifeni, adfpexifentque folem, ejufque tum magnitudinem, pulchritudinemque, tum etiam efficientian cognovifent, quod is diem efficeret, toto coelo luce difufa: cum autem terras nox opacafer, fum coelum totum cernerent aftris diftinctum et ornatum, lunxeque luminum varietatem tum crefocntis, fum fene. fcentis, corumque omnium orius et occafus, atque in omni aternitate ratos, inmutabilefque curfus: hæc cum viderent, profecto et esse dros, et hac tanta opera deorum esse arbitrarentur." De Nat. Deorum, lib. ii. § 37 .

From this paffage it is evident, that the Stagyrite, though he confidered the motions of the heavenly bodies, the cbbing and fowing of the fea, and the other phenomena of nature, as affurding a complete proof of the being and providence of God, did not however fuppofe that from thefe phenomena an untaught barbarian would difcouer this fundamental principle of religion. On the contraxy, he exprefsly afhrms, that before a man can feel the force of the evidence which they give of this important truth, be muft have Heard of the exiftence and pawer of God.
(B) It may not be improper to inform the reader, that Mr Wollafton, the author of the Religion of Nature, was a different man from Mr Woolfon, who blafphemed the miracles of our Saviour. The former was a clergyman of great piety, and of fuch moderate ambition as to refufe one of the highen preferments in the church of England when it was offered to him; the latter was a clergyman likewife, but remarkable only for gloomy infidelity, and a perverfe defire to deprive the wretched of every fource of comfort. In the mind of the former, philofophy and devotion were happily united; in the mind of the latter, there was neither devotion nor fcience. Yet thefe writers have becn frequently confounded; fometimes through inadvertence frem the fimilarity of their names; and fometimes, we are afraid, defignedly, from a weak and bigotted abhorrence of every fyftem of religion that pretends to have its foundation in reafon and in the nature of things.
}

Prelim:rary the true grounds of moral obligation, out of which naDircations tural law and satural religion both arife;" and we have ourflves uever read a work in which the various dutics which a man owes to his Maker, himfelf, and his follo:-creatures, a:c more accurately fated or placed on a furer banis than in the moral treatife of the archdeacon of Carlille.

As Wollation demonftrates with great perpicuity, the being and many of the attributes of God, it may perhaps appear fuperfuous to recommend any other book on that fabject. The prelent age, however, having among other wonderful phenomena, witneffed a revival of Ailuigm, we would advife our fudent to read with nuch attention Cudworth's Intellectual Syltem, and to read it rather in Molleim's Latin tranflation than in the author's original Englith. It is well known that Cudworth wrote his incomparable work in confutation of Hobbes's philofophy; but infead of confining himfelf to the whimfies of his antagonilt, which were in a little time to fink into oblivion, he took a much wider range, and traced atheifin through all the mazes of antiquity, expoling the weaknef of cvery argument by which luch an abfurdity had ever been mainained. In exhaufting the metaphyfical queftions agitated among the Greeks concerning the being and perfections of God, he has not only given us a complete littory of ancient learning, as far as it relates to thefe inquinies, but has in fact anticipated molt of the fophifins of our modern atheilts, who are by no means fuch difcoverers as they are fuppofed to be by their illiterate admirers.

The fodent having made himfelf mafter of natural theology, and carefully endeavoured to afcertain its limits, is now prepared to enter on the important tafk of fearching the fcriptures. In doing this, he ought to divelt himfelf as much as poffible of the prejudices of education in behalf of a particular fyltem of faith, and fit down to the fudy of the facered volume as of a work to which he is an entire ftranger. He ought firft to read it as, a moral hiffory of facts and doctrines, beginning with the books of Mofes, and proceeding through the reft, not in the order in which they are commonly pub. lihned, but in that in which there is reafon to believe they were written (fee Scriptures). If he be mafter of the Hebrew and Greek languages, he will doubtlefs prefer the original text to any verfion ; and in this peruial we would advife him to confult no commentator, becaule his object at prefent is not to tludy the doctrines contained in the bible, but merely to difcover what are the fubjects of which it treats. Many hiftories of the bible have been written; and were we acquainted with a good one, we fhould recommend it as a clue to direct the young divine's progrcls through the various books whicin compofe the facred volume. Stackhoule's hifory las been much applauded by fome, and as much cenfured by others. It is not a work of which we can exprefs any high degree of approbation; but if read with attention, it may no doubt be ufeful as a guide to the fries of faets recorded in the fcriptures. Between the Old and New Teftaments there is a great chafm in the hillory of the Jewifl mation; bot it is fupplied in a vely ante and fatisfactory manner hy Dr Prideaux, whofe Didd and New Tolament connecicd is one of the moft valuable hillorical works in, our own or any other lan. guage. Shuck ford's Satred and Profane Hiflory of the H'cmld conreited is likewife a work of merit, and may

\section*{L O G Y.}
be read with advantage as throwing light on many pafe Preliminers fages of the Old 'reftament : but this author is not in- Dirctions, tit'ed to the lame confidence with Prideaux, as his learning was not fo great, and his partialities feem to have been greater.

In thus making himfelf mafter of the hiltory of the Old and New Teltaments, the fludent will unavoidably acquire fome general notion of the various doctrincs which they contain. Thefe it will now be his bufnels to ftudy more particularly, to alcertain the precife meaning of each, and to dittinguifh fuch as relate to the whole human race, from thofe in which Abraham and his polterity were alone interefted. He mult therefore travel over the lacred volume a fecond time; and fill we would advife him to travel without a guide. From Walton's Polyglot bible, and the large colledtion called Critici facri, he may indeed derive much affiftance in his endeavours to afcertain the fenfe of a difficult text; but we think he will do well to make little ufe of commentators and expofitors, and ftill lefs of fyftem-builders, till he has formed fome opinions of his own refpect. ing the leading doctrines of the Jewih and Chriftian religions.
" Impreffed (fays an able writer) with an awful fenfe of the importance of the facred volume, the philofophical divine will fhake off the bias of prejudices however formed, of opinions however fanctioned, and of paffions however conflitutional, and bring to the ftudy of the advantage of a pure and impartial mind. Inftead of wafting all his labour npon a number of minute and lefs fignificant particulars, and of refining away plain and obvious lenfe by the fubtleties of a narrow and corrofive mind, his firft object will be to iullitute a theological inquiry into the general defign of the written word, and fiom principles fully contained and fairly underftood, to illuftrate the true nature and genius of the religions difpenfation in all its parts. He will mark the difference between the firft and fecond covenants, and obferve the connection that fubfifts between them. He will trace the temporary economy of the Old Tofamcnt, and weigh the nature and intent of the partial cozenant with the Jews; oblerving with aftonifhment how it was made introductory of better things to come : and he will follow it through the laze and the prophets in its wonderful evolutions, till he fee this vait and preparatory machine of providence crowned and completed in the eternal gofuel. This New Tefament, the lait and belt part of the religious difpenfation, he will purfue through the facred pages of that gofpel with redoubled attention; contomplating the divine foundation on which it claims to be built, the lupernatural means by which it was executed, and the immortal end which it has in view *."

In the courfe of this inquiry into the import of the facred volume, the ftudent will pay particular attention to the circumfances of the age and country in which its various writers refpectively lived, and to the nature of the different fyles, analogical and parabolical, in whith it is written. He will likewife keep in mind that God, whom it claims for its author, is the parent of truth, and that all his actions and difpenfations muf be confillent with one another. He will therefore compare the different pafages of the Old and New Teftaments which relate to the fame doctrine, or to the fame event, reafonably concluding that the bible moft be the beft interpreter of itfelf; and though the opinions which he thus

Tathan:.

\section*{T H E O}
andinninney forms may often be efroneous, they will feldom be dangernus errors, and may eafily be corrected by mature retiection, or by confulting approved authors who have treated before him of the various points which have been the fubjeet of his fudies. Of this mode of f pro. ceeding one good confequence will be, that, having from the facred fcriptures formed a fyitem of theology for himfelf, he will afterwards lledy the fyitems of other men without any violent prejudices for or againft them ; he will be fo much attached to his own opinions as not to relinquith them in obelience to mere human authority, at the fame time that he will be ready to give them up when convinced that they are not well fcunded; and if he have read the fcriptutes attentively, he will have acquired fuch 2 love of truth as to embrace her wherecver the may be found.

As we have fuppofed that every man, after having formed a theologicill fyftem of his own, will confuitt the fyltems of othere, it may perhaps be expected that we mould here recommend thofe which, in our opinion,
I. O G Y.
liar to it (c); its extraordinary adminiftration by ap-Preliminary pointed agents, endowed with fupernatural powers, and Diretions, wilh the gitts of miracles and prophecy; the doul/e ferfe in which the latter is fometimes involved; and the language confequent oar its nature and ufe-the reader will fud much erudition and ingenuity difplayed in the fecond part of Warburton's Divine Legation of Mofes demonfratce. 'That work is entitled to a fetious perufal; fur it diplays great learning and genius, and, we believe, the heavief cenlures have fallen on it from thofe by whom it was never read.

Having preceeded thus far in the courfe, the furdent's Toquiry to next bufinefs thould be to inquire ferionfly what evi- be made dence there is that the doctrines which be has fo care- into the refully fudied were indeed revealed in limes paft by God. velat.ons He mull already have perccived, in the nature and tendency of the doctrines themfelves, flrong marks of their origin being more than human; but he mull likewife have met with many difficulties, and he muft prepare himfelf to repel the attacks of unbelievers. Here he will find opportunities of exerting the utmoft powers of his reafoning faculties, and of employing in the fervice of religion all the fores he may lave amafled of human learning. The fcriptures pretend to have been written by feveral men who lived in different ages of the world; but the lateft of them in an age very remote from the prefent. His firt bufinefs therefore muft be to prove the authenticity of thefe book, by tracing them \(u_{p}\) by hiforical evidence to the feveral writers whofe names they bear. But it is not enough to prove them authentic. They profefs to have been written by men divinely infpired, and of courle infallible in what they wrote. He mult therefore inquire into the truth of this infiration. The Bible consains a number of truths doetrinal and moral, which are called my teries, and afferted to be the immediate dichatcs of God himfelf. To evince this great point to man, a number of fupernatural tefls and evidences are infeparably connected with thofe myfteries; fo that if the former be true, the latter muff be fo likewife. He mun therefore examine thefe tefts and evidences, to eftabliih the divinity of the Holy Scriptures;" and in this part of his courfe he will find much affiftance from many writers whofe defences of the truth and divinity of the Chriftian religion do honour to human nature.

The firft flep towards the embracing of any truth is, Books reto get fairly rid of the objections which are made to it; commendand the general objections made by deiflical writers to fubjecto the Chriltian revelation are by no writer more completely removed than by Bithop Butler, in his celebrated work entitled The Analogy of Religion natural and revealed to the Confitution and Courfe of Nature. This book therefore the fludent hould read with attention, and meditate on with patience; but as it does not furnih a pofitive proof of the divinity of our religion, he fhould pafs from it to Grotius de Veritate Religionis Chriftiana, and Stillingflet's Origines Sacra. Both thefe works are excellent ; and the latter, which may be confidered
(c) On this fubject the reader will find manv excellent obfervations in B:hhop Bull's Harmonia Apofolica, with its feveral defences, and in a fmall book of Dr Wells's, èntitled A Help for the Right Underfanding of the feveralDivine Laws and Covenants, whereby man has been obliged through the fevern! ages of the world to guide hiraGlf in order to faivation.

\section*{T H E O I. O G V.}

Prelinimary confidured as an improwemeni of the former, is perhaps Directions. the fulleat mad ableft defence of revelation in general that is to the found in any language. In this part of the united kingdom it is now indeed farcely mentioned, or mentioned with indifference ; but hali a century ogo the Englith divines thought it a fubjeit of triumph, and ityled its author their incomparable Silling flech. Other works, however, may be read with great advanlage, and none wi.h greater than Paley's Eviaences of the Clirifion Religian, and Lelle's Short Huthod with the Drifs; which latt wotk, in the compafs of a very few pages, contains proofs of the divinity of the Jewih and Chritian revelations, to which the celcbrated Dr Middleton coneffed (D), that for 20 ycars be had laboured in vain to fubricate a fpecious anlwe: (E).

Having fatisfied himfelf of the truth of revelation in
- IHa, bur inn's Direction for tive t.rdy of Theolig: and ti:e varions controverlas among Clarikians hamenelves. general, it may be worth the young divine's while to provide a defence of the Chritian religion againt the objections of modern Judaifm. In this part of his fludies he will need no other inftruction than what he may reap from Limborch's work entitled De Viritats Religionis Clrifiance antica collatio cum crudito Iudiro. "In that difputation, which was heid with Orobio, he will find all that the fretch of human parts on the one hand, or lcience on the other, cati produce to varnifh error or unravel fophiltry. All the papers of Orobio in defence of ludaifm, as oppofed to Chriftianity, are prined at large, with Limborch's anfueers, fection by Rection; and the fublilelt fophifms of a very fuperior genius are ably and Catisfactosily detected and ex. puled by the throng, profound, and clear reafoning, of this renowned remonflant *." See Orobi5 and LimBORCII.

The various controverfies fubfilting between the feveral denominations of Chriftians, about points which feparite them into different cluurches, ought next to be fludied in the order of the courfe; for nothing is unimportant which divides the followers of that Mafter whofe favourite precept was lowe. It has indeed been long fafhionable to decry polemical divirity as an ufelefs, if no: a pernicious, fludy; but it is not impoffible that this fathion has had its origin in ignorance, and that it tends to perpetuate thofe fchifnes which it profeffes to Jment. We are, however, far from recommending to the ycung divine a perufal of the works of the feveral combatants on each fide of a difputed queftion, till he has fitted himfelf for judging beiween them by a long courfe of preparatory Rudy; and the only preparation
which can fit him for this phepoe is an imnartial ludy firirat ... of ecclefiaticul hiflory. He who lias wi:h accuracy banction traced the progiefs of cur ho:y rchigion facm the days of the apoltles to the prefent time, and marked the introduction of hew dactrines, and the rife of the varions fects into which the Chriltian world is divided, is furnified with a criterion within limfclf by which to jadge of the importance and (ruth of the many contefled doctrines; whill he who, without this preparation, thall reas a multitude of books on any religious controverly, uill be in danger of beconaing a convert to his laft author, if that author poftels any :olerable fatare of art and ingenuity.

There are many hiforiss of the Cheifian church mpatatwhich poffels great merit, but we are acquainted with of ecclect none which appears to us wholly impartal. IIIcheeim's tical fifo. is perbaps the mont perfect compend (I); and one of broks reits greateit excellencies is, that on every lubject the beft cummend:writers are referred to for fuller information. 'Thefed. indeed hould often be confulted, not only to fupply the defects neceflarily refulting from the narrownels ot the limits which the anthor, with great propriety, preferibed to himfelf; but alfo to correct his partial ctliquities: for with all his merits, and they were many and great, he is certainly not free from the intluence of prejudice. Indecd there is no coming at the true hitory of the primitive clurch, but by tudying the works of the primitive writers; and the principal works of the firft four centuries will amply reward the labour of peruling them (G). The rife and progrel's of the reformation in general, the moft important period of chareh-hitory, may be beft learned from Sleidan's book De Seam Religioni. at Reipublica, Carolo V. Cufare, Commentaria; the Hillory of the Reformation of the Church of Scotland from Kinox and Spotifwood; and that of the Church of England from the much applauded work of Bithop Burnet.

After this comre of ecclefatical hiftory, the young divine may read with advantage the moft important controverfies which have agitated the Chrifian world. To enumerate thefe controverfics, and to point out the ableft authors who have written on each, would be a tedions, and perhaps not a very profitable talk. On one controverfy, however, we are induced to recommend a very mafterly wark, which is Chillingworth's book againit Knot, ertitled The Religion of Proteflants a fafe way to Saluation; in which the frhool jurgon of that Jefuit is adnirably expofed, and the long difpute be-
10) This piece of information we had from the late Dr Berkcley, prebendary of Canterbury, who had it from Archbithop Secker, to "hom the confefion was made.
(x.) 'l's thefe defences of revelation we might hase added the collection of fermona preached at Boyle's lecture from 1691 to 17.32 , publified in three volumes folio. 1739 ; the works of Leland; Bihlop Newton's Dillertations on Prophecy; and above all, Lardrer's Credibility of the Gofpel Hiftory, with the Supplement to it. Put there would be no en.l of ecommending eminent writers on this fulifect. We have mentioned fuch as we mof approve among thofe with whom we are beft acquainted; Lut we muft, once for all, caution the reader againf fuppcfing thar "..c approve of evcry thing to be found in any work except the facred Scriptures.
(F) The hithon of Landifin in the catalogue of books rublillied at the end of his Theological Tracts, recomarent i'reial uther ceclefiaftical hiftories as works of great merit; fuch as, Dupin's, Echard's, Gregory's and T"rn'y', tozether with I'aul Erncfi Jablonfi Infliutiones Hiforive Chrifinue, publihed at Frankfort in three wolveres: 7 it. 67.
(s) For a procf of this pofition, and for a juf eftimate of the value of the Fathers, as they are cadid, fee the introtuction to Wruburton's Jalian, and Ǩu"s Sermons at Bumpton's Lecturcs.
-clim:nry tween the Popifh and Reforncel churches phaced on its Directions. poper ground, the Holy Ecriptuics.

Une of the mont plaufible objections th the fudy of polemical divinity, is its tendency to give a rigid tuma to the fentiments of tho.e long engaged in it; whint we know, foum higher authonity that "the cnd of the commandment is clarity." duat for preferving charity in the minds of Chriftians, thete ate better means than abfolute ignorance or indifierence to truth. Charity is violated only when a church unconfonably rellains the inquiries of its own members, or exerciles intulerance towards thofe who have renounced its jurildiction. The injuthice of the firl fecties of ecclefiatical tyrany is cxpofed in a very materly manner by Jereny 'Taylor in his Liber yy of Prophecying, and by stillinglleet in his Irenicum; the injutlice of the fecond, by Locke in his celbleated Lettcrs on Toleration. The man who flall perufe thefe three works, and impartialty weigh the force of their arguments, will be in littie danger of thinking uncharitab!y of thofe from whole principles the love of truth may compel him to difent.

In thefe directions for the thady of theology, we might have enamerated many more broks on cach branch of the fubject well deferving of the moll attentive perufal ; but he who thal! have goate through the courfe here recommended, will have laid a fundation on which he may raife fuch a fuperttructure as will entitle him to the charater of an accomplihed divine. His diligence muft indeed be continued through life; for when a min ceales to make acquifitions in any department of learning, he foon begins to lofe thofe which he has already made; and a mure contemptible character is nowhere to be found than that of a clergyman unacquainted with the learning of his profeflion. This leanning, however, is not to be acquired, and indeed is fearcely to be preferved, by fludying bodies or inffitutes of theology; and though we have mentioned a lew generally approved by two rival fects of Chilitians, and mult, in conformity with the plan of our work, give another ourfelves, we do not hefitate to declare, that the man who has carefully gone through the courfe of furdy which we have recommended, thuugh it be litte more than the outlines on which he is to work, may, with no great lofs to himfelf, neglect ours and all other Tatazm. fyftems. For as an excellent writer *, whom we have often quoted, well obferves, " to judge of the fact whether fuch a revelat:on containing fuch a principle, with its myfleries and credentials, was aciually lent from God and received by man, by examining the coi-
dereces and circumplanecs which accompanicd i -the Preliminury time when, the place where, !lac mannce Low, it was Brections. delivered-blie form in which it defconds to us-and in what it is contannei-lugether with the pantular fublAance ard burden of ti-mand hew cevery part is to be rightly underflood: thete are the valius and extcintive Fubjects which conflitute the fublinac ufice of TuI.OLO. eic reasomag and the rropher study ch DiviniTY." On this account we flall pafs over flightiy, many things which cvery clergyman ough thuronghly to underitand, and coifisie ourtilyes, in the thort compend which we are to give, to the chief articles of Chrittian theology. In doing this, we thall cndeavour to diveft ourlel:its of party prejudices; but as we are far from thinking that this endeavour will be completcly fuccelsful (for we believe there is no man totally free from prejudice), we cannot conclude this part of the article more properly than with the following folemu Charge, with t Dr Toywhich a very lcamed divinof always prefaced his The- ler of Norological Lectures.
1. "I do folemnty charge you, in the name of the 1 charge God of 'Truth, and of our Lord Jefus Chnif, who is the to fuldents Way, the Truth, and the Life, and before whofe judge- of theology-ment-feat you mult in no long time appear, that in all your fludies and inquiries of a 1 eligious nature, prefent or future, you do conllantly, carefully, impartially, and confcientioully, attend to cvidence, as it lies in the Holy Sctiptures, or in the nature of thinge, and the dictates of reafon; cautioully gurding againft the fallies of imagination, and the fallacy of ill-grounded comicature.
iI. "That you admit, embrace, or affent, to no principle or fentiment by me taught or advanced, but only fo far as it flall appear to you to be fupported and juftified by proper evidence from revelation or the reafon of things.
III. "That if, at any time hereafter, any principle or fentiment by me taught or advanced, or by you admitted or cmbraced, thall, upon impartial and faithful examination, appear to yuu to be dubious or falle, you either fufpect or totally reject fuch principle or fontiment.
IV. "That you keep your mind always open to evidence: That you labour to banilh frem your breaft all prejudice, prepoffefion, and party-zeal: That you fludy to live in peace and love nith all your fellow Chrilians; and that you fteadily aflert for yourfelf, and frccly allow to others, the unalienable rights of judgerient and. confcience."

\section*{PARI I. OF NATURAL THEOLOGY.}

\section*{Sect. I. Of the Being and Attrilutes of God.}
t Pazl. HE who cometh to God, fays an "ancient divine *, deeply read in the philofophy of his age, muft believe that he is, and that he is a rewarder of them who diligently feek him. This is a truth as undeniable as that \(22 \quad\) being a man cannot concern himfelf about a nonentity. The
command the affent of every man who has any notion of the relation between effects and their caufes, and whofe curiofity has ever been excited by the phenomena of naturc. This great and important truth we have elfewhere endeaveured to demonftrate (fee Mietaphysics, Part III. Chap. vi.); but it may be proved by arguments le!s abtracted than the nature of that article required us to ufe. Of thefe we fhall give one or two, which we hope will be level to every ordinary capacity; while, at the fame time, we carneffly recommet:d to the young divine a diligent fludy of thofe books on

Reing and the fubjef which we have mentioned in the preceding Attributes directions.
of God.

We fee that the human race, and every other fpecies of animals, is at prefent propagated by the co-operation of two pareners ; but has this procefs continued from eternity? A moment's reflection will convince us that it has not. Let us take any one man alive, and let us fuppofe his father and mother dead, and himfelf the only perfon at prefent exifting: how came he into the world? It will be faid he was produced mechanically or chemically by the conjunction of his parents, and that his parents were produced in the fame manner by theirs. Let this then be fuppofed; it muff furely be granted, that when this man was born, an addition wa, made to the feries of the human race. But a feries which can be enlarged may likewife be diminithed; and by tracing it backwards, we mult at fome period, however remote, reach its beginning. Therc mult therefore have been a firt pair of the human race, who were not propagated by the conjuaction of parents. How did thefe come into the world ?
* See Bent- Anaximander tells us*, that the firt men and all aniLey'sRoyle's mals were bred in warm moifture, inclofed in cruftaccz. Fitires. ous ikins like crab-fifh or lobiters; and that when they arrived at a proper age, their flelly prifons growing dry, broke, and made way for their liberty. Empedocles informs us, that mother Earth at firf brought forth vaft numbers of legs, and arms, and heads, \&c. which, approaching each other, arranging themfelves properly, and being cemented together, flarted up at once full grown men.

Surely thofe fages, or their followers, fhould have been able to tell us why the earth has not in any climate this power of putting forth vegetable men or the parts of men at prefent. If this univerfal parent be eternal and felf-exiftent, it muft be incapable of decay or the fmallefl change in any of its qualities; if it be not eternal, we fhall be obliged to find a caufe for its exifence, or at leafl for its form and all its powers. But fuch a caufe may have produced the firt human pair, and undoubtedly did produce them, without making them fpring as plants from the foil. Indeed the growth of plants themfelves clearly evinces a caufe fuperior to any vegetative power which can be fuppofed inherent in the earth. No plant can be propagated but from feed or flips from the parent flock; but when one contemplates the regular procefs of vegetation, the exiftence of every plant implies the prior exittence of a parent feed, and the exiltence of every feed the prior exiftence of a parent plant. Which then of thefe, the oak or the acorn, was the firf, and whence was its exiftence derived? Not from the earth : for we have the evidence of univerfal experience that the earth never produces a tree but from feed, nor feed but from a tree. There muft therefore be fome fuperior power which formed the firt feed or the firft tree, planted it in the earth, and gave to it thofe powers of vegetation by which the fpecies has been propagated to this day.

Thus clearly do the procefies of generation and vegetation indicate a power fuperior to thofe which are ufually called the powers of noture. The fame thing appears no lefs evident from the laws of attraction and repulfion, which plainly prevail through the whole fyltem of matter, and liold tugether the flupendous firucture. Experiment flows that very few particles of the mof
folid body are in actual contact with eacls other (fee Being an, Optics, \(\mathrm{N}^{0} 6_{3}\)-68. Physics, \(\mathrm{N}^{0} 23\).); and that there Atribute are confiderable intertices between the particles of of God. every elaftic flud, is obvious to the fmalleft reflection. Yet the particles of folid bodies Atrongly cohere, whillt thofe of elallic Huids repel each othes. How are thefe phenomena accounted tor? To fay that the former is the effect of attraction and the latter of repulfion, is only to fay that two individual phenomena are fubject to thofe laws which prevail through the whole of the clafes under which they are refyectively arranged; whilt the quftion at iffue is concerning the origis of the laws thenselves, the power which makes the particles of gold cohere, and thole of air repel each other. Power without fubfance is inconceivable; and by a law of human thought, no man can believe a being to operate but where it is in fume manner or other actually prefent : but the particles of gold achere, and the particles of air keep at a diftance from each other, by powers exerted where no matter is prefent. There mult therefore be fome fubftance endowed with power which is not material.

Of this fubflance or being the power is cuidently immenfe. The earth and other planets are carried round the fun with a velocity which human imagination can fcarcely conceive. That this motion is not produced by the agency of thefe vaft bodies on one another, or by the interpofition of any material fluid, has been fhown elfewhere (fee Metaphysics, No 196-200. and OpTICS, \(\mathrm{N}^{0} 67\). ) ; and fince it is a law of our beft philolofophy, that we are not to multiply fubfances without necefinty, we muft infer that the fame Being which formed the firlt animals and vegetables, endowing them with powers to propagate their refpective kinds, is likewife the caufe of all the phenomena of nature, fuch as cohefion, repulfion, elafficity, and motion, even the motions of the heavenly bodics themfelves.

If this powerful Being be felf-exiftent, intelligent, and independent in his actions and volitions, he is an original or firft caufe, and that Being whom we denominate GoD. If he be not felf-exiftent and independent, there mult be a caufe in the order of nature prior and fuperior to Him, which is either itfelf the firf caufe, or a link in that feries of caufes and effects, which, howeve: valt we fuppofe it, muft be traced ultimately to fome one Being, who is felf-exiftent, and has in himfelf the power of beginning motion, independent of every thing but his own intelligence and volition. In vain have Atheifts alledged, that the feries may afcend infinitely, and for that reafon have no firf mover or caufe. \(\mathrm{An}_{\mathrm{n}}\) infinite feries of fucceffive beings involves an abfur- Abfurchity dity and contradiction (fee Metaphysics, \({ }^{0}\) 288.) of an infibut not to infilt on this at prefent, we flall only beg nite ferici leave to confider fuch a feries as a whole, and fee what of effectis. confequences will flow from the fuppofition. That we may with logical propricty confider it in this light, is incontrovertitle; for the birth of each individual of the human race fhows that it is made up of parts; but parts imply a whole as neceffarily as an attribute implies its fubject. As in this fuppofed feries there is no caufe which is not likewife an effect, nor any body moving another which was not itfelf moved by a third, the whole is undeniably equivalent to an iufinite effect, or an infinite hody moved: but if a finite cfict noun neceffarily have procected from a caufe, and a finite body

Being and in motion mult have been put into that fate by a moAttributes ver, is there a human mind which can conceive an infiof God. nite effect to have proceeded from no caufe, or an infinite body in motion to have been moved by nothing? No, furely! An infinite effect, were fuch a thing poffible, would compel us to admit an intinite caufe, and an infinite body in motion a mover of infinite power.

This great caule is GOD, whofe wifdom, power, and goodnefs, all nature loudly proclaims. That the phenomena which we daily fee evince the exiftence of onc fuch Being, has juft been thown; and that we have no reafon to infer the exiftence of more than one, is very evident. For, not to lay more ffrefs than it will bear on that rule of Newton's, which forbids us to multiply fubftances without neceflity, fuch a harmony prevails through the uhole vifible univerfe, as plainly fhows it to be under the government of one intelligence. That on this globe the feveral elements ferve for nourilliment to plants, plants to the inferior animals, and animals to man; that the other planets of our fyftem are probably inhabited, and their inhabitants nourimed in the fame or a fimilar manner; that the fun is fo placed as to give light and heat to all, and by the law of gravitation to bind the whole planets into one fyftem with itfelf-are truths fo obvious and fo univertally acknowledged, as to fuperfede the neceflity of eftablithing them by proof. The fair inference therefore is, that the folar fyltem and all its parts are under the government of one intelligence, which directs all its motions and all the changes which take place among its parts for fome wife purpofes. To fuppofe it under the government of two or more intellifences would be highly unreafonable; for if thefe intelligences had cqual power, equal wifdom, and the fame defigns, one of them would evidently be fuperfluous; and if they had equal power and contrary defigns, they could not be the parents of that harmony which we clearly perceive to prevail in the fytem.

But the Being capable of regulating the movements of fo valt a machine, may well be fuppofed to poffefs infinite power, and to be capable of fuperintending the motions of the univerfe. That the widely extended fyftem of nature is but one fyftem, of which the feveral parts are united by many bonds of mutual connection, has been thown ellewhere (fee Physics), and appears daily more and more evident from our progrefs in phyfical difcoveries; and therefore it is in the higheft degree unreafonable to fuppofe that it has more than one author, or one fupreme governor.

As the unity of defign apparent in the works of creation plainly proves the unity of their Author, fo do the immenfity of the whole, and the admirable adjultment of the feveral parts to one another, demonftrate His power and His wifdom. On this fubject the following beautiful reflections by Mr Wollafton are deferving of the mol ferious attention.
EReligion "In order (fays that able writer *) to prove to any
fNatuse, one the grandnefs of this fabric of the world, one needs f Natuse, one the grandnefs of this fabric of the world, one needs
ect. v. only to bid him confider the fun, with that infupportarop. 14. ble glory and luttre that furrounds it; to demonftrate its vaft diftance, magnilude, and heat ; to reprefent to him the chorus of plancts \(m\) ing periodically, by uniform laws, in their feveral orbits about it; guarded fome of them by fecondary planets, and as it were emulating the flate of the fun, and probably all poffeffed by proper inhabitants; 10 renind him of thefe furprifing Tol XX. PartI.
vifits which the comets make to us, and the large trains of uncommon fplendor which attend them, the far country from which they come, and the curiofity and horror which they excite not only among us, but in the inhabitants of other planets, who may alfo be up to fee the entry and progrefs of thefe minifters of fate; to direct his eye and contemplation through thofe azure fields and valt regions above him up to the fixed flars, that radiant numberlefs hoft of heaven; and to make him underftand how unlikely a thing it is that they mould be placed there only to adorn and befpangle a canopy over ou: heads; to convince him that they are rather fo many other funs, with their feveral fyitems of planets about them; to hoorv him by the help of glaffes fill more and more of thefe fixed lights, and to beget in him an apprehenfion of their inconceivable numbers, and thofe immenfe fpaces that lie beyond our reach and even our imagination: One needs but to do this (continues our author), and explain to him fuch things as are now known almoft to every body; and by it to flow, that if the world be not infinite, it is infrito fimilis, and undoubtedly the work of an Isfinite Architect.
" But if we would take a view of all the particulars contained within that aftonifhing compafs which we have thus haftily run over, how would wonders multiply upon us? Every corner, every part of the world, is as it were made up of other worlds. If we look upon this our earth, what fcope docs it furnifh for admiration? The great variety of mountains, hills, valleys, plains, rivers, feas, trees, and plants! The many tribes of different animals with which it is focked; the multifarious inventions and works of onc of thefe, \(i\). \(e\). of us men; with the wonderful inftincts of others, guiding them uniformly to what is beft for themfelves, in fituations where neither fenfe nor reafon could direct them. And yet when all thefe (heaven and earth) are furveyed as nicely as they can be by the help of our unaffilted fonles and of telefcopes, we may difcover by the affiftance of good microfcopes, in very fmall parts of matter, as many new wonders as thofe already difcovered, new kingdoms of animals, with new and curious architecture. So that as our fenfes and even conception fainted before in the val journeys ut took in confidering the expanfe of the univerfe, they here again fail us in our refearches into the principles and minute parts of which it is compofed. Both the beginnings and the ends of things, the leaf and the greatef, all confpire to baffle us; and which way foever we profecute our inquiries, we Atill meet with frelh fubjects of amazement, and frelh reafons to believe that there are indefinitely more and more behind, that will forever efcape our eagereft purfuits and deepelt penetration.
" In this vaft affemblage, and amidft all the multifarious motions by which the feveral proceffes of generation and corruption, and the other phenomena of nature, are carried on, we cannot but obferve that there are flated methods, as fo many forms of proceeding, to which things punctually and religioully adhere. The fame coufes circumftanced in the fame mamner produce always the fame effects; all the Jpecies of animals among us are made according to one general idea; and fo are thofe of plon's allo, and even of mincrals. No new fpecies are brought forth or have arifen anywhere; and the old are preferved and continued by the old ways.
6. It appears, laffly, beyond difpute, that in the part
' \(\Gamma\) t

Seins and and model of the world there is a contrivance for acAutitures complithing certain ends. The fun is placed near the oi God. centre of our fyttem, for the more convenient difpenfing of his benign influences to the planets moving about him; the place of the earth's equator interfects that of ber ortit, and makes a proper angle with it, in order to dieerfify the \(y c a r\), and create an uifful varisty of feaCons; and many other things of this kind will be always obferved, and though a thoufand times repeated, be meditated upon with pleafure by good men and true philofophers. Who can obferve the vapours to afcend, efoecially from the fea, mett above in clouds, and fall again after condenfation, without being convinced that this is a kind of difillation, in order to clear the water of its grofier falts, and then by rains and dews to fupply the fountains and rivers with frefl and wholefome 1 i quor; to nourih the vegetables below by fhowers, which defcend in drops as from a watering-pot upon a garden? Who can view the fructure of a plant or animal, the indefinite number of its fibres and fine veffels, the formation of laryer vefiels, and the feveral members out of them, with the apt difpofition of all thefe; the means contrived for the reception and diftribution of nutriment; the effect this nutriment has in extending the vellels, bringing the vegetable or animal to its full growth and expanfion, continuing the motion of the feveral fluids, repairing the decays of the body, and preferving life? Who can take notice of the feveral facul. ties of animals, their aits of faving and providing for themfelves, or the ways in which they are provided for; the ules of plants to animals, and of fome animals to others, particularly to mankind; the care taken that the feveral fpecics fliculd be propagated, withont confufion, from their proper feeds; the firong inclination planted in arimals for that purpofe, their love of their young and the like.-Who (fays our autlor) can olbferve all this, and not fee a defign in fuch regular pieces, fo nicely wrought and fo admirably prelerved ? If there were but one animal in exifferce, and it could not be doubted hut that his eyes were formed that he might fee with them, his cars that he might lear with them, and his fcet to be inftruments by which he might remave himfelt from piace to place; if defign and contrirance can be much lefs doubted, when the fame things are repeated in the individuals of all the tribes of animals; if the like obfervations be made with refpect to vegetables and other things; and if all thefe clafes of things, and mucly more the individuals comprehended under thern, be inconceivahly numerous, as moft unquetionahly they are-ore cannot but be convinceil, from what fo plamly runs through the nobler parts of the wifible world, that not oulv they, but other things, even thofe that feem to be lefs noble, have their ends likewife, though not always perceived by capacities 1 i mited like ours. And fince we cannot, with the Epicureans of old, fuppofe the parts of matter to have contrived among themfetwes this wonderful form of a world, 10 have taken by agreement cach its refpcetive pof, and then to have purfied in conjurction conflant euds by certain methods and meafures concerted, there muft be tome other Being, whofe wifdom and power are cqual to fuch a mighty work as is the fruflure and preferva. tion of the world. Thare mull be fome Almighty MIND who modelled and preferves it; lays the caufes of things fo deep; preforites them fuch uniform and

L O G I.
feady laws; deflines and adapts them to certain pur- Being and pofes; and makes one thing to fit and anfwer another Atribues fo as to produce one harmonious whole. Yes,

Thefe are thy gloricus works, Parent of good! Alinighty, thine this univerfal frame, Thus wondrous fair; THYSELF how wondrous then!
How wondrous in wifdom and in power !"
But the coudsess of God is nat lefs confpicuous in roodnef his works than His porser or His wildom. Contrivance proves defign, and the predominant tendency of the contrivances indicates the difpofition of the defigner. "The world (fays an elegant and judicious writer *) * Dr Pales abounds with contrivances, and all the contrivances in it with which we are acquainted are directed to beneficial purpofes. Evil no doubt exift; but it is never that we can perceive the object of contrivance. Teeth are contrived to eat, not to ache ; their aching now and then is incidental to the contrivance, perhaps infeparable from it ; but it is not its object. This is a diftinction which well deferves to be attended to. In defcribing implements of hurbandry, one would hardly fay of a fickle that it is made to cut the reaper's fingers, though from the conflruction of the inffrument, and the manner of uling it, this niifchief often happens. But if he had occafion to defcribe inftruments af torture or execution, this, he would fay, is to extend the finews; this to diflocate the joints; this to break the bones; this to forth the foles of the feet. Here pain and mifery are the very objects of the contrivance. Now nothing of this fort is to be found in the works of nature. We never difcover a train of contrivance to bring absut an evil purpofe. No anatomift ever difcovered a fyitem of organization calculated to produce pain and difeafe; or, in explaining the parts of the human body, ever faid, this is to irritate, this to inflame, this cuct is to convey the gravel to the kidneys, this gland to fecrete the humour which forms the gout. If by clance he come to a part of which he knows not the ufe, the mont that he can fay is, that to him it appears to be ufelefs: no one ever fufpects that it is put there to incommode, to annoy, or to torment. If God had wifhed our mifery, he might have made fure of his purpofe, by forming our fenfes to be as many fores and fains to us as they are now inftruments of gratification and enjoyment; or, by placing us among objects fo ill fuited to our perceptions as to have continually offended us, inftead of miniftering to our refreftment and delight. He might bave made, for inftance, every thing we tafted bitter, cvery thing we faw loathfome, every thing we touched a fting, every fmell a ftench, and every found a difcord."

Inflead of this, all our fenfations, except fuch as arc excited by what is dangerous to our health, are pleafures to us: The view of a landfcape is pleafant; the tafte of nourinhing food is pleafant ; founds not too loud are agrceable, while mufical founds are exquifte; and farcely any fmells, except fuch are excited by effluvia ohvioufly pernicious to the brain, are difagreealble; while fome of theni, if not too long inclulged, are de. lightful. Our lives are i forved and the fperies is continned hy obeying the impulfe of appetites; of which the gratification is exquifite when not repeated too frequently, to anfwer the purpofes of the Author of ourbeing. Since, then, God has called forth his confum-
beinr and mate widdom to contrive and provide for our happinefs, atributes and has made thofe things which are neceffary to our of God.
intermediate reafoning, we frould be in a great mea- Being and fure deprived of the mefent reward of virtue; and Attsbutes therefore this affociating primeiple contibutes mucl: of Ced. to our happinefs. But the benevolence of a Being, who feems thus anxious in furnifh tss with both fontual and intellectual enjoyments, and who has made our duty our greatelt plealure, cannot be fৃuclioned; and thercfore we mult infer, that the Author of Nature wilhes the happinefs of the whole fenfille and intelligent creation.

To fuch reafoning as this in fupport of the Divine Oljctuons, Benevolence many objections liave been made. Scine of them appear at firit fight plaufible, and are apt to flagger thie faith of him who has beftowed no time un the lludy of that branch of general feience which is cal. led phyfics (fee Prysics). To omit thefe altogether in fuch an article as this might be conftued into neglen ; while it is certain that there is in them nothing worthy the attention of that man who is gualified cither to eflimate their force, or to underfland the arguments by which they have often been repelled.

It has been afked, Why, if the Author of Nature be a bencvolent Heing, are we neceflarily fubject to pain, difeafes, and death ? The fcientific phyfiologift replies, Becaufe from thefe evils Omnipotence itfelf could not in our prefent flate exempt us, but by a confant feries of miracles. He who admits miracles, knows likewife anfucrut? that mankind were oiginally in a flate in which they were not fubjeet to death; and that they fell under its dominion through the fault of their common progenitors. But the fall and refloration of man is the great fuhject of revealed religion; and at prefent we are difculling the queftion like philofophers who have no other data on which to proceed than the phenomena of nature. Now we know, that as all maticr is divifible, every fyfem compofed of it muft neceftarily be liaible to deeay and diflolution; and our material fyllem would decay and be diffolved ling before it could ferve the purpofes of nature, were these not methods contrived with admirable wifdon for repaling the walle occa.aned by perpetual friction. The body is furnified with diferent fluids, which continuaily circulate through it in proper clannels, and leave in their way what is neceffary to repair the folids. Thefe again are fupplied by food \(a b\) extra; and to the whole procefles of digeftion, circulation, and nutrition, the air we beathe is abfolutely neceffary. But as the air is a rery heterogenecus fluid, and fubject to violent and fudden changes, it is obvicus that thefe changes mult affect the binod, and by confenuence the whole frame of the human body. The air inded in procefs of time confumes even marble itfelf; and therefore we carnot wonder, that as it is in one fate the parent of health, it hould in another be the fource of cifeafe to fuch creatures as ram and other terreftrial animals. Nor could thefe confequasices be avoided without introducing others much more dcplorable. The world is governed by general laws, without Which there could be among men neither arts nor fciences; and though laws different from thofe by which the fyftem is at prefent governed might perhaps have been eftablificd, there is not the fmalleft reafon to imagine that they could on the whole have been beitcr, of attended with ferser inconveniencies. As long as we have material and folid bcdies capable of motion, liable to refinance from other folid bolles, fuppoited by food,

Being and fubject to the agency of the air, and divifible, they mutt Auributes neceffarily be liable to pain, difeafe, corruption, and oi God.
 death, and that too by the very influence of thofe laws which preferve the order and harmony of the univerfe. Thus gravitation is a general law fo good and fo neceffary, that were it for a moment fufpended, the world would inftantly fall to pieces; and yet by means of this law the man mult inevitably be crufhed to death on whom a tower thall chance to tumble. Again, the attraction of cohefion is a general law, without which it does not appear that any corporeal fyftem could poffibly exif : it is by this law too, or a modification of it, that the glands and lacteals of the human body extract from the blood fuch particles as are neceffary to nourifh the folids; and yet it is by mears of the very fame mo. dification of the very fame law that a man is liable to be poifoned.

Although the human body could not have been preferved from dangers and diffolution but by introducing evils greater on the whole than thofe to which it is now liable, why, it has fometimes been alked, is every diforder to which it is fubject attended with ficknefs or with pain? and why is fuch a horror of death implanted in our brealts, feeing that by the laws of nature death is incvitable? We anfwer, That ficknefs, pain, and the dread of death, ferve the very beft purpofes. Could a man be put to death, or have his limbs broken without feeling pain, the human race had long ago been extinct. Felt we no uneafinefs in a fever, we thould be infenfible of the difeafe, and die before we fufpected our health to be impaired. The horror which generally accompanies our reflections on death tends to make us more careful of life, and prevents us from quitting this world rafhly when our affairs profper not according to our wifhes. It is likewife an indication that our exiftence does not terminate in this world; for our dread is feldom excited by the profpect of the pain which we may fuffer when dying, but by our anxiety concerning what we may be doomed to fuffer or enjoy in the next flage of our exiftence; and this ansiety tends more perhaps than any thing elfe to make us live while we are here in fuch a manner as to enfure our happinefs hereafter.

Thus from every view that we can take of the works and laws of God, and even from confidering the objections which have fometimes been made to them, we are compelled to acknowledge the benevolence of their Author. We muft not, however, fuppofe the Divine benevolence to be a fond affection like that which is called benevolence among men. All human affections and paffions originate in our dependence and wants; and it has heen doubted whether any of them be at firft difinterefted (fee Passon) : but he to whom exiftence is effential cammot be dependent; he who is the Author of every thing can feel no want. The divinc benevolence therefore muft be wholly difinterefted, and of courfe free from thofe partialities originating in felf-love, which are alloys in the moft fublime of human virtucs. The moft benevolent man on earth, though he withes the happinefs of every fellow-crcature, has fill, from the ties of blood, the endcarments of friendlliip, or, perhaps from a reyard to his own intereft, fome particular faThe divine vourites whom, on a compectition with others, he would tenevolence certainly prefer. But the equal Lord of all can have coincilent no particular favourites. His benevolence is therefore
with jufo with jus. lisc.
juffice, is only benevolence exerting itfelf in a particular manner for the propagation of general felicity. When God prefcribes laws for regulating the conduct of his intelligent creatures, it is not becaufe he can reap any benefit from their obedience to thofe laws, but becaufe fuch obedience is necelfary to their own happincfs; and when he punifies ti.e tranfgreflor, it is not becaufe in his nature there is any difpofition to which the profpect of fuch punifhment can afford gratification, but becaufe in the government of free agents punihment is neceflary to reform the criminal, and to intimidate others from committing the like crimes.

The effence of this felf-exitent, all-powerful, infinitely wife, and perfectly good Being is to us wholly in- God incom. , Ahat it is not comprehenfible. That it is not matter, is thown by the procefs of argumentation by which we have proved it to exift : but what it is we know not, and it would be impious prefumption to inquire. It is fufficient for all the purpofes of religion to know that God is fome how or other prefent to every part of his works; that exiftence and every poffible perfection is effential to him; and that he wifhes the happinefs of all his creatures. From thefe truths we might proceed to illull rate the perpetual fuperintendance of his providence, both general and particular, over every the minuteft part of the univerfe : but that fubject has been difcuffed in a feparate article; to which, therefore, we refer the reader. (fee Providence). We fhall only obferve at prefent, that the manner in which aninuals are propagated affords as complete a proof of the conftant fuperintendance of divine power and wifdom, as it does of the immediate exertion of thefe faculties in the formation of the parent pair of each fecies. For were propagation carried on by neceffary and mechanical laws, it is obvious, that in every age there would be generated, in each fpecies of animals, the very fame proportion of males to females that there was in the age preceding. On the other hand, but con did generation depend on fortuitous mechanifm, it is not fantly pre. conceivable but that, fince the beginning of the world, fent to his feveral fpecies of animals flould in fome age have gene- works. rated nothing but males, and others nothing but \(f e\) males; and that of courfe many fpecies would have been long fince extinct. As neither of thefe cafes has ever happened, the prefervation of the various fpecies of animals, by keeping up conftantly in the world a due, though not always the fame, proportion between the fexes of male and femalc, is a complete proof of the fuperintendance of divine prowidence, and of that faying of the apoftle, that it is " in God we live, move, and have our being."

\section*{Sect. 1I. Of the Duties and Sancticns of Natural Religion.}

From the fhort view that we have taken of the di-Reverence \(\frac{3^{6}}{}\) vine perfections, it is evidently our duty to reverence in and gratiour minds the felf-exiftent Being to whom they belong. Hude duc \(t\) This is indeed not only a duty, but a duty of which no Cud. man who contemplates thefe perfections, and believes them to be real, can poffibly avoid the performance. He who thinks irreverently of the Author of nature, can never have confidered ferioully the power, the wifdom, and the goodnefs, difplayed in his works; for whoever has a tolerable notion of thefe mult be convinced, that he who performed them has no imperfec-

Duties and tion ; that his power can accomplifh every thing which janctions of involves not a contradiction; that his knowledge is inNatural Keligion. tuitive, and free from the polfibility of error ; and that his goodnefs extends to all without partiality and without any alloy of felfih defign. This conviction mult make every man on whofe mind it is impreffed ready to proftrate himfelf in the duft before the Author of his being ; who, though infinitely exalted above him, is the fource of all his enjoyments, conftantly watches over him with paterial care, and proteets him from numberlel's dangers. The fenfe of fo many benefits muft excite in his mind a fentiment of the liveliefl gratitude to him from whom they are received, and an ardent with for their continuance.

While filent gratitude and devotion thus glow in the breaft of the contemplative man, he will be careful not to form even a mental image of that all-perfect Being to whom they are directed. He knows that God is not material ; that he exifts in a manner altogether incomprehenfible; that to frame an image of him would be to aflign limits to what is infinite; and that to attempt to form a pofitive conception of him would be impioully to compare himfelf with his Maker.

The man who has any tolerable notion of the perfections of the Supreme Being will never fpeak lightly of him, or make ufe of his name at all but on great and folemn occafions. He knows that the terms of all languages are inadequate and improper, when applied directly to him who has no equal, and to whom nothing can be compared; and therefore he will employ thefe terms with caution. When he fpeaks of his mercy and compaffion, he will not confider them as feelings wringing the heart like the mercy and compaffion experienced by man, but as rays of pure and difinterefted benevolence. When he thinks of the ftupendous fyftem of nature, and hears it, perhaps, faid that God formed it for his own glory, he will reflect that God is fo infinitely exalted above all his creatures, and fo perfect in himfelf, that he can neither take pleafure in their applaufe, nor receive any acceffion of any kind from the exiltence of ten thoufand worlds. The immenfe fabric of nature therefore only difplays the glory or perfections of its Author to \(u s\) and to other creatures who have not faculties to comprehend him in himfelf.

When the contemplative man talks of ferving God, he does not dream that his fervices can increafe the divine felicity; but means only that it is his duty to obey the divine laws. Even the pronoun \(H\) e, when it refers to God, cannot be of the fame import as when it refers to man; and by the philofophical divine it-will feldom be ufed but with a mental allufion to this obvious diftinction.

As the man who duly venerates the Author of his being will not fpeak of him on trivial occafions, fo will be be fill further from calling upon him to witnefs impertinences and falfehood, (fee ОАтн). He will never mention his name but with a paufe, that he may have time to refleet in filence on his numberlefs perfections, and on the immenfe diftance between himfelf and the Being of whom he is fpeaking. The flighteft reflection will convince him that the world with all that it contains depends every momest on that God who formed it; and this conviction will compel him to with for the divine protection of himfelf and his friends from all dangers and misfortunes. Such a wifh is in effect a prayer, and will always be accompanied with adoration, confef-
fion, and thank fgiving (fee Prayer). But adoration, Duties and confeffions, fupplication, and thankfgiving, conllitute Sanctions of what is called wor \(/\) bip, and therefore the worlhip of Naturat God is a natural duty. It is the addrefling of ourfelves \(\underbrace{\text { our }}\) as his dependants to him as the fupreme caufe and governor of the world, with acknowledgements of what we enjoy, and petitions for what we seally want, or he knows to be convenient for us. As if, e... gr. I frould in fome humble and compofed manner (fays Mr Wollafton) pray to that "Almighty Being, upon whom depends the exiftence of the world, and by whofe providence I have been preferved to this moment, and en-

40 joye Divine worjoyed many undeferved advantages, that he would gra- fhip a natucioufly accept my grateful fenfe and acknowledgments ral duty. of all his beneficence towards me; that he would deliver me from the evil confequences of all my tranfgreffions and follies; that he would endue me with fuch difpofitions and powers as may carry me innocently and fafely through all future trials, and may enable me on all occafions to behave myfelf conformably to the laws of reafon pioully and wifely; that He would fuffer no being to injure me, no misfortunes to befal me, nor me to hurt myfelf by any error or mifconduct of my own; that he would vouchfafe me clear and diftinct perceptions of things; with fo much health and profperity as may be good for me; that I may at leaft pals my time in peace, with contentment and trançuillity of mind; and that having faithfully difcharged my duty to my family and friends, and endeavoured to improve myfelf in virtuous habits and ufeful knowledge, I may at laft make a decent and happy exit, and find myfelf in fome better ftate."

That an untaught favage would be prompted by \(i x-\) Ainct to addrefs the Supreme Being in fuch terms as this, we are fo far from thinking, that to us it appears not probable that fuch a favage, in a flate of folitude, would be led by inflinet to fuppofe the exiftence of that Being. But as foon as the being and attributes of God werc, by whatever means, made known to man, every fentiment expreffed in this prayer mult neceffarily have been generated in his mind; for not to be fenfible that we derive our exiltence and all our enjoyments from God, is in effect to deny his being or his providence; and not to feel a wih that he would give us what we want, is to deny either his goodnefs or his power.

The worlhip of God therefore is a natural duty refulting from the contemplation of his attributes and a fenfe of our own dependence. But the realoning which has led us to this conclufion refpeets only private devotion; for it is a queftion of much greater difficulty, and far enough from being yet determined, wh, \(\boldsymbol{q}_{\text {wornhip } 2}\) whether public worfhip be a duty of that religion duty of nawhich can with any propriety be termed natural. Mr tural reliWollafton indeed pofitively affirms that it is, and en-gion? deavours to prove his pofition by the following arguments.
\({ }^{\text {" }}\) A man (fays he) may be confidered as a member \({ }^{42}{ }^{42}\) of fome fociety; and as fuch he ought to worthip God tor its if he has the opportunity of doing it, if there be proper prayers ufed publicly to which he may refort, and if his health, \&c. permit. Or the fociety may be confidered as one body, that has common interefts and concerns, and as fuck is obliged to worlhip the Deity, and offer one prayer. Befides, there are many who know not of

Duties and themleipes how to pray; perhaps cannot fo much as sanctions of read. Thefe muft be taken as they are; and confeVatural K -ligion. quently fome time and place aftoinied where they may have fuitable prayers read to them, and be guided in their devotions. And further, towards the keeping mankind in order, it is necefiery there f:ould be fome religion profeffed, and cren eltablifined, which cannot be without pablic worthip. And were it not for that ferfe of virtee which is princigally preferved (fo far as it is preferved) by national forms and habits of religion, men would foon lofe it a/f, rua wild, prey upon one another, and do what elfe the worn of favages do.:"

Thele are in themirlves juft obfervations, and would conse with great force and propriety from the tongue or pen of a Chrifian preacher, who is taught by revelation that the Mafter whom he ferves has commanded his followess "not to forfake the afiembling of themfelves together," and has promifed, "that if two of them thall agree on enth as touching any thing that they thanl afs, it thall be done for them of his Father who is in heaven." As urged by fuch a man, and on fuch grounds, they wond lerve to fhow the finefs of the divine ccmreand, and to point pat the benefits which a aeligious obediense to it might give us reafon to expect. But the author is here profefing to treat of natural religion, and to flate the duties which refult from the more relation which fubfits between man as a creature and God as his creator and conftant prefervér. Now, thcugh we readily adnit the benefits of public worlhip as experienced under the Chrifian difpenfation, we do not perceive any thing in this reafoning which could lead a pious theif to expect the fame benefit previous to all ex-

43
isorrowed from reve ia tion. perience. When the author thought of national forms and effabrifhments of religion, he certainly lof fight of his proper fubject, and, as fuch writers are too apt to do, compreisended under the relicion of nature what belongs only to that which is revealcd. Natual religion, in the proper fenfe of the mords, admits of no paricular forms, and of no lçal efablifoment. Private devotion is obviounly one of its cluties, becaufe fentiments of adoration, confeffion, fupplicatien, and thank friving, receffarily fpring tip in the breaft of ereery man who has jult no-' tions of Cod and of himfelf: but it is not fo obvious that fuch notions would induce any hody of men to meet at fated times for the purpole of expreffing their devotional fentiments in public. Mankind are indeed focial beings, and naturally communicate their fentiments to cach other; but we cannot conceive what hould at finf have led them to think that public worthip at flated times would be acceptable to the felf-exiftent Author of the univerfe. In cafe of a farmine, or any other calamity in which the whole tribe was equally involved, they might fpeak of it to each other, inqui:c into its caufe, and in the cxiremity of their dierees join perbaps in onc forent petition, that God would remore it. In the fame manner they might be prompted to pou: forth occafional cjaculations of public gratitude for prblic mercies; but it does not follow from thefe sncidenial occurremees that they would be lad to inflituc times and places and forms of national wornip, as if they beliceed Ile omnicient Deity mose ready to hear them in public thas in privale. That the appointment of fueh times and forms and places is benefcial to fuciety, experience reaches us; and therefore it is the duty, and has been the practice, of the fupreme magiffate, in evory age

\section*{L O G I.}
and in every civilized coubtiy, to provide for the main- Duties and tenance of the national worlhip. But this practice has taken its rife, not from the deductions of reafon, but either from direat revelation, as anong the lews and Chriftians; or frem tradition, which had its origin in fome early revelations, as among the more eniightened Pagens of ancient and modern timce.
TVe hope none of our readers will imagine that we mean, in any degree, to call in queftion the fitinefs or the duty of public worfhip. This is far from our intention; but while tre are convinced of the importance and neceffity of this duty, we do not apprehend that we leffen its dignity, or detract from the weight of almoft univerfal practice, by endeavouring to derive that practice from its true fource, which appears to us to be not human reafon, but divine revelation.

But whaterer doubts may be entertained with refpect The practo the origin of public worthip, there can be none as to tice of virthe foundation of moral virtue. Reafon clearly perceives tue a dury it to be the will of our Rlaker, that each individual of ref nationar. the human race fhould treat every other individual as, in fimilar circumfances, he would expect to be treated himfelf. It is thus only that the greateff furn of human happinefs can be produced (fce Moral Puilosophy, \(\mathrm{N}^{\mathrm{o}}\) 17. and 135. ); for were alt men tenperate, fober, juft in their dealings, faithful to their promifes, charitable to the poor, \&c. it is obvious that no miferies would be felt on earth, but the few which, by the laws of corporeal nature, unavoidably refult from the union of our minds with fyftems of matter. But the defign of God in forming fentient beings was to communicate to them fome portion, or rather fome refemblance, of that: felicity which is effential to himfelf; and therefore cvery action which in its natural tendency co-operates with this defign mun be agreeable to him, as every action of a contrary tendency mult be difagreeable.

From this reafoning it follows, that we are obliged not only to be juft and beneficent to one another, but alfo to abfain from all unnecenlary cruelty to inferior animals. That we have a right to tame cattle, and employ them for the purpofes of priculture and other arts Ineety to them for the purpoles of agriculture and othe: arts the inferic: where Arength is required, is a pofition which we be-animals a lieve has feldom been controverted. But if it is the in-fin. tention of God to communicate a portion of happincfs to all his creatures endowed with fenfe, it is obvious that we fin againlt him when we fubject even the hotfe or the afs to greater labour than he is able to perform; and this. fin is aggravated when from avarice we give not the arimal a fufficient quantity of food to fupport him under the exertions which we compel hin to make. That it is ous duty to defend ourfelves and our property from the ravages of benits of prey, and that we may eren externinate fuch beafs from the country in which we live, are truths which cannat be queflioned ; but it has been the opinion of men, cminent for wifdom and learning, that we have no right to kill an ox or a hieep for food, but in conlequence of the divise permiffion to Noah recorded in the ninth chapter of the book of Genefis. Whether this opinion be well or ill founded we flall not pofitively determine, though the arguments on which it refls are of fuch a mature as the reafoners of the prefent day would perhaps find it no ealy tafs to anfuer ; but it cannot admit of a doubt, that, in killing fuch animale, we are, in duty to thrir Creator and ours, bound to put them to the leaf polfible pain. If this be gianted, it is fill more cvideat

\section*{'art I.}
buties and evident that we ast contrary to the divine will when we anctions of torture and put to dcath fuch animals as are confeffedly Nalural Religion. not injurions to ourfelves, or to any thing on which the comforts of life are known to depend. We are indeed far from being convinced with the poct, that infects and reptiles "in mortal iufficrance feel as when a giant dies:" bat their feelings on that occation are certainly fuch, as that, when we wantonly indict them, we thwart, as far as in our power, the benevolent purpofe of the Creator in giving them life and fenfe. Let it be obforved too, that the man who pradifes meedlefs cruelty to the brute creation is training up his mind for exercifing cruelty towards his fellow-creatures, to his ीlaves if he have any, and to his fervants; and, by a very quick progrefs, to all who may be placed beneath him in the fale of fociety.

Such are the plain duties of natural religion ; and if they were univerfally practifed, it is evident that they would be productive of the greateft happinefs which mankind could enjoy in this world, and that picty and virtue would be their own reward. Nhey are however far from being univerfally practifed; and the conlequence is, that men are frequently railed to affluence and power by vice, and fometimes funk into poverty by a airgid adherence to the rules of virtue.

This being the cafe, there can be no queftion of greater importance, while there are fow more difficult to be anfwered, than "What are the fancions by which natural religion enforces obedience to her own laws?" It is not to be fuppoled that the great body of mankind fhould, without the profpect of an ample reward, practife virtue in thofe inflances in which fuch practice would be obvioully attended with injury to themfelves; nor does it appear reafonable in any man to forego prefont enjoyment, without the well-gromaded hope of thercby fecuring to himfelf a greater or more permancnt enjoyment in reverfion. Natural religion therefore, as a dyftem of doctrines infuencing the conduct, is exceedingly defective, unlefs it affords fufficient evidence, intelligible to cvery ordinary capacity, of the immortality of the loul, or at lealt of a future llate of rewards and punifiments. That it does afford this evidence, is ftrenuoully maintained by fome deifts, and by many plilofophers of a different defcription, who, though they profeis Chrilianity, feem to have fome unaccountable dread of being deceived by their bibles in every doctrine which cannot be fupported by philofophical reafoning.

One great argument made ufe of to prove that the immortality of the foul is among the doctrines of natural religion, is the univerfal belicf of all ages and nations that men continue to live in fome other flate after death has feparated their fouls from their bodies. "Quod fi omnium confenfus mature vox ef : omnefque, qui ubique funt, confentiunt efle aliquid, quod ad eos pertineat, gui vita cefferint: nobis quoque idem exifimandùm eft : et \(\mathfrak{f}\), quorum aut ingenio, aut virtute animus excellit, eos arbitramur, quia natura optima funt, cernere nature vim maxime : verifimile eft, cum ontimus quifque maxime foferitati ferviat, cfle aliquid, cujus is pof mortem fenfum fit habiturus. Sed ut decs cffe natura opinamur, qualefque funt, ratione cognofcimus, fic permanere animos arbitramut corfenfu narionum omnium *."
1. i. F1. That this is a good argument for the truth of the doctrine, through whatever channel men may have received it, we readily acknowledge ; but it appears not to us to

L O G Y.
be any proof of that doetrine's being the decuetion of Duties and human reafuning. 'The popular belief of l'agranifm, both ancient and modern, is fo fantallic and ablurd, that it could never have been rationally inferned from what nature leaclies of God and the foul. In the Elyfum of the Gieek and Roman pocts, departed fuiriss were vi fible to mortal eyes; and mull therciore lave been clothed with fome material vehicle of futhicient denfity to reflect the rays of light, though not to refift the buman touch. In the mythology of the nortlem matiuns, as deceafed heroes are reprefented as eating and drinking, they could not be conlidered as entirely divelid of matter ; and in every popular crecel of idolatry, future rewards were fuppoled to be corferred, not fur private vistue, but for public violence, on heroes and conquerors and the deftroyers of rations. Surely no admiter of what
is now called natural religion will preiend that thefe are and the deftroyers of nations. Surely no admiter of what
is now called natural religion will preiend that thefe are part of its doctrines; they are cevidently the remains of fome primeval tradition oblcured and corrupted in its long progrefs through ages and nations.
The philofophers of Grecce and home employed much time and great talents in difnuifitions concerning the hit man foul and the probability of a future ftate; and the genuine conclufions of natural religion on this fub-a future ject are anywhere to be found, one would naturally tate. look for them in the writings of thofe men whole genias and virtues did honour to human nature. Yet it is a fact, that the philofoplers held fuch notions concerning the fubfance of the foul and its flate after death as could affurd no rational fupport to fuffering virtue, (fee Metifiysics, Part 111. chap. 4.). Socrates is indeed an exception. Confiaing him!elf to the fludy of ethics, that excellent perfon inferred by the common monal arguments (fee Moral Piflosopiyy, \(\mathrm{N}^{\circ} 232-246\), that the reality of a future ftate of rewards and punithments is in the highefl derree probable. He was not, liowever, at all times abfolutely convinced of this important truth; for a little befure his death he faid to fome who were about him, " I am now about to leave this world, and ye are ftill to continue in it; which of us have the better part allotted us, God only knows *." And again, * Plato äa at the end of his moft admired difcourfe concerningt the Apolog. immortality of the foul, devirered at a time when he Soc. mult have been ferious, he faid to his friends who came to pay their laf vilit, "I would have you to know that I have great hopes that I am now going into the company of good men; yet I would not be too percmptory and confident concerning it + ."

Next to Socrates, Cicero was perhaps the inoft re- Plud. fpectable of all the philofophers of antiquity; and he feems to have ftudied this great queftion with unconmon care : yet what were his conclufions? After retaiting the opinions of various fages of Greece, and Mowing that fome held the foul to he the heart; others, the bloot in the heart; fome the brain; others, the brabih; one, that it was learnony; another, that it was number; one, that it was nothing at all; and another, that it was a certain quinteffence without a name, but which might properly be called s? \(\frac{\varepsilon \varepsilon \varepsilon \chi \text { ": - he gravely adds, "Harum }}{\text { g }}\) fententiarum quæ vera hit, Deus aliquis viderit : quæ verifimillima, magna queftio eft \(\ddagger . "\) He then proceeds to \(\ddagger\) Tufe give his own opinion; which was, that the foui is part 2 arfol lib. is of God.

To us who know by other evidence that the foul is immortal, and that there will be a fu!ure fate in which

Duties and all the obliquities of the prefent fall be made ftraight, Eanctions of the argument drawn from the moral atributes of God,
Natural
Reli; ion.
\(\underbrace{\text { Relifion. }}\) and the unequal diftribution of the good things of this life, appears to have the force of demonitration. I'et none of us will furely pretend to fay that his powers of realoning are greater than were thofe of Socrates and Cicero: and therefore the probability is, that had we been like them deftitute of the light of revelation, we fhou'd have been difturbed by the fame doubts, and lave faid with the latter, on reading the arguments of the former as detailed by Plato. "Nefcio quomodo, dum lego, affentior: cum pofui librum, et mecum ipfe de immot thitate animorum cœpi cogitare, affenfo illa elabitur *"

No one, we hope, will fufpect us of an impious attempt to weaken the evidence of a future flate. God forbid! The expectation of that ftate is the only fupport of virtue and religion; and we think the arguments we have ftated elfewhere, and referred to on the prefent occafion, make the reality of it fo highly probable, that, though there were no other evidence, he would act a very foolith part who fhould confine his attention wholly to the prefent life. But we do not apprehend that we can injure the caufe either of virtue or of religion, by confefing, that thofe arguments which left doubts in the minds of Socrates and Cicero appear not to us to have the force of complete demonflration of that life and immortality which our Saviour brought to light through the gofpel. certainly reconciling the Deity to Ginners. no means oftality of the humg foul as convincing as any gomer

Were the cafe, however, otherwife; were the argu-
ents which the light of nature affords for the immortality of the human foul as convincing as any geometrical demonftration-natural religion would ftill be defective; becaufe it points out no method by which fuch as have oftended God may be reftored to his favour, and to the hopes of happinefs which by their fin they had loft. That he who knows whereof we are made would thow himfelf placable to finners, and that he would find fome way to be reconciled, might perhaps be reafonably inferred from the confideration of his benevolence dif-
played in his works. Put when we come to inquire more Dutitis and particularly how we are to be reconciled, and whether a Sanetionso propitiation will be required, nature flops fhort, and ex- Natural pects with impatience the aid of fome particular revelation. That God will receive returning finners, and accept of repentance inflead of perfect obedience, cannot be certainly known by thofe to whom he has not declared that he will. For though repentance be the moft probable, and indeed the only means of reconciliation which nature fuggects; yet whether he, who is of purer eyes than to behold iniquity, will not require fomething further before he reftore finners to the privileges which they have forfeited, mere human reaion has no way of difcovering. From nature therefore arifes no fufficient comfort to finners, but anxious and endlefs folicitude about the means of appeafing the Deity. Hence thofe different ways of facrificing, and thofe numberlefs fuperfitions which overfipead the heathen world, but which were fo little fatisfaçory to the wifer part of mankind, that, even in thofe days of darknefs, the philofophers frequently declared that, in their opinion, thofe rites and oblations could avail-nothing towards appeaing the wrath of an offended God, or making their prayers acceptable to him. Hence Socrates and one of his difciples are reprefented by Plato \(\dagger\) as expecting a perfon divinely \(\dagger I_{z} A\) Accial commifioned to inform them whether facrifices be ac-ades. ceptable to the deity, and as refolving to offer no more till that perfon's arrival, which they pioully hoped might be at no great diftance.
This darknefs of the pagan world is to us who live Theefe \({ }^{\frac{5_{2}^{2}}{2}}\) under the funfline of the goipel happily removed by the doubst revarious revelations contained in the fcriptures of the Old the scripe and New Teftaments. Theie taken together exhibit tures. fuch a difplay of providence, fuch a fytem of doatrines, and fuch precepts of practical wifdom, as the ingenuity of man could never have difcovered. The Chriftian, with the frriptures in his hands, can regulate his conduct by an infallible guide; and reft his hopes on the fureft foundation. Thefe fcriptures it is now our bufinefs to cxamine.

\section*{PART II. OF REVEALED THEOLOGY.}

53 IN cvery civilized country the popular fyftem of theMiny pre- ology has claimed its origin from divine revelation. The tences tore-Pagans of antiquity had their augurs and oracles; the velation, Chinefe have their infpired teachers Confucius and Fohi: the Hindoos have their facred books derived from Brahama; the followers of Mahomet have their Koran dictated by an angel; and the Jews and Chriftians have the fcriptures of the Old and New Teftaments, which they believe to have been written by holy men of old, who fake and wrote as they were moved by the Holy Ghoft.

That the claims of ancient Paganifm to a theology derived from heaven, as well as the fimilar claims of the Chinefe, Hindoos, and Mahometans, are ill founded, has been ftown in various articles of this work, (fee Chws, Hindostan, Mahometanisia, Mytholociy, and loobyturism) ; whilf under the words Religion, hevemation, and Suripture, we have fufficiently proved the divinc infpiration of the Jewih and Chriftian feriptures, and of courfe the divine origin of Jewin and Chri-
fian theology. Thefe indeed are not two fyftems of theo- theugh th \(\log y\), but parts of one fyltem which was gradually re-Jewihh ans vealed as men were able to receive it; and therefore Chriftian both fcriptures mult be fudied by the Chriftian divine. are alone

There is nothing in the facred volume which it is not true. of importance to undertand; for the whole proceeds from the fountain of truth : but fome of its doctrines are much more important than others, as relating immediately to man's everlafting lappinefs; and thefe it has been cuftomary to arrange and digett into regular fyftems, called bodies or infitutes of Cliriftian theology. Could thefe artificial fyttems be formod with perfect impariality, they would undoubtedly be ufeful, for the bible contains many hiftorical details, but remotely related to falvation ; and even of its mof important truths, it requires more time and attention than the majority of Chriftiars have to beftow, to difcover the mutual connection and dependence.

Artificial lyftems of theology are commonly divided divifions o into two great parts, the theorctic and the pratical; theology.

Revealed and thefe again are fubdivided into many inferior branches.
throlusy. Under the theoretic part are fometinies clafted,

\section*{\(\xrightarrow{-}\)}
1. Dugmatic theology ; which comprehends an entire fyftem of all the dogmas or tenets which a Chriftian is bund to belicve and profefs. The truth of thefe the divine mult clearly perceive, and be able to enforce on his audience: and hence the neceffity of ftudying what is called,
2. The cxegefis, or the art of attaining the true fenfe of the holy lcriptures; and,
3. Hermentutic theology, or the art of interpreting and explaining the friptures to others; an art of which no man can be ignorant who knows how to attain the true lenfe of them himfelf.
4. Polimical theology, or controverfy; and,
5. Moral theology, which is diftinguilled from moral philofophy, or the fimple doctrine of ethics, by teaching a much higher degree of moral perfection than the mere light of realon could ever have dilcovered, and adding new motives to the praclice of vittue.

The practical fciences of the divine are,
1. Homilcic or pafloral theology; which teaches him to adapt his difcourles from the pulpit to the capacity of his hearers, and to purfue the beft methods of guiding them by his dostrine and example in the way of falvation.
2. Catcchetic theology, or the art of teaching youth and ignorant perfons the principal points of evangclical doctrine, as well with regard to belief as to practice.
3. Cafuific theology, or the fcience which decides on doubtful cales of moral theology, and that calms the fcruples of confcience which atile in the Chriftian's foul during his journey through the prefent world.

We have mentioned thefe divifions and fubdivifions of the fcience of theology, not becaufe we think them important, but merely that our readers may be at no lofs to underftand the terms when they meet with them in other works. Of fuch terms we fhall ourfelves make no ufe, for the greater part of them indicate diftinctions where there is no difference, and tend only to perplex the fudent. As the truths of Chriftianity are all contained in the fcriptures of the Old and New Teftaments, it is obvious that dogmatic theology mult comprehend the feculative part of that which is called moral, as well as every doctrine about which controverfy can be of importance: But no man can extract a fingle dogma from the bible but by the practice of what is here called the evegefis; fo that all the lubdivilions of this arrangement of theoretical theology muft be ftudied together as they neceflarily coalefce into one. The fame thing is true of the three branches into which practical theolugy is here divided. He who has acquired the art of adapting his homilies to the various capacities of a mixed audience, will need no new ftudy to fit him for inftructing children, and the mof ignorant perfons who are capable of inftruction; and the complete mafter of moral theology will find it no very difficult tafk to refolve all the cafes of confcience which he can have reafon to fuppofe will ever be fubmitted to his judgement. For thefe reafons we hall not trouble our readers with the various divifions and fubdivifions of theology. Our preliminary directions will fhow them how we think the fcience fhould be ftudied ; and all that we have to do as fyfternbuilders is to lay before them the view which the feriptures prefent to us of the being and perfections of God,

Vol. XX, Part I.

\section*{L O G Y.}
his various difpenfations to man, and the duties thence riod and incumbent on Chrinians. In doing this, we fhall follow the order of the divine difperfations as we find them recorded in the Old and New Teftaments, dwelling lungcfl on thofe which appear to us of mon general importance. But as we take it for granted that every reader of this article will have previoully read the whole facred volume, we fluall not fcruple to illultrate dogmas contained in the Old Teflament by texts taken from the New, or to illuatrate doetrines peculiar to the Chrilian religion by the tedtimony of Jewilli prophets.

\section*{Srct. I. Of God and his Altributes.}

Is: crery fyftem of theology the firt truths to be be- The 57 ift lieved are thofe which relate to the being and attributes revelition of God. The Jewift lawgiver, therefore, who records fuptowes the earlieft revelations that were made to man, begins of beat to his hillory with a difplay of the power and wildom of he a known God in the creation of the world. He does not inform truth. his countrymen, and cxpect them to believe, on the authority of his divine commifion, that God exijfs; for he well knew that the being of God mult be admitted, and jult notions entertained of his attributes, before man can be required to pay any regard to miracles which afford the only evidence of a primary revelation. "In the beginning (fays he) God created the heavens and the earth." Hcie the being of God is affumed as a truth univerfally received; but the fentence, flort as it is, reveals another, which, as we fhall afterwards fhew, human reafon could never have difcovered.

There is nothing which the fcriptures more frequently or more earneftly inculcate than the unity of the divine nature. The texts afferting this great and fundamental truth are almolt numberlefs. "Unto thee (fays Mofes to his countrymen *) it was fhewed, that thou mighteft * Deut iv. know that the Lord is God; there is none elfe befides 35. and 39. lim. Know therefore that the Lord he is God in hea. vi. 4. ven above and upon the earth bencath: there is none elfe. And again, "Hear, O lfrael, the Lord our God is one Lord," or, as it is expreffed in the original, "Jehovah our God is one Jehovah," one Being to whom exittence is effential, who could not have a beginning and cannot have an end. In the prophecies of Ifaiah, God is introduced as repeatedly declaring \(\dagger\), " I am Je- \(\dagger \mathrm{If}\) wah sir. hovah, and there is none elfe; there is no God befides 5,6, is, me ; that they may know from the rifing of the fun and \({ }^{21, ~ x l i v . ~} 80^{\circ}\) from the welt, that there is none befides me: I am Jehowah, and there is none elfe: Is there a God befides me ? Yea there is no God; I know not any." In perfect harmony with thefe declarations of Mofes and the prophets, our Saviour, addreffing himfelf to his Father, fays \(\ddagger\), "This is life eternal, that they might know \(\mid\) John xvi. Thee, the only true God, and Jefus Chrit whom Thou 3haft fent;" and St Paul, who derived his ductrine from his divine Mafter, affirms \(\oint\), that "an idol is no- \(\S 1\) Cor. siii. thing in the world; and that there is none oller God 4 . but one."

The unity of the divine nature, which, from the order and harmony of the world, appears probable to human reafon, thefe texts of revelation put beyond a doubt. Hence the firft precept of the Jewih law, and, according to their owa writers, the foundation of their whole religion, was, "Thou flualt have none other gods before \(\mathrm{U}_{11}\)

Me."

God an: Me.s Ilence, too, the reaion of that frict command kis Atrri- to Jews and Chrittia:s to give divine worfhip to none butcs.

1 Prow. ix.
but God: "Thou fhalt worllip the Lord thy God, and hins only flalt thou ferve;" becaufe he is God n!ose. Him only mult we fear, becaufe he alone hath infinite power; in him alone muft we trelt, becaufe "he only is our rock and our falvation;" and to him alone mutt we airect our devotions, becaufe "he only knoweth the hearts of the children of men."

The word \(u\) © \(\quad\) does not indicate a plurality of gods. In the opinion, howerer, of many eminent divines, it denctes, by its junction with the fingular verb, a plurality of perfons in the one Godhead; and fome few bave contended, that by means of this peculiar confruction, the Chriltian dotrine of the Trinity may be proved from the firlt chapter of the book of Gencfis. To this latter opinion we can by no means give our affent. That there are three difinat perfons in the one divine nature may be interred with lufficient evidence from a multilude of paifages in the Old and New Teftaments diligently compared together; but it would perhaps be ralh to relt the proof of lo fublime a myitery on any fingle text of ho'y fcripture, and would ceriainly be fo to relt it on the text in queltion. That Mofes was acquainted with this doctrine, we may reafunably conclude trom his fo frequently making a plural name of Goid to agree with a verb in the fingular number; but had we not polfefled the brighter light of the New Teftament to guide us, we fhould never have thought of d:awing fuch an inference. For fuppofing the word arte to denote clearly a plurality of perfons, how could we bave krown that the number is neither nore or lefs than three, had it not been afcertained to us by fublequent revelations?

There are indeed various paflages in the Oid Teftament, of the phrafeology of which no rational aceount can be given, but that they indicate more than one perfon in the Godheed. Such are thofe texts already noticed; " and the Lord Gud faid, let us make man in cur image, after our likenets ;" and " the Lord God laid, behold the man is become like oxe of us." To thefe may be added the following, which are to us perfectly unintelligible on any other fuppofition; "and the Lord God faid, let us go down, and there confound their language *." "If I be a Mafler (in the Hebrew adonim, Masters), where is my feart?" "The fear of the Lord (Jehovah) is the beginning of wifdom, and the knowledge of the Holy (in the Hebrew noly ones) is underftanding \(\ddagger\). ." " Kemember thy Creator (Hebrew, thy Creators) in the days of thy youth \(\$\)." "And now the Lord God and his Spirit hath fent me \|." "Seek ye out of the book of the Lorn and read; for MY mouth it hath commanded, and his SPIRIT it hath grathered them *."

That thefe tex!s imply a plurality of divine perfons, feems to us ineontrosertible. When Moles reprefents God as faying, let us make man, the majelly of the plural r:umber had not been adopted by earthly fovereigns; and it is obvious that the Supreme Being could not, as has been fuppofed, eall on angels to make man; for in different places of fcripture \(\dagger\) creation is attributcd to God alone. Hence it is that Solomon frealis of Creators in the plural number, though he means only the one Supreme Being, and exhorts men to remember them in the days of their youlh. In the gaflage Grat
queted from Ifaiah, there is a dittinction made between the Lord God and his Sotrit; and in the other, three divine perlons are introduced, viz. the Speaker, the Lord, and the Spirit of the Lord. It does not, how. ever, appear evident from thefe paffages, or from any other that we recollect in the Old Tellament, that the pafons in Deily are three and no morc: but no fober Chriftian will harbour a doubt but that the precife number was by fome means or other made knuwn to the ancient Hebrews ; for inquiries leading to it would be naturally fuggefted by the form in which the high pricft was commanded to blefs the people, "The Lord blefs thee and keep thee. The Lord make his face to fline upon thee, and be gracious unto thee. The Lord lift up his countenance upon thee, and give thee peace *"

The form of Chriflian baptifm eftablifhes the truth of A Irinity the doctrine of the Trinity beyond all reafonable ground in unity the of difpute. "Go (fays our bleffed Saviour) and teach doctrine of all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghoft." What was it the apoitles were to teach all nations? Wras it not to turn from their vanities to the living God; to renounce their idols and falfe gods, and fo to be baptized in the name of the Father, and of the Son, and of the Holy Ghoft ? What now muft occur to the Gentile nations on this occafion, but that, inflead of all their deities, to whom they had before bowed down, they were in future to leive, worfhip, and adore, Father, Son, and Holy Ghoft, as the only true and living God? To fuppole that God and two creatures ate here joined together in the folemn rite by which men were to be admitted into a new religion, which directly conderms all creature-wor/lip, would be fo unreafonable, that we are perfuaded fuch a fuppofition never was made by any converted Polytheill of antiquity. The nations were to be baptized in the name of thice perlons, in the fane manner, and therefore, doubtlefs, in the fame ferfe. It is not faid in the name of GOD and lis two faithful firvants; nor in the name of God, and Christ, and the Holy Ghost, which might have fuggefted a thought that one only of the three is God; but in the name of the Father, and of the Son, and of the Holy Ghost. Whatcver honour, reverence, or regard, is paid to the firt perfon in this folemn rite, the fame is paid to all three. Is lie achnowledged as the object of worfhip? So are the other two likewife. Is he God and Lord over us? So are they. Are we enrolled as fubjects, fervants, and foldiers, under him ? So are we equally under all. Are we hereby regenerated and made the temple of the Father? So are we likewife of the Son and Holy Ghoft. "We will come (fays our Saviour \(\dagger\) ) + John ait" and make our abode with him."

If thofe who believe the infpiration of the fcriptures could require any further proof that the Godhead comprehends a trinity of perfons in one nature, we might urge the apotolical form of benediction; "The grace of our Lorn Irsus Curist, and the love of God, and the communion of the Holy Ghost, be with you all \(\ddagger\)." Would St Paul, or any other man of common \(\ddagger 2\) Cora fenfe, have in the fame fentence, and in the moft folemn xii. it manner, rcommended his Corinthian converts to the love of God, and to the grace and communion of two creatures? We flould think it very ablurd to recommend a man at once to the favour of a kigg and a beg-

God and gar ; but how infinitely fmall is the diftance between the greatelt earthly potentate and the meanef beggar when compared with that which mult for ever fubfill between the Almighty Creator of heaven and earth and the moft elevated creature ?

But how, it will be anked, can three divine perfons be but one and the fame God? This is a queftion which has been often put, but which, we believe, no created being can fully anfwer. The divine nature and its man- ner of exifence is, to us, wholly incomprehenfible; and we might with greater rcafon attempt to weigh the mountains in fcales, than by our limited facultics to fathom the depths of infinity. The Supreme Being is prefent in power to every portion of fpace, and yet it is demonfrable, that in his effence he is not extended (fee Metaphysics, \(\mathrm{N}^{\circ} 309,310\) ). Buth thefe truths, his inextenfion and omniprefence, are fundamental principles in what is called natural religion; and when taken together they form, in the opinion of moft people, a myftery as incomprehenfible as that of the Trinity in unity. Indeed there is nothing of which it is more difficult to form a diflinet notion than unity finple, and abfolutely indivifible. Though the Trinity in unity, therefore, were 1 Chrillian doctrine, myfteries mult fill be believed; for they are as infeparable from the religion of nature as from that of revelation; and atheifm involves the moft incomprehenfible of all myfteries, even the begimning of exiftence without a caufe. We muft indeed form the befl notions that we can of this and all other my fleries; for if we have no notions whatever of a Trinity in unity, we can neilier believe nor difelieve that doctrine. It is however to be remembered, that all our notions of God are more or lefs analogical ; that they mult be exprefied in words which, literally interpreted, are applicable only to man ; and that propofitions underitood in this literal fenfe may involve an apparent contradiction, from which the truth meant to be expreffed by them would be feen to be free, had we direct and adequate conceptions of the divine nature. On this account it is to be wifhed that men treating of the myiteyy of the Holy Trinity, had always exprefled themfel ves in feripture language, and never aimed at being wife above what is written; but fince they have acted otherwife, we muft, in juftice to our readers, animadvert on one or two ftatements of this doctrine, which we have reafon to believe are earnefly contended for by fome who confider themfelves as the only orthodox.

In the friptures, the three perfons are denominated by the terms Father, Son, and Holy Ghost, or by GoD, the Word, who is allo declared to be God, and the Spirit of God. If each be truly God, it is obvious that they muft all have the fame divine nature, juft as every man has the fame human nature with every other man ; and if there be but one Gon, it is equally obvious that they muft be of the fame individual fubftance or effence, which no three men can pofibly be. In this there is a difficulty; but, as will be feen bv and by, there is no contradiction. The very terms Father and Sos imply fuch a relation between the two perfons fo denominated, as that though they are of the fame God, juft as a human father and his fon are equally men, yet the fecond mult be perfonally fubordinate to the firft. In like manner, the Holy Ghoss, who is called the Spirit of God, and is faid to procecd from the

\section*{I. O G Y.}

Father, and to be font by the Sorn, mult be conceived as fuburdinate to both, much in the fame way as a fon is fubordinate to his parcnts, though poffeffed of equal or cven of fupetior powers. That this is the true dochine, appears 10 us undeniable from the words of our Saviour himfelf, who, in a prayer addrefled to his Fubler, fyles him * by way of pre-eminence, "the ouly true God," as "John being the fountain or origin of the Gochead from which xvii. 3. the Son and the Holy Ghoft derive their true divinity. In like manner, S. Paul, when opjofing the polytheifm of the Greeks, fays exprefily t, that "to us there is but +x Cor one God, the Cather, of whom are all thinge, and winio. we in, or for, him; and one Lord Jrsus Christ, er whom are all things, and we by hin."

That the primitive fathers of the Chriftian church maintained this fubordination of the fecond and third perfons of the blefled 'irinity to the frit, has been evinced with complete evidence by Biflop Bull. We Ghall tranfribe two quotations from him, and refer the reader for fuller fatisfiction to fect. 4. of his Defenfio fidei Niena. The firl latll be a puffage eited from Novatian, in which the learned prelate affutes us the fenfe of all the ancients is expreffed. "Quia quid en Filius, non ex fe eft, quia nec innatus eft ; Ted ex patre eft, quia genitus eft : live dum verbum eft, five dum virtus eft, five dum 「apientia eff, five dum lus eft, live dum Filius eft, et quicquid horum eft, non aliunde elt quam ex Patre, Patri fao originem fuam debens." The next is from Athanafius, who has never been accufed of holding low opinions refpecting the fecond perfon of the holy Trinity. This father, in his fifth difcourfe againt

 cording to John, the Word was in ihis firft principle, and the Word was God. For God is the prineciple; and becaufe the Word is from the principte, therefore the Word is God. Agreeably to this doctrine, the Nicene fathers, in the creed which they publifed for the ufe of the univerfal church, Ayle the only begotten Son, God of God, deos \(\varepsilon x\) diou.

Regardlefs however of antiquity, and of the plain Denied by fenfe of fcripture, fome modern divines of great learning fome mocontend, that the three perfons in Deity are all confub-dern diAlantial. co-eternal, co-ordinate, withont derivation, fubor-vines, 2s: dination, or dependence, of any fort, as to nature or effence; while others affirm, that the fecond and third perfons derive from the firt their perfonality, but not their nature. We flall confider thefe opinions as different, though, from the obfcurity of the language in which we have always feen them expreffed, we cannot be certain but they may be one and the fame. The maintainers of the former opinion hold, that the three perfons called Elolim in the Old Tetiament, naturally independent on each other, entered into an agreement before the creation of the world, that one of them thould in the fulnefs of time affume human nature, for the rurpofe of redeeming mankind from that mifery into which it was forefeen that they would fall. This antemundane agreement, they add, coanflitutes the whole of that paternal and filial relation which fubfifts between the firf and fecond perfons whom we denominate Father and Son ; and they hold, that the Sun is faid to be begotten before all worlds, to indicate that \(H_{c}\) who was before ail worlds was begoiten, c. in be begotten, into the office

God and his Attri-
butes.

Ridgeieys Body of Div nety. 63
The expre!s ductrine of fripture.
\(t\) John iv. 5.
of redeemer; or, more decifively, to fignify that he undertook that office before the creation, and affumed to himfelf fome appearance or figure of the reality in which he was to execute it; and he is called zovorsyrs or the orly begotten, becaufe he nlone was begoiten into the c.fice of redeemer *.

To many of our readers we doubt not but this will appear a very extraordinary doctrine, and not eafy to be reconciled wih the unity of God. It is however fufficiently overturned by two fentences of holy fcriptue, about the meaning of which there ean be no difpute. God towards us, becaufe that God fent his only begot- ten Son into the world, that we might live through him." Taking the word fon in its ufial acceptation, this was certainly a wonderful degree of love in the Father of mercies to fend into the world on our account a perfon fo nearly related to him as an only fon; but if we fubflitute this novel interprtation of the words or/y begoten fon in their ftead, the apoftle's reafoning will lofe all its force. St John will then be made to fay, "In this was manifefted the love of God toward us, becaufe that God fent a divine perfon equal to himicif, and no way related to him, but who had before the creation covenanted to come into the world, that we might live through him." Is this a proof of the love of the ferfon here called God? Again, the infpied author of the epiffle to the Hebrews, treating of our Saviour's priefthood, fays, among other things expreftive of his humiliation, that "though he was a sov, yet learned
\(\ddagger \mathrm{Hcb}, \% .3\). he obedience by the things which he fuffered \(\ddagger\)." If the word fon be here underitood in its proper fenfe, this verfe diflays in a very friking manner the condefcenfion of our divine Redeemer, who, though he was no lefs a perfon than the proper Son of God by nature, yet vouchiafed to learn obedience by the things which he fuffered; but if we fubftitute this metaphorical founhip in place of the natural, the reafoning of the author will be vely exlraordinary. "Though this divine perfonage agreed before all worlds to fuffer deaih for the redemption of man. yet learned he obedience by the things which he.fuffered." What fenfe is there in this argument? Is it a proof of conde'cenfion to fulfil one's engagement? Surely, if the meaning of the rord fon, when applied to the fecond perfon of the bleffed Trinity, were what is here fuppofed, the infied writer's algument would have boen more to the purpnfe for which it is brought had it run thus; "Though he was not a fon, i. e. though he had made no previous agreement, yet condelcended he to learn," \&r.

The other opinion, which funnofes the Son and the Holy Gholt to derive from the Fatler their per'onality, but not their nature, is to us wholly unintelligible; for perfonality cannot exift, or be conceived in a tate of fenaration from all natures, any more than a quality can exilt in a flate of feparation from all fublances. The former of thefe opinions we are unable to reconcile with the anity of God; the latter is clothed in words that have no meaning. Bohb, as far as we can undertand them, are palmable polytheifin; more palpalle indeed than that of the Grecian pliiloforners, who thongh they worftipped gods many, and lords manv, vet all held one Cod fupreme over the refl. Sec PolititieIsm, \(\mathrm{N}^{2} 32\).

But if the Son and the Holy Ghof derive their na.

\section*{L O G Y.}
ture as well as their perfonality from the Father, will it not follow that they muft be poficrior to him in time, fince every effect is pofterior to its caufe? No; this confequence leems to follow enly by reafoniig too clofely from one nature to another, when there is between the two but a very ditant analogy. It is indeed true, that among men, every father mutt be prior in time as well as in the order of nature to his fon; but were it effential to a man to be a father, fo as that he could not exift otherwife than in that relation, it is obrious that his fun would be coeval with himfelf, though fill as proceeding from him, he would be polterior in the order of nature. This is the cafe with all neceffary caufes and effect. The vifible fun is the immediate and neceffary caufe of light and heat, either as emitting the rays from his own fubfance, or as exciting the agency of a fluid diffufed for that purpofe through the whole fyftem. Light and beat therefore, muft be as old as the fun; and had he exifted from eternity, they would have exified from eternity with him, though till, as his effects, they would have been belind him in the order of nature. Hence it is, that as we mult feeak analogically of the Divine nature, and when treating of mind, even the Supreme mind, make ufe of words literally applicable only to the modinications of matter, the Niecne fathers illuffrate the eternal generation of the fecond perfon of the bleffed Trinity by this proceffion of light from the corporcal fun, calling him God of God, light of light.

Another comparifon has been made use of to enable us to form fome notion, however inadequate, how three Divine perfons can fubfift in the fame fubftance, and thereby eonflitute but one God. Mofes informs us, that man was made after the image of God. That this relates to the foul more than to the body of man, has been granted by all but a few grofs anthropomorphites; but it has been well obferved *, that the foul, though in ittelf one indivifible and unextended fubltance, is con. ceived as confiling of three principal faculties, the ur- \(_{\text {g }}\) derfanding, the memory, and the will. Of thefe, though they are all coeval in time, and equally effential to a rationial foul, the underfanding is in the order of nature obvioufly the fir't, and the memory the fecond; for things mult be perceived before they can be remembered ; and they muft be remembered and compared together before they can excite volitions, from being fome agreeable, and others difar reeable. The memory therefore may be faid to \(\AA_{j}\) ring from the underftanding, and the wiil from both; and as thefe three faculties are conceived to conflitute one foul, fo may three Divire perfons partaking of the farne individual nature or effence conftilute one God.

Thefe parallels or analogies are by no means brought No contraforward as proofs of the Trinity, of which the evidence diction in is to be gathered wholly from the word of God; but the Cathothey ferve perlaps to help our labouring minds to form of the Trithe julteft notions of that myflery which it is poffible for of nity. us to form in the prefent ftate of our exillence; and they feem to refcue the doentine fufficiently from the charge of contradiction, which has been in often urged againft it by Unitarian writerc. To the laft analogy we are aware it has often been objected, that the foul may as well be faid to confift of ten nr twenty faculties as of three, fince the paffions are equally effential to it with the underfanding, the memory, and the will, and are as different frome one another as thefe three faculties are.

God nn! This, however, is probably a miffake ; for the beft phihis Attri- lolophy leems to teach us, that the paffions are not inbutes. nate; that a man might exill through a long life a Atranger to many of them; and that there are probably no two minds in which are generated a/l the paffions (fee Passion) ; but undertfanding, momory, and will, are abfolutely and equally neceflary to every rational being. Bur whatever be in this, if the buman mind can be conceived to be one indivifible fubtance, confiting of different facultues, whether many or few, why hould it be thought an impoflibility for the infinte and eternal ntture of God to be communicated to three perfons acting different parts in the creation and government of the world, and in the great fcheme of inan's redemption.

To the doctrine of the Trinity many objections have been made, as it implies the divinity of the Son and the Holy Ghoft ; of whom the former aftumed our nature, and in it died for the redemption of man. Thefe we fhall notice when we come to examine the revelations more peculiarly Chriftian ; but there is one objection which, as it refpects the doctrine in general, may be pruperly noticed here. It is faid that the firt Chrifians borrowed the notion of a Triune God from the later Platonifts; and that we hear not of a Trinity in the churcli till converts were made from the fehool of Alexandria. But if this be the cafe, we may properly ank, whence had thofe Platonifts the doctrine themfelves? It is not furely fo fimple or fo obvious as to be likely to have occurred to the reafoning mind of a Pagan philofopher ; or it it be, why do Unitarians fuppofe it to involve a contradiction? Plato indeed tanght a doctrine in fome refpects fimilar to that of the Chriftian Trinity, and fo did Pythagoras, with many other philofophers of Greece and the Eaf (fee Plitonisa, Polytheism, and Prtilagoras) ; but though thefe fages appear to have been on fume occafions extremely credulous, and on others to have indulged themfelves in the molt myfterious fpeculations, there is no room to fuppofe that they were naturally weaker men than ourfelves, or that they were capable of inculcating as truths what they perceived to involve a contradiction. The Platonic and Pythagorean trinities never could have occurred to the mind of him who merely from the works of creation endeavoured to difcover the being and attributes of the Creator; and therefore as thofe phil fophers travelled into Egypt and the Eaft in quelt of knowledge, it appears to us in the highef degree probable, that they picked up this myfterious and fublime doctrine in thofe regions where it had been handed down as a dogma from 67 the remotef ages, and where we know that feience was afwered. not taught fyftematically, but detailed in collections of fententious maxims and traditionary opinions. If this be fo, we cannot doubt but that the Pagan trinitics had their origin in fome primæval revelation. Nothing elfe indeed can account for the genesal prevalence of a doctrine fo remote from human imagination, and of which we find vettiges in the facred books of almoft every civilized people of antiquity. The corrupt fate in which it is viewed in the writings of Plato and others, is the natural confequence of its defcent through a long courfe of oral tradition; and then falling into the hands of men who bent every opinion as much as polfible to a conformity with their own fpeculations. The trinity of Platonifm therefore, inftead of being an objection, lends,

\section*{I O G Y.}
in our opinion, no feeble fupport to the Chriftian doc. Coxl and trine, fince it affords almolt a complete proof of that doctrinc's having made part of the firft revelations comhis Attr:municated to man.

Having thus difcovered that the one God compre. hends three perfons, let us now inguire what this triune God exerted when he created the heaven and the carth. 'That by the heaven and the earth is here meant the whole univerfe, vifible and invifible, is lanown to cvery perfon acquainted witls the phrafeclogy of Scripture; and we need inform no man converiant with Enghft writers, that by creation, in its proper lenfe, is meant bringing into being or making that to exiff which exifted not before. It muft, however, be acknowledged, that the Hebrew word xiz does not always imply the production of fubfance, but very often the forming of particular organized bodies out of pre-exilling matter. Thus when it is faid * that "God creared great whales, and : Gen. \(\%\) every living creature that moveth, which the waters brought \(21,27^{\circ}\) forth abundantly after their kind," and again, "that he created man male and female;" though the word \(\times\) ב uted on both ocrafions, we are not to conceive that the bodies of the firf human pair, and of thefe amimals, were brought into being from nonentity, but only that they were formed by a proper organization being given to pre-exiftent matter. But when Mofes lays, "In the Creation beginning God created the heaven and the tarth," he taught by cannot be fuppofed to mean, that "in the beginning God Mofes. ouly gave form to matter already exifting of itilelf;" for in the very next verfe we are affured that after this act of creation was over, " the earth was ftill without forms and void," or, in other words, in a chaotic flate.

That the Jews, before the coming of our Saviour; underftood their lawgiver to teach a proper creation, is plain from that paffage in the fecond book of the Maccabees, in which a mother, to perfuade her fon to fuffer the cruelleft tortures rather than forfake the law of his God, ufes the following argument: "I befeech thee, my fon, look upon the heaven and the earth, and all that is therein, and confider that God made them of things that were not." To the fame purpofe the infpired author of the epifile to the Hebrews, when magnifying the excellence of faith, fays, "Through faith we underftand that the woilds were framed by the word of God, fo that things which are feen were not made of things which do appear ;" where, as Bifhop Pearfon lias ably proved + , the phrafe \(\beta=\boldsymbol{\varepsilon} \varepsilon \varphi\) xavosevwy is equivalent to ouse
'The very fiy vere, therefore, of the book Gene tiow of the fis informs us of a mon important truth, which all the uninfpired wifdom of antiqquity could not difcover. It affures us, that as nothing exitts by chance, fo nothing is neceffarily exifing but the three divine perfons in the one Godhead. Every thing elfe, whether material or immaterial, derives its fubftance, as well as its form or qualities, from the fiat of that felf exiftent Being, "who was, and is, and is to come"

It docs not, however, follow from this verfe, or from The whow any other paffage in the facred Scriptures, that the univerie whole univerfe was called into exifence at the fame in- not created flant; neither is it by any means evident that the chaos of at once. our world was brought into teing on the firf of thofe fix days during which it was gradually reduced into form. From a paflage \(\ddagger\) in the book of Job, in which we are told by God himfelf, that when the "foundatics of the earth, cannot indeed be queltioned; for it is not only probable in iifelf from the known laws of nature, but is exprefsly affirmed by the facred hiftorian, who relates the formation of the fun and moon in the order in which it took place ; but there is one difficulty which has furmithed ignorance with fomething like an objection to the divine legation of the Hebrew lawgiver, and which we fhall notice.
\({ }^{91}\)
\(n\) dificulty
iolved.
earth was inid the morning fars fang together, and all the fons of God thouted for joy," it appears extremely probable that worlds had been created, formed, and inhabited, long before our earth had any exittence. Nor is this opinion at all contrary to what Mofes fays of the creation of the Itars; for though they are mentioned in the fame verfe with the fun and moon, yet the manner in which, according to the original, they are introduced, by no means indicates that all the flars were formed at the fame time with the luminaries of our fyftem. Mont of them have been created long before, and fome of thero fince, our world was brought into being; for that claufe (verfe 16.) " he made the ftars alfo," is in the Hebrew no more than "and the flars;" the words he made being inferted by the tranlators. The whole verfe therefore ought to be rendered thus, " and God made two great lights; the greater light to rule the day, and the leffer light with the flars to rule the night ; where nothing is intimated with refpect to the time when the ffars were formed, any more than in that verfe of the Palms *, which exhorts us to give thanks to God who made the moon and flars to rule by night; for his mercy endureth "for ever." The firft verfe of the book of Genefis informs us, that all things firitual and corporeal derive their exiftence from God; but it is nowhere faid that all matter was created at the fame time.
That the whole corporeal univerfe may have been created at once mult be granted; but if fo, we have reafon to believe that this earth, with the fun and all the planets of the fyftem, were fuffered to remain for ages in a flate of chaos, " without form and void ;" becaufe it appears from other fcriptures, that worlds of intelligent creatures exilted, and even that fome angels had fallen from a fate of happinefs prior to the era of the Mofaic cofmogony. That the fun and the other planets revolving round him were formed at the fame time with the Mofes informs us, that on the firf day after the production of the chaos, the element of light was created; and yet within a few fentences he declares, that the fun, the fountain of light, was not made till the fourth day. How are thefe two paffages to be reconciled? We anfwer, That they may be reconciled many ways. Mofes wrote for the ufe of a whole people, and not for the amufement or inflruction of a few aftronomers; and in this view his language is fufficiently proper, even though wis fup. pofe the formation of the fun and the other planets to have been carried on at the fame time, and in the fame progreflive manner, with the formation of this earth. The voice which called light into exiftence would feparate the fiery and luminous particles of the chaos from thofe which were opake, and, on this hypothefis, confolidate them in one globe, diffufing an obfcure light through the planetary fyltem; but if the earth's atmo. fphere continued till the fourth day loaded with vapours, as from the narrative of Mlofes it appears to have done, he fun could not till that day have been feen from the

L O G Y.
Part II
earth, and may therefore, in popular language, be faid God and with fufficient propriety to have been formed on the lis Attriforrth day, as it was then made to appear. (See CrLaTION, \(\mathrm{n}^{\circ} \mathrm{I} 3\).) But though this folution of the diliculty ferves to remove the objection, and to fecure the credit of the facred hiltorian, candour compels us to confefs that it appears not to be the true folution.

The difficulty itfelf ariles entirely from fuppofing the fun to be the fole fountain of light; but the turth of this opinion is not felf-evident, nor has it ever been eftablifhed by fatisfactory proof. It is indeed to a mind divefted of undue deference to great names, and confidering the matter with impartiality, an opinion extremely improbable. The light of a candle placed on an eminence may in a dark night be feen in every direction at the diftance of at leaft three miles. But if this fmall body be rendered vifible by means of rays emitted from itfelf, the flame of a candle, which cannot be fuppofed more than an inch in diameter, munt, during every inflant that it continues to burn, throw from its owr fubflance luminous matter fufficient to fill a fpherical face of fix miles in diameter. This phenomenon, if real, is ce:tainly furprifing ; but if we purfue the reflection a little farther, our wonder will be greatly increafed. The matter which, when converted into flame, is an inch in diameter, is not, when of the confiftence of cotton and tallow, of the dimenfions of the 20 th part of an inch; and therefore, on the common hypothefis, the 20th part of an inch of tallow may be fo rarefied as to fill a fpace of 113.0976 cubic miles ! a rarefaction which to us appears altogether incredible. We have indeed heard much of the divifibility of matter ad infinitum, and think we underfand what are ufually called demonfrations of the truth of that propofition; but thefe demonftrations prove not the actual divifibility of real folid fubitances, but only that on trial we flall find no end of the ideal procefs of dividing and fubdividing imaginary extenfion.
On the whole, therefore, we are much more inclined to believe that the matter of light is an extremely fubtile fluid, diffufed through the corporeal univerfe, and only excited to agency by the fun and other fiery bodies, than that it confifts of Atreams continually iffuing from the fubflance of thefe bodies. It is indeed an opinion pretty generally received, and certainly not improbable in itfelf, that light and electricity are one and the fame fubftance (fee ELECTRICITY:Index); but we know that the eleetrical fluid, though pervading the whole of corpareal nature, and, as experiments fhow, capable of acting with great violence, yet lies dormant and unperctived till its agency be excited by fome foreign caufe. .Juit fo it may be with the matter of light. That fubtance may be "diffufed from one end of the creation * to the other. It may traverfe the whole univerfe, form a communication between the molt remote fpheres, penctrate into the inmoft receffes of the earth, and only wait to be put in a proper motion to communicate vifible fenfations to the eye. Light is to the organ of fight what the air is to the organ of hearing. Air is the medium which, vibrating on the ear, caufes the fenfation of found ; but it equally exifts round us at all times, though there be no fonorous body to put it in motion. In like manner, light may be equally extended at all times, by night as well as by day, from the moft dillant fixed Itars to this earth, though it then only frikes our eyes fo as to excite vifible fenfations when impelled by the fun or fome other mafs
interferes with any of the known laws of optics; for if the rays of light be impelled in ftraight lines, and in the fame direction in which they are fuppofed to be emitted, the phenomena of vifion muft neceflarily be the fame.

Mofes therefore was probably a more accurate philofopher than he is fometimes fuppofed to be. The element of light was doubtlefs created, as he informs us, on the firf day; but whether it was then put in that ftate in which it is the medium of vifion, we cannot know, and we need not inquire, fince there was neither man nor inferior animal with organs fitted to receive its impreffions. For the firf three diys it may have been ufed only as a powerful inftrument to reduce into order the jarring chaos. Or if it was from the beginning capable of communicating vifible fenfations, and dividing the day from the night, its agency muft have been immediately excit!d by the Divine power till the fourth day, when the fun was formed, and endowed with proper qualities for inftrumentally difcharging that office. This was indeed miraculous, as being contrary to the prefent laws of nature : but the whole creation was miraculous; and we furely need not hefitate to admit a lefs miracle where we are under the neceffity of admitling a greater. The power which called light and all other things into exiltence, could give them their proper motions by ten thouland different means; and to attempt to folve the difficulties of creation by philofophic theories refpecting the laws of nature, is to trifle with the common fenfe of mankind: it is to confider as fuhfervient to a law that very power by whofe continued exertion the law is eltablifhed.

Having thus proved that the univerfe derives its being, as well as the form and adjuftment of its feveral parts, from the one fupreme and telf-exiftent God, let us here paufe, and reflect on the fublime conceptions which fuch altonilhing works are fitted 10 give us of the divine perfections.

And, in the firlt place, how ftrongly do the works of creation imprefs on our minds a conviction of the infinite power of their Author? He fpoke, and the univerfe ftarted into being; he commanded, and it ftood faft. How mighty is the arm which " ftretched out the hea. vens and laid the foundations of the earth; which removeth the mountains and they know it not ; which overturneth them in his anger; which Thaketh the earth out of her place, and the pillars thereof tremble! How powerful the word which commandeth the fun, and it rifeth not; and which fealeth up the fars;" which fuftaineth numberlefs worlds of amazing bulk fufpended in. the regions of empty fpace, and directs their various and inconceivably rapid motions with the utmont regularity ! " Lift up your eyes on high, and behold, who hath created all thefe things? By the word of the Lord were the heavens made, and all the hoft of them by the breath of his mouth. Hell is naked before him, and deftruction hath no covering. He fretcheth out the North over the empty place, and hangeth the earth upon no. thing. He has meafured the waters in the hollow of his hand, and meted out the heavens with a fpan; and comprehended the dult of the earth in a meafure; and weighed the mountains in fcales, and the hills in a balance. Behold ! the nations are as a drop of the bucket, and are counted as the fmall duit of the balance ; behold, he.
I. O G Y.
taketh up the ines as a very little thing. All nations ciod and before him are as nothing, and they are counted to him his Attrilefs than nothing, and vanity. To whom then will yc \(\underbrace{\text { butes. }}\) liken God, or what likenefs will ye compare unto * Pf. xxxiii. him *?"

As the works of creation are the effeels of God'six. 4, \&sc. power, they likewife in the molt eninent manner difplay xxvi . 6 ; his wiflom. This was fo apparent to Cicero, even from Ifa. xi. 12 : the partial knowledge in aftronomy which, his time af- Ins wifforded, that he declared t thofe who could affert the dom, contrary void of all underftanding. But if that great \({ }_{\text {Deorums }}\) De Nat. mafter of reation had been acquainted with the modern libo ii, difcoveries in aftronomy, which exhibit numberless worlds fcattered through fpace, and each of immenfe magnitude ; had he known that the fun is placed in the centre of our fyftem, and that to diverfify the feaforis the planets move round him with exquifite regularity; could he have conceived that the diflinction between light and darknefs is produced by the diurnal rotation of the earth on its own axis, inftead of that difproportionate whirling of the whole heavens which the ancient aftronomers were forced to fuppofe; had he known of the wonderful motions of the comets, and confidered how fuch eccentric bodies have been preferved from falling upon fome of the planets in the fame fyltem, and the feveral fyltems from falling upon each other; had he taken into the account that there are yet greater things than thefe, and "that we have feen but a few of God's works;"that virtuous Pagan would have been ready to exclaim in the words of the Pfalmift, "O Lord, how manifold are thy works! In wifdom haft thou made them all; the earth is full of thy riches."

That creation is the offspring of unmixed goodnefs, And gooz. has been already flown with fufficient evidence (fee nef. Metaphysics, \(\mathrm{N}^{0} 3^{12}\). and \(\mathrm{N}^{0} 29\). of this article); and from the vall number of creatures on our earth endowed with life and fenfe, and a capability of happinefs, and the infinitely greater number which probably inhabit the planets of this and other fyftems, we may infer that the goodnefs of God is as boundlefs as his power, and that "as is his majefty, fo is his mercy." Out of his own fulnefs hath he brought into being numberlefs worlds, replenifhed with myriads of myriads of creatures, furnifhed with various powers and organs, capacities and inftincts; and out of his own fulnefs he continually and plentifully. fupplies them all with every thing neceffary to make their exiftence comfortable. "The eyes of all wait upon him, and he giveth them their meat in due feafon. He openeth his hand and \(f_{2}-\) tisfies the defires of every living thing: he loveth righteoufnefs and judgement; the earth is full of the goodnefs of the L.ord. He watereth the ridges thereof abundantly; he fettleth the furrows thereof; he maketh it foft with flowets, and bieffeth the fpringing thereof. He crowneth the year with his goodnefs; and his pathe drop fatnefs. They drop upon the paftures of the wildernefs; and the little hills rejoice on every fide. The paftures are clothed with flocks; the vallitys alfo are covered with corn ; they flout with joy, they alfo fing t." Sur- \(\ddagger\) Pf. criv. vey the whole of what may be feen on and about this \(15, \pm \sigma_{0}\) terraqueous globe, and fay, if our Maker hath a fparing xxiii. 5. 1\%. hand. Surely the Author of fo much happinefs muit 10, \&si, be effential goodnefs; and we mult conclude with St John, that "God is love."

 truth，and the Son the truth itfelf，being two things as to hypoftafis，but one in agreement，content，and fame－ nefs of will．＂Nor is their union a mere agreement in will only；it is a phyfical or efiential union：fot that what is done by one muft necelfarily be done by the others alfo，according to that of our Saviour，＂I am in the Father and the Father in me：The Father who dwelleth in me，he doth the works．＂
Sect．II．Of the Original State of Man，and the fing Covenant of Eternal Life which God vouchfafed 10 make with him．
Is the Mofaic account of the creation，every atten．Peculiarity tive reader muft be fruck with the manner in which the of the cr－ fupreme Being is reprefented as making man：＂And preilion in God faid，let us make man in our image，after our is faide to likenefs；and let them have dominion over the fifh of make mam the fea，and over the fowl of the air，and over the cat－ tle，and over all the earth，and over every creeping thing that creepeth upon the earth．So God created man in his own image；in the image of God created he him；male and female created he them．And God bleffed them；and God faid unto them，he fruitful，and multiply，and replenifh the earth，and fubdue it ；and have dominion over the fifh of the fea，and over the fowl of the air，and over every living thing that moveth upon the earth．And God faid，behold，I have given you every herb bearing feed，which is upon the face of all the earth；and every tree，in the which is the fruit of a tree yielding feed ：to you it thall be for meat． And God faw every thing that he had made，and，be－ hold，it was very good．And the evening and the morning were the fixth day．Thus the heavens and the earth were finilhed，and all the hoft of them．And on the feventh day God ended his work which he had made；and he refted on the feventh day from all his works which he had made．And God bleffed the feventh day and fanctified it ：becaufe that in it he had refted from all his work which God created and made＊．＂＊Gen i．

This is a very remarkable palfage，and contains much 26, \＆c．iii． important information．It indicates a plurality of per－\({ }^{\mathrm{r}, ~}=3\) ． fons in the Godhead，defribes the nature of man as he came at firlt from the hands of his Creator，and furnift－ es data from which we may infer what were the duties required of him in that primeval ftate，and what were the rewards to which obedience would entile him．

Of the plurality of Divine perfons，and their effontial In hisown union，we have treated in the preceding fection，andimage proceed now toinquire into the fpecific nature of the firt man．This muft be implied in the image of God， Originat in which lie is laid to have been created; for it is by it appears to be in all the higher fpecies of animals, cannot refult from any organical iructure, or be the quality of a compound extended being. The vital principle in fuch animals therefore mult be immaterial as well as the human foul; but as the word immaterial denotes only a negative nolion, the fouls of men and brutes, though both immaterial, may yet be fubftances effentially different. This being the cafe, it is plain that the Divine image in which man was formed, and by which he is diftinguifhed from the brate creation, cannot confill in the mere circumflance of his mind being a fub. flance different from matter, but in fome pofitive quality which diftinguifles him from every other creature on this globe.

About this characteriflic quality various opinions have been formed. Some have fuppofed * "t that the image of God in Adam appeared in that rectitnde, righteoufnefs, and holinefs, in which he was made; for God made man upright (Ecclef. vii. 2.), a holy and righteous creature; which holinefs and righteoufnefs were in their kind perfect; his underttanding was free from all etror and mitakes; his will biafled to that which is good; his affections flowed in a right channel towards their proper objects; there were no finful motions and evil thoughts in his heart, nor any propenfity or inclinafion to that which is evil; and the whole of his conduet and behaviour was according to the will of Grod. And this righteoufuefs (fay they) was natural, and not perfonal and acquired. It was not obtained by the exercife of his free-will, but was created with him, and belonged to his mind, as a natural faculty or inflinet." They therefore call it original righteoufnefs, and fuppofe that it was loft in the fall.

To this dodrine many objections have been madc. It has been faid that righteoufnefs confiling in right actions proceeding from proper principles, could not be created with Adam and make a part of his nature ; becaufe nothing which is produced in a man without his Vor, XX. Part I.

\section*{L Ó G Y.}
lnowledge and confent can be in him either vistue or of our firt parents, to guide them in the ways of piety and virtue. 'This opinion they relt chiefly upon the authority of Tatian, Irenxus, Tertullian, Cyprian, Atha- nainion of nafius, and other fathers of the primitive church; but Bifhop Bull they think, at the fame time, that it is countenanced by and fome feveral paflages in the New Tchament. Thus when St of the anPaul fays \(\ddagger\), "and fo it is written, The firf man \(\Lambda\) dam cient fawas made a living foul, the lalt \(\Lambda\) dam was made \(a \ddagger+\) Cor. quickening Spirit;" they underltand the whole paflage x. 45,460 as relating to the creation of man, and not as drawing a comparifon between Adam and Chrift, to hoov the great fupcriority of the latter over the former. In fup. port of this interpretation they obferve, that the apofle immediatcly adds, " howbeit, that was not frit which is fpiritual, but that which is natural, and afterwards that which is fpiritual ;" an addition which they think was altogether needle s , if by the quickering Spirit he had referred to the incarnation of Chrift, which had happened in the rery age in which he was witing. They are therefore of opinion, that the body of Adam, after being formed of the dult of the ground, was frit animated by a vital principle endowed with the faculties of reafon and fenfation, which entitled the whole man to the appellation of a living foul. After this they fuppofe certain graces of the Holy Spirit to lave been infufed into him, by which he was made a quickening fpirit, or formed in the image of God; and that it was in confequence of this fuccefion of powers communica. ted to the fame perfon, that the apoltle faid, "Howbeit, that was not firf which is firitual, but that which is natural."

We need hardly obferve, that with refpect to a queftion of this kind the authority of Tatian and the other fathers quoted is nothing. Thofe men had no bettor means of difcovering the true fonfe of the feriptares of the Old Teftament than we have; and their ignorance of the language in which thefe fcriptures are written, added to fome metaphyfical notions refpecting the foul,

I \(x\) which
breath of life, and man became a living foul t." That this account of the animation of the body of man indicates a fuperiority of the human foul to the vital principle of all other animals, cannot, we think, be queftioned ; but it does not therefore follow, that the human foul is the only immaterial principle of life which animates any terreftrial creature. It has bcen nown elfewhere (fee Metaphysics, \(\mathrm{N}^{0} 235\).), that the power of fenfation, attended with individual confcioufnefs, as viec. Adam, it is added, was unqueflionably placed in a late of trial, which proves that be had righteous hasbits to aequire; whereas the doetrine under confideration, affirming his original righteoufnefs to have been perfect, and therefore incapable of improvement, is in. confiltent with a flate of trial. That his underllanding was free from all ertors and mifakes, has heen thought a blafphemous pofition, as it attributes to mans one of the incommunicable perfections of the Deity. It is likewile believed to be contrary to faet; for ciller his underftanding was bewildered in error, or his affections flowed towards an improper object, when he fuffered himfelf at the perfuafion of his wife to tranfgrefs the exprefs law of his Creator. The objector expreffes hi: wonder at its having ever been fuppofed that the whole of Adam's conduct and behaviour was according to the will of God, when it is fo notorions that he yielded to the firft temptation with which, as far as we know, he was allailed in paradife.

Convinced by thefe and other arguments, that the image of God in which man was created could not confitt in original righteoufnefs, or in exemption from all poffibility of error, many learned men, and Bifhop Bull * among others, have fuppofed, that by the image * See his of God is to be underfood certain gifts and powers fu- Evglih
 that phrafe alone that he is characterized, and his pre eminence marked over the other animais. Now thi. bodye or likenefs mutt have been found either in this could not be in his body alone, is obvious; for the infinite and ommpotent God is allowed by all men to be without body, parts, or paflions, and therefore to be fuch as nothing eorporeal can poffibly refemble.

If this likenefs is to be fonnd in the human foul, it comes to be a queltion in what faculty or power of the foul it confifts. Some have contended, that man is the only creature on this earth who is animated by a principle effentially different from matter; and hence they have inferred, that he is faid to lave been formed in the Divine image, on account of the immateriality of that vital principle which was infufed into his body that vital pinciple which was infured into his body when the "Lord God breathed into his noltrils the 1 Bull * among others, have fuppofed, that by the image
\(\qquad\)
which too many of them had derived from the fehool of Plato, rendered them very ill qualified to interpret the writings of Mofes. Were authority to be admitted, we thould confider that of Bifhop Bull and his modern followers as of greater weight than the authority of all the ancients to whom they appeal. But authority cannot be admitted; and the reafoning of this learned and excellent man from the text of St Paul is furely very inconclufive. It makes two perfons of Adam; a firft, wher he was a natural man compofed of a body and a reafonable foul; a fecond, when he was endowed with the gifts of the Holy Spirit, and by them formed in the image of God! In the verfe following too, the apoftle exprefsly calls the fecond man, of whom he had been fpeaking, "the Lord from heaven;" but this appellation we apprehend to be too high for Adam in the fate of greatelt perfection in which he ever exifted. That our firt parents were endowed with the gifte of the Holy Ghoft, we are frongly inclined to believe for reafons which Thall be given by and by ; but as thefe gifts were adventitious to their naturc, they could not be that 85 image in which God made man.

Since man was made in the image of God, that phrafe, whatever be its precife import, mufl denote fomething pectuiar and at the fame time effential to human hature; but the only two q̧ualities at once natural and pecaliar to man are his thape and his reafon. As none but an anthropomorphice will fay that it was Adam's flape which reflected this image of his Creator, it has been concluded that it was the faculty of reafon which made the refemblance. To give frength to this argument it is obferved \(t\), that when God fays, "let us make man in our image," he immediately adds, " and let them have dominion over the fin of the fea, and over the fowl of the air, and over the cattle, and over all the earth;" but as many of the cattle have much greater bodily ftrength than man, this dominion could not be maintained but by the faculty of reafon beftowed upon him and withheld from them.

If the image of God was impreffed only on the mind of man, this reafoning feems to be conclufive; but it \(\ddagger\) Cill's Bo- has been well obferved \(\ddagger\) that it was the whole man, dy of Divi-and not the foul alune, or the body alone, that is faid to niit), book have been formed in the divine image; even as the iii. chap. 3 . whole man, foul and body, is the feat of the new and fpiritual image of God in regeneration and fanctification. "'The very God of peace (fays the apofle) fanctify you wholly; and may your whole fpirit, foul and body, be preferved blamelefs to the coming of our Lord Jefus Chritt." It is worthy of notice, too, that the reafon :ffigned for the prohibition of murder to Noah and his fons after the deluge, is, that man was made in the image of God. "Whoro fleddeth man's blood, by man Chall his blood be thed; for in the inage of God made he man." Thefe texts feem to indicate, that whatever be meant by the image of God, it was ftamped equally on the foul and on the body. In vain is it faid that man cannot refemble God in thape. This is true, but it is little to the purpofe; for man does not refunble God in his reafoning faculty more than in his form. It would be idolatry to fuppofe the fupreme majefly of heaven and eatth to have a body or a flape; and it would be little flott of idolatry to imagine that he is obliged to comare ideas and intions together ; to advance from particular trulh to general propufitions;

\section*{L O G Y.}
and to acquire knowledge, as we do, by the tedious Original procelles of inductive and fyllogiltic reafoning. There can therefore be wo direct image of God either in the foul or in the body of man; and the phrafe really feems \(\underbrace{\begin{array}{c}\text { state of } \\ \text { Man. }\end{array}}_{86}\) to import nothing more than thofe powers or qualities True imby which man was fitted to exercife dominion over the port of the inferior creation; as if it had been faid, "Let us make phrafe. man in cur image, after our likenefs, that they may have dominion, \&cc." But the erect form ol man contributes in fome degree, as well as his rational powers, to enable him to maintain his authority over the brute creation; for it has been obferved by travellers, that the fierceft beaft of prey, unlefs ready to perifh by hunger, ftrinks back from a fteady look of the human face divine.

By fome *, however, who have admitted the proba- 娄 Cill, \&: hility of this interpretation, another bas been deviled for its being faid that man was formed in the image of God. All the members of Chrift's body, fay they, were written and delineated in the book of God's purpoles and decrees, and had an ideal exitence from eternity in the divine mind ; and therefore the body of Adam might be faid to be formed after the image of God, becaufe it was made according to that idea. But to this reafoning objections may be urged, which we know not how to anfwer. All things that ever were or ever thall be, the bodies of us who live at prefent as well as the bodies of thofe who lived 5000 years ago, have from eternity had an ideal exiftence in the Divine mind; nor in this fenfe can one be faid to be prior to another. It could not therefore be after the idea of the identical body of Chrift that the body of Adam was formed; for in the Divine mind ideas of both bodies were prefent together from eternity, and each body was formed after the ideal archetype of itfelf. It may be added likewife, that the bady of Chrift was not God, nor the idea of that body the idea of God. Adam therefore could not with propriety be faid to have been formed in the image of God, if by that phrafe nothing more were intended than the refemblance between his body and the body of Chrif. Thefe objections to this interpretation appear to tis unanfwerable; but we mean not to diflate to our readers. Every man will adopt that opinion which he thinks fupported by the beft arguments; but it is obvious, that whatever more may be meant by the image of God in which man was made, the phrafe undoubtedly comprehends all thofe powers and qualities by which he is enabled to maintain his authority over the inferior creation. Among thefe the faculty of reafon is confeffedly the mof important; for it is by it that man is capable of being made acquainted with the Author of his being, the relation which fubfilts between them, and the duties implied in that relation from the creature to the Creator.
That the firft man, however, was not left to difcover Relgyions thefe things by the mere efforts of his own unaffiftedintructic? reafon, we have endeavoured to thow in another place; communi(fee Religion, \(\mathrm{N}^{0} 5-10\).) ; and the conclufion 10 cated to which we were there led, is confirmed by the portion of revelation before us. The infpired hififorian fays, that "God blefied the feventh day and /anclifed it, becaure that in it he lad refted from all his works, which he created and made;" but Adam could not have underflood what was meant by the fanclification oi a particular day, or of any thing elfe, unlels he had previoully reccised

Original received fome religious inftuetion. There cannot thereState of fore be a doubt, but that as foon as man was made, his Man. Creator communicated to him the truths of what is called natural religion, which we have endeavoured to explain and eftablifi in Part I. of this article; and to thefe were added the precept to keep holy the Sabbathday, and fet it apart for the purpofes of contemplation and worhip.
Inftitution This was a very wife inllitution, as all the divine inof the Sab-ftitutions muft be. "The great end for which we are brought into life, is to attain the knowledge and be confirmed in the love of God. 'This includes obedience to his will in thought, word, and deed, or that courfe of conduct which can alone make us happy here, and fit us for everlalting glory hereafter. Sut of thefe things we cannot retain a proper fenfe without clefe and repcated application of thought; and the unavoidable cares and concerns of the prefent life occupying much of our attention, it is, in the nature of things, necefliry that fome certain portion of time fhould be appropriated to the purpofes of religious inftruction and the public adoration of our Creator, in whom we all live, and move, and have our being." Hence a very learned di\(+D \cdot T a y 2-v i n e,+\) has inferred, that thoughs the particular time is lor of Nor- a matter of pofitive appointnent, the obfervation of a fabbath in general is a duty of natural religion, as having its foundation in the reafon of things. See Sabbathe

Man therefore in his natural and original flate was a rational and religious being, bound to do " juftice, to love mercy, to walk humbly with his God, and to keep holy the Sabbath-day." Thefe feem to be all the duties which in that flate were required of him; for as foon as he was introduced into the terreflrial paradife and admitted into covenant with his Maker, lie was placed in a fupernatural tlate, when other duties were of courfe enjoined.

That our firft parents were both made on the fixth day, Mofes expsefsly affirms when he fays \(\ddagger\), that " God created them male and female, and blefled them, and called their name Adam ( \(\kappa\) ), in the day when they were created :" but that they were introduced into the garden of Eden on that day, is an opinion which, however generally it may be received, feems not to be reconcileable with the plain narrative of the facred penman. After telling us that on the fixth day God finithed all his works, which he faw to be very good, and refted on the feventh day, he briefly rccapitulates the hiftory of the generations of the heavens and of the earth, gives us a more particular account of the formation of the firft man, informing us that the "Lord God formed him out of the duft of the ground, and breathed into his noftrits the breath of life, when man became a living foul;" and then procceds to fay \(\|\), that the "Lord God planted a garden eaftward in Eden, where he put the man whom he had formed." Fron this flort hiflory of the firt pair it appears beyond dif pute evident, that neither the man nor the woman was formed in the garden; and that from their creation fome time elapfed

L O G Y.
befure the garden was prepared for their reception, is likewife evident from a comparion of Gen . i. 29. with Gen. ii. 16, 17. In the firt of thefe paflages God gives to man, immediately after his creation, "every herb bearing feed which was upon the face of all the earth, befor he and every tree, without exception, in which was the was placest fruit of a tree bearing feed: to lim he faid it fhould be in the of E . for meat." In the fecond, "he commanded the man, den, faying, of every tite of the garden thou mayeit freely eat; but of the tree of knowledge of good and evil, thou fhalt not eat of it ; for in the day thon eaterf thereof thou thalt furely die." When the firft grant of food was given, Adam and his wife mult have been where no tree of knowledge grew, and they mufl have been intended to live at leall fo long in that fiate as that they fhould have occafion for food, otherwife the formal grant of it would have been not only fuperflnous, but apt to millead them with refpect to the fubfequent refriction.
In this original ftate man was under the difcipline of what we have called natural religion, entitled to happinefs while he flould perform the duties required of him, and liable to punifhment when he flould neglect thofe dutics, or tranfgrefs the law of his nature as a rational and moral agent. This being the cafe, it is a matter of fome importance, to afcertain, if we can, what the rewards and punifhments are which natural religion holds out to her votaries.

That under every difpenfation of religion the pious and virtuous man fhall enjoy more happinefs than mifery; and that the incorrigibly wicked thall have a greater portion of mifery than happinefs, are truths which cannot be controverted by any one who admits, that the Almighty governor of the univerfe is a Being of wifdom, goodnels, and juflice. But refpecting the rewards of virtue and the punifliment of vice, more than thefe general truths feems not to be taught by natural religion. Many divines, however, of great learring did not, and worth, have thought otherwife, and have contend- when pered, that from the nature of things the rewards beftowed firmed, enby an infinite God upon piety and virtue mult be eter- to eternal nal like their authar. Thefe men indeed appear willing life. enough to allow that the punifhents with which natural religion is armed againt vice muft be only of a temporary duration, becaufe reafon, fay they, is ready to revolt at the thought of everlafing punifhment.

This opinion, which confounds natural with revealed religion, giving to the former an important truth which belongs exclufively to the latter, has been fo ably confuted by a learned writer, that we flall fubmit his arguments to our readers in preference to any thing which we can give ourfelves.
" If reafon doth, on the one hand, feem to revoit at cycrlafing puni/fment, we mult confefs that fancr, on the other, (even when full plumed by vanity), hath fcarcely force enough to rife to the idea of infinite reurards. How the heart of man came to confider this as no more than an adequate retribution for his right conduft during the fhort trial of his virtuc here, wouid X. 2
(k) The woman was fome time afterwards difinguifhed by the name of Eve, man, becaufe fie was to be the mother all living, and particularly of that bleffed feed which was to bruife the hend of the ferpent. See Parkhurf's Lexicon on the word.

Original State of Man.

92 Arguments to prove shat they did inconsufice.
be hard to tell, did wee not know what monfters pride begot of old upon Pagan philofoply; and how much greater fill thefe latter ages have difcloted, by the long incubation of fchool-divinity upous folly. What hath been urged from natural reafon, in fupport of this extravagant prefumption, is fo very fiender, that it recoils as you enforce it. Firit, you fay, "that the foul, the fubject of thefe eternal rewards, being immaterial, and fo therefore unaffected by the caufes which bring material things to an end, is, by its nature, fitted for eternal rewards.-This is an argument ad ignorantiam, and holds no farther.- Becaufe an inmaterial being is not fubject to that mode of diffolution which affects material fubftances, yous conclude it to be eternal. This is going too fatt. There may be, and probably are, many natural caufes (urknown indeed to us), whereby immaterial beings come to an end. But if the nature of things cannot, yet God certainly can, put a final period to fuch a being when it hath ferved the purpofe of its creation. Doth annihilation impeach that wifdom and goodnefs which was difplayed when God brought it out of nothing? Other immaterial beings there are, viz. the fouls of brites, which have the fame natural fecurity with man for their exiftence, of whofe eternity we never dream. But pride, as the poet obferves, calls God unjuf,

\section*{If man alone engrofs not heaven's high care ; \\ Alone made perfect here, mmortal there.}

However, let us (for argument's fake) allow the human foul to be unperithable by nature, and fecured in its exiftence by the unchangeable will of God, and fee what will follow from thence-An infinite reward for virtue during one moment of its exiftence, becaufe realon difcovers that, by the law of nature, forne reward is due? Hy no means. When God hath amply repaid us for the performance of our duty, will he be at a lofs how to difpofe of us for the long remainder of eternity? May he not find new and endlefs employment for reafonable creatures, to which, when properly difcharged, new rewards and in endlefs fucceffion will be affigned? Modeft reafon feems to diftate this to the followers of the law of nature. The flattering cexpedient of eterxal rewards for virtue here was invented in the fimplicity of early feculation, after it had fairly brought men to conclude that the foul is immaterial.
"Another argument urged for the eternity of the rewards held out by natural religion to the practice of piety and virtue is partly phyfical and partly moral. The merit of fervice (fay the admirers of that religion) increafes in proportion to the excellence of that Being to whom our fervice is directed and becomes acceptable. An infinite being, therefore, can difpenfe no rewards but what are infinite. And thus the virtuous man becomes entitled to inmortality.
" The misfortune is, that this reafoning holds equally on the fide of the unmerciful doctors, as they are called, who doom the wicked to everlasting punisiment. Indeed were this the only difcredit under which it labours, the mocilefs doctors would hold themfelves little concerned. But the truth is, that the argument frota inferity proves juf nothing. To make it of any force, both the partics flould be infinite. This inferior emanation of God's image, man, thould either be fupremely good or fupremely tad, a kind of deity or a kind of
\(L O \quad G \quad 1\).
devil. But thefe reafoners, in their attention to the divinity, overlook the humanity, which makes the decreafe keep pace with the accumulation, till the rule of logic, that the conclufion follow's the weaker part, comes in to end the dipute *."

Thefe arguments feem to prove unanfwerably that immortality is not effential to any part of the compound being man, and that it cannot be claimed as a reward due to his virtue. It is not indeed effential to any created being, for what has not exiftence of itfelf, cannot of itfelf have perpetuity of exiftence (fce Metapuysics, \(\mathrm{N}^{\circ} 272,8 \mathrm{c}\).) ; and as neither man nor angel can be profitable to God, they cannot claim from him any thing as a debt. Both, indeed, as moral agents, have duties prefcribed them; and while they faithfully perform thefe duties, they have all the fecurity which can arife from the perfect benevolence of him who brought them into exiftence, that they fhall enjoy a fufficient portion of happinefs to make that exiftence preferable to non-exiftence; but reafon and philofophy furnih no data from which it can be inferred that they thall exift for cver. Man is compoled in part of perift. able materials. However perfect Adam may be thought to have been when he came firlt from the hands of his Creator, his body, as formed of the duft of the ground, muft have been naturally liable to decay and diffolution. His foul, indeed, was of a more durable fubftance; but as it was formed to animate his body, and had no prior confcious exiftence, it is not eafy to conceive whatfhould have led him, under an equal providence, where rewards and punifhments were exactly diftributed, to fuppofe that one part of him thould furvive the other. In his natural and original flate, before the covenant made with him in paradife, he was unqueftionably a mortal creature. How long he continued in that flate, it feems not poffible to form a plaufible conjegure. Bihop Adam benot poinible to form a plaunble conjccture. Binhop fore his in-
Warburton fuppofes him to have lived feveral yearstroduction under no other difpenfation than that of natural religion; into paraduring which he was as liable to death as his fallen to deathe pofterity are at prefent.
"We muft needs conclude (fays this learned writer*), *Divine that God laving tried Adam in the fate of nature, and Legation, approved of the good ufe he made of his free-tvill under book ix. the direction of that light, advanced him to a fuperior chap. i. fation in Paradife. How long, before this remove, How long man had continued fubject to natural religion alone, we he continu. can only guefs: but of this we may be aftured, that it ed in that was fome confiderable time before the garden of Eden fate, could naturally be made fit for his reception. Since Mofes, when he had concluded his hiftory of the creation, and of God's ref on, and fandification of, the feventh day procceds to fpeak of the condition of this new world in the following terms: "And God made cvery plant of the field before it was in the earth, and every herb of the field lefore it grew; for the Lord God had not caufed it to rain upon the eartht." Which + Gen. it feems plainly to intimate, that when the feeds of vege- 4, 5: tables had been created on the third day, they were left to nature, in its ordinary operationc, to mature by fun and thowers. So that when in courfe of time Paradife was become capable of accommodating its inhabitants, they were tranfplanted thither."

This reafoning is not without a porlion of that ingenuity which was apparent in every thing that fell from the pen of YYarburton; but it was completely confut-

Original state of Man.
* Warbur-
\(t_{\text {On's }} D_{i-}\) vine Lega. tion, book tion.

Original ed almon as foon as it was given to the public, and state of Ghown to be deduced from premifes which eould be cm\(\underbrace{\text { Man. ployed againft the author's tyllem. If only the fecds of }}\) vegetables were created on the third day, and then left to nature, in its ordinary operations, to mature by fun and flowers, the firft pair muft have perilhed before a fingle vegetable could be fit to furnilh them with food; and we may fuppofe that it was to prevent this difalter that the garden of Eden was miraculoutly fored at ance with full grown trees and fruit in pelfect maturity, whilit the reit of the earth was left under the ordinary laws of vegetation. There is, however, no evidence that they were only the foeds of vegetabies that God created. On the contrasy, Mofes fays exprefsly \(t\), that God made the earth on the third day bring forth the herb yielding feed after his kind, and the tree yiclding fruit whofe feed was in itfelf after his kind;" and when he recapitulates the hifory of the creation, he fays, that God made, not every feed, but every plant of the field before it was in the earth, and every luerb of the field before it grew. From the procefs of vegetation, therefore, nothing can be inferred with refpect to the time of Adam's introduction into Paradife, or to afcertain the duration of his original ftate of nature. If angels were created during the fix days of which the Hebrew lawgiver writes the hiftory, an lypothefis very generally received (fee Ancel), though in the opinion of the prefent writer not very probable, there can be no doubt but our firft parents lived a confiderable time under the law of nature before they were raifed to a fuperior ftation in the garden of Eden; for it feems very evident that the period of their continuance in that fation was not long. Of this, horrever, nothing can be faid with certainty. They may have lived for years or only a few days in their original itate; but it is very neceffiry to diftinguifh between that fate in which they were under no other difpenfation than what is commonly called natural religion, entitled, upon their obedience, to the indefinite rewards of piety and virtue, and their flate in Paradife when they were put under a new lav, and by the free grace of God promifed, if they fhould be obedient, a fupernatural and eternal reward. Into that flate we mult now attend them, and afcertain, if we can, the precife terms of the firft covenant.

Mofes, who in this inveltigation is our only guide, tells us, that the Lord God, after he had formed the firtt pair, "planted a garden eaftward in Eden, and took the man and put him into the garden to drefs it and to keep it. And the Lord God (continues he) commanded the man, faying, of every tree of the garden thou mayelt freely eat; ; but of the tree of the knowledge of good and evil thou fhalt not eat of it; for in the day

L O G Y.
that thou eateft thereof, thou Chalt furely die t." Here Original is no mention made of the laws of piety and moral virture refulting from the relation \(\mathrm{i}, \mathrm{n}_{\text {s }}\) which the various ture retulting from the rcationt hats whech the various \(\underbrace{\text { ind }}_{\text {Gen. ii. }}\) in which all as creatures ffand to God their Almighty \(5,15,16\), and bencficent Creator. With thefe laws Adain was 170 already well acquainted ; and be muft have been fenfible, that as they were founded in lis mature no fubfequent law could difpenfe with their obligation. They have been equally binding on all men in every ilate and under every difpenfation; and they will continue to be fo as long as the general practice ol jualice, mercy, and piety, flall contribute to the fum of human happinefs. The new law peculiar to his paradifaical ftate was the command not to eat of the fruit of the tree of the knowledge of good and evil. This was a pofitize precept, not founded in the nature of man, but very proper to be the teft of his obedience to the will of his Creator. The laws of piety and virtue are fanctioncd by nature, or by that general fyftem of rules according and C , c to hich God governs the phylical and moral Worlds, ternal life and by which he has fecured, in fome ftate or other, made with happinefs to the pious and virtuous man, and mifery to Adam in fuch as hall prove incorrigibly wicked. The law re- paradife, fpecting the forbidden fruit was fanctioned by the penalty of death denounced againt difobedience; and by the fubjects of that law the mature of this penalty mult have been perfectly underftood: but Chriftian divines, as we flall afterwards fee, have differed widely in opinion refpecting the fall import of the Hebrew words which ou: tranflators have rendered by the phrafe thou foalt furely die. All, however, agree that they threatened death, in the common acceptation of the word, or the feparation of the foul and body as one part of the punifhment to be incurred by eating the forbidden fruit; and hence we muft infer, that had the forbidden fruit not been eater, our firt parents would never have died, becaufe the penalty of death was denounced againf no other tranfgreflion. What thercfore is faid refipecting the fruit of the tree of knowledge, implies not only a law but alfo a covenant (L), promifing to man, upon the obfervance of one pofitive precept, immortality or cternal life; which is not effential to the nature of any created being, and cannot be claimed as the merited reward of the greateft rirtue or the moll fervent piety.

This obvious truth will enable us to difpofe of the objections which have been fometinres brought by freethinking divines againft the wifdom and juftice of punilhing fo feverely as by death the breacls of a mere pofitive precept; which, confidered in itfelf, appears to be a precept of very little importance. We have only to reply, that as an exemption from death is not due either
(r.) It does not appear that any tranfaction between God and mankind in gerieral was denominated by a word equivalent to the Englifh word covenant till the end of the fourth century, when fuch phrafeology was introduced into the church by the celebrated Augunine, bifhop of Hippo. That the phrafeology is Arictly proper, no man can fuppofe who \(r\)-flects on the infinite diftance between the contracting parties, and the abfolute dominion of the one over the other. To be capable of entering into a covenant, in the proper fenfe of the word, both parties mult have a right either to agree to the terms propofed or to rejeet them ; but furely Adam had no right to bargain with his Maker, or to refufe the gift of inmortality on the terms on which it was offered to him. The word difpenfation would more accurately denote what is here meant by the word covenant; but as this laf is in general ufe, we hava retained it as fufficient, when thus explained, to diftinguilh what man received from God upon certain pofitive cerditions, from what he had a clim to by the conftitution of his nature.
+ Bull's
State of
Manbefor the fall.
either to the nature or to the virtue of man, it was wife and juf to make it depend on the obfervance of a pofitive precept, to imprefs on the minds of our firit parents a conftant conviction that they were to be preferved immortal, not in the ordinary courle of divine providence, but by the feecial grace and farour of God. The fame confideration will fiow us the folly of thofe men who are for turning all that is faid of the trees of knowleuge and of life into figure and allegory. But the other trees which Adam and Eve were permitted to eat were certainly real trees, or they muft have perilhed for want of food. And what rules of interpretation will authorife us to interpret eating and trees literally in one part of the fentence and figuratively in the other? A gar'sn in a delightful climate is the very habitation, and the fruits produced in that garden the very food, which we hould naturally fuppofe to have been prepared for the progenitors of the human race; and though in the garden actually fitted up for this purpofe two trecs were remarkably diftinguifhed from the reft, perhaps in fituation and appearance as wall as in ufe, the diftinction was calculated to ferve the bett of purpofes. The one called the tree of life, of which, while they continued innocent, they were permited to eat, ferved as a facramental pledge or affurance on the part of God, that as long as they hould obferve the terms of the covenant their life fhould be preferred; the other, of which it was death to tafte, was admirably adapted to imprefs on their minds the neceflity of implicit obedience to the Divine will, in whatever manner it might be made know: to them.

A queftion has been ftarted of fome importance, What would have finally become of men if the fird covenant had not been violated? That they would have been all immortal is certain; but it is by no means clear that they would have lived for ever on this eath. On the contrary, it has been an article of very general bel. - in all ages of the church \(\dagger\), that the garden of Eden was an cinblem or type of heaven, and therefore called \(P a\) radife (fee Paradise) ; and that inder the firft covenant, mankind, after a fufficient probation here, were to be tramlated into heavon without talting death. This doctrine is not indeed explicitly taught in Scripture; but many things confpire to make it highly probable. The frequent communications between God and man before the fall (n), feem to indicate that Adam was training up for fome higher fate than the terrefrial paradife. Had be been intended for nothing but to cultivate the ground and propagate his fpccies, he might have been left like other animals to the guidance of his own reafon and innlinets; which, after the rudiments of know!edge were communicated to him, mun furely have been fufficient to direct him to every thing neceffary to the comforts of a life merely fenfual and rational, otherwife he would have been an imperfect animal. It is olb"ious too, that thes earth, however fertile it may have originally been, could not have afforded the means of fubifitence to a race of immortal beings multiplying to infinity. For thefe reafons, and others which will readily occur to the reader, it feems incontrovertible,
I. O G Y.
that, under the frf covenant, either mankind would have been fuccefively tranflated to fome fuperior flate, or would have ceafed to propagate their kind as foon as the earth fhould have bcen replenified with inhabitants. He who reflects on the promife, that, after the general refurrection, there is to be a new heaven and a new earth, will probably embrace the later part of the alternative; but that part in its confequences differs not from the former. In the new earth promifed in the Chriltian revelation, nothing is to dwell but righteoufnefs. It will therefore be precifely the fame with what we conceive to be exprefled by the word heaven; and if under the firf covenant this earth was to be converted into a fimilar place, where, after a certain period, men fhould neither marry nor be given in marriage, but enjoy what divines have called the beatific vifion, we may confidently affirm, that, had the firit covenant been faithfully oblerved, Adam and his polterity, after a fufficient probation, would all have been tranlated to fome fuperior flate or heaven.

To fit them for that fiate, the gifts of divine grace and the feem to have been abfolutely neceflary. To them it gifts of was a ftate certainly fupernatural, otherwife a God of divine infinite wifdom and perfect goodnefs would not, for agrace. moment, have placed them in an inferior ftate. But to enable any creature, efpecially fuch a creature as man, whom an ancient philofopher has juttly ftyled Coros pupnleor, to rife above its nature, foreign and divine aid is unqueitionably requilite: and therefore, though we cannot perfuade ourlelves that the gifts of the Holy Ghoft conflituted that image of God in which man was originally made, we agree with Bifhop Bull, that thefe gifts were beftowed on our firf parents to enable them to fulfil the terms of the covenant under which they were placed.

On the whole, we think it apparent from the portions of fripture which we have examined, that Adam and Eve were endued with fuch powers of body and mind as fitted them to exercife dominion over the other animals; that thofe powers conntituted that image of God in which they are faid to have been formed; that they received by immediate revelation the firlt pinciples of all ufeful knowledge, and efpecially of that fyftem which is ufually called natural religion; that they lived for fome time with no other religion, entitled to the natural rewards of piety and virtue, but all the while liable to death; that they were afterwards tranflated into paradife, where they were placed under a new law, with the penalty of death threatened to the breach of it, and the promife of endlefs life if they fhould faithfully obferve it; and that they were endued with the It is ther gifts of the Holy Ghon, to cnable them, if not wanting fure impre to themfelves, to fulfil the terms of that covenant, which perly calle has been improperly termed the covenant of works, fince the coveit flowed from the mere grace of God, and conferred pri- nant of vileges on man to which the moft perfect human virtue could lay no juf clainı.
Ssci. 11I. Of the Fall of Adam, and its Confequences.
From the preceding account of the primeval fate of
(31) 'Whist there were fuch frequent communications, has been drown to be in the highen degree probable by the 1ate Dr Law bithop of Carlifle. See his Difcourfe on ihe feucra! Difpenfations of revealed Religion.
all of 1 - man, it is evident that his continuance in the terreftrial lam, and its conlcquences.
\(\overbrace{103}\)
; it could : violated ity by lobediice to one fitive mmand, paradife, ingether with all the privileges which he there enjoyed, were made to depend on his obfervance of one pofitive precept. Every other duty incumbent on him, whether as refulting from what is called the law of his nature, or from the exprefs command of his God, was as much his duty before as after he was introduced into the garden of Eden; and though the tranfgreffion of any law would undoubtedly have been punilhed, or have been forgiven only in confequence of fincere repentance and amendment, it does not appear that a breach of the moral law, or of the commandment refpecting the fanctification of the Sabbath-day, would have been punifhed with death, whatever may be the import of that word in the place where it is firf threatoned. The punilhment was denounced only againit eating the fruit of the tree of the knowledge of good and evil: "For "the Lord God commanded the may, faying, of every trec of the garden thou maycft freely eat, but of the tree of the knowledge of good and evil thou balt not eat of it; for in the day that thou eatef thereof thou flalt furely die." 'lo the word death in this paffage divines have affixed many and different meanings. By fome it is fuppoled to import a feparation of the foul and body, while the latter was to continue in a flate of confcious exiflence; by others, it is taken to imply amililation or a fate without confcioufnefs; by fome, it is imagined to fignify eternal life in torments; and by others a fpiritual and moral death, or a fate neceffarily fubject to fin. In any one of thefe acceptations it denoted fomething new to Adam, which he could not underftand without an explanation of the term; and therefore, as it was threatened as the punifhment of only one tranfgreffion, it could not be the divine intention to inflict it on any other.

Ihe abtaining from a particular fruit in the midit of a garden abounding with fruits of all kinds, was a precept which at firf view appears of eafy obfervation; and the penalty threatened againt the breach of it was, in every fenle, awful. The precept, however, was broken notwithftanding that penalty; and though we may thence infer that our firft parents were not beings of fuch abfolute perfection as by divines they have fome. times been reprefented, we Chall yet find, upon due confideration, that the temptation by which they were feduced, when taken with all its circumftances, was fuch as no wife and moden man will think himfelf able to have refifted. 'The thort hiftory of this important tranfaction, as we have it in the third chapter of the book of Genefis, is as follows.
"Now the ferpent was more fubtile than any beaft of the field which the Lord God had made; and he faid unto the woman, Yea, hath God fid, ye fhall not eat of every tree of the garden? And the woman faid unto the ferpent, We may eat of the fruit of the trees of the garden; but of the fruit of the tree which is in the midtt of the garden, God hath faid ye fhall not eat of it, neither fhill ye tomh it, left ye die. And the ferpent faid unto the woman, ye thall not furely die: For God doth know, that on the day ye eat thercof, then your eyes fhall be onened, and ye fhall be as gods, knowing good and evil. And when the women fazu that the tree was good for food, and that it was pleafant to the eyes, and a tree to be defired to make one
'lo the lefs attentive reader' this converfation between the ferpent and the woman mult appear to berin abrup ly ; and indced it is nomt pofible to reconcile it with the quences. ly; and indced it is not pofible to reconcile it with the 102
natural order of a dialogue, or even with the common in conferules of grammar, but by fuppofing the tempter's que- quence of ftion, "Yea, hath God faid, ye fhall not eat of evcry fult temptatree of the garden ?" to have been fuggefted by fome- tion, thing immediately preceding either in words or in fignificant figns. Eve had undoubtedly hy fome means blo other informed the ferpent that the was forbidden to cat of the fruit on which he was probably feafting; and that information, whether given in words or in actions, mult have produced the queftion with which the facred hiltorian begins his relation of this fatal dialogue. We are told that the woman faw that the tree was good for food; that it was pleafant to the eyes, and a tree to be defired to make one wife; but all this fhe could not have feen, had not the ferpent eaten of its fruit in her pre. fence. In her walks through the garden, it might have often appeared pleafant to her cycs; but previous to experience fhe could not know but that its fruit was the moft deadly poifon, far lefs could the conceive it capable of conferring wiflom. But if the ferpent ate of it before her, and then extolled its virtues in rapturous and intelligible language, fhe would at once fee that it was not deftructive of animal life, and naturally infer that it had very fingular qualities. At the moment fhe was drawing this inference, it is probable that he invited her to partake of the delicious fruit, and that her refufal produced the conference before us. That the yielded to his temptation need excite no wonder; for the knew that the ferpent was by nature a mute animal, and if he attributed his fpeech to the virtues of the tree, fhe might infer, with fome plaufibility, that what had power to raife the brute mind to human, might raife the human to divine, and make her and her hurband, according to the promife of the tempter, become as gods, knowing good and evil. Milton, who was an eminent divine as well as the prince of poets, makes her reafon thus with herfelf.

Great are thy virtues, doubtlefs, beft of fruits, Tho' kept from man, and worthy to be admir'd; Whole tafte, too long forborne, at firt effay Gave elocution to the mute, and taught
The tongue not made for fpeech to fpeak thy praife.
* * * * * * * * \(\quad\) * us alone

Was death invented ? or to us denied
This intellectual food, for beafts referved ?
For beafts it feems: yet that one beaft which firt
Hath tafted, envies not, but brings with joy
The good befallen him, author unfufpect,
Friendly to man, far from deceit or guile.
What fear I then, rather what know to fear
Under this ignorance of good and cvil,
Of God or death, of law or fenalty?
Here grows the cure of all, this fruit divine,
Fair to the eye, inviting to the tafte,
Of virtue to make wife : what hinders then
To reach, and feed at once both body and mind ? Paradife Lofl, book ix.

Full

Full of thefe hopes of raifing herfelf to divinity, and not, as has fometimes been fuppofed, led headlong by a fenfual appetite, fhe too's of the fruit and did eat, and gave to her hufband with her, and he did eat. The great poet makes Adam delude himfelf with the fame fophifiry ilat had deluded Ere, and infer, that as the ferpent had attained the language and reafoning porvers of man, they thould attain

> Proportional afcent, which couid not be Bat to be gods, or angels, demi-gods.

Thus was the covenant, which, on the introduction of our firlt parents into paradife, their Creator was gracioufly pleafed to make with them, broken by their violation of the condition on which they were advanced to that fupernatural flate; and therefore the hiftorian tells us, that " left they thould put forth their hand and take alfo of the tree of life and eat, and live for ever, the Lord God fent them forth frorn the garden of Eden to till the ground from whence they were taken (N)." Had they been fo fent forth without any farther intimation refpecting their prefent condition or their future profpects, and if the death under which they had fallen was on'y a lofs of confcioufnefs, they would have been in precitely the fame ftate in which they lived before they were placed in the garden of Eden; only their minds muft now have been burdened with the inward fenfe of guilt, and they muft have known themfelves to be fubjeet to death; of which, though not exempted from it by nature, they had probably no apprelenfion till it was revcaled to them in the covenant of lite which they had fo wantonly broken.
God, however, did not fend them forth thus hopelefs and forlorn from the paradife of delights which they had for recently forfeited. He deternined to punilh them for their tranfgreffion, and at the fame time to give them an opportunity of recovering more than their lott inheritance. Calling therefore the various ofienders before him, and inquiring into their different degrees of guilt, he began with pronouncing judgnent on the ferpent in terms which implied that there was mercy for man. "And the Lord God faid unito the ferpent, Becaufe thou haft done this, thou art curfed above all cattle, and above every beaft of the field: upon thy beily fhalt thou yo, and duft fhalt thou eat all the days of thy life; and I will put enmity between thee and the woman, and between thy feed and her feed: it fhall bruife thy head,

L O G T.
knows; though it is faid + , that in fome parts of the Fall of Aeaff ferients have been feen with wings, and others with fe 1 , and that thefe fpecics are highly beautiful. If there be any truth in this ftory, we may fuppofe that thefe walliing and isving ferpents have been fuffered to torthe wall. retain their original elegance, that mankind might fee Reriexawhat the whole race was before the curfe was de. mined wuits nounced on the tempter of Eve: but it is certain that moft of the fpecies have neither wings nor feet, and that many of the moff poifoncus of them live in butning deferts, where they have nothing to eat but the duft among which they crawl \(\ddagger\).
To this degradation of the ferpent, infidels have ob-clait an, jected, that it implics the punifment of an animal Pliny on which was incapable of guilt; but this objection is seritent. founded in thoughtleffnefs and ignorance. The elegant \(\mathrm{B}_{\mathrm{B}}\) th form of any fpecies of inferior animals adds nothing to Trazels. the happinefs of the anunals themfelves: the afs is probably as happy as the horfe, and the ferpent that crawls as he that flies. Fine proportions attract indeed the notice of man, and tend to imprefs upon his mind jult notions of the wifdom and goodnefs of the Creaior ; but furely the fymmetiy of the horfe or the beauty of the peacock is more properly difplayed for this purpofe than the elegance of the inftrument employed by the enemy of mankind. The degradation of the ferpent in the prefence of our firft parents mult have fersed the beft of purpofes. If they had fo little reflection as not yet to have difcovered that he was only the inftrument with which a more powerful being had wrought their ruin, they would be convinced, by the execution of this fentence, that the forbidden fruit had no power in itfelf to improve the nature either of man or of beafl. But it is impoffible that they could be fo flupid as this objection fuppofes them. They doubtlefs knew by this time that fome great and wicked firit had actuated the organs of the ferpent; and that when enmity was promifed to be put between its feed and the feed of the woman, that promife was not meant to be fulfilled by ferpents occafionally biting the heels of men, and by men in teturn bruifing the heads of ferpents! If fuch enmity, though it has literally taken place, was all that was meant by this prediction, why was not Adam directed to bruife the head of the identical ferpent which had feduced his wife? If he could derive any confolation from the exercife of revenge, furely it would be greater from his revenging himfelf on his own enemy, than from the knowledge that there flould be a perpetual warfare between his defeendants and the breed of ferpents through all generations.

We are told, that when the foundations of the earth were laid, the morning flars fang together, and all the fons of God fhouted for joy; and it is at leall probable that there would be fimilar rejoicing when the fix days work of ereation was finifled. If \(\{0\), Idam and Eve, who were but a little lower than the angels, might be admitted into the choris, and thus be made aequainted with the exillence of good and evil [pirits. At all events, we camot doubt but their gracious and merciful Cieator
(א) The ideas which this language conveys are indeed allegroricat; but they inform us of this, and nothing but this, that immortal life was a thing extrancous to our nature, and not put into our pafte or compofition when frit fshioned by the forming hand of the Crentor." W'arburson's Divine Legntion, book in. chap. 1.

Fall of A. Creato: would inform them that they had a powerful
dam, and
its conlequences. that they were not to remain for ever under its power. It was therefore their intereft, as well as their duty, to reconcile themfetves as much as poffible to their fate; to wean their affections from this world, in which they were to live only for a time; and to hope, with humble confidence, in the promile of their God, that, upon their depature from it, they @ould be received into Vol XX. Part I.
L. O G Y:
fome better ftate. To enable them to wean their af Tall of \(A\) fections from earth, nothing could more contribute than dum, and to combine fenfual enjoyment with forrow, and lay them under the neceflity of procuring theirneans of fubliflence it: confequencer. by labour, hard and often fruitlels. This would danly and hourly imprefs upon their minds a full conviction that the prefent world is not a place fit to be an everlathing habitation ; and they would look forward, with pious refignation, to death, as putting a period to all their woes. Had they indeed been furnilhed with io ground of hope beyond the grate, we camot believe that the Righteous Judge of all the earth would have added to the penally originally threatened. That pemalty they would doubteles have incurred the very di.y on which they fell; but as they were promiled a deliverance from the conferfuences of their fall, it was proper to train them up by fevere difcipline for the happincts 18 . ferved for them in a future flate.

Afler the paffing of their fentence, the man and wo. man were turned out into the world, where they had formerly lived before they were placed in the garden of Eden; and all future accefs to the ganden was for ever denied them. They were not, however, in the fame Itate in which they were originally before their introduction into Paradile : They were now confcious of gtiilt ; doomed to fevere labour ; liable to forrow and ficknefs, difeafe and death: and all thefe miferies they had brought, not only on themfelves, but alfo on their unborn pofferity to the end of time. It may feem indeed to militate againf the moral attributes of Gud, to intict mifery on children for the fins of their parents; but before any thing can be pronounced concerning the Divine goodnefs and juftice in the prefent cafe, we muft know precifely how much we fuffer in confequence of Adam's tranfgrefion, and whether we have ourfelves any Anare in that guilt which is the caufe of our fufferings.

That women would have had lefs forrow in the bringine forth of children; that we fhould have been fub- whother je ted to lefs toil and exempted from death, had our men would firit parents not fallen from their paradifaical flate-are have been truths incontrovertible by him who believes the infpira exenpted \({ }^{\text {c }}\) tion of the Holy Scriptures; but that mankind would under the in that flate have been wholly free from pain and every firf covebodily diffrefs, is a propofition which is not to be found nant, in the Bible, and which therefore no man is bound to believe. The bodies of Adam and Eve confifted of flefh, blood, and bones, as ours do; they were furrounded by material objects as we are; and their limbs were unqueftionably capable of being fractured. That. their fouls ftoould never be feparated from their bodies while they abtained from the forbidden fruit, they knew from the infallible promife of him who formed them, and breathed into their noftrils the breath of life; but that not a hone of themfelves or of their numerous polterity finuld ever be broken by the fall of a itone or of a tree, they were not told, and had no reafon to expect. Of fuch fractures, pairn would furely have been the confequence ; though we have reafon to believe that it would have been quickly removed by fome infallible remedy, probably by the fruit of the tree of life.

Perhaps it may be faid, that if we fuppofe our firft parents or their children to have been liable to accidents of this kind in the garden of Eden, it will be difficult to conceive how they could have been preferved from death, Y Y

Fi.l of A- as a fone might have fallen on their heads as well as on dinn, and thcir feet, and have at once deftroyed the principle of its conter vitality. But this can be faid only by him who knows quences. little of the phyfical world, and fill lefs of the power of God. There are many animals which are fufceptible of pain, and yet not eafily killed; and man in paradife might have refembled thefe. At any rate, we are fure that the Onnipotent Creator could and would have preferved him from death; but we have no reafon to believe that, by a conflant miracle, he would have preferved hinn from every kind of pain. Indeed, if, under the firit covenant, mankind were in a flate of probation, it is certainly conceivable that fome one individual of the numerous race might have fallen into fin, without actually breaking the covenant by eating the fruit of the tree of knowledge; and fuch a finner would undoubtedly have been punifhed by that God who is of Furer eyes than to beholdiniquity: but how punifhment could have been inflicted on a being exempted from all poffibility of pain as well as of death, we confefs ourfelves unable to imagine. Remorfe, which is the infeparable confequence of guilt, and conflitutes in our prefent flate great part of its punihment, flows from the fearful looking for of judgment, which the finner knows thall, in a future ftate, devour the adverfaries of the gofpel of Chrift; but he, who could neither fuffer pain nor death, had no caufe to be afraid of future judgement, and was therefore not liable to the tortures of remorfe. We conclude, therefore, that it is a millake to fuppofe pain to have been introduced into the world by the fall of our firft parents, or at lealt that the opision contrary to ours has no foundation in the word of God.
though
they would Death, however, was certainly introduced by their fall; for the infpired apofle affures us, that in Adam all
xCV. 23.
+ Rom.
- I5die*; and again, that through the offence of one many are dead \(\dagger\). But concerning the full import of the word death in this place, and in the fentence pronounced upon our firft parents, divines hold opinions extremely dif. ferent. Many contend, that it includes death corporal, Spiritual or moral, and eternal; and that all mankind are fubjected to thefe three kinds of death, on account of their fhare in the guilt of the original tranfgreffion, which is ufually denominated original fin, and confidered as the fource of all moral evil.

That all men are fubjected to death corporal in confequence of Adam's tranfgreffion, is univerfally admitted; but that they are in any fenfe partakers of his guilt, and on that account fubjefted to death fpiritual and eternal, has been very firenuoufly denied. To difcover the truth is of great importance; for it is intimately connected with the Chrifian doctrine of redemption. We fhall therefore fiate, with as much impartiaIity os we can, the arguments commonly urged on each fide of this much agitated quefion.

Thofe who maintain that all men finned in Adam, generally ftate their doctrine thus: "The covenant be- ing made with Adam as a public perfon, not for himfelf only but for his pofterity, all mankind defcending from him by ordinary generation firned in him and fell with him in that firll tranfgreffion; whereby they are deprived of that original righteoufnefs in which he was created, and are utterly indifpofed, difabled, and made oppolite to all that is firitually good, and wholly inclined to all evil, and that continually; which is commonly

L O G Y.
called original fin, and from which do proceed all ac. Fall of Atual tranfgreffions, fo as we are by nature children of wrath, bond-llaves to Satan, and juftly liable to all punifhments in this world and in that which is to come, even to everlafting feparation from the comfortable prefence of God, and to mott grievous torments in foul and body, without intermifion, in hell fire for ever."

That which in this paffage we are firft to examine, is the fentence which affirms all mankind delicending from Adam by ordinaty generation to have finned in him and fallen with him in his firft tranfgreffion; the truth of which is attempted to be proved by various texts of Holy Scripture. Thus St Paul fays exprefsly, that " by one man fin entered into the world, and death by fin; and fo death paffed upon all men, for that all have finned. But not as the offence, fo alfo is the free gift. Arguments For if, through the offence of one, many be dead; much for it. more the grace of God, and the gift by grace, which is by one man, Jefus Chrift, hath abounded unto many; and not as it was by one that finned, fo is the gift (for the judginent was by one unto condemnation); but the free gift is of many offences unte juftification. For if, by one man's offence, death reigned by one; much more they, who receive the abundance of grace and of the gift of righteoufnefs, fhall reign in life by one, Jefus Chrift. Therefore as, by the offence of one, judgment came upon all men to condemnation; even fo, by the righteoufnefs of One, the free gift came upon all men unto juftification of life. For as by one man's difobedience many were made finners; fo by the obedience of one fhall many be made righteous *." In this paffage the apoftle affures us, that all upon whom death hath paffed have finned ; but deatls hath paffed upon infants, who could not commit actual fin. Infants therefore mult have finned in Adam, fince death hath paffed upon them ; for death "is the wages only of fin." He tells us likewife, that by the offence of one, judgment came upon all men to condemiation; and therefore, fince the Righteous Judge of heaven and earth never condemns the innocent with the wicked, we muft conclude, that all men partake of the guilt of that offence for which judgment came upon them to condemnation. Thefe conclufions arc confirmed by his faying exprefsly, that "by one man's difobedience many (i. e. all mankind) were made finners;" and elfewhere + , that "there + Rom. iiio is none righteous, no not one;" and that his Ephefian 10. and converts "were dead in trefpalfes and fins, and were by Eph. ii. is nature children of wrath even as others." The fame \({ }^{\text {and } 3 .}\) doctrine, it is faid, we are taught by the infpired writers of the Old Teftament. Thus Job, expoftulating with God for bringing into judgment with him fuch a creature as man, fays, " Who can bring a clean tbing out of an unclean ? Not one." And Eliphaz, reproving the patient patriarch for what he deemed prefumption, afks \(\ddagger\), "What is man that he fhould be clean, or he \(\ddagger\) Job siv. who is born of a woman that he fhould be righteous ?" 4 and xvo From thefe two paflages it is plain, that Job and his 14 unfeeling friend, though they agreed in little elfe, admitted as a truth unqueftionable, that man iuherits from his parents a finful nature, and that it is impofible for any thing born of a woman by ordinary generation to be riglteous. The pfalmift talks the very fame language; when acknowledging his tranfgreffions, he fays \(\|\), "Behold I was thapen in iniquity, and in fin \(\|\) Pralm tio did my mother conceive me."
rean.

dam, and its confequences.

Fall of A- Having thus proved the fact, that all men are made dam, and finners by Adam's difobedience, the divines, who emits confe- brace this fide of the queftion, proceed to inquire how quences.

\section*{Adam's} guilt impu eed to his pofterity. they can be partakers in guilt which was incurred fo many ages before they were born. It cannot be by imitation; for infants, according to them, are involved in this guilt before they be capable of imitating any thing. Neither do they admit that fin is by the apoftle put for the confequendes of fin, and many faid to be made fin-
ners by one man's difobedience, becaufe by that difobedience they were fubjected to death, which is the wages of fin. This, which they call the doetrine of the Arminians, they affirm to be contrary to the whole fcope and defign of the context ; as it confounds together fin and death, which are there reprefented, the one as the caule, and the other as the effect. It likewife exhibits the apoftle reafoning in fuch a manner as would, in their opinion, difgrace any man of common fenfe, and much more an infpired writer; for then the fenfe of thefe words, "Death hath paffed upon all men, for that all have finned," muft be, death hath paffed upon all men, becaufe it hath paffed upon all men ; or, all men are obnoxious to death, becaufe they are obnoxious to it. The only way therefore, continue they, in which Adam's pofterity can be made finners through his difobedience, is by the impuration of his difobedience to them; and his imputation is not to be confidered in a moral fenfe, as the action of a man committed by himfelf, whether good or bad, is reckoned unto him as his own; but in a forenfic fenfe, as when one man's debts are in a legal way placed to the account of another. Of this we have an inftance in the apoflle Paul, who faid to Philemon concerning Onefimus, "If he hath wronged thee, or oweth thee any thing ( \(\varepsilon \lambda \lambda \circ \gamma s t\) ), let it be imputed to me," or placed to and put on my account. And thus the pofterity of Adam are made finners bs his difobedience; that being imputed to them and put to their account, as if it had been committed by them perfonally, though it was not.

Some few divines of this fchool are indeed of opinion, that the phrafe, "By one man's difobedience many were made finners," means nothing more than that the polterity of Adam, through his fin, derive from him a corrupt nature. But though this be admitted as an undoubted truth, the more zealous abettors of the fyftem contend, that it is not the whole truth. "It is true (fay they) that all men are made of one man's blood, and that blood tainted with fin; and fo a clean thing cannot be brought out of an unclean. What is born of the flefh is flefh, carnal and corrupt : every man is conceived in fin and fhapen in iniquity; but there is a difference between being made finners and becoming finful. The one refpects the guilt, the other the polluiton of nature; the one is previous to the other, and the foundation of it. Men receive a corrupt nature from their immediate parents; but they are made finners, not by any aft of their difobedience, but only by the imputation of the fin of Adam."

To illuftrate this doctrine of imputed fin, they obferve, that the word \(x\) xieflednoces, ufed by the apoltle, fignifies confituted in a judicial way, ordered and appointed in the difpenfation of things that fo it Chould be; juft as Chrif was made fin or a finner by imputation, or by that conflitution of God which laid upon him the fins of all his reople, and dealt with him as if he had been

\section*{I. O G Y.}
the guilty perfon. That this is the fenfe of the paffage, they argue further from the purithment inflicted on men for the fin of Adam. The punilhment threatened to that fin was death; which includes deatu corporal, moral, and eternal. Corporal death, fay they, is allowed by all to be fuffered on account of the fine of Adam; and if fo, there muft be guilt, and that guilt made over to the fufferer, which can be done only by imputation. A mural death is no other than the lofs of the image of Gud in man, which confifted in righteoufnefs and holinefs; and particulary it is the lofs of original righteoufnefs, to which fucceeded unrighteoufnefs and unholinets. It is both a fin and a punifhment for fin; and fince it comes on all men as a punifhment, it mult fuppole preceding fin, which can be nothing but Adam's difobedience ; the guilt of which is made over to his polterity by imputation. This appears till more evident from the pollerity of Adam being made liable to eternal death in confequence of his tranfgreftion; for the wages of fin is death, even death eternal, which never can be inflicted on guiltefs perfons. But from the paffage before us we learn, that " by the offence of one judgement eame upon all men to condemnation;" ald therefore the guilt of that offence mult be reckoned to all men, or they could not be jufly condemned for it. That Adam's fin is imputed to his pofterity, appears not only from the words, " by one man's difobedience many were made finners;" but likewife from the oppofite claufe, "fo by the obedience of One fhall many be made righteous;" for the many ordained to eternal life, for whom Chrif died, are made righteous, or juftified, only through the imputation of his righteoufnefs to them; and therefore it follows, that all men are made finners only through the imputation of Adam's difobedience.

To this doctrine it is faid to be no objection that Adam's pofterity were not in being when lis fin was committed; for though they had not then actual being, they had yet a virtual and reprefentative one. They were in him both feminally and federally, and finned in him *; juft as Levi was in the loins of Abraham, and *Romo vil paid in him tithes to Melchizedeck \(\dagger\). From Adam they \({ }^{1}\) derive a corrupt nature ; but it is only from him, as their + Heb. viis federal head, that they derive a fhare of his guilt, and \({ }^{9}, 10\). are fubjected to his punifhment. That he was a federal head to all his pofterity, the divines of this fchool think Adam a feevident from his being called a figure of Chrif \(\ddagger\); and deral head the firl Adam defcribed as natural and earthly, in contradiftinction to Chrift the fecond Adam defcribed as fpiritual and the Lord from heaven; and from the pu-i niftment threatened againf his fin being inflicted not on himfelf only, but on all his fucceeding offspring. He could not be a figure of Chrifl, fay tiey, merely as a man; for all the fons of Adam have been men as well as he, and in that fenfe were as much fgures of Chrit as he; yet Adam and Chrift are conftantly contrafted, as though they had been the only two men that eve: exifted, becaufe they were the only two heads of their refpective offspring. He could not be a figure of Chrift on account of his extraordinary production; for though both were produced in ways uncommon, yet each was brought into the world in a way peculiar to himfelf. The firlt Adam was formed of the duft of the ground; the fecond, though not begotton by a man, was born of a woman. They did not therefore refemble each other in the manner of their formation, but in their office as

its confe-
quences.
\(\mathrm{II}_{4}\)
No caure of con. plaint in this contitution of thiags.

Nor have any of the pofterity of Adam, it is faid, reafon to complain of fuch a procedure. Had he Itood in his integrity, they would have been, ly his ftanding, protakers of all his happinefs; and therefore thould not murmar at receiving evil through his fall. If this do not fatisfy, let it be confidered, that lince God, in his infinite widom, thought proper that men thould have a hend and reorefentative, in whofe hands their good and happinefs thuuld be placed, none cculd be fo fit for this high ftation as the common parent, made af.er the image of God, fo wife, fo holy, juf, and good. Lattly, to filence all objections, let it be remembered, that what God gave to Adam as a federal head, relating to himfelt and his pofterity, he gave as the Sovereign of the univerfe, to whom no created being has right to afk, * See crips" What duft than *?"

Bod. of D.- Such are the conferquences of Adam's fall, and fuch viratjo. the doctrine of original fin, as maintained by the more rigid foilowers of Calvin. That great reformer, however, was not the author of this doctrine. It had been

tinn the ant. by s: Ancuftime, the celebrated bihhop of Hippo (lee doctrase. taught, fo early as in the beginning of the fifth century, Augustine) ; and the authority of that father had made it more or lefs prevalent in hoth the Greek and Ruman churches long before the Reformation. Calvin was indeed the moft eminent modern divine by whom it has been held in all its rigour; and it contlitutes one great part of that theological fyflem which, from being taught by him, is now known ty the name of Calvininn.

But if it was as fovereign of the univerfe that God gave to Adam what he received in paradife relating to himfelf and his pofterity, Adam could in no fenfe of the words be a federal head ; becaufe, upon this fuppolition, there was no covenant. The Sovereign of the univerfe may ungueltionably difpenfe his benefits, or withhold them, as feems expedient to his infinite wifdom; and none of his fubjects or creatures can have a right to fy to him, What dolt thou? But the difpenfing or withholding of benefits is a tranfaction vely different from the entering into covenan's; and a judgement is to be formed of it on very different principies. Every thing around us proclaims that the Sovereign of the univerfe is a being of perfect benevolence; hut, fay the difci les of the fichool now under conlideration, the difi enfation given to Adam in pa.adile was fo far from being the , ff. furing of benpolience, that, as it is underflood ty the followers of Cilvin, it camnot poffibly be reconciled with the eternal laws of equity. The felf-exifent and allfolfi ient God might or inight not have created fuch a beong as man; and in either care there nould lave been no reafon for the queftion "What whit thou ?" But as foon as he determine I to rreate him capable of happinefs or mifcey, he would not have been either benevolent or jult, if he had not placed him a thate where, \(1 . y\) his orn exertions, he might, if he chofe, have a greater thate of happinefs than of nifere, and find his exiflence, upon the whole, a bleffing. They readily acknomledge, that the exiltense of any created being may be of longer or thorter dwration, according to the good pleafure of the Creator ; and therefore they have no obje tion to the apofolic doctrine, that "in diom all dic:" for immortality being not a debt, but a free giff, may be be-

L O G Y.
Atewed on any terns, and with perfę juntice withdrawn Fall of Awhen thefe terms are not complied wih. Between death, however, as it implies a lofs of confcioufnels, and the extreme mifery of etcrual life in torments, thene is an inmenfe difference. I'o death all mankind might jullly be fubjected through the offence of one; becaule they had oitgmally no clain to be exempted from it, though that one and they too lad remained for ever innocent : but eternal life in torments is a punilhment which a God of jullice and benevolence can never in- as incon Gict but upon pertomal guilt of the deepeit die. That we can perfonally have incurred guill from a crime com. mitted forne thoulands of years cefore we were born, is impuflible. It is indeed a notion as contrary to scrip. ture as to reafon and common fenfe: for the apolle exprefisiy informs us *, "that fin is the tranfgreflico of * I John iii. fome law; " and the fin of Adam was the trantigreflion 4. of a law which it was never in our power cither to obferve or to break. Another apofle + affures us, that \(\dagger\) Rom. iv. "where no law is, there is no tranfgreflion"; but there \({ }^{15}\) is now no law, nor has been a! y theie joco years, forbiddirg mankind to eat of a perticular truit; for, according to the Calvinilts themfelves \(\ddagger\), Adan had no \(\frac{\text { Girls }}{}\) Bo. fooner committed his firit fin, by which the covenant dy of Luriwith him was broken, than he ceaied to be a covenant. \({ }^{\text {nit }}\), bo iii. head. This law given him was no more; the promife ch. 10. of liie by it ceafed; and its fanction, death, tock place. But if this be lo, how is it poffible that his unbom poAlerity thould be under a law which had no exillence, or that they thould be in a worfe flate in coniequence of - the covenant being broker, and its promiie tiaving cealed, than the himfelf was before the covenant was fift made ? He was originally a mottal being, and was promifed the fupernatual gift of immortality on the fingle conditicn of his abfaimng from the fruit of the tree of knowledge of good and evil. From that fruit he didt not abltain; but by eating it fell back irto his natural ins flate of mortality. Thus far it is admitued that his po: the ieripflerity fell with him: for they have no claim to a fuper- the neture
natural gift which he had forfeited by his tranfgreffion. of thingso Sut we cannot admit, liy the divines of this fchool, that they fell into his guilt ; for to render it poffible for a man to incur guilt by the tranfgrefion of a law, it is neceffary not only that he have it in his power to keep the law, but alfo that he be capable of tranfgreffing it by a voluntary deed. But fureiy no man could be capable of voiuntarily eating the forbidden fuit 5000 years before he himfelf or his volitions exited. The followers of C.lvin think it a fufficient objection to the doctrine of tranfubfantiation, that the fame numerical body cannot be in different places at the fame inftant of time. But this nuiquity of body, fay the remontrants, is not more palpa ly abfurd, than the fuppofition that a man could exert valitions before he or his will had any exiftence.

Nor will the introduction of the word imputation into The werd this important queltion romove a fingle difficulty. For mputawhat is that we mean by faying that the fin of Adam nues reis imputed to his pofterity? Is the guilt of that fin difficuities. transferred from lim to them? So furely thought \(\mathrm{Dr}_{\mathrm{r}}\) Gill, when he frid that it is mode over to them. But this is the fime abfordity as the making over of the fenfible qualitics of bread and wine to the internal fubHance of our Saviour's body and bloot! This imputatinn eithe: found the polltrily of Adam guilly of his fin, or it made them fo. It could not find them guilty
\(\qquad\)

\(\qquad\)

\footnotetext{

}

 or for
all of A. for the reafon already affigned; as well as becaufe the lam, and apollle lays exprefoly, that tor the offence of one judgeis conite- ment came upon all imen, which would not be true had all ofiended. It cuull not make them guilty; for this realon, that if there be in phyfics or metaphyfies a fingle truth felfevident, it is, that the numerical powers, actions, or qualities, of one being camot poffily oe transferrel to another, and be made its powers, actions, or quilifies. Different beings may in ditant ayes have qulities of the lame kind; but as eafily may 4 and 3 be mide equal to 9 , as two beings be made to have the fane identical quality. In Scripture we nowhere revd of the aktions of one man being im, inted to another. "Abrath (we are told) believed in Gud, and it was comnted to him for righteonfnels;" but it was his owng faith, and not the faith of another man, that was fo counted. "I'o him that worketh not, but believeth, his faith (not another's) is imputed for righteoufnefs." And of our faith in him that railed Clritt from the dead, it is 「aid, that "it flall be imputed, not to our fathers or our children, but to us for righteoulinefs."

When this phrafe is ufed with a negative, not only is Ieaning of the man's own perlunal fin fpoken of, but the non-im-Scrip- putation of that fin means nothing more but that it brings not upon the finner condign punithment. Thus when Shemei "fait unto David, Let not my lord inprte iniquty unto me ;" it could not be lis meaning that the king fhould not think that he had ofiended; for with the fame breath he added, "Neither do thon remenaber that which thy fervant did perverfoly, the day that noy lord the king went of Jerulalem, that the king fhould take it to his heart. Fur thy [-rvant doth know that I have finned." Here he plainly confeffes his fin, and declares, that by intreating the king not to impute it to him, he wilied only that it fhould not be fo remembered as that the king fhould take it to heart, and punifh him as his perverlenefs deferved. When therefore
a Cor.v. it is faid *, that "God was in Chritt reconciling the world to himfelf, not imputing to them their iniquities, the meaning is only that for Clrill's fake he was pleafed to exempt them from the punifhment due to their fins. In like manner, when the prophet, foretelling the tifferings of the Meffiah, fays, that "the Lord laid on him the iniquity of us all," his meaning cannot be, that the Lord by imputation made his immaculate Son guily of all the fins that men have ever committed; for in that cafe it would not be true that the "jult fuffered for the "1 Petcriii. unjuft," as the apofle exprefsly teaches + : but the fenfe of the verfe muf be, as Bihop Coverdale tranflated it, "through him the Lord pardoneth all our fins." This interpretation is countenanced by the ancient verfion of
 מंewv; words which exprefs a notion very different fiom that of imputed guilt. The Meffiah was, without a breach of jutice, delivered for fins of which he had voluntarily oifered to pay the penalty ; and St Paul might have been juftly charged by Philemon with the debts of Onclimus, which he had defired might be placed to his account. Had the arofle, however, expreffed no fuch defire, furely Philemon could by no deed of his have made him liable for debts contracted by anothicr ; far lefs could he by imputation, whatever that word may mean, have made him virtunlly concur in the contracting of thofe debis. He could not have been juftly fubjected to fuffering without his own confent; and he could not
I. O G Y.
poflibly have been made guilty of the fins of thofe for Fall of twhom he fuffered.
The cloci rine of imputed guilt therefore, as underford by the Calvinills, is, in the opinion of their opprinents, without foundation in Siripture, and contra:y to the nature of things. It is an impious ablurdity (lay they), to which the mind can never be reconciled by the hyputhefis, that all men were in Adam both feniually and federally, and finned in him, as Levi paid tillies to Melcinzedeck in the loins of Abralam. The apofle, when he employs that argum ont to leften in the minds of his countrymen the pride of birth and the loty opinions entertained of their prielthood, plaisly intimates, that he was uling a bold figure, and that Levi's paying tithes is not to be underfood in a flict and literal ferfe. "Now confider (liys he) how grcat this man was, unto whom cven the patriarch Abraham gave the tenth of the lpoils. And, as I may fofay, Levi alfo, who receivecth tithes, paid lithics in Abaham : For he was yet in the loins of his father when Meichizedeck met him." This is a very good argument to prove that the Levitical priefhood was inferior in dignity to that of Melchizedeck; and ty the apoitle it is cmployed for no other purpofe. Lesi could not be greater than Abraham, and yet Abraham was inferior to Melchizedeck. This is the whole of St Paul's reafoning, which lends no fup. Moral gule port to the doctrine of original fin, unlefs it can be canrot be fhown that Levi and all his defendants contratied from tranmitetel this circumfance fucli a ftrong propenfity to the paying to fom fathes of tithes, as made it a matier of extreme difficuliy tor then, in every lubfequent generation, to comply with that part of the divine law which conflituted them receivers of tithes. That all men were leminally in Adam, is granted; and it is likewife granted that they may have derived from him, by ordinary generation, difeafed and enfeebled bodies: but it is as impofible to believe that moral guilt can be tranfmilted from father to fon by the phyfical act of generation, as to conceive a fearlet colour to be a cube of narble, or the found of a trumpet a cannon ball. That Adam was as fit a perfon as any other to be entrufted with the good and happinefs of his pofterity, may be true ; but there is no fitnets whatever, according to the Arroinians, in making the everlalling tappinefs or mifery of a whole race depend upon the conduct of any fallible individual, "That Do. 7 rine any man fhould fo reprefent me (fays Dr Taylor *), siz Prizime that when he is guilty, 1 am to be reputed guily; when he tranfgreffics, I thall be aecountable and punilinable for his tranfgreflion; and this before I am born, and confequently before \(I \mathrm{am}\) in any capacity of knowing, helping, or lindering, what he doth: all this evely one who wieth his undertanding muft clearly fee to ine falle, unreafonable, and alogether inconfiftent with the truth and goodnefs of God." And that no luch appointment ever had place, he endeavours to prove, by ihuwing that the texts of Scripture unon which is bualt the doctrise of the Calvinitts refpecting original fin, will each admit of a very different interpretation.
One of the frongeft of thefe texts is Romans r. 19. The teveral which we have alieady quoted, and which cur author texts on thus explains. He rbferves, that the apollle was a lew, "ointrint is familiarly acquainted with the Hebrew (ongue ; that hetumet capi wrote his epille as well for the ufe of his own country- ble of a wifmen refiding in Rome, as for the bencfit of the Gentile frans converts; and that though he made ufe of the Gicek ticrpertalanguage,

Fall of A- language, as moft generally underfood, he frequently dan, and employed Hebrew idioms. Now it is certain that the
its confe- Hebrew words mon and iny "fin and iniquity," are quences. \(\underbrace{\text { queaces. }}\) Hebrew words הטו " "fin and iniquity," are frequently ufed in the Old Teftament to fignify fuffering, by a figure of fpeech whicl puts the effect for the caufe; and it is furely more probable, that in the verfe under confideration, the apoftle ufed the correfponding Greek word \(\dot{\alpha} \mu \approx g \tau \neq \lambda\) or in the Hebrew fenfe, than that he meant to contridict what he had faid in the former verfe, by teaching that all men were made guilty of an act of difobedience committed thoufands of years before the majority of them had any being. In the preceding verfe he fays, "that by the offence of one, judgement came upon all men to condemnation." But this cannot be true, if by that offence all men were made finners; for then judgement muft have come upon each for his own thare in the original difobedience. "Any one may fee (fays our author) that there is a vaft difference between a man's making himfelf a finner by his own wicked act, and his being made a finner by the wicked act of another. In the latter cafe, he can be a finner in no other fenfe but as he is a fufferer; juft as Lot would bave been made a finner with the Sodomites, had he been confumed in the iniquity of the city \({ }^{*}\); and as the fubjects of Abimelech would have been made finners, had he, in the integrity of his heart, committed adultery with Abraham's wife + . That the people of Gerar could have contracted any real guilt from the adultery of their fovereign, or that he, by lying with a woman whom he had reafon to believe to be not the wife but the fifter of another man, would have incurred all the moral turpitude of that crime, are pofitions which cannot be maintained. Yet he fays, that Abraham had brought upon him and on his kingdom a great fin; though it appears, from comparing the 6th verfe with the \(17^{\text {th }}\) and 18 th, that he had not been brought under fin in any other fenfe than as he was made to fuffer for taking Sarah into his houfe. In this fenfe, "Chrift, though we are fure that he knew no fin, was made fin for us, and numbered with the tranfgrefiors," becaufe he fuffered death for us on the crofs; and in this fenfe it is true, that by the difobedience of Adam all mankind were made finners, becaufe, in confequence of his offence, they were by the judgement of God made fubject to death.

But it may be thought that this interpretation of the words \(\sqrt{2 n}\) and finners, though it might perhaps be admitted in the 19th verfe, cannot be fuppofed to give the apoftle's real meaning, as it would make him employ in the 12 th verfe an abfurd argument, which has been already noticed. But it may perhaps be poffible to get quit of the abfurdity, by examining the original text in-

 to afcertain the real fenfe of thefe words, the firf thing to be done is to difcover the antecedent to the relative

L O G Y.
i. Our tranllators feem to confider it as ufed abfolute- Fall of 4 ly without any antecedent ; but this is inaccurate, as it may be queltioned whether the relative was ever ufed in any language wthout an antecedent either exprefled or underftood. Accordingly, the Calvinitt critics, and even many Remonftiants, confider evos \(\alpha\) थegwiov in the boginning of the verfe as the antecedent to \(\%\) an the end of it, and tranilate the claufe under confideration thus: "And fo death hath paffed upon all men, in whon: (viz. Adam) all have finned." ©axyios, honever, flands much nearer to \(u\) than \(\alpha v \mathrm{l} \mathrm{g} \omega \mathrm{iov}\); and being of the fame gender, ought, we think, to be confidered as its real antecedent: but if fo, the claufe under confideration flould be thus tranflated: " and fo death hath paffed upon all men, unto which (0) all have finned, or, as the Arminians explain it, have fuffered. If this criticifm be admitted as juft, \(8 \uparrow \varphi\) muft be confidered as flanding here under a particular emphafis, denoting the utmoft length of the confequences of Adam's fin ( P ); as if the apofle had faid, " fo far have the confequences of Adam's fin extended, and fpread their influence among mankind, introducing not only a curfe upon the earth, and forrow and toil upon its inhabitants, but even death, universal death, in every part, and in all ages of the world." His words (fay the Remonftrants) will unqueftionably bear this fenfe; and it is furely much more probable that it is their true fenfe, than that an infpired writer fhould have taught a doftrine fubverfive of all our notions of right and wrong, and which, if really embraced, muft make us incapable of judging when we are innocent and when guilty.

When the apofle fays that there is none righteous, no not one, he gives us plainly to underfand that he is quoting from the \(14^{\text {th }} \mathrm{Pfalm}\); and the queftion firft to be anfwered is, In what fenfe were thefe words ufed by the Pfalmint ? That they were not meant to include all the men and women then living, far lefs all that have ever lived, is plain from the fifth verfe of the fame Pfalm, where we are told that thofe wicked perfons "were in great fear, becaufe God was in the congregation of the righteous." There was then, it feems, a congregation of righteous perfons, in oppofition to thofe called the children of men, of whom alone it is faid that there was none that did good, no not one. The truth is, that the perfons of whom David generally complains in the book of Pfalms, conflituted a ftrong party difaffected to his perfon and government. That faction he defcribes as proud and oppreflive, as devifing mifchief againft him, as violent men continually getting together for war. He flyles them his enemies; and fometines charaterizes them by the appellation which was given to the apoflate defcendants of Cain before the deluge. Thus in the 57 th Pfalm, which was compofed when he fled from Saul to the cave in which he fpared that tyrant's life, he complains, "I lie among them that are fet on fire, even the sons of men, whofe teeth are fears," \&c.;
(0) That \(6 \pi\), when conftrued with a dative cafe, often fignifies to or unto, is known to every Greek fcholar.

 (Gal. v. 13.). Ktiodephs ev X See alfo 1 Thef. iv. 7.; 2 Tim. ii. 14 .; and many other places of the New Teflament.
(P) \(E \varphi^{\prime}\) a has likewife this import, denoting the terminus ad quem in Phil. iii. 12. and iv. 10.

1 of A- and again, in the 58 tl P(alm, he fays, "Do ye indeed m , and fpeak righteoufnefs, O congregation? Do ye judge confe- uprightly, O ye fons of men ?" By comparing thefe texts with I Sam. xxvi. 19. it will appear evident that by the sons of men mentioned in them, he meant to characterize thofe enemies who exalperated Saul againft him. Now it is well known, that there was a party adhering to the interefts of the houfe of Saul, which continued its cnmity to David during the \(4^{\circ}\) years of his reign, and joined with Abfalom in rebellion againft him only eight years before his death. But it is the opinion of the molt judicious commentators + , that the r 4 th Pfalm was compofed during the rebellion of Abfalom; and therefore it is furely much more probable, that by the children of men, of whom it is faid there is "none that doth good, no not one," the infpired poet meant to characterize the rebels, than that he thould have directly contradieted himfelf in the compafs of two fentences fucceeding each other. Had be indeed known that all the children of men, as defcending from Adam, "are utterly indifpofed, difabled, and made oppofite to all that is fipiritually good, and wholly and continually inclined to all evil," he could not, with the leaft degree of confiftency, have reprefented the Lord as looking down from heaven upon them, to fee if there were any that did underfand and feek after God;" but if by the children of men was meant only the rebel faction, this fcenical reprefentation is perfectly confiftent, as it was natural to fuppofe that there might be in that faction fome men of good principles milled by the arts of the rebel chiefs.

Having thus afcertained the fenfe of the words às originally uled by the Pfalmift, the Arminian proceeds to inquire for what purpofe they were quoted by the apoltle; and in this inquiry he feems to find nothing difficult. The averfion of the Jews from the admirion of the Gentiles to the privileges of the gofpel, the high opinion whick they entertained of their own worth and fuperiority to all other nations, and the ftrong perfuafion which they had that a frict obedience to their own law was fufficient to jullify them before God, are facts univerfally known ; but it was the purpofe of the apofle to prove that all men flood in need of a Redeemer, that Jews as well as Gentiles had been under the dominion of fin, and that the one could not in that refpect claim any fuperiority over the other. He begins his epiftle, therefore, with thowing the extreme depravity of the Heathen world; and having made good that point, he proceeds to prove, by quotations from the book of Pfalms, Proverbs, and Ifaiah, that the Jews were in nowife better than they, that every mouth might be flopped, and all the world become guilty, or infufficient for their own juftification before God.
The next proof brought by the Calvinifts in fupport of their opinion, that all men derive guilt from Adam by ordinary generation, is that text in which St Paul fays that the Ephefians "were by nature children of wrath even as others." To this their opponents reply, that the doctrine of original fin is in this verfe, as in the laft quoted, countenanced only by our tranflation, and not by the original Greek as underftood by the ancient fathers of the Chriftian church, who were greater mafters of that language than we. The words are xat jंpet rexve \(\varphi\) yog ogras ; in which it is obvious, that \(\sigma\) exva, though in its original fenfe it fignifes the genuine chil-

\section*{L O G Y.}
dren of parents by matural generation, cannot be fo un. Fall of Adertood here; becaufe no man was ever begotten by, or born of, the abftract notion wrath. It muft therefore be ufed figuratively; and in other places of fcrip. ture it often denotes a clofe relation to any perfon or thing. Thus we read of the children of God, of the kingdom, the refurrection, wifdom, light, obedience, and peace; whence it is concluded, that by the children of wrath are meant thofe who are liable to punifhment or rejection. And becaufe there were in thofe days fome children, in a lower and lefs proper fenfe, by adoprion, and others, in a higher and more proper fenfe, by natural generation, of whom the relation of the latter to their parents was much clofer than that of the former; the apoille tells the Ephefians, that they were by nature children of wrath, to convince them that they were really liable to it by the firicteft and clofeft relation polfible. That the word \(\varphi\) vara here is of the fame import with really or truly, and that it does not fignify what we mean by nature in the proper fenfe of that word, the ancient fathers are generally agreed *; and \({ }^{*}\) See Hamthat the modern Greeks, who fill fpeak a dialect of mont and the noble language of their ancenors, undertiand the thitty on word in the fame fenfe, is apparent from their verfion of and Suidas the text before us. In the moft correct and eleganton the word edition of the New Teflament in their vernacular tongue, puris. the words under confideration are thus rendered; xat
 impofible that \(\varphi\) vorua can fignify natural, otherwife the apoftle will be made to fay, not that we are by nature derived from Adam liable to wrath, but that we were naturally begotten by wrath in the abftract! For taking the word \(\varphi\) veas in the fenfe of really or truly, both the ancient and modern Greeks appcar indeed to have the authority of St Paul himfelf; who, writing to Timothy, calls him grigoov rexvov," his true or genuine fon ;" not to fignify that he was the child of the apoftle by natural generation, but that he was clofely related to him in the faith to which St Paul had converted him. That the words \(\tau\) sevo Quast ogrms can fignify nothing but truly or really relations to wrath, is ftill farther evident from the ground alligned of that relation. It is not the fin of Adam, or the impurity of natural generation, "but the trefpaffies and fins in which the Ephefians in time paft walked, according to the courfe of the world, according to the prince of the power of the air," the the firit that at the time of the apofle's writing "worked in the children of difobedience." Surely no man can fuppofe that the Ephefians at any pait time walked in Adam's treepafs and fin, or that the prince of the power of the air tempted them to eat the forbidden fruit.

Having thus commented on the principal texts whick are cited from the New Teftament to prove the doctrine of original fin, the Arminians treat thofe which are quoted from the Old Teltament, in fupport of the fame doatrine, with much lefs ceremony. Thus, when Job fays, "who can bring a clean thing out of an unclean ? Not one," he is fpeaking, fay they, not of the pravity of our nature, but of its frailty and weaknefs, of the fhortnefs and mifery of human life. The fentence is proverbial; and as it is ufed only to fignify, that nothing can be more perfect than its original, it muft, whenever it occurs, be undertood according to the fubject to which it is arplied. That in the glace under contdera-

Fill of A. d.im, and its conlequences.
* Scripture Dōirine, [art ii.
tion it refers to our mortality, they think plain from the context; and Dr Caylor adds *, with fome plafibility, that if the words refer to the guilt which we are fuppofed to derive from Adzm, they will prove too much io ferve the common fcheme of original fin. They will prove that our natural and inherent paavity, fo far from rendering us fit fubjects of wrath, may be urged as a reafon r:hy God thould not even bring us into judgement : for the patriarch's whole expoftulation runs thus, - Dult thou open thine eyes upon fuch a one, and bringeit me into judgement with thee? Who can bring a clean thing out of an unclean ?"

The oilher text, quoted from the fame book, they think fill lefs to the purpofe; for Eliphaz is evidently contralling the creature with the Creator; in compatifon with whom, he might well fay, without alluding to criginal guilt, "what is man that he fhould be clean? and he who is born of a woman that he flould be righteous? Behold he putteth no truit in his faints; yea the heavens are not clean in his fight. How moch more abominable and filthy is man, who drinketh iniquity like water ?" He does not fay, who derives by birth an iniquitous nature; for he knew well, that as we are born, we are the pure workmanhip of God, " whofe hands have fathioned and formed every one of us;" but "who drinketh iniçuity like water," who maketh himfelf iniquitors by running headlong into every vicious practice.

Of the text quoted from the fffty-hrf pfalm in fupport of the dectine of original fin, Dr Taylor labourst, by a long and ingenious criticifm, to prove that our tranllators lave miltaken the fenfe. The word which they have rendered fhapen, he fhows to be ufed once by Iraiah, and twice in the book of Pooverbs, to fignify irought forth; and that which is rendered conceived me, is never, he fays, employed in feripture to dewote human conception. In this lat remark, however, he is coatradicted by a great authority, no lefs indeed than that of Mr Parkhurft \(\ddagger\), who fays, that the LXX conItantly render it by zorธow of syrvorzw, and the Vulgate gencraliy by concipio. Without taking upon us to decide betreen thefe two eminent Hebrew fcholars, we ftall only obferve, that upon one occafion || it certainly denotes ideas mach crrofier than thofe which the Pfamint mutt have had of his mother's conception; and that there, at leaf, Dr Taylor properly tranlates it, incalefceban, adding, "de hoc rero incalefcendi genere loqui Davidem nem, finus exitimare potet. Matrem enim incalu:fe, aut ipfum calefecifte eo modo quo incalefcerent Jasohi pecudes legem dicere, prorfus indecorum et ahfurdum." IIe contends, however, that the original force of the word is to be hot, and that it is applied to roncention, to refentment, to suarmilh by which the body is nour-flird, to idolaters in lure with idols, and to the lieat of metais. The heat of idolaters, of refentment, and of metals, are evidently foreign to the Phalmif's purpore; and the idea conveyed by the word incalcfcere being fitafide for the reafons alre.dy affigned, there remains only the warmth by which the body is nouritied, ent of that warmth our author is confident that David spoke.

If this criticifm be admitted, the whole verfe will then run thus: "Behold I was bon in iniquity, and in fin did my mother nurfe me;" which hath no reference to the original formation of his conftitution, but is a

I O G Y.
periphrafis of this being a fimer from the womb, and Fall cis' means nothing mote than that he was a great finnor, or had contuakted early halits of fin. He so more defigned to fignify in this verfe, that hy ordinary generation he had a nature conveyed to lim which was "utterly indilpoled, difabled, and oppufite to all that is fpiritually good, and wholly and cominually inclined to evil," than he meant in another * to fignify llrictly and properly that "the wicked are effranged from the dinnt, ank
its confe its confe.
cuen.es. \(\underbrace{\text { cuernces. }}\) womb, and teifl lifs as luon as they are born; \({ }^{\prime \prime}\) or that Job meant to fignify \(t\), that from the moment he came from his mother's womb he had been a guide 10 is. the widow and a fuccour to the fatherlefs. All thele are hyperbolical forms of expreflion; which, though they appear ीrained, and perhaps extravagant, to the phlegmatic inhabitants of Europe, are perfectly fuited to the warm imaginations of the orientals, and to the genius of eallern languages. They mean not that Job was born with halnits of virtue, that the wicked adually walked, and fpoke, and fpoke lies from the inftant of their birth, or that the Plalmilt was really /hapen in \(\sqrt{6}\) and conccived in iniquity. This laft fentence, if inter. preted literally, would indeed be grofsly impious: it would make the infpired penman throw the whole load of his iniquity and fin from of himelf upon him who haped, and upon her who conceived him; even upon that Gud "whofe hands had made him and fafhioned him, and whom he declares that he will praife for having made him fearfully and wonderfully," and upon that parent who conceived him with forrow, and brought him forth with pain, and to whom the divine law commanded him to render honour and gratitude. "But if, after all (fays Dr Taylor \(\ddagger\) ), you will adhere to the li- \(\ddagger\) Serithe teral fenfe of the text for the common doctrine of ori-Doतrine ginal fin, how me any good reafon why you ought not part ii, to admit the literal fenfe of the text, this is my lody, for tranfulfantiation? If you fay, it is abfurd to fuppofe that Chritt fpeaks of his real natural body; I fay, it is likewife abfurd to fuppofe that the Pfalmift feaks of his being really and properly thapen in iniquity, and conceived in fin. If you fay, that the fenfe of the words this is my body may be clearly explained by other tests of fcripture where the like forms of fpeech are ufed; I fay, and have fhown, that the Pfalmilt's fenfe may as clearly and evidently be made out by parallel texts, where you have the like kind of expreffion. If you lay that tranfubflantiation is attended with confequences hurtful to piety, I fay that the common doctrine of original fin is attended with confequences equally huriful; for it is a principle apparently leading to all manner of iniquity to believe that fin is natural to us, that it is interwoven and ingrafted into our very conltitution from our conception and formation in the womb."

The Arminians having thus, as they think, proved Conteryu that the pofterity of Adam are not in any fenferender- ces of ca ed guilty by his fin, contend, that the death threatened bidden againt his eating of the forbidden fruit, and which, in fruit, ac confequence of his tranfereffion, came upon all men, cording can mean nothing more than the lofs of that vital prin- the Arm ciple which he reseived when God breathed into his no- nians. Alils the breath of life, and he bccame a living [oul. Erety thing beyond this is pure conjecture, which has no futudation in the feriptures of truth, and is directly contrary to all the notions of right and wrong nlich

\section*{'art 11.}

T II E O
all of A- we have been able to acquire from the fludy of thofe

\section*{lam, and} tts confein the hitlory, that Adam could underiland it of g lofs of any other life than that which he had lately reeeived, for no other life is fioken of to which the threateried death can be oppofed; and in luch circumilances it was flrange indeed, if by the word death he underftood cither eternal life in mifery, or a neceflity of continuing in firl. The fenfe theretore of the threatesing, fay they, is this: "I have formed thee of the duft of the ground, and breathed into thy noftrils the breath of life ; and thus thou art become a living foul. But if thou eateft of the fruit of the tree of knowledge of good and evil, thou fhalt ceafe to be a living foul ; for I will take from thee the breath of life, and thou Shalt return to the duft of which thou waft formed."

Thus far the Arminians of the prefent day are agreed oppoling the doctrine of the iigid Calvinifts, and in flating their own notions of the confequences of Adam's fall; but from that event their adverfaries deduce one confequence, which fone of them admit and others deny. It is faid, that though we cannot poffibly be partakers in Adam's guilt, we yet derive from him a moral taint and infection, by which we have a natural propenfity to fin ; that having lof the image of God, in which he was created, Adam begat fons in his own image ; and in one word, that the fenfual appetites of human nature were inflamed, and its moral and intellectual powers greatly weakened by the eating of the forbidden fruit. The heathens themfelves acknowledged and lamented this depravity; though they were ignorant of the fource from which it fprung. The feriptures affert it, affirming that no man can be born pure and clean; that whatever is born of the flefh, or comes into the world by ordinary generation, is flefh, carnal and corrupt ; that the imagination of the thoughts of man's heart is only evil continually ; that the heart is deceitful above all things and defperately wicked; and that out of it proceeds all that is vile and finful *.

This depravity of human nature, thus clearly deducible from fcripture, and confirmed by the teftimony of ages, an ingenious writer of the moderate Arminian fohool undertakes to illuftrate upon the principles of \(n\) tural knowledge. "We know (fays he \(\dagger\) ), that there are feveral fruits in feveral parts of the world of fo noxious a nature as to deftroy the beft human conflitution on earth. We alfo know that there are fome fruits in the world which inflame the blood into fevers and frenzies; and we are told that the Indians are acquainted with a certain juice, which immediately turns the perfon who drinks it into an idiot, leaving him at the fame time in the enjoyment of his health and all the powers of his body. Now I afk Whether it be not poffible, nay

I」 O G Y.
fol think fully and clearly from the covering which \(\Lambda\) datn and Eve made ufe of foon after their offence; for haere is no imaginable reafon for that covering but one, and that one fulliciently demonftrates, that irregularity and violence of appetite, independent of the dominion of sealun, was the effect of their offence. Put the fruit which inflamed the fenfual appetite might likewile debafe their rational powers; for I afk, whether the fame juice, which now affects the brain of an ordinary man to as to make him an idiot, might not affect the brain of Adam lo as to bring his underllanding down to the prefent Itandard of ordinary men? And if this be poffible, and not ablurd to be fuppofed, it is evident that the fublequent ignorance and corruption of human nature may be clearly accounted for upon thefe fuppofitions; nay, I had almof faid upon any one of them. For it is univerfally known, that the infections and infirmities of the father affect the children yet in his loins; and if the mother be equally infected, muft, onlefs removed by proper remedies, affect their pofterity to the end of the world, or at leaft till the racc become extinct. Therefore why all mankind might not by their firlt father's fin be reduced to the fame condition of infirmity and corruption with himfelf, efpecially when the mother was equally irfirm, and infected, I believe no man anyway thilled in the knowledge of nature will fo much as pretend to fay."

Ihis account of the corruption of human nature feems to be generally adopted by moderate divines, as well among the Calvinifts as among the Arminians; but by the high-fliers in both fchools it is rejected, on different principles indeed, with great indignation. The zealous Calvinift contends, that this hereditary corruption is not to be accounted for or explained by any principle of phyfical fcience, fince it is part of that punithment which was inflicted on the race for their original - fin. If we were not partakers of Adam's guilt, fay they, we fhould not have been partakers of his corrup. tion. The one is previous to and the foundation of the other. The depravity of human nature is a punifhment for fin? and fo it was threatened to Adam, and came upon him as fuch, and fo to all his pofterity, by the ordination and appointment of God; for which there can be no other foundation but the imputation of Adam's difobedience to them, nor can any thing elfe vindicate the righteoufnefs of God. For if the law of nature was fufficient, why thould this original taint infect men rather than the fins of their immediate parents \(f\) ?"

The more violent Arminians, on the other hand, deny that we inherit any moral taint whatever from Adam, or that the rational powers of our minds are naturally weaker than his were. Of that wonderful degree of perfection which is ufually attributed to the firit pair, they find no evidence in fcripture. All that we learn of them, fay they, is, that they fell from a flate of exquifite happinefs by yielding to a temptation lefs powerful by far than fome others which many of their degenerate fons have fuccefffully refilted. "I leave you to judge (fays Dr Taylor \(\ddagger\) ), whether Jofeph, when he \(\ddagger\) Scripture refilled the folicitations of his mintrefs, and Mofes when Ductrine, he refufed to be called the fon of Pharaoh's daughter, choofing rather to fuffer afliction with the people of God than to enjoy the pleafures of fin for a feafon, ellecming the reproach of true religion greater riches
than the treafures of Egypt , did not exhibit proofs of
\(\mathbf{Z z}\)
regularity
+ Gill's Bo. whether it be not rational, to believe, that the fame fruit, which, in the prefent infirmity of nature, would utterly deftroy the human conftitution, might, in its higheft perfection, at leaft difturb, impair, and difeafe it? and whether the fame fruit, which would now inflame any man living into a fever or frenzy, might not inflame Adam into a turbulence and irregularity of paffion and appetite? and whether the fame fluids, which inflame the blood into irregularity of paffion and appetite, may not naturally produce infection and impair the conתitution? That the forbidden fruit had the effeet to produce irregularity of appetite, appears as from other proofs,

Vol. XX. Part I.

Fall of A- regularity of paffions and appetites equal at leaft to what dan, and its confequencos. Adam difplayed in the garden of Eden. When the three young men mentioned in the book of Daviel lubmitted to be burnt alive in a fiery furnace rather than worthip Nebuchadnezzar's golden image; when Daniel himelf refolved, rather than conceal the worlhip of Ged for one month nuly of his life, to be torn in pieces by hungry lions; and, to come nearer to our owa times, when numbers of men and women, during the reign of Mary queen of England, chole rather to be burnt at a thake than renounce the reformed religion and embrace the errors of popery-furely all thefe perfons exhibited a virtue, a faith in God, and a theady adterence to what they believed to be the truth, far fuperior to what Adam dilplayed, when his wife gave him of the forbidden fruit, and he did eat." If it be faid that thefe perfons were fupported under their trials by the grace of God firengthening them, the fame will be faid of Adam. He was undoubtedly lupplied with every aid from the firitit of grace which was necefliary to enable him to fulfil his duty; for being defigned for more than mere animal life, even for the refined enjoyments of heaven, there is eivery reaton to believe, as we have already obferved, that he was put under the guidance of the Holy Gholt, to train him for that fupernatural ifate of felicity. Thefe communications of the fpirit would of courfe be withdrawn when he forfeited his right to thofe privileges, on account of which they were originally vouchfafed to him; but that any pofitive malignity or taint was infufed into his nature, that his mere rational powers were weakened, or lis appetites inflamed by the forbidden fruit, there is no evidence to be found in fcripture, or in the known conflitution of things. The attributing of this fuppofed hereditary taint to the noxious qualities of the forbidden fruit, is a whimfical hypothe lis, which

127 and deem the phyfical illuntration of it whimfital; receives no countenance from any well authenticated fact in natural hiftory. After the numberle's falfe1 hoods that have been told of the poifon tree of Java, fomething more would be requifite than the common evidence of a lying voyager to give credit to the qualities of the Indian tree, of which the fruit infiantly turns the wifeft man into an idiot: and yet for this fingular fory our ingenious author vouchfafes not even that evidence, flight as it generally is. The inference drawn from the covering ufed by our firft parents is contradicted by every thing that we know of luman nature ; for furely no man, inflamed to the utmof with the fire of amimal love, ever turned his eyss from a naked beauty ready and eager to rcceive him to l:er embrace. Yet this, it feems, was the behaviour of Adam and Eve in fuch a ftate! According to our author, the juice of the forbidden fruit had rendered thair sarnal appectites riolent and iudependent of reafon; according to the fcripture, they were both naked; and as they vere hufand and wile, there was no law prohibit. ing them from gratifying thefe inflamed appetites. In fuch circumftances, horv did they conduct themfelves? Onc would naturally imagine that they immediately retired to fome fhady grove, and pleafed themfelves in all the foft dalliances of wedeled love. Their conduct, however, was very diferent. We are told, that " they fewed fig.leaves together, and made themfelves aprons to cover their nakednefs:" And this tranfaction is brought as a proof of the impetuofity of their carnal apputitcs. The truth is, that the carnal appetite appears
not to be naturally more violent than is neceniary to an- Fall of Afwer the end for which it was implanted in the human dam, and coantitution. Among favages the defires of animal love are generally very moderate; and even in fuciety they have not ofien, unlefs intlamed by the luxurious arts of civil lite, greater tlrength than is requifite to make mankind attend to the continuation of their fpecies. In the decline of empires highly polified, where the difference of rank and opulence is great, and where every man is ambitious of emulating the cxpence of his immediate fuperiors, early marriages are prevented by the inability of molt people to provide for a family in a way fuitable to what each is pleafed to confider as his proper flation; and in that flate of things the violence of animal love will indeed frequently produce great irregularities. But for that itale of things, as it was not intended by the Author of nature, it is perhaps unreafonable to fuppofe that provifion fhould be made; and yet we believe it will be found, upon due confideration, that if the defires of animal love were lefs riolent thana they are, the general confequences would be more pernicious to fociety than all the irregulatities and vices which thefe delires now accidentally produce; for there would then be no intercourfe between the fexes whatever except in the very higheft ftations of life. That our comfitution is attended with many fenfual appetites and paffions, is true; and that there is a great danger of their becoming exceflive and irregular in a world fo full of temptation as ours is, is alfo true; but there is no cridence that all this is the confequence of Adam's fall, and far lefs that it amounts to a natural propenfity to fin. For I prefume (fays Dr Taylor), that by a maintain. natural propenfity is meant a neceffary inclination to fin, ing that w or that we are neceffarily finful from the original bent have no na and bias of our natural potwers. But this mull be falfe; ;ural profor then we fhould not be finful at all, becaufe that which peeni. is necefiary, or which we cannot liclp, is not fin. That we are weak and liable to temptation, is the will of God holy and good, and for glorious purpofes to ourfelves; but if we are wicked, it mult be through our own fawlt, and cannot proceed from any conftraint, or meceflity, or taint in our conflitution."
Thus have we given as full and comprehenfive a view as our limits will permit of the different opinions of the Calvinifs and Arminians refpecting the confequences of Adam's fall. If we have dwelt longer upon the fcheme of the latter than of the former, it is becaufe every Arminian argument is built upon criticifm, and appeals to the original text; whilf the Calvinifts reft their faith upon the plain worls of frripture as read in our tranflation. If we might hazard our own opinion, we fhould fay that the truth lies between them, and that it has ons of mo. been found by the moderate men of both parties, who derate mel whitc they make fo different language, feem to wis \({ }^{\text {saiong the }}\) while they make ufe of different language, feem to us anong the finned in Adam, and are on that account liable to moll nians the grievous torments in foul and body, without intermif. fame, and fion, in hell fire for ever, is a doctrine which cannot be reconciled to our natural notions of God. On the other hand, if human nature was not fomehow debafed by the tion fail of our firft parents, it is not eafy to account for the numberlefs phrafes in fcripture which certainly feetu to fpeak that language, or for the very general opinion of the Pagan pliilofoplers and poets relpeeting the golden age and the degeneracy of man. Ciccro, in a quotation pieferved

\section*{'art II.}

THEEO Theology preferved by St Augufine from a work that is now loff, from the has thefe remarkable words, "Homo non ut a matre fed (all of A lam to the :oming of Chrit. ut a noverca natura editus eft in vitam, corpore nudo, et frapili, et infirmo; animo autem anxio ad molellias, humili ad timores, molli ad labores, prono ad libidines; in quo tamen ind? tanquam obrutus quidam divinus ignis ingenii et mentis to." Nor do we readily perccive what thould induce the more zealous Arminians to oppofe fo vehemently this general opinion of the corruption of human nature. Their defire to vindicate the jultice and goodnefs of God does them honour ; but the doctrine of inherent cornuption militates not againil thefe attributes; for what we have lolt in the firft Adam has been amply fupplied to us in the fecond; and we know from the higheft authority that the duties required of us are in proportion to our ability, fince we are told, that "unto whomfoever much is given, of him fhall much be required."

\section*{Sect. IV. View of Theology from the fall of Adam to the coming of Chrif.}

We have drett long on the original tate of man, his introduction into the terteftrial paradife, the privileges to which he was there admitted, his forfciture of thofe privileges, and the ftate to which he was reduced by tranfgreffing the law of his Maker; but the importance of thefe events renders them worthy of all the attention that we have paid to them. They paved the way for the coming of Chrift and the preaching of the gofpel ; and unlel's we thoroughly undertand the origin of the gofpel, we cannot have an adequate conception of its defign. By contrafting the firft with the fecond Adam, St Paul gives us clearly to underftand, that one purpole for which Chrift came into the world and fuffered death on the crofs, was to reftore to mankind that life which they had loft by the fall of their original progenitor. The preaching of the golpel therefore commenced with the firf hint of fuch a reftoration ; and the promife given to Adam and Eve, that " the feed of the woman ftould bruife the head of the ferpent," was as truly evangelicat as thefe words of the apolle, by which we are taught, that "this is a faithful faying and worthy of all acceptation, that Chrift Jefus came into r Tim. i. the world to fave finners *." The former text taken by itfelf is indeed oblcure, and the latter is explicit; but both belong to the fame fyftem, for the feriptures contain but two covenants or difpenfations of God to man, in which the whole race is included.
hriftianity Chrilianity therefore is indeed very near as old as the ay be faid creation; but its principles were at firft obfcurely res have
ommenced onmenced til dI. vealed, and afterwards gradually developed under different forms as mankind became able to receive them, (fee Prophecy, \(\mathrm{N}^{0} 5 . \& \mathrm{c}\).). All that appears to have been at firft revealed to Adam and Eve was, that by fome means or other one of their pofterity fhould in time redeem the whole race from the curfe of the fall; or if they had a diftinet view of the means by which that redemption was to be wrought, it was probably communicated to them at the inftitution of facifices, (fee SAcritfice). This promife of a future deliverer ferved to comfort them under their heavy fentence; and the inftitution of facrifices,' whilft it impreffed upon their minds lively ideas of the punihment due to their tranfgrefion, was
J. O G Y.
admirably calculated to prepare both them and their pofterity for the great atonement which, in due time, was to take away the fins of the world.

Our firft parents, after their fall, were fo far from being left to fabricate a mode of worlhip for themfelves ty thofe innate powers of the human mind of which we thote imnate powers of the human mind of which we \(\underbrace{}_{31}\) daily hear to much, and feel to little, that God was gracioully pleated to manifett himfelf to their fenfes, and vi- Revequent in fibly to conduct them by the angel of his prifence in all the early the rites and duties of religion. This is exident from ages of the the different difcourfes which hee held with Cain, as well world ; as from the complaint of that murderer of being hid from his face, and from its being faid, that "he went out fiom the prefence of the Lord and dwelt on the eaft of Eden." Nor does it appear that God wholly withdrew lis vifible prefence, and left namkind to their own inventions, till their wickednefs became fo very great that his fpirit could no longer Itrive with them. The infant ftate of the world flood in confant need of his fupernatural guidance and protection. The early inhabitants of this globe cannot be fuppofed to have been able, with Mofes *, to look up to him who is invifble, and perform a worthip purely rational and fpiritual. I'tuey were all tillers of the ground, or keepers of cattle; employed in cultivating and replenifhing this new world; and, through the curfe brought upon it by their forefather, forced, with him, to eat their bread "in the fweat of their brow." Man in fuch circumfances could have little leifure for fpeculation; nor has mere fpeculation, unlefs furnilhed with principles from another fource, ever generated in the human mind adequate notions of God's nature or providence, or of the means by which he can be acceptably worhhipped. Frequent manifeftations, therefore, of his prefence would be neceffary to keep a tolerable fenfe of religion among them, and fecure obedience to the divine inffitutions; and that the Almighty did not exhibit fuch manifeftations, cannot be inferred from the filence of that very thort hiftory which we have of thofe early ages. Adam himfelf continued 930 years a living monument of the juftice and mercy of God ; of his extrome hatred and abhorrence of fin, as well as of his love and long fuffering towards the finner. He was very fenfible how fin had entered into the world, and he could not but apprife his children of its author. He would at the fame time inform them of the unity of God, and his dominion over the evil one; of the means by which he had appointed himfelf to be worhinped; and of his promife of future deliverance from the curfe of the fall. Such information would produce a tolerable idea of the Divine Being, and afford fufficient motives to obey his will. The effects of it accordingly were apparent in the righteous family of Seth, who fon dilingoifhed themfelves from the pofterity of Cain, and tor their eminent piety were honoured with the appellation of the fons of God. Of this family fprang a perfon to remarlable.fint virtue and devotion, as to be exempted from Adam's fentence and the common lot of his tons; for afier he had walked with God 300 years, and prophecied to his brethren, he was tramfated thas he fhould not fee death. Of this miraculous event there can be no doubt but that his contemporaries had fome vifible demonftration; and as the fate of Abel was an argument to their reafon, fo the tranflation of Enoch was a proof to their fenfes of another ftate of life after the nerefent. To Adam himefelf. Zz 2

Theology from the fall of Adam to tine coming of Chirit. \(\xrightarrow{-}\) 3.

Tucolosis.fिụin the tiat of Adum to ine cuming of Clints.
particular revelations were vouchfafed wherever men were difpofed to regard them. Peleg had his name prophatically given him from the difperfion which was to happen in his days; and not only his father Lber, but all the leads of tamilies mentioned from Noah to Abrallam, are with much plaufibility fuppofed to have had the jpirit of prophecy on many occafions. Noah was undoubtedly both pieft and prophet; and living till within two years of the birth of Abraham, or, according to others, till that patriarch was near 60 years old, he would furely be able to keep up a tolerable fenfe of true religion among fuch of his defcendants as fojourned within the influence of his doctrine and example. His religious fon Shem, who lived till after the birth of Ifaac, could not but preferve in tolerable purity the faith and worthip of the true God among fuch of his own defcendants as lived in his neighbourhood.

But though the remains of true religion were thus preferved among a few righteous men, idolatry had in a thort time prevailed fo far among the fons of Noah, that God, faw it expedient not only to fhorten the lives of men, but alfo to withdraw his prefence from the generality, who had thus rendered themfelves unworthy of fuch communications; and to felect a particular family, in which his worfhip might be preferved pure amid! the various corruptions that were overfpreading the world. With this view Abraham was called, and, after many The call of remarkable trials of his faith and conftancy, admitted to Abraham a particular intimacy and friendfhip with his Maker. God entered into a peculiar covenant with him, engaging to be his prefent guide, protector, and defender ; to beltow all temporal bleflings upon lim and his feed; and to make fome of thofe feed the inftruments of conveying bleflings of a higher kind to all the nations of the earth.

It was doubtlefs for his fingular piety that Abrahamto prevent \({ }^{136}\) was fixed upon to be the parent of that people, who the univerfhould preferve the knowledge of the unity of God in fal fpreadthe midit of an idolatrous and polytheific world; but ing of ido we are not to imagine that it was for his fake only that all this was done, or that his lefs worthy defcendants were by the equal Lord of all treated with partial fondnefs for the virtues of their anceftor; it was for the bcnefit of mankind in general that he was called from his country, and from his father's houfe, that he might preferve the doctrine of the divine unity in his own family, and be an inftrument in the hand of Providence (and a fit one he was) to convey the fame faith to the nations around him. Accordingly, we find him diftinguifhed among the neighbouring princes, and kings reproved for his fake; who being made acquainted with his prophetic charactet, defired his interceflion with God. Hillory tells us of his converfing on the fubject of religion with the molt learned Fgyptians, who appear to have derived from him or fome of his defcendants the rite of circumcifion, and to have heen for a while ftopt in their progrefs towards the laft ftage of that degrading idolatry which afterwards rendered their national wormip the opprobrium of the whole earth, (fee Polytueism, \(\mathrm{N}^{\circ} 28\) ). We are informed that his name was held in the greatelt veneration all over the Ealt; that the Magians, Sabians.

Perfians,

\section*{'att II.}
'I II I O Micology Perfans, and Indians, all glory in him as the greatelt refrom the furmer of their refpective religions: and to us it appears ill of A- extremely probable, that not only the Brachmans, but am to the likewile the Hindoo god Brahma*, derive their names chinin. from the father of the faithlul. As he was let into the
che various counfils of the Almighty, and taught to reafon and reflect upon them; as he was fully apprifed of the overthrow of Sodom and Gomorrah, with the particular circumitances of that miraculous event ; and as he had fuitable notions of their Creator, and gradually to open up to them, as they were able to receive \(i\), the nature of that difpenfation under which "all the nations of the earth were to be bleffed in the patriarch's feed, (fce l'rophecy, \(\mathrm{N}^{0} \mathrm{I}_{3}\) ). For this purpofe, he held frequent correfpondence with them; and to itrengthen and

\section*{L. O G Y.}
confirm their faith, to fix and preferve their dependence on the one God of heaven and earth, he daily gave them new promifes, each more magnificent than that which preceded it. He blefled llaac, miraculoully increafed his fubtlance, and foon made him the cnvy of the neightouring princes. He foretold the condition of his two fons, renewed the promife made to Abraham, and blefled the adopted fon Jacob, with whom he condefected to converfe as he had converfed with \(A\) brahanı and Ifaac; rerewing to him the great promife; beftowing upon him all kinds of riches; and imprefling fuch terror upon all the cities which were round about him as prevented them from hurting either him or his family.

All this was indecd little enough to keep alive cven in the mind of Jacob a tolerable fenfe of duty and dependence on his Creator. After the firt vifion he is furprifed, and hefitates, feemingly inclined to make a kind of Itipulation with his Maker. "If (fays be) God will be with me, and will keep me in this way that I go, and will give me bread to eat, and raiment to put on, fo that I come again to my father's houle in peace, then fhall the Lord be my God f." It appears not to Gen. have been till after many fuch revelations, bleffings, and wxviii. \(2 o_{0}\) deliverances, and being reminded of the vow which on this occafion he had vowed, that he fet himfelf in good earneft to reform the religion of his own fanilly, and to drive out from it all ftrange gods *. So little able, in that age, were the boafted powers of the human mind to prelerve in the world juft notions of the unity of the Godhead, that we fee there was a neceflity for very frequent revelations, to prevent even the beft men from running headlong into polytheifm and idolatry.

Thus was God obliged to treat even with the patriarchs themfelves, by way of poftive covenant and exprefs compact ; to promife to be their God if they would be his people; to give them a portion of temporal bleffings as inlroductory to future and fpiritual ones; and to engage them in his fervice by immediate rewards, till they could be led on to higher views, and prepared by the bringing in of a better bope to worfhip him in fpirit and in truth. With regard to what may be called the theory of religion, mankind were yet farcely got out of their childhood. Some extraordinary perfons indeed occafionally appeared in different countries, fuch as Enoch, Noah, Abrabam, and Job, with many others, who had a more enlarged profpect of things, and entertained more worthy fentiments of the divine difpenfations and of the ultimate end of man; but thefe were far fuperior to the times in which they lived, and appear to have been providentially raifed up to prevent the favage fate and favage idolatry from becoming univerfal among men. See Savage.

The wormip which was practifed by thofe holy men The patriappears to have confifted principally of the three kindsarchal worof facrifice mentioned elfewhere (fee SACRIFICE); to thip of of lacrifice mentioned eliewhere (fee Sacrifice); to thofe early
which were doubtlefs added prayers and praifes, with ages perthe formed in faith
(U) There are great difputes anoong the learned refpeeting the antiquity and the author of the book of Job, and whether it be a hiftory of events, or a poem which has its foundation in hiftory. All fober men, howcver, are agreed, that there really was fuch a perfon as Job, eminent for patience under uncommon fufferings; and that he was of very remote antiquity. The LXX. give us the names of his father and mother, and fay that he was the: fifth from Abraham.
the more valuable oblation of pure hands and devout hearts. Such of the: as looked forward to a future redemption, and had any tolerable notion of the means by which it was to be effected, as Abraham certainly had, mult have been fentible that the bload of bulls and of goats could never take away fin, and that their facrifices were therefore valuable only when they were offered in faith of that great promife, "which they, having feen it afar off, were perfuaded of, and embraced: and confelfed that they were flrangers and pilgrims upon earth."
That fuch perfons looked for "a better country, eren a heavenly one," in a future flate cannot be queftioned; for they knew well how fin and death had entered into the world, and they muft have under?ood the promife made to their original progenitor, and repeatedIy renewed to themfelves, to include in it a deliverance at fome period from every confequence of the firf tranfgreffion. They were to all intents and purpofes Chriftians as well as we. They indeed placed their confidence in a Redeemer, who in the fulnefs of time was to appear upon earth, while we place ours in a Redeemer that has been already manifefted; they exprefled that confidence by one mode of worfhip, we exprefs it by another; but the patriarchal worthip had the fame end in view with the Chrifian-the attainment of everlafting life in heaven.

The generality of men, however, appear not, in the early age of which we now write, to have extended their views beyond the prefent life. From the confufed remains of ancient tradition, they acknowledged indeed fome fuperior power or powers, to whom they frequently applied for direction in their affairs; but in all probability it was only for direction in temporal affairs, fuch as the cultivation of the ground, or their tranfactions with each other. In the then flate of things, when no part of the world was overfocked with inhabitants, and when luxury with its confequences were everywhere unknown, virtue and vice muft have produced their natural effects; and the good man being happy here, and the wicked man miferable, reafon had no data from which to infer the reality of a future flate of rewards and puniflments. Thofe who were bleffed with the light of revelation undoubtedly looked forward to that fate with a holy joy; but the reft worfhipped fuperior powers from worldy motives. How many of thofe powers there might be, or how far their influence might reach, they knew not. Uncertain whether there be one Supreme Gavernor of the whole world, or many co-ordinate powers prefiding each over a particular country, climate, or place-gods of the hills and of the valleys, as they were afterwards diffinguifhed-they thought that the more of thefe they could engage in their intereft the better. Like the Sa maritans therefore, in after times, they fought, wherever they came, the "the manners of the god of the land,"
\(1 \neq 2\)
The purpufe for whirh the Ifraelites were made tri fojourn in Egylt and ferved him, together with their own gods.

Thus was the world ready to lofe all knowledge of the true God and his worthip, had not he been gracioufly pleafed to interpofe, and take effectual care to pieferve that knowledge in one nation, from which it might be conveyed to the refl of mankind at difierent times, and in greater or lefs degrees, as they fhould be capable of receiving it. To this purpofe he made way for the removal of Jacob and his family to one of the mofl im. proved and polifhed countries of the world ; and introduced them into it in a manner fo advantagcous, as to
give them an opportunity of imparting much religious knowledge to the natives. The natives, however, were gro.s. idolaters; and that his chofen people might be as far as poffible from the contagion of their example, he placed them upon the borders of Egypt, where, though they multiplied exceedingly, they were by their very occupation + dill kept a feparate people, and mult havc + Gen. xlet. beeri rendered, by a long and fevere oppieffion, in a 33,340 great degree averle to the manness and religion of their neighbours. This avcrion, however, feems to have gradually becomes lefs and lefs; and before they were miraculoully redcemed from their houfe of bondage, they had certainly loft all correct notions of the unity of God, and the nature of his worhip, and had adopted the greater part of the fuperfitions of their tafl-matters. Of this we need no other proof than what is implied in the words of Mofes \(\ddagger\), when he faid unto God, "Be- \(\ddagger\) Exod. iii, hold, when I come unto the children of Ifrael, and fay 143 unto them, the God of your fathers hath fent me unto confequens you; and they fhall fay unto me, What is his Name ? ces of it. wha! Thall I fay unto then ?" Had not the deflined lawgiver of the Hebrews been aware that his countrymen had adopted a plurality of gods, this dificulty could not have occurred to him; for names are never thought of but to diftinguifh from each other beings of the fame kind; and he mun have remembered, that in Egypt, where the multitude of gods was marfhalled into various clafies, the knowledge of their names was deemed of great importance. This we learn likewife from Herodotus, who informs us *, that the Pelafgi, * Lib. it. after fettling in Grcece, thought it neceffary to confulteap. 52 , the oracle of Dodona, whether it would be proper to 53. give to their own gods the names of the Egyptian divinities ? and that the oracle, as might have been fuppofed, aflured them that it nould. Indeed the Hebrews during their refidence in Egypt had acquired fuch an attachment to the idolatrous worfhip of the country, that it appears never to have left them entirely till many ages afierwards, when they were carried captive into Babylon, and feverely punifhed for their repeated apoAlacies; and fo completely were they infatuated by thefe fuperfitions at the era of their exodus, that, as the proplet Ezekiel informs us \(\S\), they rebelled againft God, § Ch. \(x=\) and would not caft away their abominations, or forlake the idols of Egypt, even in the very day that the hand of Omnipotence was lifted up to bring them forth of that land in which they had been fo long and fo cruelly oppreffed. In fuch a fate of things, to have fuffered them to remain longer in Egypt, could have ferved no good purpofe; and therefore to fulfil the promife which he had given to Abraham, God determined to deliver them out of the hand of the Egyptians by means which flould convince both them and their offspring of his own fupremacy over heaven and earth. meffage to Pharaol, and to demand of him leave for the poined to Ifraelites to go three days journey into the wildernefs to out of E . ferve the God of their fathers, it was neceffary that he gyput. Mould be endowed with the power of working miracles to evince the reality of his divine miffion. Without a conviction that his claims were well fumded, neither Pharaoh nor his own countrymen could reafonably have been expected to liften to the propofals of a man who, though bleffed in his youth with a princely eduration, had come directly on his embafly frum the humble em-
ployment

Theology from the fall at A. dam to the coming ot Chritit.

Theolozy ployment of a fucpherd, which he had for many years from the exercifed in the country of Midian. 'lo prove that he sill of Alan to the coming of Chrif. was really fent by God, any vifible and undoubted controul of the laws of nature would have been abundantly fullicient; but he was to prove not only this truth, but alfo the unity of the Divine nature; and the miracles which he was directed to work werc exccutions of judgeExod. xii. ments againll the very gods of Egypt \(\dagger\).
2. When Pharaoh firit turned a deaf ear to his requeft, though enforced by the converfion of a rod into a ferpent, at the command of Jchovah he fmote with the fime rod upon the waters in the river, which were inRantly converted into blood, and occafioned the death of all the filhes that fwam in them. 'lo any people this miracle would have been a proof of Divine agency; but it was in a particular manner calculated to open the eyes of the blind and infatuated Egyptians, who confidered the Nile as one of their greateft gods, and all the filhes that it contained as fubordinate divinities. They called that noble river fometimes Sirius, fometimes \(O / f\). ris, fometimes Canobus (fe Canobus), and not unfrequently £xamas ( \(x\) ); and adored it as the parent of all their deities. What then munt the people have thought when they found their moft revered god, at the command of a fervant of Jehovah, converted into blood, and all his facred offspring into tinking carcafes? To conceive their confternation, if it can be conceived, the reader muft remember, that the Egyptian prielts held blood in the utmof abhorrence, as a thing of which the very touch would deeply pollute them, and require immediate and folemn cxpiation. The fame facred river was a fecond time polluted, when it fent forth frogs, which covered all the land of Egypt, and died in the houfes, in the villages, and in the fields; thus rendering it impoffible for the people to avoid the touch of dead bodies, though from cvery fuch contant they believed themfelves to contract an impurity, which, in the cale before us, mult have been the more grievous, that in the whole country there was not left a pool of uninfected water to wafl away the ftain.

The third plague inflicted on the Egyptians was, the converting of the duf of the land into lice, upon man and upon beaft, throughout the whole kingdom. To fee the propriety of this miracle as a judgement upon their idolatry, we mut recollect their utter abhorrence of all kinds of vermin, and their extreme attention to external purity above every other people perhaps that has hitherto exifted on the face of the earth. On this head they were more particularly folicitous when about to enter the temples of their gods; for Herodotus informs us, that their priefts wore linen raiment only, and fhaved off every hair from their heads and bodies, that there might be no loufe or other deteftable object upon them when performing their duty to the gods. This plague therefore, while it lafted, made it impoffible for them to perform their idolatrous worfhip, without giving fuch offence to their deities as they imagined could never be forgiven. Hence we find, that on the production of the lice, the priefts and magicians perceived immediately from what hand the miracle had come, and exclaimed, "This is the finger of God!" The fourth
plague feems to have been likewife acknowledged to bc the finger of God, if not by the magicians, at leatt by Pharaoh; for in a fit of terror he agreed that the lfae'ites thould go and ferve the Lord. That he was terrified at the fwarms of llies which infented the whole country, except the land of Gomen, will excite no wonder, when it is known that the worhip of the tly originated in Egypt; whence it was carried by the Caphorim to Paleltine; by the Phoenicians to Sidon, I'yre, atad Babylon; and from thefe regions to other parts of the world. The denunciation of this plague was delivered to Pharaoh early in the morning, when he was on the banks of the Nile, probahly paying his accuftomed devotion to his greatell god; and when he found himfelf and his people tormented by a fwarm of fubordinate divinities, who executed the judgement of Jelovah in defiance of the power of the fupreme numen of Egypt, he mull have been convinced, had any canduur remained in his mind, that the whole fyftem of his fuperfition was a mafs of abfurdities, and that his gods were only humble infiruments at the difpofal of a Superior Power. He was not, however, convinced; he was only alarmed, and quickly relapfed into his wonted obthinacy. The fifth plague therefore, the murrain among the cattle, brought death and deftruction on his mof revered gods themfelves. Neither Offir, nor Ifis, nor Ammon, nor Pan, had power to fave his brule reprefentatives. The facred bull, and heifer, and ram, and goat, were carried off by the fame malady which fwept away all the other berds of deities, thefe diiffercorei, who lived on. grafs and hay. The impreflion of this punifiment muft have been awful on the minds of the Egyptians, but perhape not equal to that which fucceeded it.

In Egypt there were feveral altars on which human facrifices were offered; and from the defcription of the perfons qualified to be victims, it appears that thofe unhappy beings mult have been foreigners, as they were required to have bright hair and a particular complexion. The hair of the Ifraclites was much brighte: than that of the Egyptians, and their complexions fairer; and therefore there can be little doubt but that, during their refidence in Egypt, they were made to furnilh the viltims demanded by the bloody gods. Thefc victims being burnt alive on a high altar, and thus facrificed for the good of the nation, their afhes were gathered together by the priefts, and fcattered upwards in the air, that a bleffing might be entailed on every place to which an atom of thic duft fhould be wafted. Mofes too, by the direction of the true God, took athes of the furnace, probably of one of thofe very furnaces in Which fome of his countrymen had been burnt, and fprinkling them towards heaven in the fight of Pharaoh, brought boils and blains upon all the people, of fo malignant a nature, that the magicians and the other minifters of the medical gods, with which Egypt abounded beyond all other countries, could not themfelves efcape the infection.

The powers of darknefs were thus foiled; but the heart of the monarch was ftill hardened. Defruction was therefore next brought on him and his country by the elements, which were among the carlieft idol deities

Theoingy not only of the Egyptians, but of every other polytheif. from the tic nation. "The Lord rained hail on the land of fall or A- Egypt; fo that there was hail, and fire mingled with dam wo the Egypt ; furhat there was none like it in ali the land Chrift. Egypt fince it became a nation. And the hail finote throughout all the land of Egypt all that was in the field, both man and bealt; and the hail fmote every herb of the field, and broke evely tree of the ficld." This was a dreadiul calamity in itelelf; and the horror which it excited in the minds of the people mult have been greated aggravated by the well-known fact, that Egypt is blefied with a fky uncommonly ferene; that in the greateft part of it rain has never been feen at any other time fince the creation of the world; and that a flight and tranfient thower is the utmont that in the ordinary courfe of nature falls anywherc throughout the country. The fmall quantity of vegetables which was left undeftroyed by the fire and the hail was afterwards devoured by locults, which by a frong eaft wind were brought in fuch numbers from Arabia, where they abounded at all times, that they covered the whole face of the earth, and did eat every herb of the land, and all the fruit of the trees, fo that there remained not any green thing in the trees or in the herbs of the field through all the land of Egypt.

The ninth plague which the obflinacy of Pharaoh brought upon his country, whilf it feverely punifted the Egyptians for their cruelty to the Hebrews, ftruck at the very foundation of all idolatry. We have ellewhere fhown, that the firl objects of idolatrous worthip were the contending powers of light and darknefs (fee PolyTheIsm ; and that the benevolent principle, or the power of light, was everywhere believed to maintain a conftant fuperiority over the power of darknefs. Such was the faith of the ancient Perfians; and fuch, as a very learned writer has lately proved, was likewife the faith of the earlier Egyptians. It was therefore with wifdom truly divine, that God, to show the vanity of their imaginations, brought upon thofe votaries of light, who fancied themfelves the offspring of the fun, a preternatural darknefs, which, for three days, all the powers of their fupreme deity, and his fubordinate agents, could not difpel.

The tenth and laf plague brought on this idolatrous people was more univerfally and feverely felt than any which had preceded it. It was likewife, in fome fenfe, an inflance of the lex talionis, which requires an eye for an eye, and a tooth for a tooth, \&c. Mofes was commanded, at his firlt interview with Pharaoh, to fay, "Thus faith the Lord, Ifrael is my fon, even my firtborn. Let my fon go that he may ferve me: and if thou refufe to let him go, behold, I will nay thy fon, even tly firl-born." Before this threat was put in execution, every attempt was made to foften the hardened heart of the obltinate tyrant. The waters of his facred niver were turned into blood, and all the fifhes that it
contained flain; frogs were trought over all the land to pollute the people; the miniters of religion were icn de ed fo impure by vermin, that they could not difcharge the ir wonted offices; the animals molt revered as gods, or emblems of gods, were cut off by a murrain; the elements, that were everywhere worflipped as divimitie,, carried through the land a devaftation, which was completed by fwarms of locults; the athes from the facred furnace, which were thought to convey bleflings whitherfoever they were wafled, were made to communicate incurable difeafes; a thich and preternatural darknels was fpread over the kingdom, in defiance of the power of the great Ofiris; and when the hearts of the people and their Covereign continued flill obdurate, the eldeft fon in each family was flain, becaufe they relufed to let go Ifrael, God's firft-born. From this univerial pettilence the Ifraclites were preferved by fprinkling the door-pofs of their houfes with the bluod of one of the animals adored in Egypt; a fact which, as it could not be unknown to Pharaoh or his fubjects, ought to have convinced that people of the extreme abfurdity of their impious fuperftitions. This effict it fcems not to have had ; but the death of the firl-born produced the deliverance of the Hebrews; for when it was found that there was not a houfe where there was not one dead, "Pharaoh called for Mofes and Aaron by night, and faid, Rife up, and get you forth from among my people, both you and the children of Ifrael; and blefs me allo. And the Egyptians were urgent upon the people, that they might fend them out of the land in hatte; for they faid, We be all dead men ( \(Y\) )." The wonted obftinacy of the monarch indeed very foon returned; and his fubjects, forgetting the lofs of their children, joined with him in a vain attempt to bring back to bondage the very people whom they had been thus urgent to fend out of the land; but their attempt was defeated by Jehovah, and all who engaged in it drowned in the Red fea.

The God of Irael having thus magnified himfelf over the Egyptians and their gods, and refcued his people from bondage by fuch means as muft not only have flruck terror and afonifhment into the whole land, but alfo have fpread his name through all the countries which had any communication with that far-famed nation, proceeded to infruct and exercife the Hebrews for many years in the wildernefs. He inculcated upon them Reafon of the unity of the Godhead; gave them natutes and detaining judgements more righteous than thofe of any other na. \({ }_{i}\) the Ifracttion; and by every method confiftent with the freedom in the wilof moral agency guarded them again \(\Omega\) the contagion of dernelis. idolatry and poiytheifm. He fent his angel before them to keep them in the way, took upon himfelf the office of their fupreme civil governor, and by his prefence directed them in all their undertakings. He led them with repeated figns and wonders through the neighbouring nations, contirued to try and difcipline
thicm
(y) For this account of the plagues of Egypt, we are indebted to the very valuable Otfervations on the fubject publiihed hy Mr Bryant. We have not quoted the asthotities by which the learmed and pious author fupports his opinions; becaufe it is to be hoped, that for a fuller account of thefe important tranfactions the reader will have recourfe to his work, of which we have given only a wery brief abftrag For much of the preceding parts of this fection, we acknowledge our obligations to Bifhop Law's admirable difcourfe on the Steveral Di/profations of ReFicaled Religion.

Theology them till they were toletably attached to his government from the and eftablifhed in his worlhip, and introduced them infall of A- in the l'romiled Land when its inhabitants were ripe un to the aming of Chill. them a fummary repetition of their furmer laws, with note fuch ortinanses, doth of a eeremonial and mord kind, as were hoth liticd to their temper and circumftances, as well as to prefigute, and hy degrees to prepare them for, a more perled difpenlation under the Mefliah.

The Icrifl law had two great objects in view; of which the firf was to preferve among them the knowledge of the true God, a rational worfnip fpringing from that knowledge, and the regular praclice of moral vintue: and the fecond was to fit them for receiving the aecomplillment of the great promile made io theit anceltors, by means analogous to thofe which a dchon:mafter emplays to fit his pupils for difeharging the duties of maturer years. Every thing in that law peculiar to itfelf, its various ceremonies, modes of facrificing, the fanctions by which it was enforced, and the thencratic government by which it was adminiftered, had a direct tendeney to promote one or other of thefe ends; and keeping thefe ends in view, even the minutef laws, at which impious innorance has affected to make itfelf merry, will be difeovored by thofe wha fhall thudy the whole fyftem, and are at the fame time acquainted with the genius of ancient polytheifm, to have been enacted with the moft confummate wifdom.

It is not eafy for \(n s\), who have been long bleffed will the light of revelation, to conceive the propenfity of all nations, in that corly age of the world, to the worftip of falfe gods, of which they were daily adding to the number. It is indeed probable, from many pafiages of Scripture, as well as from profane authors of the greateft antiquity, that one fupreme numen was everywhere acknowledged: but be was confidered as an extramundane being, too highly exalted to concern himfelf with the aftiars of this world, the government of which, it was believed. He had delegated to various orders of fubordinate deities. Of thofe deities, fome were fuppofed to have the charge of one nation and fome of another. Hence it is, that we read of the gods of ligypt, the gods of the Ammorites, and the geds of the different nations around Paleftinc. None of thofe nations denied the exiftence of their neighbour's gods ; but all agreed, that while the Egyptians were the peculiar care of Oftris and Ifis, the Amorites might be the farourites of Moloch, the Phcenicians of Cionus, and the Plalifines of Dagon; and they had no objection occafionally to join with each other in the warthip of their refpective tutelary deities. Nay, it was thought impiety in foreigners, while they fojourned in a trange country, not to facrifice to the gods of the place. Thus Sophocles makes Antigone fay to her father, that a Aranger thould both venerate and abhor thote things which are

Vol. XX. Part I.
venerated and ablorred in the city where he refides; and another author *, who, though comparatively late, drew much of his information from ancient writings: which are now lofl, affures us, that this complailance proceeded from the belief that the "feveral parts of the world were liom the beginning dillibuted to feveral powers, of which each had his peculiar allotment and relidence."

From this notion of local divinities, whofe power or partial fondnefs was confined to one people, the Ifraelites, on their departure from Egypt, appear not to have heen free \((z)\). Hence it is, that when the true Crod firft tells them, by their leader Mofes \(t\), that if they would + Exod. obey his voice indeed and keep his covenant, then they xix. \(=\) fhould be a peculiar trfasure to lim above all people: to prevent them from fuppofing that he thared the easth with the idols of the lieathen, and had from partial fondncfs chofen them for his partion, he immedi- rit atsly adds, for ADL THE FARTHI is SHEE. By this ad- Purfole of dition he gave them plainly to undertland that they tha ir ipawere chofen to be his peculiar treafure for fome purpofe ather peoof general importunce; and the very firt article of the pile, covenant which they were to keep was, that they hould have no other gods but him. So invetcrate, however, was the principle which led to an intercommunity of the objects of worthip, that they could not have kent this article of the covenant but in a ttate of reparation from the refl of mankind \(\ddagger\); and that feparation conid \(\ddagger\) a Sam. neither have been effected nor continued without the xwvi, 1yvifible providence of the Alnighty watching over them as his peculiar treafure. This we learn from Mofes himiclf, who, when interceding for the people aficr their idolatrous wormip of the golden ealf, and intreating that the prefence of God would ftill accompany them, adds thefe words §: "For wherein flall it be § Exod. known here that I and thy people have found grace in axaiii. 1 隹 thy fight? Is it not in that Thou golst wrth us? So thall we be sEparatred, I and thy people, from all the people that are on the face of the earth." On this feparation every thing depended; and therefore to render it the more fecurc, fchovah was gracioufly pleafed to become likewife their fupreme Magiffrate, making them a ". kingdom of priefts and a holy nation," and delivering to them a digeft as well of their civil as of their religious laws.

The Almighty thus hecoming thecir King, the govern- cf their ment of the Ifraelites was properly a THEOCRACY, in theocranic whieh the two focieties, civil and religious, were of ment, courfe incorporated. 'They had indeed after their fettlement in the Promifed Land, at firf, temporary judges occafionally raifed up; and nfterwards permanent magiftrates called kings, to lead their armics in war, and to give vigour to the adminiftration of juftice in peace : but neither thofe judges nor thofe kings could abrogate a fingle law of the original code, or make the fmalleft addition to it but by the fpirit of proplecy. They can-
\[
3 \mathrm{~A} \text { not }
\]
(z) It is not indeed crident that they had got entircly quit of this abfurd opinion at a much later period. Jeph. tha, one of their judges, who, though half paganized (as Warburton obferves) by a bad education, had probably as correet notions of religion as an ordinary lfraclite, certainly talked to the king of Anmon as if he had believed the different nations of the earth to be under the immediate protedion of different deities: "Wilt not thou (fays he) poficfs that which Chemolh THY GOD giveth thee to poffef! So whomfoever the Lord our Gon fall drive oe:from before us, them will we pafefs. (Judges xi. 24.).

Theoiogy from the fall of \(A\). dain to the coming of Chriat.

not therefore be confidered as fupreme magiftrates, by whatever title they may have been known; for they were to go out and come in at the werd of the prielts, who were to afk counfel for them of the Lord, and with whom they were even atociated in all judicial proceedings, as well of a civil as of a \{piritual nature *. Under any other tlan a theocratic government the Hebrews could not have been kept feparate from the nations around them; or if they could, that feparation would not have anfwered the great purpofe for which it was eftablidhed. "The people, on their leaving Esypt, were funk isto the loweft practices of idolatry. lo vecover them by the difcipline of a feparation, it was neceffary that the idea of God and his attributes should be imprefled upon them in the mof fenfible manner. But this could not be commodiounly done under his character of God of the univerle : under his character of ling of Ifrael, it well might. Hence it is, that we find bim in the Old Tellament fo fiequently reprefented with affections analogous to human pafions. The civil relation in which he ftood to the Ifraelites made fuch a reprefentation natural; the groffnefs of their conceptions made the reprefentation neceffary; and the guarded manner in which it was always qualified prevented it from being mifchievoust," Hence too it is, that under the Mofaic difpenfation, idolatry was a crime of Aate, punillable by the civil magiltrate. It was indeed hirrh treafon, againft which laws were enacted on the juneft principles, and carried into effect without danger of error. Nothing lefs indeed than penal laws of the fevereft kind could have reftrained the violent propen. fity of that headifrong people to worthip, together with their orn Gud, the gods of the Heathen. But penal laws enacted by human authority for errors in religion are manifeftly unjuft ; and thercfore a theocratic government feems to have been abfolutely neceffary to obtain the end for which the Ifraelites :vere feparated from the furrounding nations.

It was for the fame purpofe that the ritual law was given, after their prefumptuous rebellions in the wildernefs. Before the bufinefs of the golden calf, and their frequent attempts to teturn into Egypt, it feems not to have been the Divine intention to lay on them a yoke of ordinances; but to make his covenant depend entirely on their duly practifing the rite of circumcifion; oblerving the feffivals inftituted in commemoration of thcir deliverance from bondage, and other fignal fervices rouchfafed them; and keeping inviolate all the precepts of the decalogue (A), which, if they had done, they thould have even lived in them \(\ddagger\). But after their repeated apofacies, and impious wifhes to mix with the furrounding nations, it was neccifary to fubject them to a multifarious ritual, of which the ceremonial parts were folemn and fylendid. fitted to engage and fix the attention of a prople whofe hearts were grofs; 10 inSpire them with reverence, and to withdraw their affec. tions from the pagcantry of thofe idie fupernitions which they had fo long witncfled in the land of Egypt.

\section*{L O G Y.}

To keep them warmly attached to their public worhip, that worhip was loaded with operofe and magnificent ritcs, and fo completely incorporated with their civil polity as to make thie tame things at once duties of religion and acts of tlate. The fervice of God was indeed foordered as to be the conftant bufinels as well as entertainment of their lives, fupplying the place of all other entertainments; and the facrifices which they were commanded to offer on the moft folemn occafions, were of fuch animals as the Egyptians and other Heathens deemed facred.

Thus a heifer without blemifi was in Egypt held fa-inftanced cred to the goddefs Ifis, and wormipped as the reprefentative of that divinity; but the fame kind of heifer was by the ritual law of the \(I\) lebrews commanded to be burnt without the camp, as the vileft animal, and the water of feparation to be prepared from her alles *. Num. xis. The goat was by the Egyptians lield in great veneration as emblematical of their ancient god Pan, and facrifices of the molt abominable kind were offered to the impure animal (fee PAN); but God, by his ferrant Mofes, enjoined the Ifraelites to offer goats themlelves as facrifices for fin, and on one occafion to difmifs the live animal loaded with maledictions into the wildernefs \(\dagger\). I'he Egyptians, with fingular zeal, worfhip- \(\dagger\) Levit. xvi ped a calf without blemint as the \(1 y \mathrm{mbol}\) of A pis, or the god of fertility; and it appears from the book of Exodus, that the Ifraelites themfelves had been infected with that fupetfition. They were, however, fo far from being permitted by their Divine lawgiver to confider that animal as facred, that their priefts wete commanded to ofter for themfelies a young calf as a fin-offering \(\ddagger\). No animal was in Egypt held in greater ve-t Levit. is. neration than the ram, the fymbol of their god Ammon, one of the conftellations. It was therefore with widdom truly divine, that Jehovah, at the inftitution of the paffover, ordered his people to kill and \(\epsilon\) at a young ram on the very day that the Egyptians began their annual folemnities \(\S\) in honour of that animal as one of their \& Stencer greateft gods; and that he enjoined the blood of this di-de legiburs, vinity to be fprinilled as a fign on the two fide-folts and upper door-poft of the houfe in which he was eaten.cap. iv.
Surely it is not in the power of imagimation to conceive a ritual better calculated to cure the Ifratites of their propenfity to idol wormip, or to keep them feparate from the people who had filt given them that propenfity, than cne which enjoined them to offer in factifice the very creatures which their fuperlitious matters had wor hipped as gods. "Shall we (faid Mofes) facrifice the abominations of the Egyptians before their eyes, and will they not ftone ue?"

But it was not againft Egyptian idolatry only that the ritual law was framed: the nations of Syria, in the midft of whom the Ifraelites were to dwell, were addited to many cruel and abfurd fuperftitions, againft which it was as neceflary to guard the people of God as againt the brute-worlhip of Egypt. We lieed not inform any reader of the book of Mofes that thofe nations woifhipped
(A) Of thefe precepts we think it not meceffary, in an alforact fo flort as this, to watte the reader's time with a formal and laboured defence. To the decalogue no objection can lic made by any man who admits the obligations of nateral religi n; for, except the obfervation of the Sabbath-day, it enjoins not a fingle duty which docs not by the confefion cf n!l men refalt from our relations to God, oufelyes, and our fellow-creatures.

Theology ped the fun and moon and all the hoft of heaven; or from the that it was part of their religion to propitiate their offall of A- fcuded gods by occafionally facrificing their fons and lam to the coming of Chritt.
their daughters. From fuch worlhip and facrifices the Ifraelites were prohibited under the feveref penalties; but we cannot confider that prohibition as making part of the ritual law, fince it relates to practices impious and immoral in themfelves, and therefore declared to be abominations to the I.ord. The Phoenicians, however, and the Canaanites, entertained an opinion that every child came into the world with a polluted nature, and that this pollution could be removed only by a lugral fire. Hence they took their new-born infants, and with particular ecremonics made them pafs through the flame of a pile facred to Baal or Moloch, the fymbols of their great god the fun. Sometimes this purgation was delayed till the children had arrived at their tenth or twelfth year, when they were made either to leap through the flame, or run feveral times backwards and forwards between two contiguous facred fires; and this luftration was fuppofed to free them from every matural pollution, and to make them through life the peculiar care of the deity in whofe honour it was performed *. The true God, however, who would have no fellow hhip with idols, forbade all fuch purgations among his people, whether done by fires confecrated to himfelf or to the bloody deitics of the Syrian nations. "There thall not be found (lays he) among you any one that maketh his fon or his daughter to pals through the fire \(\dagger\)."

There are, in the Jewinh law, fcw precepts more frequently repeated than that which prohibits the feething of a kid in its mother's milk \(\ddagger\); and there being no moral fitnefs in this precept when confidered abfolutely and without regard to the circumfances under which it was given, infidel ignorance has frequently thought fit to make it the fulject of profane ridicule. But the ridicule will be forborne by thofe who know that, among the nations round Judea, the feafting on a kid boiled in its mother's milk was an effential part of the impious and magical ceremonies celebrated in honour of one of their gods, who was fuppofed to have been fuckled by a the-goat. Hence, in the Samaritan Pentateuch, the text runs thus: "Thou thalt not feeth a kid in its mother's milk; for whoever does \(f 0\), is as one who Cacrifices an abominable thing, whicl1 offends the God of Jacob \$." Another precept, appareutly of very little importance, is given in thefe words: "Ye fall not round the corners of your heads, neither thalt thou mar the corners of thy beard \(\|\)." JBut its widdom is feen at once, when we know that at funerals it was the practice of many of the heathens, in that early period, to round the corners of their heads, and mar their beards, that by throwing the hairs they had cut off on the dead body, or the funeral pile, they might propitiate the Made of the departed hero; and that in other nations, particularly in Phenicia, it was cullomary to cut off all the hair of their heads except what grew on the cromn, which, with great folemnity, was confecrated either to the fur or to Saturn *. The unlearned Chriftian, if he be a man of reflection, muft read with fome degree of wonder fuch laws as thefe: "Thou thalt not fow thy vineyard with divers feeds, lef the fruit of thy feed which theu hatt fown and the fruits of thy vineyard be defled. Thou fhalt not plow with an ox and an als logether.

\section*{L O G Y.}

371
Thou fhalt not wear a garment of divers forts, or of woollen and linen together \(t\)." Put his wonder will ceale when he knows that all thefe were prachices from which the Sabiom idolaters of the eaft expected the greateft advantages. Their belief in magic and judicial aftrology led them to imagine, that by fowing different kinds of corn among their viacs they fhould propitiate the gods which were afterwards known in Rome by the 1 names of Bacchus and Ceres; that, by yoking animal; fo heterogeneous as the ox and the afs in the fame plough, they fhould by a charm lecure the favour of the deities who prefided over the affaits of laubandry; and that a garment compofed of linen and woollen, wom under certain conjunctions of the ftars, would protect its owner, his flocks, his herds, and his field, from all malign influences, and render him in the ligheft degree profperous through the whole courfe of his life \(f\). But magical ceremonies were always performed in order to render propitious good or evil demons (fee Macic) cap. 30, and therefore fuch ceremonies, however unimportant in themfelves, were in that age mof wifely prohibited in the Mofaic law, as they naturally led thofe who were addicted to them to the worfhip of idols and impure fpi. rits.

If the whole ritual of the Jewifh economy be examined in this manner, every precept in it will be found to be directed againt Come idolatrous practice of the age in which it was given. It was thereforc admirably calculated to keep the Ifraelites a Ceparate people, and to prevent too clofe an iniercourfe between them and their Gentile neighbours. The diftinction made by their law between clean and unclean animals (fee Sraverr, \(\mathrm{N}^{0} 33\).) rendered it impoffible for them, without a breach of that law, to eat and drink with their idolatrous neighbours; their facred and civil ceremonies being directly levelled againft the Egyptian, Zabian, and Canaanitifh fupertitions, had a tendency to generate in their minds a contempt of thofe fuperflitions; and that contempt muft have been greatly increafed by their yearly, montbly, and daily facrifices, of the very animals which their Egyptian maters had worthipped as gods.

That thefe laws might have the fuller effeet on minds The Mogrofs and carnal, they were all enforced by temporal faic laws fanclions. Hence it is that Mofes affured them, that if by tempothey would hearken to God's judgements, and keeprat fancthem, and do them, they fhould be bleffed above alltions. people; threatening them at the fame time with utter deffruction if they thould at all walk after other gods, and ferve them, and worhip them \(\delta\). Nor were thefe if Deut. temporal rewards and punifiments held out only to the pafim. nation as a collective body; they were promifed and threatened to every individual in his private capacity as the certain confequences of his obedience or difobedience. Every particular Hebrew was commanded to honour his father and mother, that it might go well with him, and that his days might be prolonged : whits he who curfed his father or his mother was furely to be pul to death. Againft every idolater, and even againft the wilful tranfgrellor of the ceremonial law, God repeatedly declared that he would fet his face, and would cut off that man from anong his peaple: and that individuals, as well as the nation, were in this life actually rewarded and punithed according to their deferts, has \(L_{i} \cdots\). Ies. been proved by Bihop Warburton \|. Indeed the Mo book :.

* Deut. Nxx. I519. mxis. 25 -

Theolory faic Jans, taken in its titeral fenfe, holds ont no other rrom the fali of Adam to th oming of Chrit. profpects to the Ifraelites than temporal happinefs; fuch as, health, long life, peace, plenty, and dominion, if they thould keep the coveriant ; and temporal mifery, viz. difeafes, immature death, war, famine, want, fub- jection, and captivity, if they hould break it. "See (fays Mofes), I have fet before thee this day life and good, deatls and evil ; in that I command thee this day to love the Lord thy God, to walk in his ways, and to keep his commandments, and his flatutes, and his judgements, that thou mayelt live and multiply; and the Lord thy God thall blefs thee in the land whither thou goeft to poffers it. But if thine heart turn away, fo that thou wilt not hear, but thalt be drawn away, and worfhip other gods, and ferve them; I denounce unto you this day, that ye fhall furely perilh, and that ye thall not prolong your days upon the land whither thou pafieft over Jordan to poffefs it." And elfewhere, having informed them that, upon their apoftacy, their land fhould be rendered like Sodom and Gomorrah, he adde, that all men thould know the reafon of fuch barrennefs being brought upon it, and dhould fay, "Becaufe thev have forfaken the covenant of the Lord God of their fathers, which he made with them when he brought thom forth out of the land of Egypt, the anger of the Lord was kindled againft this land, to bring upon it all the curfes that are written in this book *."

From this fact, which fcarcely any man of letters will venture to deny, Jome divines have concluded, that the ancient Ifraclites had no hope whaterer beyond the grave; and that in the whole Old Teeftament there is not a fingle intimation of a future flate. That many of the lower claffes, who could neither read nor write, were in this fiate of darknefs, may be tue ; but it is impoffible that thofe who underftood the book of Genefis could be ignorant that death came into the world by the tranfgreffion of their firt parents, ald that God had repeatedly promired to redcem mankind from every confcquence of that tranigreffion. They mult likewife have known that, before the deluge, Ench was tranllated into heaven without talting death ; that afterwards Elijain had the fame exemption from the common lot of humanity; and that, as God is no refpecter of perlons, every orie who ferved him with the zeal and fidelity of thefe two prophets would, by fome means or other, be anade capable of enjoying the fame rewards. The God of Abraham, Ifaac, and Jacob, was not the God of the dead, but of the living.

In the earliefl periods of their commonwealth, the If. raclites coult, indeed, only infor, from different paffages of their lacred books, that there would be a general refurcection of the dead, and a future fiate of rewards and puniflments; but from the writings of the prophets it appears, that before the Babylonifl captivity that doctrine mull have been very gencrally received. In the Pfalms, and in the prophecies of Ifaial, Daniel, and Lext:iel, there are feveral texts whic!s feem to us to prove, incontrovertibly, that, at the time when thele iuppired bouk were written, every Ifraclite who could sead the feriptures mult have had Some hopes of a refursection from the dead. We flall confider tivo of thele texts, becaufe they have heen quoted by a very learned an:I valuable writer in fupport of an opinion the reverfe of ours.

I? a fublime fong, compled with a view to incite

L O G Y .
Part II.
the people to confidence in God, the prophet Ifriah has Theology thefe remarkable words; "Thy dead mon thall live; from the together with my dead body thaill they arifc. Awake dall of to the and fing, ye that dwell in the duft; for thy dew is as the dew of herbs, and the carth flall calt out the dead *." We agree with Binop Warburton that thele words are figurative, and that they were uttered to give the Ifraelites confolation in very difaftrous times. The purpofe of the prophet was to affure them, that though finted. their community thould, in Babylon, be as completely * Chap. diffolved as a dead body reduced to duft, yet God would rellore them to their own land, and raife that community again to life. This was indeed a prophecy only of a temporal deliverance; but as it is exprefled in terms relating to the death and refurrection of man, the doctrine of a refurrection mult then have been well known, and generally received, or fuch language would have been altogether unintelligible.

The prophet Ezeki:cl, when the חate of things was moll defiperate, is carried by the Spirit into a valley full of dry bones, and afked this quellion; "Son of man, can thefe bones live?" To which he anfivers; "O Lord God, thou knoweft \(\dagger\)." He was not afked if all \(\dagger\) Chap. the dead would rife at the laft day; but only if the par- xxsvii. 3 . ticular bones then prefented to him could live at that fime, and while other bones were mouldering in corruption: and to fuch a queftion we cannot conceive any anfwer that a man brought up in the belief of a gencral refurrection could have given, but-" O I_ord God, thou knoweft." Had Ezekiel been a ftranger to the doctrine of a generas refurrection, or had he not believed that docirine, he would doubtlets have anfwered the queltion that was put to him in the negative; but convinced that all men are at fome pericd to rife from the dead, "that every one may reecive the things done in lis body, according to that he hatly done, whether it be good or bad," he very naturally faid, that God alone knew whether the bones then exlibited to him ia the valley would rife before the general refurrection.

But though the more intelligent and righteous Ifrael-The hope ites certainly " all died in faith, and not having re-or the Heceived the promifes, but having feen them afar off, brews, were perfuaded of them and embraced them, confeffing however, that they were ftrangers and pilgrims on earth, who de not fheir own fired a betler country, that is, a heavenly one \(f\)," we law. are not to fuppofe that this heavenly defire arofe from \(\ddagger\) Hele xin any thing taught in the law of Mefes. That law, when 3 , \&ic. taken by itfelf, as unconnected with prior and fubrequent revelations, makes no mention whatever of a heavenly inheritance, which St Paul affures us § was given \& Gal. iii. 430 years before to Abraham by a promife which may \(16-10\). be traced back to the firlt ray of comfort vouchfafed to fallen man in the fentence paffed on the original deceiver. "Wherefore then ferved the law? It was added (fays the apollie), becaufe of tran/greffions, till the feed ihould come to whom the promile was madc." The trangreflions here alluded to were polytheifm and idolatry, which, with a train of cruel and deteftable vice, hat overfpread the whole world; and the pirimary intention of the law was to flem the torrent of thefe corruptions, for which we have feen it "as almirably calculated; and, lihe a cchoomatler, to infruct the Ifraclites in the unity and worfhip of Jchoovah, and thus by degracs bring thean to Clriit.
heology :om the ll of 1 in to th ming of Chrift.

But though it is apparent that a future nate of rewards and panihments made no part of the Mofaic difpenfation, yet the law had certainly a fpiritual meaning to be underfood when the fulnefs of time nould come. Every Chrilian fees a Ariking refemblance between the facrifice of the pafchal lamb, which delivercd the Ifratiles from the delfroying angel in Egypt, and the facrifice of the Jamb of God, which taketh away the fin of the world. Indeed the whole ritual of Sacrifice muft have led the more intelligent of them to faith in a future facrifice; by which, while the heel of the feed of the woman hould be bruifed, the head of the ferpent thould be completely cruthed (fee Sacrifice); and as prophets were raifed up from time to time, to prepare thein for the coming of the Melliah, and to foretel the nature of his kingdom, there can be no doubt but that thole infpired teachers would lay open to them, as far as was expedient, the temporary duration of the Mofaic law, and convince them that it was only the fladow of better things to come. From the nature of their ritual, and the different prophecies vouchfafed them, which became more and more explicit as the time approached for their accomplillment, they mut furely have been led to expect redemption from the curfe of the fall by the fufferings of their Meffiah; but that any one of them knew precifely the manner in which they were to be redeemed, and the nature of that religion which was to fuperfede their own, is wholly incredible. Such knowledge would have made them impatient under the yoke of ordinances to which they were fubjected ; for alter the Chrilian faitis came into full fplendoar, mankind could be no longer under the tuition of fuch a fchoolmafter as the law, which " bad only a fladow of good things; and fo far from their reality, not even the very image of them *." 'Through thefe thadows, however, the Jews, aided by the clearer lighe of prophecy, though it ton fone in a dark place, might have feen enough of God's plan of redemption to make them acknowledge Jefus of Nazaretl, when he came among them working miracles of mercy, for the Melliah fo long promifed to their forefathers, and in whom it was repeatedly faid, that all the nations of the earin flould be bleffed.

While fuch care was taken to prepare the defcendants of Abraham for the coming of the Prince of Peace, we mult not luppofe that Gof was a refpecter of perfons, and that the reft of the world was totally neglected. The difperfion of the ten tribes certainly contributed to fread the knowledge of the true God among the eaftern nations. The fubfequent captivity of the tribes of Jodah and Berjamin mut have coufirmed that know ledge in the great empires of Babylon and Perfia; and that particular providence of God which afterwards led Ptolemy Philadelphas to have the Jewih feriptures tramlated into the Greek language, laid the divine oracles open to the Audy of every accomplifhed fcholar. At laft, when the arms of Finme had conquered the civilized world, and rendered IUdea a province of the empire; when Auguftus had given peace to that em-

\section*{I. O G Y.}
pire, and men were at leifure to cullivate the arts and feiences; when the different fects of philofophers lad by their difputations whetted each others underfandings, fo that none of them was difpofed to fubmit to an im. ceming of pollure ; and when the police of the lioman government was luch that intelligence of every thing important was quickly tranfmitted from the moll dillant provinces to the capital of the empire; "when that fulacis of time was come, God fent forth his Son made of a woman, made under the law, to redeem them that were under the law, that we might receive the adoption of fons," and be reftored to that inheritance of which the forfeiture introduced the feveral difpenfations of revealed religion into the world.

\section*{Sect. V. View of Theology more peculiarly Chrifian.}

Mankind being trained by various difpenfations of providence for the reception of Jefus Chrift, and the time fixed by the prophets for his coming being arrived, "a meffenger was fent before his face to prepare his way before him by preaching the baptifin of sepentarice for the remifion of fins." "This meflenger was John the Baptit, a very extraordinary man, and the greaten of all the prophets. His birth was miraculous, the fcene of his minithy the wildernefs, his manners autlere, and his preaching upright, without refpect of perfons. He frankly told his audience that he was net the Me?fial, that the Meffiah wonld foon appear among them, that the was misgtier than himfelf, and that he would baptife them with the Holy Ghoft and with fire."

Mightier indeed he was; for though born of a woman the Mrfinh was not the fon of a buman father; and though living for the firt thir! y years of his life in obfeurity and poverty, he was the lineal defcendant of David, and heir to the thronc of Ifracl. But the dignity of his human defocnt, great as it was, vanithes from confideration when compared with the glory which he had with his Father befure the world was. The Jewith difpenfation was given by the miniftry of Mofes, and illuftrated by fubfequent revelations wouchfafed to the prophets; the immediate author of the Chrifian icligion is the \(\lambda\) oryos or the fecond perfon of the blefied 'lririty, of whom St John declares, that "s be was in the beginning with God, and was God; that all things were made by him; and that witheut him was not any thing made that was made:" Wre !ave already proved that in the one Godhead there is a Trinity of perfons; and that the \(\lambda c\) yos is one of the three, is apparent from thefe words of the apotte, and from many other pallages of facred fcripture. Thus he is called the Lord of hofls himfelf; the firfl ant the laff, hefives whom there is no Cod; the moft high God; Gad hlefled for ever; the mighty Gol, the everlafing Father, Jelovah our rightcoufnefr ; and the only wife God our Saviour (B). This great Being, as the fame apoltle aflures us, was made flefh, and dwelt among men; not that the divine nature was or could be changed into humanity, for God is immutable, the fame almighty and incomprehenfible

Theolozy Spirit yefterday, to-day, and forever; but the Word or more pecu-fecond perfon in the godhead, afluming a human foul liarly Chri-
fian.
\(16!\)
Obections
to the incarnation of the Word. nature of man ;" phrafes of the fame import with that which afierts "the Word to lave been made fleth."

I'his incarnation of the Son of God is perhaps the greateft myftery of the Chriftian faith, and that to which ancient and modern heretics have urged the moft plaufible objections. The doetrine of the Trinity is indeed equally incomprehenfible; but the nature of God and the mode of his lubfitence, as revealed in fcripture, no man, who thinks, can be furprifed that he does not comprehend; for a revelation which ftould teach nothing myfterious on fuch a fubject would be as incredible and as ufelefs as another which contained nothing but mysiery. The dificulty refpecting the incarnation, which forces itfelf on the mind, is not how two natures fo different as the divine and human can be fo intimately united as to become one perfon; for this union in itfelf is not more inconceivable than that of the foul and body in one man; but that which at firf is apt to ftagger the faith of the reflecting Chriltian is the infinite ditance between the two natures in Chritt, and the comparatively fmall importance of the object, for the attainment of which the eternal Son of God is faid to have taken on him our nature.

Upon mature reflection, however, much of this diffculty will vanih to him who confiders the ways of Providence, and attends to the meaning of the words in which this myltery is taught. The importance of the object for which the Word conde?cended to be made fleh, we cannot adequately know. The oracles of truth indeed inform us, that Chrift Iefus came into the world to fave finners; but there are pafinges foattered through the New Teffament * which indicate, not obfcurely, that the influence of his fufferings extends to other worlds befides this: and if fo, who can take on him to fay, that the quantity of good which they may have produced was not of fufficient importance to move even to this condefcenfion a Being who is emphatically ftyled Love?

But let us fuppofe that every thing which he did and tanght and fuffered was intended only for the benefit of man, we flall, in the daily adminitration of providence, find other inftances of the divine condefcenfion; which, though they cannot be compared with the incarnation of the fecond perfon in the blefled Trinity, are yet fufticiant to reconcile our underftandings to that myftery when revealed to us by the Spirit of God. That in Chrift thete thould have dwelt on carth "all the fulnefs of the Godhear bodily \(t\)," is indeed a truth by which the devout mind is overwhelmed with afonifment ; but it is little lefs aftonithing that the ommipotent Creator ftoould be intimately prefint at every inflant of time to the meaneft of his creatures, "upholding all things, the vilest reptile as well as the moft glonious angel, by
\# Ifeb. i. 3. the word of his power \(\ddagger\)." Yet it is a truth fell-cvident, that without this conftant prefence of the Creator, nothing which had a beginning could continue one moment in beines; that the vifible univerfe would not only crumble into chaos, but vanith into nothing; and that the fouls of mcn , and even the mold exalted fpirits of

L O G Y.
creation, would inftantly lofe that exifence, which, as Theolocy it was not of itfelf, and is not neceffary, mult depend more pecu. widelly on the will of Him from whom it was originally liarly Chri derived. See Metaphysics, \(\mathrm{N}^{0} 272-276\), and Pro- \(\underbrace{\underbrace{\text { dian }} \text {. }}\) Nidence, N \({ }^{\circ} 3\).

In what particular way God is prefent to his works, we cannot know. He is not difuled through the univerfe like the anima mundi of the encient Platonifts, or that modern idol termed the fubfratum of fpace (MeTaphysics, \(\mathrm{N}^{0} 369,310\) ) ; but that he is in power as intimately prefent now to every atom of matter as when he firl brought it into exiftence, is equally the dictate of found philofophy and of divine revelation; for "in him we live and move and have our being;" and power without fubflance is inconceivable. If then the divine nature be not debafed, if it cannot be debafed by being conftantly prefent with the vileft reptile on which we tread, why fhould our minds recoil from the idea of a Itill clofer union between the fecond perfon of the ever bleffed Trinity and the body and foul of Jefus Chrift? The one union is indeed different from the other, but we are in truth equally ignorant of the nature of both. Reafon and revelation affure us that God muft be prefent to his works to preferve them in exittence; and revelation informs us farther, that one of the perfons in the Godhead affumed human nature into a perfonal union with himfelf, to redeem myriads of rational creatures from the miferable confequences of their own folly and wickednefs. The importance of this object is fuch, that, for the attainment of it, we may eafily conceive that he who condefcends to be potentially prefent with the worms of the earth and the grals of the field, would condefcend ftill farther to be perfonally prefent with the fpotlefs foul and body of a man. Jefus Chrift lived indeed a life of poverty and fuffering upon earth, but his divine nature was not affected by his fufferings. At the very time when, as a man, he had not a place where to lay his head; as God, he was in heaven as well as upon earth *, dwelling in light inacceffible; and while, as a * John iii. man, be was increafing in wifdom and fature, his divini- 13 . ty was the fulnefs of him who filleth all in all, and from whom nothing can be hid.

Perhaps the very improper appellation of mother of God, which at an early period of the church was given to the Virgin Mary, may have been one caufe of the reluctance with which the incarnation has been admitted; for as we have elfewhere obferved (fee Nrs. Torius), fuch language, in the proper fenfe of the words, implies what thofe, by whom it is ufed, cannot poffibly believe to be true; but it is not the language of fcripture. We are there taught, that "Chrif being in the form of God, thought it no robbery to be equal with God; but made himfelf of no reputation, and took upon him the form of a ferrant, and was made in the likencfs of man \(\dagger ;\) " that "God fent forth his Son made of a woman, made under the low, to redeem them that Philip. is were under the law, that we might receive the adoption of fons \(\ddagger ;\) " and that "the word who was in the be- \(\ddagger\) Gal. ik. ginning with God, and was God, by whom all things 4, s. were made, was made fleft, and dwelt among men (who beheld his glory, the glory as of the only begotten of the Father), full of grace? and truth \(\int:\) " but we are no- \(\$\) John \(i\). where taught that, as God, he had a mother! It was i Hurfeg's indeed the doctrine of the primitive church \(\|\), that the Scrmon 0.6 very principle of perfonality and individual exifence in the morat-
heology Mary's fon, was union with the uncreated word; and ore pecu- this doctrine is thought to imply the miraculous concepaly Chri- tion, which is recorded in the plainct terms by two of ftanl. the evangelills; for he was conceived by the Holy Gholt and born of a virgin *; but, as God, he had been begotten from all eternity of the Father, and in older of nature was prior to the Holy Gholt. This is evident from the appellation of : dogos given to him by St John; for the term being ufed in that age, both by the Jewith 1 abbies and the heathen philofophers, to denote the fecond divine fulffilence, which they confidered as an eternal and neceflary cmanation from the firft, fometimes called r'uysfay and fometimes to \(8 v\); and the apoftle giving no intunation of his ufing the word in any uncummon fenfe, we mult neceffarily conclude, that he meant to inform us that the divinity of Chrift is of eternal generation. That the term royos was ufed in this fenfe by the later Platonilts, and in all probability by Plato himfelf, we have fufficiently fhewn in another place (fee Plitonism) ; and that a fimilar mode of expreffion prevailed among the Jews in the time of St John, is apparent from the Chaldee paraphrafe; which, in the 110 th pralm, initead of the words "the Lord faid unto my Lord," has, "the Lord faid unto his word." Again, where we are told in the Hebrew Jehovalı Jaid to Alraham \(t\), "I am thy thield and thy exceeding great reward," we read in the Chaldce, " my word is thy hield, and thy exceeding great reward." Where it is faid, " your new moons and your appointed feafts my foul hateth \(\ddagger\)," the paraphralt hath it, "my word hateth;" and where it is faid, that "Ifrael thall be faved in the Lord with an everlafting falvation \(\oint\)," in the fame paraphrafe it is, "Ifrael thall be faved by the word of the Lord with everlafting fatvation." But there is a paffage in the Jerufatem Targum which puts it beyond a doubt, that by the noyos the Jews underftood a divine perfon begotien of his Father before all worlds; for commenting on Genefis iii. 22. the authors of that work thus exprefs themfelves: "The word of the Lord faid, behold Adam, whom I created, is the only begotten upon earth, as I AM THE only begotten in heaven :" in conformity with which, Pinilo introduces || the Logos fpeaking thus of
 थparis. I am neither unbegotlen, as God, nor begollcn after the fame mantur as you are.

From thefe quotations we may jutly comclude, that the Nicene fathers expreffed themfelves properly when they declared that the only begotten Son of Gud was begotten of his Father before all worlds, and is God of

L O G Y.
God; for if Si John had beileved the z.oye; or word to Theology be unbegotten, contrary to the belicf of atl who made more pectiufe of the phrafe at the time when he wrote, he would furely have expreffed his diffent from the generally re-

Rian. ceived opinion. 'Ihis however he is fo far from doing, that he gives the ampleft confirmation of that opinion, by declaring, that "he beheld the glory of the worn incarnate as the glory of the only begotten of the liather ;" for this declaration is true only of the divisity of Chritt, his human nature not being begotten of the Father, but conceived by the Holy Ghot of the Virgin Mary. Hence our blelfed Lord aftures us, that "as the Father matu life in mmself, fo hath he gives the Son to have life in himfelf;" that "the Son can do nothing of himfelf, but what he feeth the Father do *;", St Jolus and that "he knew the Father, becaufe he was from v. 26. 19. him and fent by him t." We muft therefore agree with + John rii. Bifhop Pearfon (c), that "though the Father and Son \({ }^{29}\). are both truly God, and thesefore equal in refpect of nature, yet the one is greater than the other, as being the fountain of the Godicad. The Father is God, but not of God; Light, but not of Light. Chrift is Gad, but of God; Light, but of Light. There is no difference or inequality in the nature or effence, becaufe the fame in both; but the Father of our Lord Jefus Chrift hath that effence of himfelf, from none; Chrift lath the fame effence, not of himfelf, but from him."

The great purpofe for which this divine perfon was Purpore font into the world, was to bruile the head of the fer-for which pent, and reftore mankind to the imheritance which had Chrift was been furfeited by Adam's tranfgreffion. Every difpen- the worts fation of Providence from the fall had been preparatory to this refluration. Prophets had been raifed from time to time to preferve in the eally ages of the world the knowledge and worthip of the tive God: the children of Abraliam had been feparated from the furrounding nations for the fame purpole; and by the difperfion of the Ien tribes, the captivity of the other two in Babylon, and the tranlation of the Hebrew feriptures into the Greek language, much of the knowledge which had been revealed to the Irraelites was gradually diffufed over the eaftern world.

But while the Jews vere thus rendered the influments of enlightening the heathen nations of antiquity, their intercourfe with thofe nations made them almoft unavoidably acquainted with the philofophy which was cultivated among the Chaldeans, the Perfians, and the Egyptian Greeks; and ingrafting many of the opinions derived from thofe fchools upon the doctrines of Mofes and the prophets, they corrupted their own religion while
(c) We beg leave 10 recommend to our readers this author's excellent expofition of the apofle's creed, as a woik which will render them great affitance in acquiring juf notions of the fundamental articles of the Chrittian faith. They will find it, we think, a complete antidote againft the poifon of modern Unitarians and modern Tritheilts ; of whom the former teach that Jefus Chrift was a mere man, the fon of Joleph as well as of Mary; while the latter, running to the other extreme, maintain, that, with refpect to his divinity, he is in no fenfe fubordinate to the Father, but might have been the Father, the Son, or the Holy Ghoft, according to the good pleafure of the cternal three. We have been at fome pains to prove his divinity, and likenife his eternal generation; but in fuch a flort compend as we mult give, it feems not to be worth while to prove his miraculous conetption. That miracle is plainly afferted in the New Teftament in words void of all ambiguity; and as it is furely as eafy for God \(t o\) make a man of the fublance of a woman as of the dut of the earth, we cannot conceive what fhould have induced any perfon profelling Chiftianity to call it in queftion. The natural generation of Chrif is a grounditfs fancy, which can ferve no purpofe whatever, even to the Unitarians.

Theolory while they improved that of their neighbours. Hence, riore pata-by the time that Chrift came among them, they had fian. made the worl of Gud of none cfeet through a number \(\underbrace{\text { tuan. }}\) of ille fancies whin they inculcated on the people as the trad:itions of the clders; and as they had attached themferes to diferent mafters in philofoplyy, their unauthorifed opinions were of courle different according to the different fources whence they were drawn. '1he peculiar tenets of the Essenes feem to have been a
fpecies of myftic Platorifm. The Phirisees are thought to have derived their origin from a Jewih philofopher of the Peripatetic fchool ; and the refemblance between the doctrines of the Sadouctis and the philofophy of Epicurus has elcaped no man's oblervation.

Though thefe fects maintained mutual communion in public worthip, they abhorred each other's diftinguifhing tene:s; and their wranglings had nearly banifhed from them every fentiment of true religion. They agreed, lowever, in the general expectation of the Mefliah promifed to their fathers; but, unhappily for themfelves, espected him as a great and temporal prince. 'lo this n.iftake leveral circumfances contributed : fome of their prophets had foretold his coming in lofty terms, borrowed from the situal law, and the fplendor of earthiy mona:ch:. The neceflity of caftirg this seil over thofe living oracles we have fhewn in another place (fee Profhmer, No \({ }^{17}\) ). At the time when the predietions were made, the Mofaic fydtem had not run out half its cuurfe, and was therefore not to be expofed to popular contempt by an information that it was only the harih rudiment of one more eafy and perfect. To prevent, however, all millakes in the candid and impartial, when the Meflinh fhould arrive with the credentials of iniraculous powers, other prophets had deferibed him in the cleateft terms as having no form nor comelinces, as a theep dumb before his fhearers, and as a lamb brought to the Raughter; but the lens had fuffered fo much from the Chaldeans, the Grectis, and other wations by whom they had been conquered, and were then fuffering fo much from their mafters the Romans, that they could think of no deliverance greater than that which n:ould refcue their nation from every foreign yoke.

What men earnefty wilh to lie true, they readily believe. Hence that people, lofing fight of the yohe under which they and the whole human race were brought by the fall of Adam, millaking the fenfe of the blefling promifed to all nations through the feed of Abraham, and devoting their whole attention to the mof magnificent defcriptions of the Mefliah"s Lingdom, expected in lim a prince who ftould conquer the Romans, and cilablifh on cath a univerfal monarchy, of which Jerufalem was to be the metropolis.

As our Saviour came for a very different purpofe, the firt object of his miffion was to reclify the nations of his erring counliymen, in order to fit them for the deliverance which they were to obtain through fim. Accordingly, when he entered on his office as a preaclice of xighteoufnefs, he embraced every opportunity of inveighing againtl the falle doctrines taught as traditions of the rders; and by his lenowledge of the fectets of all hearts, he sxpofed the vile hypocrify of thofe who made a gain of godlinefs. 'the Jows had been led, Ly their feparation from the reft of the world, to confider themfelves as the peculiar favourites of Jetorah; and the confequence was, that, contrary to the firit of their

L O G I.
own law, and the explicit doctrines of fome of their pro- Theolony phets, they looked on all other mations with abhorrence, more prat as on people plyfically impure. Thefe prejudices the lianly Chribleffed Jefus laboured to eradicate. Having detired a lowyer, by whom he was temptid, to read that part of the law of Noics which commanded the limelites to love their teeghbours as themfelves, he compelled him, Ly means of a parabulical account of a compaffronato Samaritan, to acknowledge, that under the denomination of reighbour the divine lawgiver had comprehended all mankind as the objects of lore *. The importance* St Luke in which Mofes beld the ritual law, and to which. as \(\times .25-3\). the means of preferving its votaries from the contagion of idolatry, it was jufty intitled, had led the Jerss to confider every ceremony of it as of intrinfic value and perpetual obligation : but Iefus bretight to their recollection Gou's declared preference of mercy to facrifice ; fhewed them that the weightier matters of the law; judgement, mercy, and faith, clamed their refard in the firft place, and its ceremonial obfervances only in the fecond; and taught them, in conformity with the predictions of their own pronhets \(t\), that the hour was \(\dagger\) Jeremian about to come when the worfhip of God thould not xxxi. 3I, be confined to Jerufalem, but that "true worlhippers \&c. Thould everywhere worhip the Father in fpirit and in truth \(\pm . "\)

It heing the defign of Chrif's coming into the world \({ }^{2} 5-27\). to break down the niddle wall of partition between the Jews and Gentiles, and to introduce a now difpenfation of religion which thould unite all mankind as brcthren in the wormip of the true God, and fit them for the enjoyment of heaven; he did not cuntent himfelf with merely refloring the moral part of the Mofaic law to its primitive purity, difencumbered of the corrupt gloffes of the Scribes and Pharifees, but added to it many fpiritual precepts, which, till they were taught by him, had never occurred either to Jew or Gentile. The Hebrew lavgiver had prohibited musder under the penalty of death; but Chrift extended the prohibition to caufilefs anger, and to contcmptuous trealment of our brethren, commanding his followers, as they valued their evel lafting falvation, to forgive their cnemies, and to love all mankind. Adultery uas forbidden by the law of Mofes as a crime of the decpeft dye; but Jefus faid to his dif. ciples," that whofoever looketh on a weman to lutt after her, hath committed adultery with her already in his heart," and is of courfe liable to the Disine vengeance. The les talionis was in force among the Jews, fo that the man who had deprived his neighbour of an eye or a tooth, was to fuffer the lofs of an cye or a tooth himfelf; but this mode of punifment, which inticied blemifb for blemifl, though fuited to the hardnefs of Jewin: hearts, being inconfflent with the mild fpinit of Chrifianity, was abolilhed by our bleffed Lord, who fevercly prolfibited the indulgence of revenge, and commanded his followets to love even their enemies. Perjury has in every civilized nation been juitly confidered as a crime of the lighef atrocity, and the Mofaic law doomed the falfe witnefs to bear the punithment, whatever it might be, which he intended by fwearing falfely to bring on his brother; but the Author of the Clarifian relyion forbade not unly falfe fweaning, lut fwearing at all, cacept on folemn occafions, and when an oath flould be required by legal authority. Sce OAJH.

Py thus reforing the law to its original purity, and

\(n\) which e execu--d the ofce of a rophet. Deut.
houfe of lfrael; but had he not been more than an ordinary propliet, he could not have abrogated the moft trivial ceremony of it, nor even extended the fenfe of any of its moral precepts ; for their great lawgiver had told them, that " the Lord their God would raife up unto thern but one Prophet, like unto him, to whom they fhould hearken \(\ddagger\)." "1hat Prophet was by themfelves underftood to be the Meffiah, whom they expected to tell them all things. It was nectiary therefore that Jefus, as he taught fome new doctrines, and plainly in. dicated that greater changes would foon be introduced, Gould vindicate his claim to that exalted character which alone could authorife him to propofe innovations. This he did in the ampleft manner, by fulfilling prophecies and working miracles (fee Miracle and Prophecy); fo that the unprejudiced part of the people readily acknowledged him to be of a truth "that prophet which mould come into the world-the Son of God, and the King of Ifrael." He did not, however, make any change in the national worfhip, or affume to himfelf the fmalleft civil authority. He had fubmitted to the rite of circumcifion, and ftrictly performed every duty, ceremonial as well as moral, which that covenant made incumbent on other Jews; thus fulfiling all righteoufnefs. Though the religion which he came to propagate was in many refpects contrary to the ritual law, it could not be eftablifhed, or that law abrogated, but in confequence of his death, which the fyltem of facifices was appointed to prefigure; and as his kingdom, which was not of this world, could not commence till after his refurrection, he yielded during the whole courfe of his life a cheerful obedience to the civil magitrate, and wrought a miracle to obtain money to pay the tribute that was exacted of him. Being thus circumftanced, he chofe from the loweft and leaf corrupted of the people certain followers, whom he treated with the moft endearing familiarity for three years, and commiffioned at his departure to promulgate fuch doctrines as, confiftently with the order of the divine difpenfations, he could not perfonally preach himfelf. With thefe men, during the courle of his miniftry on earth, he went about continually doing good, healing the fick, cafting out devils, raifing the dead, reproving vice, preaching righteoufnefs, and inftructing his countrymen, by the moft perfect example which was ever exhibited in the world, of whatfoever things are true, or honeft, or juft, or pure, or lovely, or of good report. The Scribes and Pharifees, however, finding him not that conqueror whom they vainly expected, becoming envious of his reputation among the people, and being filled with rancour againft him for detecting their hypocritical arts, delivered him up to the homan governor, who, though convinced of his innocence, yielded to the popular clamour, and crucifed him between two thieves, as an enemy to Cafar.

Juft before he expired, he faid, It is finifhed, intimaling that the purpofe was now fulfilled for which he had come into the world, and which, as he had formerly told his difciples, "was not to be miniftered unto, but to minitter, and to give his life a ranfom for many \(\| \mid\)." For his blood, as he affured them at the inftitution of the Eucharift, "was to be ftied for the remiftion of fins." That Chrift died voluntarily for us , the juft for the unjuf, and that " there is none other name under heaYol. XX. Part I.

L O G Y.
ven given among nen whereby vie soun be faved," is Theokg? the uniform doctrine of the prophets who forctold his more pecu. coming, of John the Baptift who was his immediate har- liarly Chribinger, and of the apoftles and evangelifts who preached fiar. the gofpel after his afcenfion into heaven. 'Thus Ifaiah 170 fays of the Meftiah *, that " he was wounded for our He voluntranfgrefions, and bruifed for our iniquities; that the tarily ded challifement of our peace was upon him, and that wit for us. his ftripes we are healed; that we had ail like flheep gone liii. aftray, turning every one to his own way, and that the Lord laid on him the iniquity of us all; that he was cut out off out of the land of the living, and flrickert for the tranfgreflion of God's people; that his foul or life was made an offering for fin; and that he bore the fir of many, and made intercelfion for the tranfgreflors." The Baptift, "when he faw Jefus coming unto him, faid to the people, Behold the Lamb of God, which taketh away the fin of the worid ;" plainly intimating that his death was to be a facrifice, fince it was only as a facrifice that the Jews could form any conception of a lamb taking away fin. The epiftles of St Paul are fo full of the doetrine of Chrill's fatisfaction, that it is needlefs to quote particular texts in proof of it. He tells the Romans, that Jefus Chrift was fet forth to be a propitiation through faith in his blood; he was delivered for our of fences, and "raifed again for our juttification; that he died for the ungodly; and that God commendeth his love towards us, in that while we were yet finners Chrift died for us." He affures the Corinthians that Chrif died for all; that they who live fhould not henceforth live unto themfelves, but to him who died for them and rofe again; and that God made him to be fin for us, who knew no fin, that we might be made the righteoufnefs of God in him." He informs the Galatians, that Chrif "gave himfelf for our fins, that he might deliver us from this prefent evil world, according to the will of God and our Father; and that he redeemed us from the curfe of the law, being made a curfe for us." St Peter and St Juhn fpeak the very fame language; the former teaching us, that "Chrift fuffered for us, and bare our fins in his own body on the tree \(\dagger\); the latter, that the \(f\) i Peter blood of Jefus Chrift cleanfeth us from all fin, and that \({ }^{\text {ii. } 21 \text {, and }}\) he is the propitiation for our fins; and not for our fins \({ }^{24}\) only, but alfo for the fins of the whole world \(\ddagger\)." That \(\ddagger\) I John is he came into the world for the purpofe of fuffering, ap-7. ii. 2. pears from his own words: for "s no man (faid he §) ta- § St Jubs. keth my life from me, but I lay it down of myfelf: Ix. 18 . have power to lay it down, and I have power to take it again. This comenandment have I received from my Father." And that he voluntarily laid it down for mankind, is evident from his calling himfelf the Good \({ }_{y}\) Ibia Shepherd, and adding, that "the Good Shepherd gi-ver. in. veth his life for the fheep \(\|\)."

178
That Chrift died for the benefit of the human race, is Different a truth fo apparent from thefe texts, that no man profeffing Chriftianity has hitherto called it in queftion. Very different opinions have been formed indeed concerning the nature and extent of that benefit, and the means by which it is applied; but that the pafion and death of the blefled Jefus were fential parts of his minifry on earhed from has feldom been controverted. That on the crofs he his death made fastaction to his Father for the fins of the is the general belief of Chiftians; but prefumptur men, aiming at being wife bevond what is written, have farted a choufand idle queftions concerning the neceftity 3 B
T.eology of fuch fatisf.ction, and the manner in which it was more pccu- macie. Some limiting the power and mercy of the Omliarly Chriftian.

\section*{\(\underbrace{-}\)} niposent, have dared to affirm that God could not have pardoned man without rectiving full fatisfaction for his offeces; that nothing but the thedding of the bloud of Li:i:ft could make that fatisfaction; that his death was indeed fufficient to atone fur a choufand worlds; that, huwever, he did not die for all mankind, but only fur a chofen few, ordained to eternal life by a fecret decree bitore the foundation of the world; and that the reft ot the race are pafled by, and doomed to eternal perdition, for the glory of God', jufice. Ohhers, convinced by every thing around them that the Creator and Governur of the univeste is a being of infinite benevolence, whote only end in giving li e mult have been to communicate happinefs, have contended, that no atonement whatever could be neceffary to ohtain from him the forgivenefs of fin on lincere repentance; that it is contrary to all our notions of jufice to punith the intrucent for the guilty; and that therefure the death of Chrift, though the effntial part of his miniltry, could not be neceflary, but at the moll experdient.

We enter not into thefe debates. The Scriptures have nowiere feid what God could or could not do ; and on this fubject we can know nothing hut what they have taught us. That "we are reconciled to God by the death of his Son," is the principal ductrine of the New Teffament ; and without prefuming to limit the power, the mercy, or the wifdom, of him who created and fuffains the univerfe, we ftall endeavour to flow that it is a doetrine worthy of all acceptation. In doing this, we fhall fate impartially the opinions which pious men have held refpecting the form or manner in which Chrift by his death made latisfaction to Gud for the fins of the world ; and we hope that our readers will embrace that opinion which fhall appeat to them moff confonant to the \(g\) neral fenfe of facred Scripture.

The frictell adherents to the theological fyftem of Calvin, interpreting literally fuch texts of Scripture as fipak of his being made fin for us, of his bearing our fins in his own body on the tree, and of the Lord's layong on lim the in'q ity of as all, contend, that the fins of the el-et "ere lifted off from them and laid on Chritt by imputation, much in the fame way as they thin \(k\) the fin of Adam is imputed to his pofteri'y "By bearing
the fins of tris leuple (fays Dr Gill *) he took them off from them, and took them upon hemfelf, bearing or carrsing them, as a man bears or carries a buiden on his hhoulders. There was no fin in him inherently, for if there had, he would not have been a fit perfon to make fatisfagiton fur it ; but fin was put upon him by his Divine Father, as the fins of the Ifraelites were put upon the fcape-gnat by Aaron. No creature (continues he) could have done thir; but the Lord hath laid on him, or male to meet un him, the iniquity of us all, net a fi gle iniquity, but a whole mafs and lump of fins cullicted together; and laid as a cummon burden up.on him; cyen the fins of all the eleet of God. 'Whis, harafe of baying fin on Chritt is expreflive of the impuration of it to him; for it was the will of God not to impute the

\section*{L O G Y.}
tranfgrefions of his elect to themfelves, but to Chrift, Theology which was done by an act of his own; for he hath made more pectuhim to be fin for us, that is, by imputation, in which \({ }^{i}\) way we are made the righteoufnefs of God in lim ; that being imputed to us by him as our "fins were to Chrif. The fenfe (fays cur author) is, a cliarge of lin was brought again \(\boldsymbol{\Omega}\) him as the furety of his people. He was numbered with the tranfgrefors; for beaing the fins of many, he was reckoned as if he had been a finner himfelf, fin being imputed to him; and he was dealt with as fuch. Sin being found upon him by inmputation, a demand of fatisfaction for fin was made, ard he anfiwered it to the full. All this was with his own confent. He agreed to have fin laid upon him, and imputed to him, and a charge of it brought againlt him, to which he engaged to be refporifile; yea, he himfelf touk the fins of his people upon him; fo the evangelill Matthew has it, 'He himelf took our infirmities, and bore our ficknefles t.' As he louk the natuse of men, fo he took \(t\) cilu. p. their fins, which made his teth to have the likenffs of finn-wiii. 1\%ful fefb, though it really was not finful. What Carift bore being laid upon him, and imputed to him, were fins of all forts, original and actual; fins of every kind, open and fecret, of heart, lip, and life; all acts of fin committed by his people, for he has redcemed them from all their iniquities; and God, for Chrill's fake, forgives all trefpafies, his blood cleanfes from all fin, and his righteufne's juftifies from all; all being imputed to him as that is to them. Bearing fin fuppofes it to be a burden; and indeed it is a burden too heavy to bear by a fenfible finuer ( E ). When fin is charged home upon the confcience, and a faint groans, being burdened with it, what muft that burden be, and how heavy the lond which Chrill bore, colfiling of all the fins of all the elect from the beginning of the world to the end of it ? and yet he funk not, but flood up under it ; failed not, nor was he difcouraged, being the mighty Gurl, and the Man of God's right hand, made flrong for hin: Etf."

To the Arminians or Remonftrants, this doctrine of \(\mathrm{O}_{\mathrm{bjecta}} \mathrm{I}^{173}\) the imputation of the fins of men to the Son of God ap- to. pears as abfurd as the fimilar doctrine of the imputation of the fin of Adam to his unborn pofterity; and it is certainlv attended with confequences which have alarmed ferious Chriitians of other denominations.

Were it polfible in the nature of things, fays the Arminian, to transfer the guilt of one perfon to another, and to lay it upon him as a burden, it could not be done without violating thofe laws of equity which are eftablifhed in the fcripture and engraven on the human heart. But this is not poffible. To talk of lifting lumps of fin. or transferring them like burdens from the guil'y to the innocent, is to utter jargon, fays he, which has no meaning; and we might with as much propriety fperk of lifting a fcarlet colour fiom a piece of cloth and laving i: on the found of a trumpet, as of literally liftin o the fins of the eleat from then ard laying them on Chrifa. Guilt is feated in the mind; and no man can become a firner but iy an act of solition. If Chrift therefore rally took upon him the fins of his prople, he muft have deliberately formed a wih to have actually
(r.) By the phrafe a fenfil/e finner, the learned author means a fimmer who is not paft fecling, but has a confience alive to the fenfe of remorfe.

Theology committrd all thefe fins; but fuch a wifh, though it ore peciu- would have made himi inherently guilty, and therefore wry Clini- incapable of fatisfying for fin, could not have cancetled deeds that were done before he was born, or have male thofe innocent who really had been firmers. A deed once done cannot be undone; a volition whieh has been formed cannot be annihilated. By fincere repentance, the hatitual difipoitions are indced changed, and thofe who have been firners become objects of mercy; but no power can recal the hours that are paft, or make thofe actions which have been performed to have been not performed. To remove guile from the finner and lay it on the innocent may therefiore be fifely pronounced imporfible even for O-nripotence itfelf, for it implies that a thing may be and not be at the fame inflant of time; and the doatrine which teaches that this removal was made from the eleet to Chri', is an imagination of yefterday, which has no countenance from fcripture, and is contraty to the eftablitied conlitutuion of things. Thofe whlo inagine that guilt may be propagated from father to fon, have fomething like an argument to urge for the imputation of Adam's fin to his numberlefs pofterity; for all the men and women who have by ordinary gencration been introduced into the world, have undoubtedly derived theit nature from the primeval pair. But Chrif did not derive his nature from the elect, that their fins fliould be communicated to him ; nor, as he was miraculoufly conceived by the Holy Ghof, can we attibute to him any degree of that taint which is fuppofed to have been conveyed from Adam to all the other generations of men.
Nolhing more, therefore, can be meant by "Chril's hich they being made fin for uc," and "bearing our fins in his e built ciplained. own body on the tree," or by God's "laying upon him the iniquity of us all," than that by his fufferings we are freed from the purnifhment of our fins; it being in frcipture a conmon figure of fpeech, as even Dr Gill has fome where acknowledged, to denote by the word fin the confequences of fin. That this figure is ufed in thole texts from which he infers that Chriit took the fins of the elect on himfelf, is evident from the verfe which he quotes from the gofpel of St Mathew ; in whiel it is faid, that " himfelf took our infirmities and bore our fickneffes." The fickneffes and infrmities there alluded to are the leprofy, the palfy, the fever, and demoniacal poffeffions: but when our bleffed Lord cured thele difeafes, furely he did not by his omnipotent word lift them off from the patients and take them on himfelf. 万o as actually to become a leper, a paralytic, and a demonic, or even to be reckoned as fuch either by the mulititude, or by the priefls, whofe duty it was to take cognizance of every illegal uncleannefs \(*\). And if his invelerate enemies did not impute to him the lcprofy when he removed that plague from othcre, why thould it be fuppofed that kis own Father, to whom he was at all times well-pleafing, imputed to hin the fins of which, by his fufferings, he removed the punifhment from thofe who were guilty? To impute to a perfon any a ation, whether virtuous or vieious, which he did not perform, can procced only from ignorance, or malice, or partiality ; but God is no refpecter of perfions, and from ignorance and malice he is removed to an infinite diftance. It is indeed an undoubted truth, that "the Lord Jefus, by his perfect obedieñce and facrifice of himelf, which he througlh the cternal fpirit once offered up unto God, hath fully
fatisfied the juftice of his Father; and purchafed not Theo ary only reconciliatiun, but an ceverlatling inh, rtance in the inore p. .t. kingdom of heaven for all thofe whom the Futher hath liady Cluigiven himf;" but that he actually took on himfelf the fans. fins of mankind, of that thole fins were imp uted to him I contoflun by God, who punithed him as a perfon whom lie collf. of Faith, dered as guilty, is a doefrine equally injurious to the thap. wiitio juftice of the Father and to the iminaculate puity of the Son.
The earnefnefs with which this doat tine was inculca. They iture ted by fome of the carlieft reformers, and the impolibi prabainy liy of admitting it, which every retlcting ald urpre contributey judiced mind mult feel, was probably one of the cautes socinus which drove Socinus and his followers to the othct ex-dery than treme of denying Chrift's fatisfaction altogether, and doctrine of confidering his death as nothing more than that of an rolempordinary martyr, permitted for the purpofe of attefting the truth of his doetrine, and paving the woy for his reliurrection, to confirm the great promife of immortility. Aceording to thefe men, forgivencfo is freely difpenfod to thole who repent, by the effential goodncfs of God, without regard to the merit or fufferings of any other being; and the gofpel is faid to fave from fin, becaure it is the molt per ect leffon of righteouficefs. The great objection of Crellius to the doctrine of the fatis faetion is, that it is a hinderaice to piety; for if Chrita has paid the whole debt, he thinks that he muft have nothing to do, as nothing more can be required of us. And if it were indeed true that our fins are imputed to Chrift, and his righteoufners imputed to us, this objection wo:ld be infurmountable ; for God could not jutily exact a double punilliment for the fame fin, or inthit mifery on thofe to whom he imputes perfeet righteoufnefs. But as to this imaginary transfering of virtues and vices from one perfon to another, the Cicriptures give no countenance; fo they nowhere call the death of Chrift a fatifaction for the fins of men. The term has indeed been long in ufe among divines, and when properly explained it may be retained without any danger ; but in treating of this fuhjeca, it would perhaps be more prudent to reltrio ourfelves to the ufe of fcipture language, as the word fatiifaction carries in it the ideas of a delot paid and accepted; whereas it is faid by St Paul, that "eternal life is the gift of God througl Jefus Chritt our Lord; and that we are justified freely hy his grace through the redenption that is in Jefus Clinift, whom God hath fet forth to be a propitiation through faith in his blood."
To clear up this matter, and at'ain adequate notions of The deatin redemption and juffification, it will be neceffiry to look of Chrill back to the fall of our firt parents; for the great pur- -tented to pofe for which Chritt was promifed, and for which he what they came into the world, was, by bruifing the head of the had loft in ferpent, to reftore mankind to the inheritance which they liad loft throug't the tranfgreffion of Adam. This is apparent not only from the original promife made to the woman, but alfo from different palazges in the epilles of St Paul, who exprefly calls Chint the fecond Adam, and fays, that, "as by the offence of one, judgement eame upon all men to condemration; even fo by the righteoufnefs of one, the free.gift came upon all men unto jutfification of lipe;" that "as by one man's difobedience many were made firners, fo by the obedience of one fhall many be made righteous;" and that, "as in Adam all die, even fo in Chrilt llall all be madé

Theolont alive.," Hence it was,that John the Baptift, when he more percu- faw Jefus coming to bim, Caid to his difciples \(\dagger\), "Behold laarly Chri- the Lamb of God which taketh away, not the fins, but
fuan. \(\underbrace{}_{\text {man. the fiz of the world," evidently alluding to Adam's fin }}\) + Ch. i. ver.and its confequences, fince no other fin was ever com23. mitted of which the confequences extend to the whole world.

This being the cafe, it is undeniable, that whatever we loft in the firit Aday, is reffored to us by the fecond; and therefore they who believe that the punihment denounced againft eating the forbidden fruit was death curporat, \(\sqrt{p}\) i. rilual, and eternal, muft believe that we are redecmed from all thefe by Chrilt; who having " appeared once in the end of the world to put away fin by the facrifice of * Heb. ix. himfelf, died for us, that whether we wake or fleep, we 26. I Thell. Thould live together with him *" If the image of God
r. 10.
+ Titus ii. 3.
\(\ddagger\) Rom. v. in which man was created was loft by the breach of the firlt covenant, it is more than reftored to us " by the Mediator of a better covenant, which is eftablifhed upon better promifes;" if by the fin of Adam we were utterly indifoled, difabled, and made oppofite to all that is fipiritually good, and wholly inclined to all evil, and that continually, we are freed fiom that dreadful curle by " our Saviour Jefus Chrift, who gave himfelf for us, that he might redeen us from all iniquity, and purify to himfelf a peculiar people zealous of good workst;" and if for our thare in the firf tranfgreffion we be juftly liable to all punithments in this world and in that which is to come, the apofle affures us, that "when we were enemies we were reconciled to God by the death of his Son, becaufe that God was in Chrift reconciling the world to himfelf, not imputing their trefpafles unto them \(\ddagger\)." As Jefus is "the Lamb flain in the divine decree from the foundation of the world," thefe beneficial confequences of his death have been extended by a retrofpective view to all in every age whofe names are written in the book of life, though it is abfurd to fuppofe that he literally took their fins upon him, and impious to imagine that he fuffered under the imputation of fin.
Such is the general doctrine of redemption, as it is taught by the more moderate Calvinilts and more moderate Remonftrants ; for moderate Chriftians of all denominatiuns, though they exprefs themfelves differently, bave nearly the fame views of the fundamental articles of their common faith. It muft not, however, be con- cealed, that many divines of great learning and piety contend Atrenuoufly againdt the doetrine of vicarious atonement for actual tranfgrefions of the moral law. Thefe are the more zealous A rminians, who deny that we iuherit any mortal taint or intellectal weaknefs from our firf parents, whom they believe never to have been in a flate of greater perfection than many of their pofte-
\(17^{3}\) rity who are called degenerate. According to them, we Doctrine of loft nothing by the fall of Adam but our title to eter-
nal life or perpetual exiftence, tegether with thofe graces of the Holy Spirit which were beftowed under the firf covenant to train mankind for the fociety of heaven; and as eternal life and fupernatural grace conflituted one free.gift, not due to the nature of man, or indeed of any created leeing, they might, when forfeited, he refared by any means or on any condition which fhould feem expedient to the all-wife Donor. Thefe means, and that condition, human reafon cannot indeed difcover; but it feems very fit that they flould be different
from the means by whicin moral agents under the law Theology of nature can fecure to themfelves the favour of their more pecuCreator, or recover it when occafionally lolt. The iiarly Chrifornier depends on arbitrary will and pleafure, or at leaft on no other principles difcoverable by us; while the latter ariferh out of the ellablifhed and well-known conflutution of things. Thus moral virtue, comprehending piety, was the condition of that favour and protection which man, in his original ftate, could claim from his Maker; but obedience to a pofitive command was the condition of the free gift of immortality conferred on Adam on his introduction into paradife. The claim arifing from the relation betwcen the creature and the Creator is indifloluble, becaufe that relation cannot be diffolved: fo that the man who, by a tranfgreffion of the moral law has forfeited the favour of God, may rea. fonably hope to recover it by fincere repentance and a return to bis duty : and nothing but fuch repentance and reformation can recover it; becaufe, in a moral agent, nothing can be agreeable to God but moral difpofitions, which cannot be transferred from one perfon to another, and for the want of which nothing can atone. Our virtues are not required nor our vices prohibited, as if the one could profit and the other injure him who created us; for "is it any plenfure to the A1mighty that we are righteous? or is it gain to him that we make our ways perfect ? Will he reprove us for fear of us?" No! He commands us to be virtuous, and forbids us to be vicious, only becaufe virtue is neseffay to our own happinefs, and vice productive of everlating mifery.

Were an immoral man to be introduced into the fociety of angels and juft men made perfect, he would not experience in that fociety what we are taught to expect from the joys of heaven; becaufe to fuch joys his acquired difpofitions would be wholly repugnant. Nor could the fufferings of any perfon whatever, or the imputation of any extrinfic righteoufnefs, make that mind which had long been immerfed in the groffell fenfuality relifin the intellectual and refined enjoyments of heaven; or the man who had been the habitual llave of envy, malice, and duplicity, a fit inhabitant of that place where all are actuated by mutual love. On the other hand, fay the divines whofe doetrine we are now detailing, it is impofible to fuppofe that the Father of mercies, who knows whereof we are made, thould have doomed to eternal mifery any moral agent who had laboured through life to ferve him in fincenity and in truth; or that any atonement could be neceflary to redeem from the pains of bell the man whofe pious and virtuous difpofitions have through penitence and prayer become fuited to the fociety of heaven. Unfinning perfection never was nor ever could be expected in man. He is brought into the world free indeed from vice, but equally deffitutc of virtue; and the great bufinefs of his life is to guard his mind from being polluted by the former, and to acquire difpofitions habitually leading to the practice of the latter. Till thefe habits be fairly formed, it fcems impoffible that he fhould not fometimes deviate from the paths of retitude, and thereby incur a temporary forfeiture of the divine favour ; but the very conflitution of his mind, and the purpofe for which lie is piaced in a flate of probation, hlow that the divine favour thus forfeited can be recoverd only by sepentance and reformation.

}

That Chritt
lied to releem us rom the wower of he grave. man has no natural claim. When the condition is bruken on whicl fuch a gilt was heflowed, repentance can be of no avail; it inuit be either irrecoverably loft, or reftored by the mere good pleafurc of the giver. Immortality or perpetual exiltence is a gift which upon certain terms was freely beftowed upon the human race, and forfeited by the tranfgreftion of their firf parent violating thofe terms. It was reflored by the free grace of God, who was pleafed to ordain, that "fince by man came death, by man thould alfo come the refurrection of the dead; for as in Adam all die, even fo in Chrift hall all be made alive. "Hence the apollte, writing to the Romans of the benefits of being the children of God, and joint-heirs with Chrilt, fummeth up thofe benefits with refurrection from the dead." For the creature, i. e. mankind, was made fubject (fays : Rom. viii. he *.) to vanity or death, not willingly, but by reafon of him who hath fubjected the fame in hope: becaufe the creature itfelf allo thall be delivered from the bondage of corruption into the glorious liberty of the chitdren of Gud. For we know that the whole creation groaneth, and travaileth in pain together until now: and not only they, but ourfeloes alfo, who have the fird fruits of the firit, even we ourfelves groan within ourfelves, waiting for the adoption, viz, the redemption of our body ( F ). That this the redcmption of our body is the confequence of the facrifice of Chrif, is taught in the moft explicit terms in the epillle to the Hebrews; of which the infpired author informs us, that " forafmuch as the children are partakers of llefli and blood, he alfo himfelf likewife took part of the fame; that through death he might dellroy him that had the power of death, that is the devil; and deliver them, who through fear of death were all their lifetime fubject to bondage *.". A vicarious atonement made with this view, the divines, whofe theory we are now confidering, acknowledge to be perfectly rational and confiltent with the ftrictelt juftice. "The law of nature (fay they \(t\) ) allows not of vicarious atonements; but ordains that the man who tranfgreffeth fhall himfelf bear the punihment of his iniquity; a punilhment which no man deferves for the faults of another, unlefs he be partaker of the guilt by joining in the tranfgreffion." And in proof of this their opinion, they appeal to the words of God himfelf, declaring to Mofes,-"Whofoever hath finned againft me, him will I blot out of my book \(\ddagger\)." But when the free gift of immortality was loft, it was with great wifdom, fay they, that God reftored it through a Mediator who flould make atonement by his blood for the breach of the frit covenant; fince fuch a mediation implies that the gift reftored is merely of grace, to the attaimment of which man could no further co-operate than by his hopes and wifles.

To this view of redemption, and indeed to every view

L 0 G \(Y\).
of it which we have yet taken, in objection fortes itfelf Theology upon the mind. Throughout the New Teflament Life more preuAND MMMORTALTTY are conlidered as a friek gift, and liarly Chri called \(f_{0}\) in exprefs words by St Paul \(*\). To the fcheme \(\underbrace{\text { Jtian. }}\) under confideration it is elfential to confider them as * Rom. \(\downarrow\). fuch; and yet we know that a large price was paid for \(15^{\circ}\)
them, as S't Pau! likewife acknowledges, when he twice tells the Corinthians that they were bought with a 1 cor. vi. price \(\dagger\).
"To clear up this matter (fays Bifhop Warburton), Obviated. and to reconcile the apoftle to himfelf, who certainly was not defective either in matural fenfe or artificial logic, let us once again remind the reader, that life and inmmortality beftowed on Adam in paradife was a FREE gift, as appears from the hiftory of his creation. As a free gift, it was taken back by the Donor when Adam fell ; to which refumption our original natural rights are not fubject, fince natural religion teacheth, that fincere repentance alone will reinflate us in the poffefion of thofe rights which our crimes had fufpended. So that when this free gift, forfeited by the frifl Adam, was recovered by the fecond, its nature continuing the fame, it muft fill remain a free gift-a gift to which man, by and at his creation had no claim; a gift which natural religion did not beflow. But if mifled by meafuring this revented mystery of human redemption by the fcant idea of human tranfactions, where a free gifo and purchafed benefit are commonly oppofed to one another, yet even here we may be able to fet ourfelves right, fince, with regard to man, the character of a free gift remains to immortality refiored. For the price paid by forfeited man was not paid by him, but by a Redeemer of divine extraction, who was pleafed, by participating of man's nature, to ftand in his flead. Hence the facred writers feeing, in this cafe, the perfe? agreement between a FREE GIFT and a PURCHASED POSSES- \(\ddagger\) Div. Leg sron, call it fometirpes by the one and fometimes by book g. cho the other name \(\ddagger\)."
A reftoration to life and immortality from that flate The death of unconfcioufnefs or extinction, to which all mankind of Chrift were doomed in confequence of the fall, is that great an atonefalvation which we have obtained through the blood of ment only our Redeemer; and according to the theologians whofe for actual theory we are now confidering, it was the only thing in firm the divine intention when the promife was given to the firft mother that the feed of the woman thould bruife head of the ferpent. But though they contend that the death of Chrint does not operate direcfly as an atonement for the nivual fins of men, they admit that it does fo indirettly and by neceffary confequence, fince it gives opportunities for repentance and newnefs of life, which under the firf covenant they did not enjoy. Had a man under that covenant tranfgrefled any moral precept, he would have forfeited the favour of his God, and either been fubjected to punifhment or to a long courfe of re: pentance; but fuppofing the efficacy of repentance under
(r) That by the words creature and creation the apofle here means all mankind, and by vanity and corruption, death, the reader will find proved by Dr Whitby, in his note on the place, with a ftrength of argument which, cannot be flaken; and that the whole creation, the Gentiles as well as the Jews, groaned and travailed in pain to gether under the apprehenfion of death, is apparent from the writings of Cicero, who always feems doubtful whe-; ther death be a good or an evil; and from the lamentation of Hezekiah, when defised by the prophet to fet his: koufe in order becaufe he fhould die and not live..

Theology der the law of nature to be what they fuppofe it to be, more pecu- he might before it was perfected hase lof his exiftence liarly Chri- by the eating of the forbidden fruit; and thus his peni-
nian. than. tence or punthment have ended in everlatting death. This can never be the iflue of things under the new covenant, which, by the death of Chrilt, lecures immortality to man, and gives to him opportunities, as long as he fhall be in a Itate of probation, of recovering the divine favour when forfeited, whether by a noral uanfgreffion or a temporary violation of the peculiar condition of the covenant. Hence they admit the truh of the apolle's doctrine, that we are gainers by the fall of Adam and the redemption wrought by Chrilt ; which whll appear when we come to confider their notions of jultification. In the nican time it may be proper to obferve, that they conlider it as no fmall confirmation of their opinion, that it tends to fut an end to the long agitared dulputes concerning the extent of redemption, and to reconcile paliages of fcripture which, on the common'y received theories both of Calvinitts and Arminians, feem to be at variance with each other.

183
According to the Lat vinits
Chrit died unly for the elect.
a curnfefren of Faith of the Ceurc) of Scotlente, cll. uil. §o
+ Gill's
liody of
Drzintit,
sol. ii. boot S. ch. 3 .

It is well known to be one of the fundamental doctrines of the Calvinillic fclool, that " none are redecmed by Chritt, effectually called, juflified, adopted, la chified, and faved, but the elect oriy *;" and if the notions of redemption, which, in the end of the 1 pth century, were very genetally embraced, be admitted as jult, it will not be eafy to overturn the arguments by which that doctine is fupported. Such of them as are connected with the great queftion of election and reprobation, and enter into the decifion of \(i t\), we have fated in another place (fee Predestination, \(\mathrm{N}^{\circ} \mathrm{I}_{4}\) ) ; but it is farther argued \(\dagger\), that the doctrme ot univerfal redemption reflects on the widdom, the juttice, and the power of God, and robs him of his gloyy.

The friptures aflure us that all men ftall not be faved; but how can this be, if Chrill died for all, and the fcheme of falvation by his death was formed by infinite wildom? The Arminians indeed fay, that thole who fail of falvation, fail through their own fault in not performing the conditions required of them; but God cither knew or knew not that fuch men would not perform t. ofe conditions. If he knew it not, his knowledge is limited; if he did know it, where was his wifdom in providing a fcheme of redemption for men to whom he was aware that it would be of no benefit? "God, we are told, is rightcous in all his ways, and holy in all his works;" but there is no righteoufnefs in making Chint bear the fins of all men, and fuffer the puniflment due to them, if any one of thofe men thall be afterwards punihed everlaftingly. It Chrift has alrealy paid the debts of the whole world, it cannot be jull to call a fingle inhahitant of the whole world into the prifon of hell, there to be dctained till he thall again have paid the uttermoll farthing. "The Lord's hand is not ftortened that it caunot fase;" for he is and always will be the fame Almighty power that he was from etemity: but if by the divine decree Chrift died for all men, and yet all men faall not be faved, it would appear that man is mightier than his Maker! The ultimate end of God in the redemption of man is admitted to have been lisown glory; but if any individual of thic human race, who was redcemed by Chrift, fhatl not be faverl. God will fo far lofe his end, and he deprived of his glory. Ior, if this were the cafe, where
I. \(O G \quad{ }^{r}\).
would be the glory of God the Father in forming a I hewiogy fcheme which, with refpect to multitudes, dues not fuc- more pesu. ceed ? and where would be the glosy of the Son of liany hin God, the ledeemer, in working out the redemption of men who are jet not to be faved by him? and where would be the glory of the fpnit of God, if redemption were not by him ctiectually afplied to every individual for whom it was wrought? By fuch arguments as thefe do the Calvinills oppole the fchene of univerlal reden:ptiun, and contend that Chrift died only for the elcet, or fuch as thall be placed on his right hand at the day of judgement. This notion of a limited redemption, as they think it more worthy of the fovereignty of Cod, they believe to be taught by our Saviour himlelf, when he laith *, "All that the Father givelh me flatl come to me; and him that cometh to me, I will in nowile John wio calt out. For I came down from heaven, not to do mine own will, but the will of him that fent me. And this is the Father's will who hath fent me, that of all which he hath given me I fhould lole nothing, but thould raife it up again at the lall day."

The Arminians, on the oiter hard, confend, that it According is impious to limit the effects of Chrilt's death to a cho- to the Ar* fen few, fince it appears from fcripture, that by the de- minians tee cree aad intention of his Father he tafted death for med m. every man, that all, without exception, might through him obtain remifion of their fins. Thus our Lord himfelf told Nicodenus \(t\), that "s as Mofes lifted up the + John iii. ferpent in the wildernefs, even fo mull the Son of Man 14-18. be lifted up; that whofoever believeth in him, fheold not perifh, tut have everlatting life. For God fo loved the zeord, that he gave his only begotten Son, that wholoever believeth in him fhould not perith, but have ererlatting life. For God fent not his Son into the morld to condemn the world, but that the world through lim might be faved." In perfect conformity with the docirine of his divine Matter, St Pasul teaches \(\ddagger\), that \(\ddagger 2\) Cor. ro "Chilt died for all; that God was in Chift reconcil. ing the world to himfelf, not imputing their trefpafies \({ }^{\text {I }} 1\) in?, ii. unto them ;" that "he will have \(a / l\) men to be faved, 4-7. Het, and to come unto the knoxledge of the truth;" that "Chrift gave himelf a ranfom for all;" and that "Jefus was made a little lower than the angels, that by the grace of God he fhould talte death for every man." The very fame thing is taught by St Peter and St John, when the former fays \&, that " the Lord is not willing \& a Petcr that any fhould perith, but that all thould come to re-iii. 9.
rentance;" and the latter \(\|\), that " Jefus Chrilt the righteous is the propitiation for our fins; and not for \({ }_{2}\) our's only, but for the whole world."

On thefe texts, without any commentary, the Arminians are willing to reft their doctrine of univerfal redemption; though they think that a very flrong additional argument for its truth arifes from the numberlefs abfurdities which flow from the contiary opinion. Thus, fay they *, the apoltles were commanded by our Savi- I.jmour +10 "go into all the world and preach the gofpeliorch"s to every crature," and all who hear it preached are Theologia required to believe it: but no man, as the Calvinifts Ling. Imand themfelves confefs, can believe the gofpel as a Chriftian, bouk to without belicving that Chrift dicd for him; and there-ch. 3 . fore, if it be true that Chrill died only for the clect, at Si Mark great part of mankind are required to believe a lic, and \({ }^{x i .15,16}\) a fallity is made the olject of divine faith! \(\Delta\) gain, if Chrift did not die for all, then no man can be furc that
[heology he is bound to believe in Chrit when preaclacd to him ; ore pern- nor can any man be jully condemned fur infidelity: rrly Chri- which is not only ablurd in itfelf, but directly contrary \(\overbrace{\text { do what we are taught isy un blefled Loid, who affures }}\) to whe St John us *, that unbelief is the caule of condemmation. Laftly, 1. 19, 19, if Chatit died not for alt, then is it certain that he canad 36. not claim duminion ourer alt in eonfequence of his death Rom. xiv. and refurrefion; but S \(P\) ul fige ex, mevly t, that "to this cnd Coritit both died, ind rofe, and revived, that he might be the Lord botn of t.re diad and living." The Arminians acknowledge, that though Chrift died for all, there are many who will not be laved; for, fay

Hellis they \(\ddagger\), the death of Carilt did not literally pay the debts incurred by funers, but only obtained for them the gracious covenant of the golpel, by which all who believe in him, and fincerely endeavour to work out their ofrn falvation with fear and crembling, are entitled to forgivenefs of tins and etermal life.

\section*{ifficultics Such is the flate of this controverfy as it was agitated} moved by between the Calvinits and Arminians of the 1 yh cenie modern tury; but the prefent leaders of this latter fchool are .rminians. of opinion, that it never could have been itarted, had not both parties miftaken the purpole for which Chritt died. It is not conceivable, fay they, that any thing for which the etcrnal Son of God took upon him human niture, and in that nature fulfered a cruel and ignominious death, thall not be fully accomplifhed; and therefore, if in the divine intention he died to make atonemeat for the fins of man actual as well as original, we inut of nec fliy conclude, that thofe for whom he died hall certainly be faved. Yet we learn from fripture that many thall go away into everlating punifhment, though the fame fcripture repeatedly affures us that Chrilt gave his life a ranrom for all, and that he is the propitiation for the whole wr/d. 'To reconcile thefe different paffages of feripture is impoffible, if we fuppofe that he laid doan his life to atone for the a fuat tranfgrefions of men; but if the dired purpofe of the Godhead in forming this Itupendous plan of redemption was, that the death of Chrilt flould be the ranfom of all from the grave or utter extinction, evely dificulty is removed; for we know that all, the wicked as well as the righteous, fhall through him be raifed to life at the laft day. That this was the purpofe for which he died, they think apparent from the very words quoted by the Calvinifts to prove that redemption was not univerfal; for he declares that it was his Fathen's will, "that of all which had been given him he fhould lofe nothins," not that he thould fave it all from fuure punifoment, but only that he " Chould raife it up at the lat day." When St John calls him a propitiation for our fins, Which, as we have feen, the divines whofe doetrine we are now flating hold him to be indirectly, he does not add, as in our tranflation, for the fins of the whole world, but age shou sou xogreou, for the whole world, which, by his death, he redeemed from that vanity and corruption under which, according to St Paul, it had groane! from the fall till the preaching of the gofpel. Hence it is that our bleffed Lord calis himfelf "the refurrection and the life," and always promifes to thofe who thould believe in him that though they were dead, yet fhould they live, and that he wonld raife them up at the laft day.

Among thefe various oninions refpecting the deftination of the death of Chrift, it belongs not to us to dz-

L O G Y.
cide. The ferious reader, divening himfelf of prejurlice Thectosy in davour of the lyftem in which he has been educated, more p: uwill fearch the foiptures, and adopt the theory wis ciarly Chrilie flall find mont explicitly taught ita that facred vo- letar. Jume; but as in every fyftem it is adnuitted, that one 16 purpufe for which Chrit died was to redeem mankudone purfrom the everlating power of the grave, and bring topmit :or light life and immortality, it is of the utmorl impor an es his hat to know whether that purpole has been fulliy attained. Chars dech Death we fee ttill triumphing over all the generationsbrm to of men; and as the leriptures give us no hopes of being \({ }^{2}\) hit ite refcued from its dominion but through the modium of a ared nmatr refurrection, fome fentible evidence leens neccflary to \({ }^{\text {taily. }}\) evince that a general refurrection thall actually take place. This we are promifed as one great benefit purchafed for us by the fulferings of Chrift lacrified on the crofs. And fance the price has been paid, and paid thus vifibly, the nature of the covenant requires that the benetit hould be as wifhly enjoyed by the perfon whofe fufferings obtained it for his brethren. "If the Redeemer himfelf had not been feen to enjoy the fruits of the redemption procured, what hopes could have remained for the relt of mankind? Wrould not the natural conclufion have been, that the expedient of redtmpti, \(n\), by the death and facrifice of Jefus, had proved ineifectual ?" This is the conclufion which St Paul laindelf draws: "It Chrit be not rifen ( fays he *), then is our * I Cor. preaching vain, and your faith is alfo vain; ye are yet xy. \(1_{2}-23^{\circ}\) in your fins. Then they allo, who are fallen alleep in Chritt, are perifhed- \(\alpha \pi \omega \lambda o n\)-are loit, as if they had never exilied. But now (adds he) is Chritt rifen from the dead, and become the firt fruits of them that flepi. For fince by man came death, by man came alfo the \(r e\) furrection of the dead : For as in Adam all die, even ro in Chrilt thall alt be made alive."-So necelf tily ronnected, in the opinion of the apofle, is the refurrection of Cirritt with the very effence of Chrithanity + .

We have in another place (fee Resurrection, fravize \(\mathrm{N}^{0}\) 50.) Ilated luch arguments for the truth of this fun- \(m\) m un the damental article of our common faith, as muft carry fefurnece conviction to every mind capable of ellimating the force of evidence; we thall not here refume the fubjest.

Archbithop King has fuppofed \(\ddagger\), that the human will \(\ddagger\) origi of is a faculty diftinct from the underftanding and the appe- Ewil, 4 th tites; that activity is eflential to it; and that previous edit. ch. vo to an election formed, it is equally indifferent to ail ob- iect. 3. and jects. He thence infers, that a man may choofe, and 4 . even take delight in, what is not naturally agreeable to any of his appetites; becaufe when the choice is made, a relation is formed between the will and the object of choice, which, from being originally indifferent. now becomes a favourite object. But neither his Grace, nor any other afferter of human liberty, has ever affirmed or fuppofed, that any man or hody of men could deliberately choofe evil for its own fake, or enter zcaloully upon a tedious and difficul enterprife. from which no good could polmily arife, and fro nthich unmied mifery was clearly forefeen as the necefary rcfult of every Aip of the progrefs. Such, hovever, mult have hern the choice and the concluct of t'e apoftes, when they refolved to preach a new religion founded on the refurrection of Jefus, if they did not certai dy know that Jefus had tiren from the dead. And this conduet muft have been adopted, and, in oppofition to erery molize which can influence the human mind, have been pere-

Theology vered in by a great number of men and women, without mere pect- the fmallelt contradiction having ever appeared in the Larly ChriGỉar. various teltimonies, which at different times, and under the cruelleft tortures, they all gave to a variety of circumftances, of which not one had its foundation in truth. He who can admit this fuppofition, will not furely object to the incredibility of miracles. The refurrection of a man from the dead is an event fo different indeed from the common courfe of things, that nothing but the molt complete evidence can make it an object of rational belief; but as the refurrection of Jefus has always been faid to have had God for its Author, it is an effect which does not exceed the power of the caufe affigned, and is therefore an event poffible in itfelf and capablc of proof. It is a deviation from the laws of nature, but it is not contradictory to any one of thofe laws.

That a grcat number of men and women flould deliberately form a plan of ruin and mifery to themfelves, without a profpect of the fnalleft advantage either in this world or in the next, is as different from the common courfe of things as the refurrection from the dead; and therefore in itfelf at leaft as great a miracle: but that they fhould perfift in profecuting this plan in the midf of tornents; that they flould fpread themfelves over the whole world, and everywhere publifh a number of falfehoods, without any one of them contradicting the reft ; that truth mould never efeape them either in an unguarded moment, or when lingering on the rack, and yet that all their lies fhould be in perfect agreement with each other; that they fould every one of them court fufferings for a perfon whom they knew to be an impoftor; that not one of the number-not even a fingle woman-fhould have fo much compafion for a fellowcreature, as to refcue him from the flames by confelling a truth which could injure nobody-not even the fuffering deceivers themfelves;-all this is not only different from the common courfe of things, but directly contrary to the moft known laws of nature, and is therefore not miraculous, but may be pronounced impoffible. Yet this impoffibility we muft admit, or acknowledge, that as Chrit died for our fins, according to the Scriptures, and was buried; fo he rofe again the third day according to the Scriptures; that he was feen of Cephas, then of the twelve ; after that of above five hundred brethren at once; after that of James; then of all the apoftles; and that he was laft of all feen of St Paul *, who was converted by the vifion to preach. the faith which till then he had perfecuted.

Thus are we affured, that "thofe who have fallen afleep in Chritt are not lof, fince he is rifen from the dead, and become the firft fruits of them that flept. For fince by man came death, by men came alfo the refurrection of the dead. For as in Adam all die, even fo in Chrift Aall all be made alive. But every man in his own order: Chrift the firt-fruits, afterwards they that are Chrift's at his coming; for all that are in the graves fhall hear his voice, and thall come forth; they that have done good unto the refurrection of life, and they that have done evil to the refurrection of damna+1 Cor. tion + ."
xv. 20-24. Our hleffed Lord having converfed familiarly with and St John the eleven apoftles for forty days after his refurrection, จ. 28, 29 .
- Cor .
xv. 3-9.

Hence we

\section*{are aflured} of our own refurrection.
dom of God; having extended their authonity as lis
minifters, by giving them a commiftion to teach all na- Theology tions, and make them his difciples, by baptizing them in the name of the Father, and of the Son, and of the Holy Gholt ; and having promifed them power from on high to enable them to difcharge the duties of fo laborious an office-led them out as far as Bethany, that they might be witnefles of his afcenfion into heaven. "When they therefore were come together, they anked of him, faying, Lord, wilt thou at this time reftore again the kingdom to Ifrael? And he faid, it is not for you to know the times and the feafons, which the Father hath put in his own power. But ye fhall receive power after that the Holy Ghof is come upon you; and ye flall be witneffes unto me, both in Jerufalem, and in all Judea, and in Samaria, and unto the uttermoft parts of the earth. But tarry ye in the city of Ierulalem, until ye be endued with power from on high; and he lift up his hands and bleffed them; and it came to pafs while he bleffed them, he was parted from them, and a cloud received him out of their fight. And while they looked ftedfaftly towards heaven, as he went up, behold, two men food by them in white apparel; who alfo faid, ye men of Galilee, why ftand ye gazing up into heaven? This fame Jefus, who is taken up * St Luks from you into heaven, thall fo come, in like manner as xxiv. \(45-\) ye have feen him go into heaven. And they wor- 53 and flipped him, and returned to Jerufalem with great Actsi. \(6-\) joy *."

That our bleffed Lord afcended into heaven, will Proofs of fcarcely be denied in the prefent age by any one who Chrift's afe admits that he rofe from the dead. The afcenfion wasconfion. indeed the natural confequence of the refurrection; for we cannot fuppofe that a man would be calied back from the grave to live for ever in a world where all other men fall in fucceflion a prey to death. The purpofe for which he died was to recover for the defcendants of Adam every privilege which they had forfeited through his tranfgreffion; and if, as has been generally believed, mankind were by the terms of the firt covenant to enjoy eternal life in heaven, fome proof was neceflary that Chrift by his death and refurrection had opened the kingdom of heaven to all faithful obfervers of the terms of the fecond. Hence it was prophefied \(+t+\mathrm{Pf}\). Iswis of the Meffiah, in whom all the nations of the earth 18. cx. 1. were to be bleffed, that "he fhould afcend on high, Micah ii lead captivity captive, and fit on the right hand of God \({ }^{13}\) until his enemies thould be made his footilool." It was therefore of the greateft importance to the apoftles to have fufficient proof of their Mafter's exaltation to the right hand of the Majefty on high ; for otherwife they could neither have looked for an entrance into heaven themfelves, by a new and living way, as the author of the epiftle to the Hebrews expreffes it, nor have preached Jefus as the Meffiah promifed to their fathers, fince they could not have known that in him thefe prophecies were fulfilled. But the proof vouchfafed them was the molt complete that the nature of the thing would bear. The fpectators of the afcenfion were many; for, according to the hiftory of St Luke \(\ddagger\), thofe who returned \(\ddagger\) Ams \(i\) from the Mount of Olives to Jerufalem, and prepared \(1=-16\) themfelves for the coming of the Holy Ghoth, were in number ahout fix foore; and to fuch a clond of witnefles the evangelift would not have appealed, had not the fact he was recording been very generally known. Yet thefe were perhaps but part of the witnefics; for

Theology fince Chrit had told to his difciples that he was to afnore pectu-cend to his Father and their Father, to his God and their God, and that he was going to prepare a place for then, that where he is there they might be likewife; we can hardly doubt but that all who believed in him as the Redeemor of the world would take care to be prefent, not only to view their Maffer's triumph over all his enemics, but alfo to have a fight of that glory which awaited themfelves. It was on this occafion probably that he was feen after his refurrection by above five hundred brethren at once, of whom the greater part were alive at the writing of St Paul's firt epiftle to the Coririthians.

But though fuch multitudes of people faw Jefus lifted up from the mount, and gradually vanith out of their fight, fome other evidence ficmed neceffary to certify them of the place to which he had gone. Two angels therefore appear, and attct what human eyes could not fee, but what was indeed the confequence of what they had fecin. They atteft that Chrift had afeended to heaven, not to defeend agair till the laft day; and furely , with refpect to this point, the citizens of heaven were the moft unexceptionable witneffes. We murt thesefore acknowledge and confels, againt all the wild lherefies of old ( \(\kappa\) ), that Jefus Chrift the Son of God, who died and rofe again, did with the fame body and foul with which he had lived upon earth afcend up "into heaven, there to appear in the prefence of God for us *." Having in the outward tabernacle of this world once offered up himfelf a pure and perfect facrifice for the expiation of our fins, he entered within the veil into the moft holy place, there to prefent his blood before God himfelf, in order to obtain mercy for us, and reftore us to the Divine favnur. Sn that, "if any man fin, we have an advocate with the Father, Jefus Chrift the righteous, who is the propitiation for our fins, and not for ours only, but alfo for the fins of the whole world; and he is able to fave to the uttermof thofe that come to God by him, feeing he ever liveth to make interceffion for us." "Seeing then that we have a great high-prief, who is paffed into the heavens, Jefus the Sun of God, we may through him come boldly unto the throne of grace, that we may obtain merey, and find grace to help in time of need."

But it is not the office of a prieft only that our Lord difcharges in heaven; he is reprefented as fitting on the right hand of God, to denote that regal authority with which he is now vefted; "angels, and authorities, and

Peter powers, being made fubject to him \(t . "\). Hence it is, that after his refurrection, he faid of himfel \(\ddagger\), "all power is given unto me in heaven and in earth;" for, as St Paul informs us \(\bar{\rho}\), " hecaufe he humbled himfelf and became ohedient unto death, even the death of the crols, therefore God hath highly exalted him, and given him a name which is above every name: that at the Voi. XX. Part I.
name of Jefus every knce flould bow, of things in hea- Theology ven, and things in earth, and things under tive earth." more peccuAnd this fubmiffion is due to him, becaufe "God raifcd liarly Chrihim from the dead, and fet him at his own righi hand Ntan. in the heavenly places, far above all principalities and powers, and might, and dominion, and every name that is named, not only in this world, but alfo in that whish is to come; and hath put all things under his feet, and gave him to be head over all things to the chirch *.". FIth. As God, Chrift poffefled a kingdom, which, as it had \({ }^{\text {i. 20, sec. }}\) not a beginning, can never have an end : but the dominion, of which the apofile is here treating, was confersed upon him as the mediator of the new covenant, and will no longer continue than till his enemies fhall be fubdued; for we are told, that "he muft reign till he hath put all enemies under his feet; and that the laft enemy which thall be dellroyed is death." "Hc will ranfom his fubjects from the power of the grave; he will redeem them from death. O death, he will be thy plague; \(O\) grave, he will be thy deftruction \(\dagger . "\) " Hofea The trumpet hall found, the graves thall be opened, all \({ }^{\text {xili. }}\) st the fons and daughters of Adam thall return to life, and death thall be fwallowed up in victury. "Then cometh the end, when the office of modiator ceafing, he firll have delivered up the kingdom to God, even the Father, when he flall have put down all rule and all authority and power. For whea all things fhall be fubdued unto him, then fhall the Son alfo limfelf be fubject unto him that put all things under him, that God may be all in all \(\ddagger\)."
The firf confpicuous proof which our bleffed Lord \(\times \mathrm{c}\) 2. 2. gave of being vefted with fupreme power, and made \({ }^{28}\). head over all things to the cllurch, was on the day of Defcent Pentecoff. He had told the apofles that he would the Holy pray the Father to give them another comforter, who Ghot on thould abide with them for ever, even the Spirit of the apotruth, which fhould teach them all chings, and bring fles. all things to their 1 emembrance which he had faid unto them. He had affured them, that it was expedient for them that he himfelf fhould go away; "for if I go not away (faid he *), the Comforter will not come unto * John xvi, you; but if I depart, I will fend him unto you." At\%. his laft interview with them, jutt before his afcenfion, he had defired them to tarry at Jerufalem till they fhould be endued with power from on high, before they entered upon their great work of converting the nations. Thefe promifcs were amply fulfilled; for "when the day of Pentecoft was fully come, they were all with one accord in one place. And fuddenly there came a found from heaven as of a rufting mighty wind, and it filled all the houfe where they were fitting. And there appeared unto them cloven tongues, like as of fire, and it fat upon each of them. And they were all filled with the Holv Ghof, and hegan to fpeak with other tongues, as the Spirit gave them utterance. And there were
(H) There was one Apelles in the primitive church, who was condemned as a heretic for teaching that Chrif's body was diffolved in the air, and that he afcended to heaven without it. The opinions of this man and his followers are flated at large and confuted by Tertullian, Gregoy Nazianzen, and Epiphanius; and the reader who thinks fuch ridiculous notions worthy of his notice, will find enough faid of them in the Notes to the fixth aricle of Pearfon's Expofition of the Creed. Perhans it may be from a hint communicated in thefe Notes, that our great modern corrector of the evangelifts has difcovered, if it be indeed true that he pretends to have difcovered, that Jefus Chrift is fill upon earth.

Theoiogy dwelling at Jerufalem Jews, devout men, out of every more pecu-nation under heaven. Now when this was noifed Liarly Chrl-
fian! \(\underbrace{\text { fian. }}\)
i Aft ii. I-13. \(19^{2}\) Certainiy withat mi riale. founded, becaufe that every man heard them fpeak in his own language. And they were all amazed, and marvelled, laying one to another, Behold, are not all thele who fpeak Galileans? And how hear we every man in our own tongue, wherein we were born? Parthians, and Medes, and Elamites, and the dwellers in Mefopotamia, and in Judea, and Cappadocia, in Pontus and Afia, Phrygia and Pamphylia, in Egypt and in the parts of Libya about Cyrene, and ftrangers of Rome, Jews and profelytes, Cretes and Arabians-we do hear them fpeak in our tongues the wonderful works of God. And they were all amazed, and were in doubt, faying one to another, What meaneth this \(\dagger\) ?"

That thofe who heard the apofles fpeak fo many different languages were amazed, is what we Mould naturally fuppofe; but that a fingle individual among them remained unconvinced, is aftonifhing? for the gift of tongues on the day of Pentecoft is one of the moit palpable miracles that was ever wrought. It is likervife one of the beft autherticated miracles; for the book entitled the AZAs of the Apofles was written not more than 30 years after the event took place (fee Scrifture, \(\mathrm{N}^{\mathrm{O}}{ }_{\mathrm{I}}\) 68.) ; and it is not conceivable that, within fo fhort a period, St Luke, or any man of common fenfe, would have appealed for the truth of what he recorded to fo many inveterate enemies of the Chriftian name, had he not been aware that the miraculous gift of tongues was a fact incontrovertible. We all know how defirous the Jewinh rulers were to fop the progrefs of the faith, by whatever means; but if this miracle was not really performed, they had now an opportunity of doing it effectually by means to which truth and honour would give their approbation. Thoufands muf have been alive in the city of Jerufalem who were men and women at the time when the apofles were faid to have been thus fuddenly infpired with the tongues of the Parthians, Medes, and Elamites, \&c.; and as thefe foreigners were themfelves either Jews by defcent, or at leaft profelytes to the Jewih religion, furely the chiefpriefts would have found multitudes ready, both at home and abroad, to contradict this confident appeal of St Luke's if contradiction had been poffible. We read however of no objection whatever being made to this miracle. Some of the audience, indeed, when the apoftles addreffed people of fo many nations in all their refnective languages, not undertanding what was faid, and taking it for jargon which had no meaning, conciuded, not unnaturally, that the fpenkers were full of new wine, and mocked then for being drunk fo early in the day; but this is a circumftance which, fo far from rendering the niracle doubtful, adds much to the cridit of the hiftorian, as it would hardly have occurred to the writer of a narrative wholly falfe, and would certainly not have been mentioned, had he known thast the apofles really attempted to impofe on the multitude unmeaning founds for foreign languages.

As it is thus certain that the apofles were miraculonfly furnifhed wit's the gift of tongues, fo the elegance and prowriety of that miracle to atten the real defcent of the Spirit of truth, who was to teach them all things, and endue them with power from on high to convert the nations, can never be enough admired by the pious

Chriftian ; for words being the vehicle of hnowledge, Theology an ability to fpeak the different languages of the earth more pectuwis ablolutely neceffary to enable thofe who had been liarly Chrioriginally fifiermen to go into all the world and preach \(\underbrace{\text { Rian. }}\) the gofpel to every creature. Yet there have been writers *, who, though unable to call in queltion the * Dr Midd 1eality of the gift of tongues on the day of Pentecoft, deeorn and
have contended, that it was a gift "not lafting, but Lord Shaf. have contended, that it was a gift "not lafting, but tefurury inftantaneous and tranfitory ; not befowed upon them for the conflant work of the minilitry, but as an occafional fign only, that the perfon endowed with it was a chofen minifter of the gofpel ; which fign, according to them, ceafed and totally vanilhed as foon as it had ferved that particular purpofe." The chief argument upon which this opinion is attempted to be built, is Objections, drawn from the frripture Greek, which is faid to be "utterly rude and barbarous, and abounding with every fault which can poffibly deform a language; whereas we thould naturally expect to find an infipired language pure, clear, noble, and affecting, even beyond the force of common fpeech; fince nothing can come from God but what is perfect in its kind. In flort, we fhould expect, fays the objecter, the purity of Plato and the eloquence of Cicerot."

In reply to this objection, it has been well obferved \(\ddagger\), on the Gifit that it fuppofes what is called the purity, elegance, and of Tongues fublinity, of language, to be fomething natural and effential to human ipeech, and inherent in the conftitution of things. "But the matter is far otherwife. Thefe qualitics are accidental and arbitrary, and depend on ton's Doc. cuftom and fafhion; modes of humanity as various as Anfwered the differing climes of the earth; and as inconflant as the tempers, genius, and circumfances, of its inhabitants. For what is pority, but the ufe of fuch terms and their combinations as the caprice of a writer or fpeaker of authority hath preferred to their equals? what is elegance, but fuch a turn of idiom as a farhionable fancy hath brought into credit? and what is fublimity, but the application of fuch images as arbitrary and cafual connections, rather than their own native grandeur, have dignified and ennobled? The confequence of this is, that the mode of compofition which is a model of perfection to one nation or people, has always appeared either extravagant or mean to another. Afiatic and Indian eloquence was efteemed hyperbolical and unnatural by the Greeks and Romans, and is fo efteemed by us; whilh the Greek and Roman eloquence in its turn appeared cold and infipid to the warm inhabitants of the eaft ; and ours would appear perhaps fill colder. But the New Teftament was deligned for the rule of life to all mankind. Such a rule required infpiration; and infpiration, fay the objecters, implies the moft perfect eloquence. What human model then was the Holy Ghof to follow? for a human model it muft have been, becaufe there was no other; and if thore had, no other would have anfwered the purpofe, which was to make a due impreffion on the mind and affections. Should the eaftern eloquence have been employed? But it would have been too fwelling and animated for the weft. Should the weflern? This would have been too ftill and inactive for the eaft. Or fuppofe us only folicitous for what we beft underfand; which fpecies of this latter genus fhould the facred writers have preferred? The diffolute foftnefs of the Afiatic Greeks, or the dry concifenefs of the Spartans? The flowing ex-
uberances more pecu- the Roman?
liarly Chri- "But are there not forme general principles of eloquence in common to all the fpecies? There are. Why then flould not thefe have been employed to credit the apoltalic infpiration? Becaufe the end even of thefe (replies our author), is to millead reafon, and inflame the paftions; which being abhorrent to the truth and purity of our holy religion, were very fitly rejected by the infpired penman. Befides, it might eafily be known to have been the purpofe of Providence, though fuch purpofe had not been exprefsly declared, that the gofpel thould bear all poltible marks of its divine original, as well in the courfe of its progrefs as in the circumftances of its promulgation. To this end, the human inffruments of its conveyance were mean and illiterate, and chofen from among the loweft of the people, that when the world faw itfelf converted by the foolifbnefs of freachings, as the only learned apofte thinks fit to call it, unbelievers might have no pretence to afrribe its fuccefs to the parts, or fations, or authority, of the preachers. Now had the language infpired into thefe illiterate men been the eloquence of Plato or Tully, Providence would have appeared to counteract its own meafures, and to defeat the purpofe beft calculated to advance its glory. But God is wife, though man is a fool. The courfe of Providence was uniform and conftant: It not only chofe the weakeft inftruments, but carefully kept out of their hands that powerful weapon of words which their adverfaries might fo eafily have wreffed to the difhonour of the golpel. Common fenfe tells us, that the fyle of an univer(\{2] law fhould retain what is cormmon to all languages, and neglect what is peccliar to each. It hould retain nothing but crearness and precisiov, by which the mind and fentiments of the writer are intelligibly conveyed to the reader. This quality is effential, invariably the fame, and independent of cuftom and faflion. It is the confequence of fyntax, the very thing in language which is leaft pofitive, as being formed on the principles of philofophy and logic: whereas all befides, from the very power of the elements and fignification of the termis to the tropes and figures in compofition, are arbitrary ; and, as deviating from thefe principles, frequently vicious. But this quality of clearnefs and precifion eminently ditinguifhes the writings of the New Teffament; infomuch that it may be eafily fhown, that whatever difficulties occur in the facred books do not arife from any imperfect information caured by this lecal or nominal barbarity of fityle ; but either from the fublime or obfcure nature of the things treated of, or from the intentional concifenefs of the writers; who, in the cafual mention of any thing not effential to the difpenfation, always obferve a fludied brevity."

After much ingenious and found reafoning on the nature of language in general, our author concludes, that the styik of the New Teftament, even on the truth of what has been faid to its difcredit, is fo far from proving the language not to be divinely inf(ited, that it bears one certain mark of that original. "Every language confifts of tiwo diflinct parts, the fingle terms, and the phrafes and idioms. Suppofe now a foreign Ianguage to be inflantaneoully introduced into the minds of illiterate men like the aponles; the imprefion murat be made either byy fixing in the mcrmory the terms and

\section*{L O G Y.}
fingle words only with their fignification, as, for in- Thenlogy. fance, Greek words correfponding to fuch or fuch Syriac more pecu: or Hebrew words; or elle, together with that fimple liarly Chriimpreffion, by enriching the nind with all the phrafes \(\underbrace{\text { a }}_{\text {finm. }}\) and idioms of the language fo infpired. But to enrich the mind with the peculiar phrales and idiom of a foreigu language, would require a previous inpreftion to be made of the manners, notions, fafhions, and opinions, of the people to whom that language is native; becaule the idiom and phrafes arife from and are dependent on thefe manners. But this would be a wafte of miracles without fufficient caufe or occafion; for the Syriac or Hebrew idiom, to which the lews were of themfelves enabled to adapt the Greek or any other words, abundantly ferved the ufeful purpofes of the gift of tongues, which all centered in thofe tongues, being fo fpoken and written as to be clearly un derstood. Hence it follows, that if the ftyle of the New Teftament were indeed derived from that language which was miraculoully imprefled upon the apoftles on the day of Pentecoft, it mult be juit fuch a one as in reality we find it to be; that is, it mult confift of Greek words in the Syriac or Hebrew idiom."

The immediate author of this gift, fo neceffary to the Divinity \({ }^{126}\) propagation of the gofpel, was the Spirit of truth, or of the Hos the Comforter, who is the Holy Ghoft and the third ly Ghoft. perfon in the bleffed Trinity. 'That there are three perfons in the one Godhead, has been thewn at large in a former fection of this article; and that the Holy Ghoft is one of thefe three, might be fafely concluded from the form of baptifm inllituted by Chrift himfelf. But as more plaufible objections have been urged againft his divinity than any that we have met with againit the divinity of Chrif, it may not be improper to confider thefe before we procecd to give an account of the graces which he imparted to the infant church, and of the apofles preaching under his influence. By the Arians the Holy Ghoft is confidered as a creature; by the Socinians and modern Unitarians, as they call themfelves, the words Holy Ghof are fuppofed to exprefs, not a perfon or fpiritual fubfilence, out merely an energy or operation, a quality or power, of the Father, whom alone they acknowledge to be God. If this doctrine can be confuted, the Arian hypoihefis will fall to the ground of itfelf; for it is not conceivable than any infpired teacher fhould command his followers to be baptized in the name of the felf-exiftent God and two creatures.

It is admitted by the Socinians themfelres, that in the Scriptures many things are fpoken of the Holy Ghoft which can be properly predicated only of a perfon; but the inference drawn from this conceffion they endeavour to invalidate by obferying, that in fcripture there are likewife expreffions in which things are predicated of abftract virtues, which can be literally true only of fuch perfons as practife thefe virtues. Thus when St Paul fays *, that "charity fuffereth long and *i Cor. is kind, charity envieth not, charity vaunteth not itfelf, siii. 4-3. is not puffed up, \&c." we cannot fuppofe his meaning to be, that thefe actions are performed by charity in the abttract, but that every charitable perfon, in confequence of that one Chrifian grace, fuffereth long and is kind, envieth not, vaunteth not himfelf, and is not puffed up, \&c. In like manner, fay they, perfonal actions are attributed to the Holy Ghof, which itelf is

Theology no perfon, but only the virtue, power, or efficacy, of more pecu-God the Father; becaufe God, the Father, who is a liarly Chri- perfon, performs fuch actions by that power, virtue, or Atian. perfon, performs, in himfelf, which is denominated the Holy * Acts \(x\) Ghof. Thus when we read * that "the Spirit faid un19, 2e. Lo Peter, Behold three men feek thee; arife therefore and get thee down, and go with them, doubting nothing, foi 1 have fent them ;" we mutt underitand that Gud the Father was the perfon who fpuke thefe words and fent the three men; but becaule he did fo by that virtue in him which is called the Spirzt, therefore the Spirit is faid to have fpoken the words and fent the men. Again, when " the Holy Gholt faid + to thofe at Antiuch, Separate me Barnabas and Saul for the work whereunto I have called them;" we are to conceive that it was Gud the Father who commanded the two apoltles to be feparated for the work to which he had called them; but bccaufe he had done all this by that power within him which is called the Huly Gholt, therefore his words and actions are attributed to the Holy Ghot, juft as long-fuffering in men is attributed to charity.

This reafoning has a plaufible appearance, and would be of much force were all the actions which in fcripture are attributed to the Holy Ghot of fuch a nature as that they could be fuppoled to have proceeded from the perfon of God the Father in confequence of any particular power or virtue in him; but this is far from being the cale. Thus "Spirit is faid \(\ddagger\) to make interceffion for us;" but with whom can we fuppule God the Father, the fountain of divinity, to intercede? Our Saviour allured \(\oint\) his difciples, that the Father would, in his name, fend to them the Holy Ghult, who is the Comforter; that he would himfelf fend the Comforter unto them from the Father; that the Comforter nould not fpeak of himfelf, but fpeak only what he foould hear ; and that he fhould receive of Chrif's, and Thew it unto them. But we cannot, without blafphemy and abfurdity, fuppofe that the Father would, in the name of Chrift, fend himfelf; that the Son would fend the Father from the Fither; and the Father would not fpeak of himfelf, but fpeak only what he heard; or that either the Father in perfon, or a quality of the Father, fhould receive any thing of Chrift to hew unto the apolles.

The fagacity of Sxinus perceived the force of fuch objections as thefe to his notion of the Holy Gholt, being nothing more than the power of the Futher perfonified; and therefore he invented another profopopeia to ferve his purpofe in the interpretation of thole texts to which this one cannot be applied. "The Spirit of
fpiration even of Chrift, will relifh fuch a degree of in- Theology fpiration as this, which raifes mere men to a temporary more pecuequality with God, we know not; butleaving them to Cettle the difpute with their matter, we thall produce one or two paffages in which perfonal attributes are given to the Spirit of God, when it is impollible to conceive that Spirit, either as a power inherent in the Divine Father, or as the perfon on whom that power is operating. We need not bring new texts into view, as fume of thofe already quoted will ferve our purpofe. When our Saviour promifes that the Holy Ghof, the Comforter, the Spirit of truth, foould be fent by the Father and the Son to the apotlles, we have feen, that by this Spirit he could not mean the Father or a property of the Father ; neither could he poffibly mean the apoftles themfelves, unlels we are to fuppofe that the Father and the Son fent St Peter to St Peter, and that St Peter, fo fent, came to St Pe. ter! Again, when Chrift faith of the Huly Ghott, " he thall receive of mine, and thall thew it unto you," be could not, for the reafon already alfigned, mean by the Holy Gholl the Father or the power of the Father; and furely his meaning was not, that the apoltlcs, under the influence of the power of the Father, fhould receive fomething and hew it each to himfelf! The Huly Ghof therefore is unqueftionahly a perion; for though there are many paffages of fcripture in which the gifis of the Holy Gholt are called the Holy Gihof, they are fo called by a very common figure of fipeech, in which the effect receives the name of its caufe : and fince this perfon is joined with the Father and the Son in the formula of Chritian bapilim; fince they who lied to the Holy Gholt are faid * to have lied unto God ; fince blafphemy * Acts v. againft him is a more heinous offence than the fame fin 4 . againft even the Father or the Son \(\dagger\); and fince it was \(\dagger\) Markiii. by the operation of the Holy Gholt that Jefus Chrilt 2S, 29, was conceived of the Virgin Mary, and even on that account callcd the \(\ddagger\) Son of God-il follows that the Holy \(\ddagger\) Luke is Gholl is God, of the fame fubftance with the Father and \(35^{\circ}\) Son.

It was this Divine Spirit which, on the day of Pente- The \({ }^{199}\) coft, infpired the apofles with the knowledge of dif-ftes miraferent languages; and as thefe were given only to en-culoully is ahle them to preach the gofpel to every creature, it can fructed in admit of no doubt but that he, who fo amply provided ciples of re the means of preaching, would take care that the gof-ligion.
pel fhould be preached in purity. Our Saviour had told his apoltles, that the Comforter would guide them into all the truth ( \(\varepsilon \varepsilon_{5} \pi \alpha \sigma \alpha y\) т朔 \(\alpha \lambda y \in \varepsilon \alpha a y\) ), and bring all things to their remembrance, whatfoever he had faid unto them; but if they had not comprehended the meaning of what he faid, the bate remembrance of his fayings would have been of little importance. That before this miraculous thedding abroad of the Spint they had but a very imperfect knowledge of \(h \mathrm{~s}\) doetrines, and of the purpofe for which he had come into the world, is apparent from that unfeafunable quellion which they put to him when affembled to witnefs his glorious afcenfi \(n\); "Lord, wilt thou at this time retlore again the kingdom to If rael ?""

Their minds ftill cherifhed with fondnefs the vair pro- \({ }^{306}\) fpeet of temporal power ; but after the day of Pente- Their need coft they were directed to !obler objects. From the of fuch in. fame Spirit they received diverfities of gifts befi ies that fruction. of lansuage: for we are affured by St Paul *, when * i Cor. fpeaking of the early converts to Chriftianity in gene- xii. 8-1才.

\section*{Part II.}

Theology ral, that " to one was given by the Spirit the word of more pectl- wisbom; to another the word of KNowledges by the Larly Chri- fame Spirit; to another FAITH by the fame Spirit; 10
ftian. another the gifts of healing by the fame Spirit; to another the working of MIRACLFS; to another PRo. pifecy; to another discerning of spirits; to amother divers kinds of tongues; to another the interpri:tation of tongues:" and thele gifts, which were feverally divided either among private Chriftians or among the inferior orders of minilters in the church, we have reafon to believe were all bellowed in a greater or lefs degree upon each of the apolles.

Men thus endowed were well q̧ualified to declare unto the world all the council of God. By the word of wifdom they communicated to the Gentile nations a pure fyttem of what is ealled natural religion; turning them from the vanity of idols to the worlhip of the living God: by the word of knowledge, they preached the great doctrines of revelation both to Jews and Gentiles, illewing them that there is none other name under heaven given unto men whereby they may be faved than the name of Jefus Chrift (i.) ; and by their gifts of healing and of miracles, \&c.; they were enabled to prove unanfwerably, that their doctrines wete divine. They taught everywhere the unity of God, the creation of the world, the fall of man, the necellity of redemption, the divinity of the Redeemer, his facrifice on the crofs to reftore mankind to their forfcited immortality, and the terms of the new covenant into which they had through lim been gracioufly admitted by God.

Such a view as our limits would admit of we have given of all thefe doctrines, except that which refpects the terms of the gofpel covenant ; but thefe being explicitly ftated only by St Paul and St James, we could not till now inveltigate them, without violating the hiftorical order into which, for the fake of perfpicuity, we have digefled the feveral parts of this fhort fyltem. Our Saviour himfelf has indeed taught with great plainnefs the neceflity of faith and baptifm to the falvation of thofe who have an opportunity of hearing the gofpel preached with power (fee Baptism) ; and in his fermon on the mount, which is fuch a lecture of ethics founded on religion as the Son of God only could have delivered, we learn, that " unlefs our righteoufnefs thall exceed the righteoufnefs of the Scribes and Pharifees, we thall in no cale enter into the kingdom of heaven; that not every one who faith unto Chrift, Lord, Lord, Mall enter into the kingdom of heaven, but he who doth the will of the Father who is in heaven; and that many will fay to him at the day of judgement, Lord, Lord, have we not prophefied in thy name, and in thy name done many won-

L O G Y.
derful works?" which could not be done without faith; Theology to whom he witl, notuithitanding, fay, "Dcpart from more pecume, ye that work iniquity *" St paul, however, feems \({ }^{\text {llarly Chri- }}\) to attribute our jullification to the bare act of believing; ftian. for he repeatedly aflures us, "that a man is junified by \({ }^{\text {st }}\) faith without the deeds of the law; " while St James, on Mattl. v. the other hand, affirms, " that by works a man is juti. 20. vii 22 fied, and not by fath only." This apparent difference in the language of the two apoftles, has produced among divines opinions really different relpecting the jullification of Chriftians; and the principal ol thele opinions it is our duty to llate.

Between pardun of fuy and juffifcation there is fo clofe 20x a connection, that many writers feem to confider the of juftifica: terms as fynonymous, and to infer, that he who is par-tion. doned is ipfo facto juttfied. That every Chritian, who thall be pardoned at the judgement of the great day, will likewife be jullified, is indeed true; but in propricty of Speech, jufification is a word of very different import from pardon, and will entitle the Chrillian to what mere pardon could not lead him to expect. An innocent perfon, when falfely accufed and acquitted, is jufified but nut pardoned; and a criminal may be pardoned, though he cannot be jufiffied ur declared innocent. A man whole fins are parduned is free from punifiment; but the juftified Cotritian is entitled to everlating life, happinefs, and glory. If we were only pardoned through Chrift, we fhould indeed efcape the pains of hell, but could have no claim to the enjoyments of heaven; for thefe, being more than the molt perfect human virtue can merit, muft be, what in the feriptures they are always faid to be, "the gift of God through Jefus Chrift our Lord." Hence it is that St Paul, dittinguilhing, as we have done upon his authority, between mere remiffion of fins and jultification of life, declares \(\dagger\), that "Je- \(\dagger\) Romats. fus our Lord was delivered for our offences, and raifed \({ }^{\mathrm{iv} .25 .}\) again for our jufification."

The word jultification, as ufed both by St Paul and St James, has been very generally confidered as a forenfic term exprefing the fentence of a judge. The moft eminent reformed divines of all denoninations \(\ddagger\), and \(\ddagger\) Limo even many of the Romanifts themfelves, have Ifrenu-borch, Bull, oully contended, that this is its genuine fenfe, when it is di- Waterla . de, \(_{\text {, }}\), ftinguifhed from mere remiffion of fins, regeneration, and Wa, burtor, fanclification; and if fo , it will fignify God's pronoun-Vitrmga,. cing a perfon \(j u / f\), either as being perfectly blamelefs, or Gill, sic. as having fulfilled certain conditions required of him in the Chriftian covenant. But that "there is not a jult man upon earth, who doth good and finneth not," is made known to us by the mofl complete evidence poffible, the joint dictates of our own confciences and of divine
(I.) It is not perhaps eafy to determine what is here meant by the word of wisdom and the word of know1.f.DGE, as diftinguithed from each other. By the former ( doyos oopras), Bihop Warburton underftands all the \(^{\text {a }}\) great principles of natural religion. "The ancients (fays he) uled the word ropic in this peculiar fenfe; it is ufed in the fame fenfe by St Paul in Col. iv. 5.; and we can harily give it any other in the place before us, where we fee the word of wifdom diffinguified from the word of knowledge ( \(\lambda\) orys yraviws), which evidently means all the great principles of revelation ; the term ywors being as peculially applied by Chrittian writers to revealed retigion as ropur is bv the Gentiles to the natural. St Paul ufes the word in this fenfe in 2 Cor. xi. 6. where he fays,
 heretics who fo much deformed the fimplicity and purity of the Chriftian faith bv vifionary pratences to fiperior kncwlerge of revelation, tork from this word the name of Gnoftics." See Warburion's Sermon on the Office and Operation of the Holy Ghof.

Theulogy divine revelation; and therefore whofoever is pronounmere pectiliarly Chriftian.
\(\qquad\) ced jult by the Judge of all the earth, mult be fo, either becaufe, though not abfolutely blameleis, he has performed the conditions required of him in the covenant of grace, or becaufe Chrift has fulfilled all righteoufnefs in
ะ22
It is a fo-
renfic term.
* Rom. iii.

24, 25. his ltead.
If this be the Scripture notion of juftification, it muft be wholly the act of God, and cannot be the effect either of our faith or of our virtue. Accordingly, we are faid by the aportle to be juttifed freely by his grace through the redemption that is in Jefus Chrift; whom God hath fet furth to be a propitiation through faith in his blood w. The act of jutification therefore proceeds from the divine philanthropy, and cannot be performed by the inftrumentality of faith ; for it is not God, but man, who believes; and man is not the juftifier of himfelf. To talk of any kind of infrument of juftification befides the propitiation fet forth by God, is indeed to make ufe of very improper language: "Om4 Harmonia nis caufa inltrumentalis (fays Rifhop Bull + ), fuo modo Apofolica, in effectum influit, eique effecti productic propriè attap. ii. \(\$ 9\). tribui poteft. Jam vero, cum juftificatio nihil aliud fit quam gratiofus Dei actus, quo peccata noftra nobis condonet, ac nos ad falutem acceptet, valde abfurdum effet dicere, vel fidem, vel opera noftra, vel quidvis aliud noftri aut remittere peccata noftra, aut perfonas noftras acceptare: quod tamen, fi inftrumentalis caula jultifica. tionis fides fit, planè dicendum effet."

In this fentiment of the bithop of St David's fome of the moll eminent divines both among the Calvinifts and Arminians agree. Many, however, have chofen to treat of jultification not only in the active fenfe, as it is the act of God, for all admit that it is he who juftifies; but likewife in a paffive fenfe, as it means our privilege or poffiflon holden of him, when we are faid to be juftified by his grace. In this view of the fubject they may talk, with fufficient propriety, of an inftrument of juftification, not as the mean by which it is conveyed, but as the medium through which it is received by the true Chriftian. And hence it follows, that Waterland and Warburton firenuoully maintain the doctrine of the Weftminfter Confeffion, " that faith receiving and refting on Chrift is the alone inftrument of jultification; though it cannot be alone in the perfon juftified, but muft ever be accompanied with all other faving graces, and be a faith which worketh by love."

But notwithftanding this agreement between the leaders of the rival feets, they bave found abundant matter of controverfy refpecting faith and works, in deciding the great queftion, "Whether, when God jultifies man, he confiders him as abfolutely righteous on account of Chrift's righteoufefs performed in his flead ; or only as jutt, becaufe he has fulfilled the conditions of the covenant of grace, which does not require of him perfect righteoufnefs?" The former is the doctrine of the more rigid Calvinifts, the latter that of the Arminians or Remonftrants.

Body of
Dizinity,
vol. ii.
book iii.
chap. 8. \(\$ 5\).
"A notion (fays Dr Gill \(\ddagger\) ) obtained fome years ago, that a relaxation of the law and the feverities of it has been obtained by Chrif: and a new law, a remedial law, a law of milder terms, been introduced by him, which is the gofpel ; the terms of which are, faith, fepentance, and new obedience ; and though thele be imperfect, yet, being fincere, they are accepted by God in the room of perfect righteoufnefs. But every article of

L O G Y.
this fcheme (continues he) is wrong; for the law is not Theotogy relaxed, nor any of its feverities abated; Chrill came more pecuno. to deftroy, but to fulfil it ; and therefore it requires liarly Chrithe fame holy, juft, and good things, as ever. Nor is \(\underbrace{\text { ftan. }}\) the gofpel a new law. There is nothing in it (he fays) which looks like a law; for it has no commands in it, but all promiles, being a pure declaration of grace and falvation by Chrift; nor are faith, repentance, and a new obedience, required by it as conditions of man's accep-1t. tance with God. Faith and repentance are gofpel doctrines, and parts of the gofpel miniftry; they are graces, and not terms required to be performed by men of themfelves. Failh is the gift of God, and repentance is a grant from him. It is not true (continues our author) that God will accept of an imperfect righteoufnefs in the room of a perfect one ; nor can any thing more highly reflect upon the juftice and truth of God, who is the judge of all the carth, than to fuppofe that he can ever account that as a righteoulnefs which is not one."

Having thus proved by arguments which were almolt in the fame words flated long before by Bithop Beveridge *, that the gofpel is no relaxation of the law, he * See his proceeds to lay down his own notions of juntification, of Prisate which (he fays) "the fole matter, or that for the fake Thoughts: of which a finner is juftified before God, is the righteoufnefs of Chrift-that which he did and fuffered on earth, in our nature, in our flead, and as our reprefentative. This is commonly called his active and paflive obedience; and when the purity and holinefs of his own nature was added to it, the whole made up the dixaswere tou vorou, the righteoufnefs of the law, which was fulfilled by him as the head and reprefentative of his peoplet; for whatever the law required is neceffary to a finner's juftification before God, and it required of finners more than it did of man in innocence. Man was created with a pure and holy nature, conformable to the pure and holy law of God ; and it was incumbent on him to continue fo, and to yield in it perfeet and finlefs obedience, in the failure whereof he was threatened with death. Man did fail, by which his nature was vitiated and corrupted, and his obedience became faulty and imperfect. He therefore became liable to the penalty of the law, and ftill perfect obedience was required of him. To the juftification of a finner therefore is required the moft complete obedience, active and paffive; or, in other words, purity of nature, perfect obedience, and the fufferings of death; all which meet in Chrift, the reprefentative of his people, in whom they are juttified. There are indeed fome divines (continues our author) who exclude the active obedience of Chrift from being any part of the righteoufnefs by which men are juftified. They allow it to have been a condition requifite in him as a Mediator, qualifying him for his office; but deny that it is the matter of juftification, or reckoned for righteoufnefs to man. But without the aftive obedience of Chrift the law would not be fatisfied; the language of which is, Do and live; and unlefs its precepts be oheyed, as well as its penalty endured, it cannot be fatisfied; and unlefs it be fatisfied, there can be no jurtification. If therefore men are juftified by the righteoufnefs of Chrif, it mut be by his active obedience imputed and made over to them, fo as to become their's, even as Divid deScribeth the bleffednefs of the man unto whom God imputeth rightcoufrefs without "works \(\ddagger\). That this is really t Ror.oit the way in which men are iuftified, our author thinkso.
evident,

Tirelogy evident, becaufe they muft be juftified either by an inhemore pecus rent or by an imputed righteoufnefs; but they cannot be Larly Chrithan.

- Mhilip.
juftified by their own inherent righteoufnefs, for that is imperfect, and thercfore not jultifying. Hence the apolle 'counts all things but dung, that he may win Chrilt and be found in him; not having his own righteoulnefs, which is of the law, but that which is through the faith of Chrilh, the righteoumeis which is of God by faill **. But by fuch a righteoufnefs as this a man cannot be juftified in any other way than by an imputation of it to him. Whence it follows, that 'as by one man's difobedience many were made fonners by imputation, fo by the obedience of one foall many be made righteous, by having that obedience placed to their own account."

As this author properly confiders jultification as the ast of God, he does not approve of the language in which faith is called the inftrument either of conferring or receiving it. "Faith (rays he \(\dagger\) ) is merely the evidence of jnitification to the perfon juftified; for 'faith . is the evidence of things not feen.' The righteoufnefs of God, of the God-man and Mediator Jefus Chrilt, is revealed from faith to faith in the everlafting gofpel \(\ddagger\); and therefore mult be before it is revealed, and before the faith to which it is revealed. Faith is that grace whereby a foul, having feen its want of righteoulnefs, beholds in the light of the Divine Spirit a complete righteoufnefs in Chrif, renounces its own, lays hold on that, puts it on as a garment, rejoices in it, and glories of it; the Spirit of God witneffing to his fpirit that he is a jufified perfon: and fo he is evidently and declaratively ' juftified in the name of the Lord Jefus, and by the fpirit of our God \(\|\).' Faith adds nothing to the e \(\| f\), only to the bene effe of juftification; which is a complete ast in the eternal mind of God, without the being or confideration of faith, or any forefight of it. In the account of God, a man is as much jultified before his faith as after it; and after he does believe, his juttification depends not on his acts of faith, for though we believe not, yet God abides faitlyful to his covenant-engagements with his Son, by whofe furctyhip-righteoufnefs the eleet are jultified; but by faith men have a comfortable fenfe, perception, and apprehenfion, of their juftification, and enjoy that peace of foul which refults from it. It is by that only, under the tellimony of the Divine Spirit, that they know their intereft in it, and can claim it, and fo have the comfort of it."

Though this language differs from that of the Weftminfter Confffion, the author feems not to teach a different doctrine; for if faith be that grace by which a foul renounces its own righteoufnefs, and lays hold of Chrift's, which it puts on as a garment, it mult be that very thing which the compilers of the Confellion meant by their definition of faith receiving and refting on Chrift and his righteoufnefs, when they called it "t the alone inftrument of juftification." Accordingly our author elfewhere * teaches, that "true faith in fenfible finners affents to Chritt and embraces him, not merely as a Saviour of man in general, but as a fpecial fuitable Saviour for them in particular. It proceeds upon Chrift's being revealed in them as well as to them, by the firit of wifdom and revelation, in the knowledge of him as a Saviour that becomes them. It comes not merely through external teachings by the hearing of the word from men; for no man, faith our blefled Lord, can come to me except the Father draw him ; but fuch fouls as are thus drawn, having hoard and learned of the

\section*{L O G Y.}

Father, believe not only in the doctrine of Chrift, but Theology allo in himelf, trufting in him alone for everlating life more pecu-. and falvation."

Were it not that this author, in every thing that he fian. writes, has an eye to the doctrine of election and reprobation, which he carties to a greater height than almoft And of the any other divine with whofe works we are acquainted, more mohe would differ little in his notions of juilification from derate Arthe more nodere Aminins. the nore moderate Amminans. Junfication (lays Limborch) is the merciful and gracious act of God, whereby he fully ablolves from all guilt the truly penitent and belicving foul, through and for the fake of Chrift apprehended by a true faith : or gratuitoufly remits fins upon the account of faith in Jefus Chrift, and graciounly imputes that faith for righteoufnefs." Here indeed the im. putation of Chrift's righteoulnefs is exprefsly denied; but Dr Waterland, who can hardly be confidered as a Calvinit, feems to contend for the imputation of that righteoufnef's to the finner, as well as for faith being the inftrument by which it is received.
" It cannot be for nothing (fays that able writer *) * Summathat St Paul fo often and fo emphatically fpeaks of man's ry Viezu of being juftified by faith, or through faith in Chrift's blood; Yuflificaand that he particularly notes it of Abraham, that he believcd, and that his faith was counted to him for juilification, when he might as eafily have faid that Abraham, to whom the gofpel was preached, was juftified by gofpelfaith and obedience, had he thought faith and obedience equally inftruments of jultification. Befides, it is on all hands allowed, that though St Paul did not directly oppofe faith to cvangelical works, yet he comprehended the works of the moral law under thofe which he excluded from the oftice of juflifying, in his fenfe of the word juflification. He even uled luch arguments as extended to all kinds of works; for Abraham's works were excluded, though they were undoubtedly cvangelical. To prove that he interprets the apofle's doctrine fairly, our author quates, from the genuine epitle of Clemens of Rome, a paflage, in which it appears beyond a doubt that this fellow-labourer of St Paul fo underftood the doctrine of juntifying faith as to oppofe it even to evangelical works, however exalted. It is true (continues our author), Clemens elfewhere, and St Paul almoft everywhere, infills upon true holinefs of heart and obedience of life as indifpenfable conditions of falvation or juffification; and of that, one would think, there could le no queftion among. men of any judgment or probity. But the queftion about conditions is very diltinct from the other queftion about inftruments; and therefore both partsmay be true, viz. that faith and obedience are equally conditions, and equally indifpenfable where opportunities permit; and. yet faith over and above is emphatically the inftrument both of receiving and holding jultification, or a title to falvation.
"To explain this matter more diftinctly, let it be rimembered, that God may be confidered either as a party contracting with man on very gracious terms, or as a Judge to pronounce fentence on him. Man can enter into the covenant, fuppofing him adult, only by affent. ing to it, and accepting it, to have and to hold it on fuch kind of tenure as God propofes: that is to fay, upon a felf-denying tenure, confidering himfelf as a guilty man flanding in need of pardon, and of borrowed merits, and at length refting upon mercy. -So here, the previous queftion is, Whether a perfon thall confent to, hold a privilege upen this fubmifive kind of tenure or

Theolory not ? Such affent or confent, if he comes into it, is the Toore peat- very thing which St Paul and St Clemens call faith. liarly Chri-
ftian. And this previous and general queftion is the quellion \(\underbrace{\text { ftarl. which both of them determine againt any proud claimants }}\) who would hold by a more felf-admiring tenure.
"Or if we newt confider God as fitting in judgement, and man before the tribunal going to plead his caufe; here the queftion is, What kind of plea ftall a man refolve to trull his falvation upon? Shell he fand upon his innocence, and relt upon flrict law? or thall he plead guilty, and reft in an att of grace? If he choofes the former, he is proud, and fure to be caf: : if he choofes the latter, he is fafe fo far in throwing himfelf upon an act of grace. Now eids queftion alfo, which St Paul has decided, is previous to the queftio", What conditions even the act of grace itfelf finally innills upon? A queftion which St James in particular, and the general tenure of the whole Scripture, has abundantly fatisfied ; and which could never have been made a queftion by any confiderate or impartial Chriltian. None of our works are good enough to fland by themfelves before him who is of purer eyes than to behold iniquity. Chrift only is pure enough for it at firf hand, and they that are Chrit's at fecond hand in and through him. Now becau'e it is by faith that we thus interpofe, as it were, Cbritt between God and us, in order to gain acceptance by him; therefore faith is emphatically the infrument shereby we receive the grant of juftification. Obedience is equally a condition or qualification, but not an inftrument, not being that act of the mind whereby we louk up to God and Chrif, and whereby we embrace the promifes."

But though our author contends that faith is the inftrument of jultification, he dues not, like the Antinomi.ns, teach that it will fave men without works. "The covemant of grace (fays he) has conditions annexed to it of great importance, for without them no inflruments can avail. Thefe are faith and obedience, as St James hath particularly maintained. St Paul had before determined the general and previous queftion refpecting the plea by which we ought to abide; and when fome libertines, as is probable, had perverted his doctrine of faith and grace, St James ftowed that the very faith which refts in a covenant of grace implies a cordial fub. mifflion to the conditions of that covenant, otherwife it would be nothing but an empty ceremony. The perfeet agreement between St Paul and St James in the article of juffification, appears very clear and certain. St Paul declares, that in order to come at jullification, it is neceflary to fland upon grace, not upon merit; which St James does not deny, but rather corfirms, in what he fays of the perfect law of liberty (James i. 25. ii. 12). St Pitul makes faith the infrument of receiving that grace; which St James does not difpute, but approves by what he fys of Abrahan (ii. 23.) ; only he main. taims alfo, that, in the conditionate fenfe, juffification depends equally upon faith and good works; which St Paul alfo teaches and inculcates in effect, or, in other words, though all his writings. If St Paul had had
precifely the fame queflion before him which St James Theology happened to bave, he would have decided juft as St innere pectJatues did; and if Si Jannes had had precilely the fame liarly Chriqueftion before hinn which S: Paul had, he would have determined jult as St P'aul did. Their principles were cxactly the fame, but the queftions were divcrfe; and they had different adverfaries to deal with, and oppofite extremes to encounter, which is a common cafe.
"It may be nuied, that that faith which is here called a condition, is of much wider compafs than that particular kind of faith which is precifely the inftrument of jultification. For faith as a condition means the whole comples of Chriftian belief, as expreffed in the creeds; while faith as an intrument means only the laying hold on grace, and refting in Chrilt's merits in oppofition to our own defervings: though this alfo, if it is a vital and operative principle (and if it is not, it is nothing worth), muft of courfe draw afier it an hearty fubmiffion to, and obfervance of, all the neceflary conditions of that covenant of grace wherein we repofe our whole truft and confidence. So that St Paul might well fay, "Do we then make void the law (the moral law) through faith? God forbid: Yea, we ellablifh the law *." Wie ex- * Rom. iii.. empt no man from religious duties; which are duties g fill, though they do not merit nor are practicable to fuch a derree as to be above the need of pardon: they are neceffary conditions in their meafure of jullification, though not fufficient in themfelves to juftify, nor perfect enough to fland before God or to abide trial : therefore Chrif's merits mult be taken in to fupply their defects: and fo our refling in Chrill's atonement by an humble felf-denying faith is our laf refort, our anchor of falvation both fure and fledfaft, after we have otherwife done our utmof towards the fulfiling of God's facred laws, towards the performing of all the conditions required.
"That good works, internal and external, are according as opportunities offer and circumflances permit, conditions properly fo called, is clear from the whole tenor of Scripture, as hath been often and abundantly proved by our own divincs ( 11 ), and is admitted by the moft judicious among the foreign Reformed ( K ). Yet fome have been rery frrupulous as to this innocent name, even while they allow the abfulute neceffity of good works as indifpenfable qualifications for future bleffednefs. Why not conditions therefore as well as qualifications? Perhaps becaufe that name might appear to fltike at abfolute predefination, or unconditional election; and there may lie the fcruple: otherwife the difference appears to lie rather in words than in things.
"Some will have them called not conditions, but fruits or confequents of juttification. If they mean by juftification the fame as the grace of the Holy Spirit, and the firt grace of faith fpringing from it, they fay true; and then there is nothing more in it than an improper ufe of the word jufification, except that from abufe of words very frequently arites fome corruption of doetrine. If they mean only, that outward acs of righteoufnefs are fruits of inward habits or difpofitions;
(M) Bull. Op. Latin:"p. \(412,414,415,430,434,514,516,544,583,645,668\). Edit. uft.-Stillingfleet's Works, vol. iii. p. \(367,380,393,398\).-Tillotfon's Polthumeus Sermons, vol. ii. F. 484, 487.
(i) Voftus de Bonis Operibus, Thef. x. p. 370 .-Op. tom. vi.-Frid. Spanhem. fil. Op. tom, iii. p. 141, 159.

Thenogy that alfo is undoubtedly true : but that is no reafon why wore pecu- internal acts, virtues, graces (good works of the mind), arly Chrr- fhould not be called conditions of juftification ; or why ftian.
 duties which, if he do not fincerely perform, he mult of courle forfeit the favour of his Maker; but the mont perfect performance of his natural duties would not entille him to a fupernatural and eternal reward. Eiemal tille him to a fupernatural and eternal reward. Etemal
life is the gift of God through Jefus Chrift ; and it is furely reafonable that we fnould acknowledge it to be fo, and not claim it as a debt due to our merits. The fo, and not claim it as a debt due to our merits. The
pious and virtuous man has a natural claim to more happinefs than mifery during the period of his exiltence, a claim founded on the attributes of that God who called
him into being; but he has no natural claim to a future claim founded on the attributes of that God who called
lim into being; but he has no natural claim to a future life, and ftill lefs to a perpetuity of exillence. This is a truth not more clearly taught in the holy fcripture than confonant to the foundeft philofophy: and yet, by not attending to it, have St Paul and St James been fet not attending to it, have St Paul and St James been fet fpecting the juftification of Chriftians.

Becaufe frith in Chrift cannot entitle a wicked man to cternal happinefs, one clafs of divines feem to infer
that fuch faith is not neceflary to Chriftian juffification,
and that "his faith cannot be wrong whofe life is in the
right." They proceed upon the fuppofition that man is to cternal happinefs, one clafs of divines feem to infer
that fuch faith is not neceflary to Chriftian juffification,
and that "his faith cannot be wrong whofe life is in the
right." They proceed upon the fuppofition that man is to cternal happinefs, one clafs of divines feem to infer
that fuch faith is not neceflary to Chriftian juffification,
and that "his faith cannot be wrong whofe life is in the
right." They proceed upon the fuppofition that man is to cternal happinefs, one clafs of divines feem to infer
that fuch faith is not neceflary to Chriftian juffification,
and that "his faith cannot be wrong whofe life is in the
right." They proceed upon the fuppofition that man is

Yol. XX. Part I. f puward acts thould not be jallly thocght condion ordinarily given to alults, without any jreparative or previous conditions of faith and repentance, that indeed is very new doctrime and dangerous, and opens a wide door to carnal leemity and to all ungodlinefs."

Such is the doctrine of Chiftian jultification as it has been taught by the followers of Calvin, and by rome of the moft emment A:minians who Hourilled in the end of the 17 th and beginning of the 18 th century. They appear nut, from this view of their opinions, to differ fo widely as fome of them lave wifted the world to believe. It is evident that D. Waterland, though he rejects fome of the dillinguifing tenets of Calvinilm, lays greater threfs upon faith in his fcheme of jullification than Dr Gill himfelf; and that they both confider it as the infrument by which the adult Chisitian muf reccive the imputed righteoufnefs of Chrift. The greater part of modern Arminians, however, exclaim adainft the insputation of Chrin's righteoufnefs, as a doetrine falfe in itfelf, and frauglt with the mon pernicious confequences; and they would be ready to tell Dr Gill, in his own words, that of his fcheme every arlicle is wrong. It is ew true (fay they) that God exacts of mall, or ever exnt of him, an obedience ablolutely perfect, for ....der had habits of virtue and piety to acquire ; and it is probable that his progrefs in piety, virtue, and widdom, will continue for ever, as none but God is perfeet and At:1tionary, and incapable of dcviating from the line of rectitude. Moll of them, after Bilhop Buil, dillike the ufe of fuch unfcriptural phrafes as :he infrument of juftifcation, applied either to faith or to works; and think, that by confidering God as the fole junifier of man, upon certain conditions, they can more precifely afcertain the diftinet provinces of faith and obedience in the fcheme of juftification, than either their brethren of the old fchool of Arminius, or their rivals of the fchool of Calvin.

By the very confitution of man, piety and virtue are

L O G I.
naturally inmortal ; that piety and virtue are cntitled to reward; and that therefore the pious and virtuous man, whatever be his belief, muft undoubtedly inherit an eternal reward. But this is very fallacious reafoning. That picty and virtue are through the divine jultice and benevolence entitled to rexard, is indeed a truth incontrovertible; but that mian who is of yelterday is naturally immortal ; that a being who began to exitt by the mere good will of his Maker, has in himfelf a principle of perpetual exiftence independent of that will-is a direct contradiction. Whatever began to be, can be continued in being only by the power, and according to the pleafure, of the infinite Creator; but it plealed the Creator of his free grace at firlt to promife mankind eternal life, on the fingle condition of their firf father's obferving one pofitive precept. 'That precept was tiolated, and the free gift loll: but the covenant was renewed in Chilt, who " by his death bath abolithed 209 death, and by his refurrection hath brought to light life Faith the and immortality." The condition amexed to the gift cile corthus reftored was faith; for " being jullified by faith *, dition of we have peace with God through our Lord Jefus Chrift ; catompoby whom alfo we have accefs by fuith into this grace culiarly wherein we tand, and rejaice in the hope of the Grory Chriatian: of Goo." Faith therctore in the Son of Grod and Sa- FRom. ت viour of the world, is not only a condition, but the fole \({ }^{1,3}\)
condition, of that juftification which is peculiarly ChriAian; for nince Chrift, without any co-operation of ours, hath purchafed for us the free gift of ctem mal life, we hall be guilty of the groffef ingratitude to our Divine Benefactor, and impioufly claim an independence on God, if we look upon that gift either as a right inherent in our nature, or as a debt due to our meritorious deeds.

But though faith be the condition of juftificatic , as but net of that implies the inheritance of cicrnal life, there are obtaining other conditions to be performed before a man can be eeemal put in polteftion of cternal felicity. By a law long prior to the promulgation of the golpel-a law interwoven with our very being-no man can enjoy the favour of his Maker, who doés not make it his conftant endea. vour "to do juttly, to love mercy, and to walk humbly with his God." This law was in force before man fell; it continues to be in force now that he is redeemed; and it will not be abrogated even at that period when frith thall give place to rifion, and hope to enjoyment. By the prace of the Chrigtian covenant all mankind ate The difBy the grace of the Chritian covenant, all mankind ate ferent con-
rendered immortal in confequence of the dcath and re-ditions of furrection of Chrilt, who is the Lainb flain, in the divine divine fedecree, from the foundation of the world ; but to obtain vour and of immortal happincfs, they muft oblerve the conditions both of natural and of revealed religion, which are repentance from dead works, and faith in Chritt the Redeemer. The former is that condition upon which alone we ean retain the Divine favour, and of courfe enjoy either prefent or future hanpinefs; the latter is a moft equitable acknowledgement requircd of us, that perpetual conlcious exiftence is neither a right inherent in our nature, nor a debt due to our virtuous o'vedience, but merely the gift of God through Jefus Carill our Lord.
"To make the diffinct provinces of faith and works in the bufinefs of jullification clear, let us fuppofe ( fays Bilhop Warburton \(\dagger\) ), that, at the publication of the book Les. gofpel, all to whom the glad tidings of immortality cho?. 3.

Theulogy more peculiarty Chiri. fian.

were
mere

Theology were offered on the condition of failk in Jefus had been mure pecn- moral or virtuous men, and on that account entitied (as natural religion teacheth) to the favour of God and an ajundant reward : is it not felf-evident, that fatth ALove, exclufive of the condition of good works, would, in that cafe, have beca the very thing which julified or entitled them to life everlafing? But are good works, therefore, of no ufe in the Chritian fyltem? So far from it, that thole only who ferve God in finccrity and in truth are capable of the juftification which faith alone embraces ; for, to illuffrate this matter by a faniliar inflance, fuppofe a Britifh monarch to beftow, in free gift, a certain portion of his own domains, to which immortality may well be compared, upon fuch of his fubbjects as fhould perform a certain fervice to which they were not obliged by the laws of the kingdom ; it is evident that the performance of this laff fervice oNiY would be the thing which entitled them to the free giff. Yet it is obvious that obedience to the lars, which gave them a chaim to protection as fubjects, in the enjoyment of their owe property (to whicls the reward offered by natural religion may be compared), would be a previous and neceffry qualification to their enjoyment of their new porefirn ; fince it is abfurd to fuppore that fuch a gific could be intended for rebels and traitors, or indeed for any but good and faithful fervants of their king and country." Well therefore might the apoftle reprove the ignorance or licentioufnefs of certain of his converts at Rome, in his queflion-" Do we then make void the Law hhrough Fattil? God forbid! yea, we establisu THE LAW ;", obedience to it being the previous qualification of all who are entitied to the fruits of jullifying faith-lifi and mmortality.
Had proper attention been paid to this diftinction, which St Paul everywhere makes between fuch duties as are common to all religions that are truc, and thofe whlich ate peculiar to the Chrillian revelation, many ufelefs controverfies might have been avoided refpe ting the inftrumeat of jultificatiou and tie conditions of the Clrifian covenant. By not attending to it, the divines of one fchool, who perceive that the mere belief of any truth whatever cannot entitle a man to eternal felicity, have almoft dropt faith from their fyfiem of Clrififianity, and taught moral duties like Pagan philofophers; whilh another party, who eir almoft as far in their interpre tations of frripture, finding cternal life reprefented as the gift of God, and faith in Clrift as the infrument or means by which that gift muft be accepted, have expunged from their fytem the neceffity of good works, forgetting furely that wicked believers, like believing devils, may be doomed to an eternity of tormerts. But the fum of Chrifitianity, as we are taught by the beloved difciple, is comprelended in this one commandment of God, "that we thould believe on the name of his Son Jefu, Currit, and love one another as he gave us commandment." In perfect harmony with him, the great
* G.al v. . Gapaille of the Gentiles aflures us *, that "in Chrif I lefus nothing can avail to our eternal happinefs but faith

L O G Y.
from the dead to perpetual confcious exintence, are made Theology to us upon the exprefs condition that we obey the law more pecu. of the gofpel; "for God will render to every man according to his deeds: to them that are contentious and do not obey the truth, but obey unrighteoufnefs, indignation and wrath ; tribulation and anguifh upon every foul of mait that doth eril, of the Jew firf and alfo of the Gentile ; but glory, honour, and peace to every man that worketl good, to the Jew firft and alfo to the Gentile *."
Such are the notions of julfification entertained by \(s, 0\). thofe who in the prefent age lave' been confidered as the leaders \(t\) of the fect of Arminians. How far they + Warrourare juff, the reader mult decide for himfelf; but under ton and every view of this doetrine which we have taken, the \(L^{L u z ;}\), \&ce Chrillian covenant appears mach more gracious than that into which Adam was admitted in paradife: fince \(\mathrm{H}_{2}^{214}\) Clriit afiords room for repentance, even to that man, who ftizn covemay be fo unhappy as to be drawn for a time into apof nant more tacy from the terms of the covenant. Whetlier the gracious death of Chrift therefore was a direct atonement for the than thie actual fins of men, or only operated as fucb indirectly by procuring for them repeated opportunities of repentance, it is an undoubted truth, that "if through the offence of one many be dead, mucla more the grace of God, and the gift by grace, which is by one man, Jefus Chrift, hath abounded unto many. And not as it was by one that finmed, fo is the gift: for the judgement was of one offence to condernnation, but the fire gift is of many offence to jufificcation \(\ddagger\)."
Thus gracionfy has the divine gooduefs difplayed it. felf in the refloration of our lof inheritance. Bur it flopt not here. The fame bountititul Lord of life, for its further fecurity, imparts to every true believer the frength and light of his holy fpirit to fuppoit faith in working out our own falvation. Our blefied Saviour promiled, before he left this world, to fend to his followers the Holy Ghoft or Conforter to abide with them for ever, to guide them into all truth, to bring all things to their remembrance whatioever he lad faid unto them, and, as we learn from other paliages of fripture, to "work in them both to will and to do of his good pleafure." How amply this promife was fulfilled to the apoftles, we lave already feen; but we are not to fuppofe that it was refricted to them. As man is defigned for a fupernatural flate in heaven, he flands in need of fupernatural direc-
 Saviout for as no man knowetly the things of a man fave the fpirit of a man which is in him, even fo none knoweth the things of God but the Spirit of God." This omnifcient Spirit indeed "fearcheth all lhings, yea even the deep things of God," and revealeth them to the fons of men, to enlighten their underfandings and purify their hearts. The grace whicl he theds abroad is cither external and general, or interval and particular. The former has been extended to the whole church of God under the patriarchal, Mofaic, and Chrifitian difpenfations, in fuch a revelation of the divine will as was fufficient to inftruet men unto etermal life, whether they had a clear view or not of that flupendous plan of redemption, by which the hingdoin of heaven was opented to them after the forfeiture of the terretrial paradife; for therc have beep " holy prophes's. ceer fince , the world
begra:

Theology began; and prophecy came not at any time by the will rore pecti- of man, but holy men of God fpake as they were moved arly Ciri- by the Holy Gholl *." Hence it is that all friputure \(\overbrace{\text { Rum. }}^{\text {was given by infpiration of God to teach us every thing }}\) Luke i. Which it is neceflary for us to know and believe; and o. and the folipture is that work of the fipirit which is extended peter i. to the univerlal church.

But the lime firit which thus grenerally reveals the object of faith to the church, does likewife particularly illuminate the minds of individual believers, working in them an affert to that which is tought them from the witten word. It was thus that " the Lord opened the
Ant wi. heart of Lydia + ; that llie attended to the things which wete poken by Paul;" it is thus that "the word preached doth not profit if it be not mixed with faith in them who hear it \(\ddagger\);" and it is thus that "God deals to every
Rom. xii. man the meafure of faith \(\|\);" for "by grace are we faved through faith, which is not of ourfelves; it is the
Ephe ii.s.gift of God §." This illumination of the Spirit was conveyed to the apollles "in a found from heaven as of a rulling mighty wind," becaule it was meatt to teftily to the world that they were chofen minillets of the golpel ; but the ordinary Chriftian receives it "in the tlill finall voice," becaule it is conveyed to him only to "open his underitanding that he may underitand the fcriptures."
egenerates Another operation of the Spirit on the minds of behem, lievers is that which in foripture is called i\}EgENERATION ; for "accolding to his mercy Giod liveth us by the walhing of regeneration and renewing of the Holy \({ }^{\text {'Titus i. Ghof * }}\), which he theds on us abundantly through Jefus ,6. Chrift our Lord." To thofe who believe that we derive from Adam a corrupted nature, this particular grace mult appear fo ablolutely neccllary, that without it we could have no relif, for heaven or heavenly things." "The natural man (we are told) receiveth not the things of the fpirit of God; for they are foolithnefs to him ; neither can he know them, becaule they are fpiritually difcerned." Indeed whatever be the powers of our moral faculties, when compared with thofe of our firit father, it is fo long before they be completely developed, that we thonld infallibly be loft, if we were not bleffed by a fupernatural guide, when reafon is incapable of directing our conduct. Our paffions and appetites are in their full frength before experience has furnithed the mind with materials, by mans of which motives may be weighed; and therefore it would be impoffible, duting the giddy period of youth, to keep there in due fubjection, or to prevent vicious habits from being furmed, were we not influenced by divine grace. So true is it, that " except a man be born again of water and of the Foly Gholt, he cannot enter into the kingdom of God." This change in our difpolitions, from an immoderate attachment to earth to a relift for the things of heaven, is in fcripture called "a renewing of our minds, a new creation, a new man;" in oppoff. tion to our natural difpofition, which is called "t the old man, corrupted according to the deceitful lufts." The ancient fathers of the church, as well as fome very eminent modern divines \(t\), generally fpeak of baptifm as the inftrument in Gud's hand of man's regeneration; and for (un. the truth of their opinion they appeal to Jolm iii. 3, 5. Ephef. v. 25, 26. and I Cor. vi. II in which great flefs is certainly laid on the ralhing of water, as well as on fanctification by the word.

\section*{L O G Y.}

A third ollice of the Holy Spirit is to lead, direct, and govern us through all the periods of our lives. Without fuch a leader and guide, the temptations with which we are furrounted nould certainly overcome us, and we thould faint long before we urive at the end of 2 217

Theology more pecter iarly Chrs. tisn. our journey. By the very confticution of our nature we Fides are fubjected in lome degree to the intluence of lenfe, them of which the objects are prefent, whint the enjoymentstiongh of heaven are future, and feen, as at a cintance, only by the eye of taith; but "the law of the Spirit of life, in Chrill Jefus, hath made us free nom the law of fin and death;" for God worketh in us both to will and to do of his good pleafure; and as nany ats are thus led by the fpirit ct God, they are the fons of Gool ; and while they walk in the Spirit, they do not fullin the lutts of the fteth." Withoul the aid of the fame Spirit, we could not even make our prayers acceptable; for fince "our confidence in God is, that he hearetly us only when we alk ary thing according to his will; and fince we know not what we flould pray for as we ought, the Spirit itlelf maketh interceffion for us with groanings which cannot be uttered *.

A fourth operation of the Holy Ghon, as he is the 26. fanctificr of Chrifians, is to join them to Chrit, and make them members of that one body of which he is the head. "For by one Spirit are we all baplized into one body + ; and as the body is one and lath many +1 Cor. members, and all the members of that one body being xit. 12,13 . many are one body, fo alfo is Chrit." "Hereby we unites them know that God abideth in us, by toe Spirit which he to Clurit, hath given us;" and as, in the ordinary courfe of his dealings with Chrilians, this Spinit is firtt given in baptifm, to is it continued to the faithful by the inlmomentality of the Lord's fupper. That ordinance we have ellewhere (lee SUpPER of the Lord) proved to be a federal rite; and furely no time can be fappofed fo highly fanctified for the reception of the graces of the Holy Spinit, as that in which we renew uur federal unton with our Lord and Mafter in the communion of his body and blood.

It is likewife the office of the Holy Ghon to give us an earneft of our everlafling inheritance, to create in us a lenfe of the paternal love of God, and thereby to affure us of the adoption of fons. "As many as are led by the Spirit of Gud, they are the soss of God; and becaule we are fons, God hath fent forth the fpirit of his Son into our hearts. For we lave not received the fpirit of bondage again to fear: but we have received the Spirit of adoption, whereby we cry Abba Father; the Spirit itfelf bearing witnefs with our fpirit, that we are the children of God t"".

As the gifts of grace are generally amexed to means, to the proper ufe of the word and facraments, it is a fixth office of the fame Spirit to fanctify fuch perfons as are regulatly fet apart for the work of the miniftry, and ordained to offer up the public prayers of the people; to blefs them in the nane of God; to teach the du feine 1279 fer the of the gofpel ; to adminifter the facraments inlfituted by fies the adChrift; and to perform all things neceflary "for the tions of the perfecting of the faints, for the work of the minifry, minifers for the edifying of the body of Clirill \(\|\)." The fame of the gofSpirit which illuminated the apoflles, and endowed them with power from above to perform perfonally their apollolic functions, fitted them alfo for fending others, as they were fent by their Divine Mafter ; and for elta-

Thesogr bubhing fuch a conftitution of the church as was belt -are pecu- alopied for prelerving Chrilians in the unity of the
 power io a fucceftive minittry to be conveyed duwn to the end of the sorld; and thofe sho are refted with that power are obliged to "take heed unto themfelves, and to all the flock over which the Holy Gross hath made them overfeers to feed the church of God, and to contend eameli!y for the faith which was once deli-
* 3.C:Sx.

3ô. and
Thue ver. 3 vered unto the faints *" Sec Eriscoracy, Independents, Prestyterians, Porl, at d Quakers.

By thefe, and the like nicans, doth the Spirit of God fanctify the fons of men; and in confequence of this fanctification proceeding immediately from his office, he is callen the Holy Spiric and the Comforter. This is luch a provifion "for renewing us in the lpirit of our minds, and cnabling us to put on the new man, which, after God, is created in righteoufnefs and true holinefs," as, whea made known by revelation appears to have been expedient, may be conceived to have been even neceffary, and, though reaton could hardly hare hoped
2n9 for it, is contradicted by none of our natural notions Controver- eitter of God or of man. Many, howewer, are the controverfies to which it has given rife in the chutch of God; forme contending that it is given only unto the clect, upon whom it operates with refitlefs efficacy; others affirming that it is offered to all, but in fuch a manner as that, by the abufe of their free will, it may ce "refifted, grieved, and quenched ;" and fome few; fill intosicated with the pride of Peringus, think it is not neceffary, and of courfe is not bellowed.
'The quettions concerning election, the efficacy of grace, and the final perfeverance of the faints, we have thated elferwhere, and given a fummary view of the arguments by which the contending parties maintain their refective opinions (fee Predestivation); and the texts of Scripture which we have juft quoted, under the cifferent heads of fanctification, how fufficiently that the cpinion of Pelagius is directly contrary to the doctrine of the apoftles. It may not be improper to enguire whether it be as agreeable to reafon and experience as its patrons feem to imagine.

If it be unteafonable to cxpeet any affifance from the Spizit of God in carrying on the work of our own falvation, how came fo many of the wifeft and beft of men in all ages to believe, that he who fincerely endeavours to difcharge his duty is fupported in that endeavour by affilance from heaven ? That fuch was the popular belief of the early Greeks, is evident from the pocms of Honcr; in which we everywhere find Come god calming the paftions of the heroes, altering their delerminations when improper, and infpiring them witl vifdom. Nor was this the fentiment of the poets only. Socrates, it is well known, profeffed to believe that his own conduct was under the direction of a fuperior fpirit, which he called a diemon; and Plutarch, as we find him quoted by Wollatton, fpeaks of the gods aflifing men, by "exciting the powers or faculties of the [oul; by fuggefting feeret principles, imaginations, or thoughts; or, on the contrary, by diverting or flopping them." Of the famc opinion mun Cicero have been, when he faid, "ftabit illud quidem, quod locum bunc continet, de quo agimus, effe Deos, et eorum providentia mundum adnuinillrari, cofdemque confulcre rebus humanic, nec folum wiverfors, verum etiam sinculs *;" for it is

\section*{L O G Y.}
not conceivable that a particular providence can be ad. Theolong miniltered without the influence of the Deity on the more pecuminds of men. That the poets and philotophers of the liarly Cliriheatien world derived thefe notions fiom primeval tradition, cannot, we think, be quettioned ; but if they were ablurd in therafelves, or apparently contradictory to the laws of nature, they would not furely have been fo univerfally embraced; for it will fearccly be denied, that Socrates and Cicero were men of as great natural fagacity as Pelagius or any of his followers. It is inn deed fo far frem being incredible that the Father of fpirits occafiomally directs the thoughts and actions of men, that we believe there are very few who have made obfervations on themfelves and their own affairs, who hare not found, on reflection, many inflances in which their ufual judgement and fenfe of things were overruled, they know not hoze or whiy; and that the actions which they performed in thote circumtlances have had confequences very remarkable in their general hifory. See Promdence, N \({ }^{11} 18\), 19 .

This being the cafe, why flould the pride of Chriflians make them heftate to admit, on the authority of divinc revelation, what Socrates, and Plutarch, and Cicero, and all the virtuous and wife men of antiquity, admited in effect, on no better evidence than that of oral tradition, fupported by their own meditations on their own thoughts, and the principles of their own conduet? Is it that they fee not fuch bencficial effects of Chillianity as to induce them to believe the profeffors of that religion to be indeed "chofen to falvation through the fanetification of the Spirit \(f\) ?" Let them ftudy the practical precepts of the gofpel, confider the Theff. it: confequences which they have had on the peace and happinefs of fuciety, and compare the general conduct of Contifians with that of the lews, Pagans, and Mahometans (fee Remigios), and they will doubtlefs find reafon to alter their opinion; and let thofe who embrace the truth. remember, that as they are the temple of God, if the Spirit of Cod dwell in them, "it is their indifpenfable duty to cleanfe themfelves from all fith:nefs of the flell and fpirit; to follow peace with all men, and holinefs, without which no man flall fce the Lord; and to work out their own falvation with fear and trembling, fince it is God who worketh in them both to will and to do of his good plenfure."

From this chort view of the feveral difpenfations of The gopet revealed religion, it is evident that the golpel is not on-the left rely the beft but the laft gift of the kind which man has relation. to expect from his Maker; that the fcheme of reveliation is completed; and that the pretences of Mahonet and of more modern enthufiafts to divine infpiration are not only falfe, but fraught with contradictions. All thefe men adnut the divine origin of the Mofaic and Chriflian religions; but it appears from the fcriptures, in which thofe religions are taught, that the fyftem of revealed truths which confitute the Patriarchal, Mo. faic, and Chriftian revelations, commenced with the fall of man, and that it muft therefore neceffarily cnd with his refloration to life and immortality by the facrifice of Chrift upon the crofs. A new revelation therefore like that of Mahomet cannot be admitted without rejecting the whole Biblc, though the impoftor himfelf every: where acknowledges the infpiration of Abraham, of Mofes, and of Chrift. Nor is greater regard due to the claims of Ciriftian enthufiats. Such as pretend to
beology have been in heaven *, and thence to have brought re pecti- fyiritual difcoveries to the earth, have cilher forgotien ys Cari- or never underitood, that in the friptures of the Old ftian. and New 'Tetlaments the great fene of Providence appears to be clofed in the full completion of its one regular, entirc, and cternal purpofe ; that St Paul has pronounced + a curic on any inan or angel from heaven who hasll preacha another gofipel than what has been already preached by the apuilles and cvangeliits; that in
their writings we are taught every thing which it is our Theology duty to believe or to prachife in order to our own falva. more pecution; and that we lave the promife of our bleffed liarly fian. Lord himfelf, that the Spirit of truth flall remain \(\underbrace{\text { Hiano }}\) with us to guide us into all necoffary truith, till that great day when he flall come again to judge the world in righteoufnefs, and render to every man ascording to his works.

neophraf- THEOPHRASTA, a genus of plants belonging to in the clafs pentandria. See Borany Index.

THEOPHRASIUS, the philofopher, was born about 371 years before Chrift, and was fucceffively the difciple of Plato and of Ariftotle. He fuccecded Arifrotlc in the Peripatetic fchool, and conducied the charge with fuch high reputation that he had about 2000 foholars. He is lighty celebrated for his induifry, learning, and eloguence ; and for his senerofity and public fpirit. He is faitl to have twice freed his country from the opprefion of tyrants. He contributed liberally towards defraying the expence attending the public meetings of phiilofoplers; which were held, not for the fake of thow, but for learned and ingenious converfation. In the public fichouls he commonly appeared, as Aritotle had done, in an elegant drefs, and was very attentive to the graces of elocution. He lived to the advanced age of 85 : fome fay of \(10 \%\). Towards the clofe of bis
tory of life, he grew exceedingly infirm, and was caried to the
ilofof ity. fchool on a couch. He exprefficd great regret on account of the fhortnefs of life; and complained that nature had given long life to itags and crows, to whom it is of fo little raiue, and had denied it to man, who, in a longer duration, might have been able to attain the furmit of fcience; but now, as foon as he arrives within fight of it, is taken away. His laft advice to lis difciples was, that, fince it is the lot of man to die as foon as he begins to live, they would take more pains to enjoy life as it paffes, than to acquire pofhumous fame. His funeral was attended by a large hody of Athenians. He wrote many valuable works, of which all that remain aue, feveral treatifes on the Natural Hifory of Plants and Fofflls; Of Winds, Of Fire, \&c. a rhetorical work entitled "Claracters," and a few Metaphyfical Fragments.

To Theozhrattus we are indebted for preferving the works of Aritotle. See Aristorie.

THEOPOMPUS, a celebrated Greek orator and hiftorian, was born in the ifland Chios, and flomifhed in the reign of Alewander the Great. He was one of the mof famous of all the difciples of 1 focrates, and won the prize from all the panegyrits whom Arlemifia invited to praife Maufolus. He wrote feveral works, which are lont.

THEOREM, a propofition which terminates in theory, and which cunfiders the properties of things already made or dosie ; or it is a feculative propofition deduced from comparing together feveral definitions. A theorcm is fomething to be proved, and a problem fomething to be done.

\section*{T H E}

THEORETIC, fomething relating to theory, or that Treeret is terminales in fpeculation.

THEORY, in general, denotes any dotrine which torminates in fecculation, without confidering the pradi. cal ufes or application thercof.

THEOSOPHISTS, a fet of men who pretend to derive all their knowledge from divine illumination. They boaf that, by means of this celeftial light, they are not only admitted to the intimate knowledge of God, and of all divine truth, but have accefs to the moft fublime fecrets of mature. They afcribe it to the fingular manifcftation of divine bencvolence, that they are able to make fuch a ufe of the element of fre, in the chemical art, as enables them to difcover the efiential frinciples of bodies, and to difclofe fupendous myferies in the phyfical world. They even pretend to an acquaintance with thofe celefial beings which furm the medium of intercourfe between God and mar, and to a power of obtaining from them, by the rid of magic, aftrology, and other fimilar arts, various kinds of information and affilance.

To this clais belonged Paracelfus, Robert Yludd, Ja. cob Bechmen, Toun Helmont, Peter Poiret, and the lioficrucians. They are alfo called Fter-Philofophers.

THERAPEUTE, a term applied to tho? that are wholly in the fervice of religion. This general term has been applied to particular fects of men, concerning whom there have been great difpites among the learned.

THERAPEUTICS, that part of medicine which acquaints us with the rules that are to be obferved, and the medicines to be employed, in the cure of dif. eafes.

THERMIA, hot baths or bagnios. Iuxury and extravagance were in nothing carried to fuch heights as in the therme of the Foman emperons. Ammian com plains, that they were built to fuch an extent as to equa! whole provinces; from which Valefus would abate, by reading pifcince inftead of provincice. And yet after all, the remains of fome fill flanding are fufficient teffimonics for Ammian's cenfure; and the accounts tranfmitted of their ornaments and furniture, fuch as being laid with precious fones (Serieca), fet round with feats of folid filver (Pliny), with pipes and cifterns of the fame meta! (Statius), add to. rather than take from, the cenfure. The moft remarkable bagnios were thofe of Dioclefian and Caracalla at Rome, great part of which remains at this day; the lofty arches, fately pillars, varie. ty of foreign marble, curious vaulting of the roofs, great number of fpacious apartments, all attaet the curiohty

Invention
of the thermometer.
MArtine"s
ETav.
* cbem. I. p. 152,156 + Life \(F\). Paul, p. 15 S . flit. Ga7il. p. 67. if Corn. inn Gaient. [1. \(736-3+2\) \(\$ D_{e} 12 \mathrm{t}\). Auimal. II. prop. 175. + opera Po/tb. P. 30 , rould be, to fuppole that he themometer was really invented by different perfons about the fame time. We know that there are certain periods in the progrefs of the arts when the flream of human genius runs in the fame direction, and moves towards the fame object. That part of the current which reaches the object firft may poffefs the title; but the other parts follow fo rapidy and arrive fo foon aficr, that it is impoffible fur a fockator to cecide which is firt in point of time.
The air. thermometer deffribed.

The firf form of this inftrument for meafuring the degrees of heat and cold, was the air-thermometcr. It is a well known fact that air expands with heat fo as to occupy more fpace than it does when cold, and that it is condenfed by cold fo as to occupy lefs fpace than when warmed, and that this expanfon and condenfation is greate: or lefs according to the degree of heat or cold afplied. The principle then on which the air-thermometer was conltructed is wery fimple. The air was confined in a tube by means of fome coloured liquor; the liquor rofe or fell according as the air became expanded or condenfed. What the full form of the tube was, cannot now perhaps be well known; but the following defcription of the air-thermometer will fully explain its namure.

The air-thermometer confifts of a glafs tube BE, connected at one end with a large glafs ball A , and at the other end immerfed in an open veffel, or terminating in a bal! DE , with a narrow orifice at D : which veffel, or ball, contains any coloured liquor that will not eafily freeze. Aquafortis tinged of a fine blue colour with a fulution of vitriol or copper, or firitit of wine tinget with cochineal, will anfwer this purpofe. But the ball A muft be firft moderately warmed fo that a part of the air contained in it may be expelled through the orifice I ; and then the liquor preffed by the weight of the atmofphe:e will enter the ball DE, and rife, for examp!e, to the middle of the tube at C , at a mean temperature of the "eather; and in this Itate the liquor by its weight, and the air iucluded in the ball \(A\), \&ic. by its clafticity, will counterhalarice the weight of the atmofineere. As the furrounding air becomes warner, the air in the ball and upjer part of the tube, expanding ty leat, will drive the liquor into the lower ball, and confequently is furface will defcend ; on the contrary, as the ambient air becomes colder, that in the ball is condenfed, and the liquor preffed by the weight of the atmofphere will afcend: fo that the ligtor in the
tube will afeend or defcend more or lefs according to Tiermothe flate of the air contiguous to the inftrumernt. 'To the tube is affised a fcale of the fame length, divided upwards and downwards from the middie C into 100 equal parts, by means of which the afeent and defent of the liquor in the tube, and confequently the variations in the cold or heat of the atinofphere, may be obferved.

This inftument was extremely defective; for the air tot deficas \({ }^{3}\) in the tube was not only affecled by the heat and cold of the atmofphere, but alfo by is weight.

The air being found improper for meafuring with ac- The 4 , init cuacy the variations of heat and cold according to the of wine form of the thermometer which was firit adopted, ano-thermome ther tluid was propofd about the middle of the 17 tht \(^{\text {ter }}\)
century by the Florentine academy. This fluid was fpirit of wine, or alcohol, as it is now generally named. The alcohol being coloured, was inclofed in a very fine cylindrical glafs tube previoufly exhaufted of its air, having a hollow ball at one end A , and hermetically fealed at the other end D. The ball and tube are filled with rectified fpirit of wine to a convenient height, as to C , when the weather is of a mean temperature, which may be done by inverting the tube into a veffel of flagnant coloured pirit, under a receiver of the air-pump, or in any other way. When the thernometer is properly filled, the end D is heated red hot Ly a lamp, and then hermetically fealed, leaving the included air of atout one-third cf its matural denfly, to present the ar which is in the fpirit from dividing it in its expanfion. To the tube is apphied a fcale, civided from the midelc, into reo equal parts, upwards and downwards.

As firit of wine is capable of a very conliderable degree of tarefaction and confenfation by heat and cold, when the heat of the atmofphere increafes the fpiit dilates, and corfequently rifis in the tube; and when the beat deczeafes, the firit defcends, and the degree or quantity of the motion is fhown by a feale.

The lpirit of wine thermomeler was not fubje \&t tolis defectso fome of the inconveniences, which attended the air thermometer. In particular, it was not affected by vaisations i:a the weight of the atmorphere : accordingly it foon carie into general ufe among philofophers. It was, wartine: at an early period, introduced into Britain by Mr Boyle. Evayso To this influmient, as then ufed, there are, however, many objections. The liquor was of different degrees of ftrength, and therefore different tubes filled with it, when expoled to the fame degree of licat, would not correfpond. There was alfo another defect: The fcale which was adjufted to the thermometer did noit commence at any fixed point. 'The highert term was adjufted to the great funfline heats of Florence, which are 100 variable and undetermired; and frequently the workman formed the fcale according to his own fancy. While the thermometer laboured under fuch difadvantages it could not be of general ufe.

To obtain fome fixed unalterable point by which a Diferne determined fcale might be difoovered, to which all ther-fixed point monneters might be accurately adjufled, "as the fubject propored hy which next drew the attention of plilofophers. MIr phers. Brylc, who feems at an early period to have fudied this fubject with much anxiety, propofed the freczing of the efiential oil of amifeeds as a convenient point for grasluating the mometes; bet this opinion he foon haid afide. Dr Ifalley next propofed that thermometers

\section*{T H E [ 399 ] T H F}

Thicrmo- fhould be graduated in a deep pit under ground, where meter.

\section*{\(\rightarrow\)} the temperature both in winter and fummer is pretty unitorm; and that the point to which the firit of wine fhould rife in fuch a fubterraneous piace fhould be the point from which the fcale flould commence. But this propolal was evidently attended with fuch inconveniences that it was foon abandoned. He made experiments on the boiling point of water, of mescury, and of fpirit of wine; and he feems rather to give a preference to the fpirit of wine *. He objected to the freczing of rranf. Alr. water as a fixed point, becaufe he thought that it admitted confiderable latitude.

It feems to have been referved to the all-conquering genius of Sir Ifaac Newton to determine this important point, on which the accuracy and value of the themometer depends. He chole, as fixed, thofe points at which water freezes and boils; the very points which the experiments of fucceeding philofopliers have determined to be the moit fixed and conventent. Senfible of the difadvantages of firit of wine, he tried another liquar which was homogeneous enough, capable of a confiderable rarefaction, about 35 times greater than fpirit of winc. 'This was linfeed oil. It has not been obferved to freeze even in very great colds, and it bears a heat about four times that of water before it boils. With thefe advantages it was made ufe of by Sir lface Newton, who difcovered by it the comparative degiee of leat for boiling water, melting wax, builing fpirit of wine, and melting tin; beyond which it does not appear that this thermometer was applied. The method he ufed for adjufting the fcale of this oil thermometer was as follows: Suppofing the bulb, when immerged in thawing fnow, to contain 10,000 parts, he found the oil expand by the heat of the human body fo as to take up \(\frac{{ }^{\frac{3}{3}}}{3}\) th more fpace, or 10,256 fuch parts; and by the heat of water boiling frongly 10,725 ; and by the eat of melting tin 11,516. So that reckoning the freezing point as a conmon limit between lieat and cold, he began his fcale there, marking it 0 , and the heat of the human body he made \(12^{\circ}\); and confequently, the degrees of heat being proportional to the degrees of rarefaction, or \(256: 725:: 12: 3 \frac{1}{4}\), this number \(3+\) will exprefs the heat of boiling water; and by the fame rule, 72 that of melting tin \(\dagger\). This thermometer was conltructed in 1701.

To the application of oil as a meafure of heat and cold, there are infuperable ubjections. It is fo vifcid, that it adheres too flrongly to the fides of the tube. On this account it afcends and defcends too flowly in cafe of a fudden heat or cold. In a fudden cold, fo great a portion remains adbering to the fudes of the tube after the \(r\) fit has fubfided, that the furface appears lower than the correfponding temperature of the air re. quires. An oil thermometer is therefore not a proper meafure of heat and cold.

All the thermoneters litherio propoled were liable to many inconveniences, and could not be confidesed as cxact fandards for pointing out the various degrees of temperature. This led Reaumur to attempt a new one, an account of whicle was publithed in the year 1730 in the Memoirs of the Academy of Sciences. This thermometer was made with fuirit of wine. He took a large ball and tube, the dimenfions and capacities of which were known; he then graduated the tube, fo that the fpace from one divifon to another might con-
tain 1000 h part of the liquor; the liquor containing Therme1000 pats when it itood at the freezing point. He ad. meter. julled the thermoneter to the freezing point by an ar. Martunes tificial congelation of water: then putting the ball of F:/fuys \(n\) his thermometer and part of the tube into hoilisg water, tio Cionhe obferved whether it rofe 80 divifions: if it exceeded /ltution of thele, he changed lis liquor, and by adding water thermomelowered it, till upon trial it mould juft rife \&o divifions; or if the liquor, being too low, fell thort of 80 divifions, he raifed it by adding rectified fpirit to it. The liquor thus prepared fuited his purpofe, and ferved for making a thermoneter of any fize, whofe fcale would agree with lais flandard.

This thermumeter was far from being perfcet. Asjes defects the bulbs were three or four inches in diameter, the furrounding ice would be melted before its temperature could be propagated to the whole firits in the bulb, and confeq̧uently the freezing point would be marked higher than it mould be. Dr Martine accordingly found, that intead of coinciding with the 32 d degree of Fahrenheit, it correfponded with the 34 th, or a puint a little above it. Keatmur comenitted a mittake alfo refpecting the boiling point; for lee thought that the firit of wine, whether weak or trong, when innmerged in boiling water, received the fame degree of heat with the boiling water. But it is well known that highly rectified fpirit of wine cannot be licated much beyond the 175 th degree of Fahrenheit, while boiling water railes the quickfilver 37 degrees higher. There is another thermometer that goes by the name of Reaumu's, which thall be afterwads deferibed.

At length a different fluid was propofed, by which Mercuriat thermometers could be made fret from manf of the de thermumefeets litherio mentienid. This fluid was mercury, \({ }^{\text {ters. }}\) and feems firt to have occurred to Dr Ilalley in the laft century; but was not adopted by him on account of its having a fmaller degree of expanfibility than the other fluids ufed at that time *. Boerhave fays that * plit. the mercurial thermometer was finf confructed by Tranf. voi. Olaus lioemer ; but the honour of this invention is ge- xiii. or nerally given to Fahrenheit of Ampterdam, who prefented an account of it to the Ruyal Society of London in 1724.

That we may judge the more accurately of the proFricty of employing mercury, we wil! compare its n?alities with thofe of the fluids already mentioned, air, al. cohol, and oil.

Air is the molt expanfible fluid, but it does not re-Properries ceive nor part with its heat fo quickly as mercury. Al. of air, alcohol does not expand much by heat. In its ordinary cohol, anes fate it does not bear a much greater heat than \(175^{\circ}\) oil. of Fahrenireit; but when highly reaified it can bear a greater degree of cold than any uther litguor hitherto empluyed as a meafure of temperature. At Hudfon's Bay, Mr Macnab; by a mixture of vitrolic acid and fnow, made it to defcend-to 69 below of Fahrenheit. This is an inconvenience, horevet, attending the ufe of this liquor ; it is not poffible to get it always of the fame degree of Brensth. As to oil, its expanfion is about 15 times greater than that of alcohol; it futains a heat of \(600^{\circ}\), and its freezing point is fo low that it has not been deteminecr; but its vifcofity renders it ufelefs.

Mercury is fuperior to alcohol and oil, and is much metrical more manageable than air. I. As far as the experi-properties

Fherms- ments already made can determine, it is of all the fluids macter.

Tra\%\% ior : 56. hitherto employed in the contruetion of thermometers, that which meafures moft exactly equal differences of heat by equal differences of its bulk : its dilatations are in fact very nearly proportional to the augmentations of heat applied to it (A). 2. Of all liquids it is the moft eafily freed from air. 3. It is fitted to meafure high degrees of heat and cold. It fuftains a heat of \(630^{\circ}\) of Fahrenheit's fcale, and does not congeal till it fall 39 or 40 degrees below 0 . 4. It is the moft fenfible of any fluid to heat and cold, even air not excepted. Count Rumford found that mercury was heated from the freezing to the boiling point in 58 feconds, while water took two minutes 13 feconds, and common air 10 minutes and 17 feconds. 5. Mercury is a homogeneous fluid, and every portion of it is equally dilated or contracted by equal variations of heat. Any one thermometer made of pure mercury is, coeteris paribes, poneffed of the fanse properties with every other thermometer made of pure mercury. Its power of expanfion is indeed about fix times lefs than that of fpirit of wine, but it is great enough to anfwer moft of the purpofes for which a thermometer is wanted.

The fixed points which are now univerfally chofen for adjufting thermometers to a fcale, and to one another, are the boiling and freezing water points. The boiling water point, it is well known, is not an invariable point, but vaties fome degrees according to the weight and temperature of the atmofphere. In an exhaufted receiver, water will boil with a heat of \(98^{\circ}\) ar \(100^{\circ}\); whereas in Papin's digefter it will require a heat of \(4^{12}\). Hence it appears that water will boil at a lower point, accooding to its height in the atmopliere, or to the weight of the column of air which preffes upon it. In order to enfure uniformity therefore in the confruction of thermometers, it is now agreed that the bulb of the lube be plunged in
the water when it boils violently, the barometer flanding Tiermoat 30 Englifh inches (which is its mean height round London), and the temperature of the atmópliere \(55^{\circ}\). A thermometer made in this way, with its boiling point at \(212^{\circ}\), is called by Dr Horney Bird's Fahrenheit, becaufe Mr Bird was the firt perfon who attended to the flate of the barometer in confructing thermometers.

As artifts may be olten obliged to adjult thermometers Rule for under very different preffures of the atmofphere, philo-adjuting fophers have been at pains to difcover a general rule thermome. which might be applied on all occafions. M. de Luc, in ters to his Recherches fur les MIod. de CAtmo/phere from a feries of experiments, has given an equation for the allowance on account of this difference, in Paris mealure, which has been verified by Sir George Shuckburgh*; allo* fbil. Dr Honley, Dr Mafkelyne, and Sir George Stiuck-Tranif. for burgh, have adapted the equation and rules to Englifh 1755 and meafures, and have reduced the allowances into tables \({ }^{177^{8}}\). for the ufe of the artift. Dr Horfley's rule, deduced from De Luc's, is this :
\[
\frac{99}{8990000} \log . z-92.804=h
\]
where \(h\) denotes the height of a thermometer plunged in boiling water, above the point of melting ice, in dcgrees of Bird's Fahrenheit, and \(\approx\) the height of the barometer in roths of an inch. From this rule he has computed the following table, for fuding the heigits, to which a good Bird's Fahrenheit will rife when plunged in beiling water, in all fates of the barometer, from 27 to \(3^{1}\) Englifh inches; which will ferve. among otlier uiles, to dite \(\mathcal{C t}\) inftrument-makers in making a true allowance for the effect of the variation of the barometer, if they thould be obliged to finith a thermometer at a time when the barometer is abnve or below 30 inches; though it is beft to fix the boiling roint when the barometer is at that height.

Equation
(A) We have affirmed that the expanfons of the bulk of quichfilver hy heat are nearly (for they are not frietly So) in a regular arithmetical progreffion, according to the quantity of heat it is expefed to ; and fuch feenss to be the cafe according to the Table publithed by Mr de Luc, at page 3 eg of his firft volume on the Nodifications of the Atmofphere. The following extrad of this table Mows thefe vaitations: and the firt and fecond difierences are Crompeds.s. added, in order to render thefe irregularities more fenfible. They are fuch as can hardly be conceived from the Nineralonature of any fubftance, without the influence of extrancous and accidental caufes, which may have efcaped the 3y', vol. ii. attention of the obferver; neither have they been found cxactly true by Dr Crawford. Mr de Lue fuppofes the whole heat from melting ice to that of boiling water to be divided into 80 parts; by the fractional fubdivifions of which he exprefles the abfolute quantities of heat, anfwering to each 5 or 10 degrees of Reaumur's thermometer ( \(=22,5\) of Fahrenheit's fale); fo that the whole fum of thefe fraclions amounts exactly to the affumed number 30. The numbers in the frt column of this table exprefs heights of the quickflver in the barometer in Englith inches and decimal parts: the fecond column hows the equation to be applied, according to the fign prefixed, to \(212^{\circ}\) of Bird's Fahrenheit, to find the true boiling point for every fuch fate of the barometer. The boiling point for all intermediate fates of the barometer may be had with fufficient accuracy, by taking propertonal parts, by means of the third column of differences of the equations. See Philofophical Tranfactions, vol. Ixiv. art. \(3^{\circ}\).; alto Dr Mafkelyne's I'aper, vol. lxiv.

Sir George Shuck burgh has alto fubjoined the following general table for the use of artifts in constructing the thermometer, boll according to his own obforvations and thole of M. de Lac.

7hernoom motes.

The Royal Society, fully apprifed of the importance 01, ivaof adjufting the fixed points of thermometers, appointed tins made a committee of, fever gentlemen to confider of the bert by a contmethod for this purpose; and their report is published the Royal in the Phil. Tranf, vol. lxvii. part ii. art. 37.

They observed, that though the boiling point be plat- adjusting cen fo much higher on forme of the thermometers now the fixed made than on others, yet this does not produce any con- \({ }^{\text {points. }}\) fiderable error in the obfervations of the weather, at leal in this climate; for an error of \(\frac{70}{2}{ }^{\circ}\) in the pofition of the boiling point, will make an error only of half a degree in the position of \(92^{\circ}\), and of not more than a quarter of a degree in the point of \(62^{\circ}\). It is only in nice experiments, or in trying the heat of hot liquors, that this error in the boiling point can be of much emportance.
In adjusting the freezing as well as the boiling point, the quickfilver in the tube ought to be kept of the fame heat as that in the ball. When the freezing point is placed at a considerable diflance from the ball, the pounded ice fhould be piled to fuck a height above the ball, that the error which can rife from the quickfilver in the remaining part of the tube not being heated equally with that in the ball, foal be very finall, or the observed point mull be corrected on that account according to the following table:
\begin{tabular}{|c|c|}
\hline \begin{tabular}{c} 
Heat of the \\
Air.
\end{tabular} & Correction. \\
\hline \(42^{0}\) & .00087 \\
52 & \(.0017+\) \\
62 & .00261 \\
72 & .00348 \\
82 & .00435 \\
\hline
\end{tabular}

19 Table for correcting the freezing point.

The correction in this table is expreffed in rogoth parts of the diflance between the freezing point and the Surface of the ice: e. gr. if the freezing point fiends Seven inches above the furface of the ice, and the heat of the room is 62 , the point of \(32^{\circ}\) fhould be placed \(7 \times 00261\), or .018 of an incl lower than the obferred point. A diagonal fcale will facilitate this correcion.

\section*{23}

At what
n , in the fcale ought :o com. menre.

The committee obferve, that in trying the heat of liquors, cave fhould be taken that the quick filver in the tube of the thermometer be heated to the fame degree as .that in the ball; or if this cannot be done conveniently, the obfersed heat thould be corrected on that account; for the manner of doing which, and a table calculated for this purpofe, we muit sefer to their excellent report in the Pail. Tranf, vol. 1xyii. part ii. art. 37.

With regard to the choice of tubes, they ought to be exactly cylindrical. But though the diameter hould vary a littie, it is eafy to manage that matter in the manner propofed by the Abbé Nollet *, by making a fmall portion of the quickfilver, e. gr. as much as fills up an inch or half an inch, flide backward and forward in the tube; and thus to find the proportions of all its inequalitie, and from thence to adjuft the divifions to a fcale of the moft perfect equality. The capillay tubes are preferable to others, becaufe they require fmaller bulbs, and they are allo more fenfible; and lefs brittle. The moft convenient fize for common experiments has the internal diameter about the 40 th or 50 th of an inch, about nine inches long, and made of thin glafs, that the rife and fall of the mercury may be better feen.

The next thing to be confidered, is of what number of degrees or divifions the fale ought to confitt, and from what point it ought to commence. As the number of the divifions of the fcale is an arbitrary matter, the fcales which have been employed differ much from one another in this circumitance. Fahrenheit has made 180 degrees between the freezing and boiling water point. Amontons made 73, and Sis Ifaac Newton only \(34 \cdot\) There is, however, one general maxim, which ought to be obferved: That fuch an arilhmetical numbler flould be cloofen as can enfily be divided and Jubdivided, and that the number of divifions foould le fo great that there foll feldom be occafion for fraitions. The number 80 chofen by heaumur anfwers extremely well in this refipect, becaufe it can be divided by feveral figures without leaving a remainder; buit it is too fmall a number: the contequence of which is, that the degrees are placed at too great a. diftance from one another, and fractions muft therefore be often employed. We think, therefore, that 160 would have been a more convenient number.' Fahrenheit's number 180 is large enough, but when divided its quotient foon becomes an odd number.

As to the point at which the frale ought to commence, various opinions have been entertained. If we kuew the begiming or lowell degree of heat, all philofophers would agree, that the lowett. point of the thermometer ought to be fixed there; but we know neither the loweft nor the higheft degrees of heat; we oblerve only the intermediate parts. All that we can do, then, is to begin it at fome invariable point, to which thermometers made in different places may eafly be adjufted. If poffible too, it ought to be a point at which a natural well-known hody receives fome remarkable change from the effects of heat or cold. Fahrenheit began his fcale at the point at which fnow and falt congeal. Kirwan propofes the freezing point of mercury. Sir lface Newton, Hales, and Reaumur adopted the freezing point of water. The oljeetion to Fahrenheit's lowen point'is, that it commences at an artifcial cold never snown in nature, and to which we cannot refer our
feelings, for it is what few can ever experience. There would be feveral great advantages gained, we allow, by aropting the freezing point of mercury. It is the loweft degrec of cold to which mercury can be applied as a meafure; and it would render unneceffary the ufe of the figns plus and minus, and the extenfion of the fale below o. But we object to it, that it is not a point well known; for few, comparatively feaking, who ufe thermometers, can have an opportuity of feeing mercury congealed. As to the other advantage to be gained by adopting the freezing point of mercury, namely, the abolition of negative numbers, we do not think it would counterbalance the advantage to be enjoyed by ufing a well-known point. Befices, it may be alked, Is these not a propriety in ufing negative numbers to exprefs the degree of cold, which is a negative thing? Heat and cold we can only judge of ty our feelings : the point then at which the fcale fhould commence, ought to be a point which can form to us a flandard of heat and cold; a point familiar to us from being one of the moft remarkable that occurs in nature, and therefore a point to which we can with moft clearnefs and precifion refer to in our minds on all occafions. This is the freezing point of water chofen by Sir Iface Newton, which of all the general changes produced in nature by cold is the mofl remarkable. It is, therefore, the moft convenient point, for the thermometers to be ufed in the temperate and frigid zones; we may fay over the globe, for even in the hotteft countries of the torid zone many of the mountains are perpetually covered with fnow.

The thermometers which are at prefent in moft ge-Thermome neral ufe, are Fahrenheit's, De l'Me's, Reaumur's, and ters geneCelfus's. Fahrenheit's is ufed in Britain, De l'Ille's rally ufed. in Ruffia, Reaumur's and the thermometre centigrade in France, and Celfis's, the fame as the lafl named, in Sweden. They are all mercurial thermometers. For their defcription and the method of comparing them together, fee Chemistry, \(\mathrm{N}^{\circ}\) 198-201. Sec allóo Plate DXXXIV.

25
As in meteorological obfervations it is neceffary to at. Account tend to the greateft rife and fall of the thermometer, attempts have been made to conftruct a thermometer which might regiter the greateft degree of heat, or greateft degree of coid, which wok place during the abof feli-regi flering the: mometers fence of the obferver. In 1757 Lord Charles Cavendifh Lord \({ }^{26}\) prefented to the Royal Society of London a thermome- Charles ter in two different forms; the one contrived to mark Cavendifi' the greatef degree of heat, and the other the greateft \({ }^{\text {t }}\) degree of cold.
thermome.
Plate
The firt confifts of a glafs tube AB, with a cylin-DXXXiII drical bulb B at the lower end, and capillary at the top, Fig. 3 . over which there is fixed a glafs ball C. The bulb and part of the tube are filled with mercury, the top of which Alows the degrees of heat as ufual. The upper part of the tube above the mercury is filled with fipitit of wine; the ball C is alfo filled with the fame liquor almon to the top of the capillary tube. When the mercury rifes the fpirit of wine is alfo raifed, and falls into the ball C, which is fo made that the liquor cannot return into the tube when the mercury finks ; confequently the height of the fpirit of wine in the ball, added to that in the tube, will give the greatert degree of heat to which the thermometer has pointed fince lafl obfervation. When a new oblervation is to be made, the influn:ent, muft be inclined

\section*{T H E [ 403\(] \quad\) T H E}

Thermo- inclined till the liquor in the ball cover the end of the meter.

In this thermometer it is evident that the mercury rmult be affected by the weight and elalticity of the fpirit of wine, and therefure it will not correfpond to any of -the common mercurial thermmeters.
11. The thermometer for llowing the greatef deigree of cold is reprefented in fig. 4. by the crooked tube \(\triangle \mathrm{ABCD}\). This inftrument is filled with firit of wine, with the addition of as much mercury as is fufficient to fill both legs of the fyphon, and about a fourth or fifth part tof the hollow ball C. We are not told what the proportion of mercury was to that of !pirit of wine. The degrees of heat are flown by the rifc or fall of the mercury in the leg AB. The thermometer marks the greatelt fall by means of the hollow ball C . When the mercury in the longer leg finks by cold, that in the fhorter will rife and run over into the ball C, from which it cannot return when the mercury fubfides in the morter and rifes in the longer leg. The upper part of the thorter leg will therefore be filled with a column of fpirits of a length proportional to the increafe of heat; the bottom or lower furface of which, by means of a proper fcale, will thow how much the mercury has been lower than it is; which being fubtracted from the prefent height will give the loweft point to which the mercury has fallen. That the thermometer may be fitted for a new obfervation, the mercury muft be made to run back from the ball into the fhorter leg, by inclining the tube and lieating the ball.
In 1782 Mr Six propofed another felf-regiftering thermometer. It is properly a fpirit of wine thermometer, though mercury is alfo employed for fupporting an index. \(a b\) is a thin tube of glafs 56 inches long, and stoth of an inch caliber: \(c d e\) and \(f g h\) are lmaller tubes about \({ }^{\frac{\pi}{5}}{ }^{5}\) th of an inch caliber. Thefe three tubes are filled with highly rectified Pirit of wine, except the fpace between \(d\) and \(g\), which is filled with mercury. As the firit of wine contracts or expands in the middle tube, the mercury falls or rifes in the outide tubes. An index, fuch as that reprefented in fig. 6. is placed on the furface, within each of there tubes, fo light as to float uponit. \(k\) is a finall glafs tubc \(\frac{3}{4}\) ths of an inch long, hermetically fealed at each end, and inclofing a piece of fteel wire nearly of its own length. At each end \(l, m\), of this fmall tube, a ftort tube of black glafs is fixed, of fuch a diameter as to pafs freely up and down within either of the outfide tubes of the thermometer ceor \(f h\). From the upper end of the index is drawn a fpring of glafs to the finenefs of a hair, and about sths of an inch long; which being placed a little obliquc, preffes lightly ayainft the inner furface of the tube, and prevents the index from defeending when the mercury defcends. Thefe indexes being inferted one into each of the outfide tubes, it is eafy to underftand how they point out the greateft heat or cold that has happened in the obferver's abfence. Whien the fpirit of wine in the middle tube expands, it preffes down the mercury in the tube \(h f\), and confequently raifes it in the tube ec; confequently the index on the left liand tube is left behind and marks the greaten cold, and the index in the right hand tube rifes and marks the greatelt heat.

In 1790 a paper was given in to the Royal Society of Edinburgh, defribing two thermometers, neivly inverited, by Dr John Rutherford of Middle Baililh; the one b ml
for regiftering the highefl and the other for regiftering the loweft degree of heat to which the thermometer has rifen or fallen during the abfence of the obferver. An account of them may be found in the third volume of the Tranfations of the Snciety.

A new felf-regiftering thermometer has been in-Mr Keith's vented by Mr Keith of liavelitone, which we confider ther momeas the moft ingenious, fimple, and perfect, of any which \({ }^{\text {ier. }}\) has hitherto appeared. Its fimplicity is fo great, that it requires only a very fhort defcription to make it intelligible.
\(A B\) is a thin glafs tube about \({ }^{4} 4\) inches long and Fig. 7 , \(\frac{1}{4}\) ths of an inch caliber, clofe or hermetically fealed at top. To the lower end, which is open, there is joined the crooked glafs tube BE, feven incles long, and \({ }^{4}\). th of an inch caliber, and open at top. The tube \(A B\) is filled with the itrongeff fpirit of wine, and the tube BE widl mercury. This is properly a finit of wine thermometer, and the mercury is ufed nierely to fupport a piece of ivory or glafs, to which is aftixed a wire for raifing one index or depreffing another, according as the mercury rifes or falls. E is a fmall conical piece of ivory or glafs, of fuch a weight as to float on the furfuce of the mercury. To the float is joined a wire called the foot-zvire, which reaches upwards to H, where it terminates in a knee bent at right angles. The floatwire, by means of an eye at \(a\), moves cafily along the fmall harpfichord wire GK. LL are two indexes made of thin black oiled filk, which flide upwards or downwards with a force not more than two grains. The one placed above the knee points out the greateft rife, and the one placed below it points out the greateft fall, of the thermometer.

When the inftrument is to be prepared for an obfervation, both indexes are to be brought clofe to the knee H. It is evident, that when the mercury rifes, the float and float wire, which can be moved with the fmallett force, will be pufthed upwards till the mercury become ftationary. As the knee of the float-wire moves upwards it will carry along with it the upper index L. When the mercury again fubfides, it leaves the index at the highef point to which it was raifed, for it will not defcend by itst own weight: As the mercury falls the float-wire does the fame; it therefore brings along with it the lower index L, and continues to deprefs it till it again becomes ftationary or afcend in the tube: in which cale it leaves the lower index behind it as it had formerly left the upper. The feale to which the indexes point is placed parallel to the flender harpfichord wire. It may be feen more diftinctly in fig. 8. That the fcale and indexes may not be injured by the wind and rain, a cylindrical glafs cover, clofe at top, and made fo as to exactly fit the part GF, is placed over it.

The ingenious inventor has another improvement in contemplation, which, if upon trial it be found to anfwer, will make this thermometer as perfect as can be defired, provided there do not arife fome errors from the variable preffure of the atmofphere. He propofes to adopt clock-work to this thermometer, in fuch a way as to regiter with the utmoft precinion the degrees of heat and cold for every month, day, and minute in the year. The principles on which this clockwork is to be formed we fhall forbear to deicribe, hoping that the antho: himfelf, atier his experiment has met with the fuccef3
which

Mr Cavallo haspropoled a thermometrical barometer.

32
The thermometers deferibed above too limited.

33
Sir liaac
Neviton's method of extendisg the fcale of the thermo meter.

Martine's EJI:.
M. de Lac has deferibed the beft methed of conAracting a thermometer, fit for deternining the temperature of the air, in the menforation of heights by the barometer. He has allo Hown how to divide the fcale of a thermometer, fo as to adapt it for aftronomical purpofes in the obfervation of retactions.
Mr Cavallo, in 1781 , propoled the conflraction of a thermometrical barometer, which, by nieans of boiling uater, might indicate the various gravity of the atmofphere, or the height of the barometer. But as he does not fay that the imitrument has been tied with the defired fuccefs, we forbear to defcribe it. Thofe who with to know his ideas refpecting it may confult the Philofo. phical Tranfactions, vol. lxai. 1. 524 .
'The thermometers hitherto defcribed are very limited in their extent; they indecd point out to us the lowelt degrees of heat which are commonly obferved even in cold climates, but they by no means reach to thofe degrees of heat which are very familiar to us. 'I he mercurial themoneter extends no farther than to \(6=0\) of Fahrenheit's fcale, the heat of boiling mercury; but we are fure that the heat of folid bodies, when heated to ignition, or till they emit light, far exceeds the heat of boiling mercury.

In order to remedy this defect, Sir Laac Neuton, whole genius overcame thufe obftacles which ordinary minds could not approach, attempted by an ingenions experiment to extend the feale to any degree required. Having leated a mafs of iron red hot, and expofed it to the cold air, be obferved the time which elapfed till it becan.e cold, or of the feme temperature with the air ; and when the heat fo far decrealed that he could apply freke kown mealure (as a thermometer) to it, he oblerved the degrees of heat loll in given times; and thence drew the general conclofion, that the quantivies of heat loft in given fmall fpaces are always proportional to the heat remaining in the body, teckoning the leat to be the exrefs by which it is warmer than the ambient air. So that taking the number of ninutes which it took to cool after it came to a determined point in an atithmetical progreflion, the decrements of the heat of the iron would be continually proportional. Hasirg hy this proparion foum out the decrements of heat in a given time after it came to a known poim, it was eifly, by carrying upwards the fame proportion to the beginning of its cooling, to determine the greateft heat which the horly had arquired. 'I his preportion of Sir Taac's was tond by Dr Martine to be fomewhat inacrurate. The heat of a cooling ody does not decreafe as ally in proportion to that which the lody retains. As the refult of many olfervatienc, be found that tro birds of proportion took place. an srithmetical as well as the geometrical proportion which Sir Ifac Newion had
adopted; namely, that the decrements of heat were partly proportional to the times (that is, that quantities of heat are lot in equal times), as well as partly in proportion to the remaining heat; and that if thefe two are added together the rale will be fufficiently accurate. By the geometrical proportion which Sir Ilaac Newton adopted he difcovered the heat of metals red hot or in fution.

This method, fo fuccelsfully purfued by Sir Iaac, Mr \({ }^{34} \mathrm{edg}\) was fufficient to form a fcale of high degrees of heat, wood's the but was not convenient for practical purpules. Ac-moniteref cordingly the ingenious Mr Jofiah Wedguood, who is meafuing well known for his gieat improvement in the art of pot-grees uf tery, applied himfelt in order to difcover a thermometer heat which might be eantly managed. After many experiments recorded in the Philofophical Tranfactions, but which it is unneceffary to detait in this place, he bas invented a thermoneter which marks with much precifion the differeat degrees of ignition from a dull red heat vi. fible in the dark to the heat of an ait-furnace. This thermometer is extremely fimple. It confits of two sulers fixed upon a fmooth flat plate, a little farther afunder at the one end than at the other, leaving an open longitudinal fpace between them. Small pieces of alum and clay mixed together are made of fuch a fige as juft to enter at the wide end; thicy are then heated in the fire along with the body whole heat we wilh to deternine. The fire, according to the degree of heat it contains, diminimes or contracts the earthy body, fo that when applied to the wide end of the gage, it will llide on towards the narrow end, lefs or more according to the degree of heat to which it has been expoled.

That this inflrument may be perfectly underflcod, we Defribeet have given a reprefentation of it in fig. 9. \(\triangle \mathrm{ECD}\) is a fmootly Hat plate; and EF and GH wo rulers or flat pieces, a quarter of an inch thick, fised flat upon the plate, with the fides that are towards one another made perfectly true, a little farther afunder at one end EG than at the other end FH : thus they inclade between them a long converging canal, which is divided on one fide into a number of fmall equal parts, and which may be confidered as performing the offices both of the tube and feale of the common thermometer. It is obvious, that if a body, fo adjufted as to fit exantly at the wider cnd of this calal, be afterwards diminifted in its bulk by fire, as the thermometer pieces are, it will then pafs further in the canal, and more and more fo according as the diminution is greater ; and converfely, that if a body, fo adjufed as to pafs on to the tuarrow end, be afterwards expanded by fire, as is the cafe with metals, and applied in that expanded flate to the fale, it will not pafs fo far; and that the divifions on the fide will be the meafures of the expanfions of the one, as of the contrections of the other, rechoning in both cales from that point to which the body was adjufted at finf.

I is the body whofe alleration of bulk is thus to be meafured. 'This is to be gently puthed or fid along towards the end FH , till it is fopped by the converging fides of the canal. Sce CuFmistry, \({ }^{0} 1412\).
'IHLRMOPYLAE, in Auciont Geograply, a narrose pals or defile, bctween the walh of the Sinus Maliacus on the eath, and Itecp mometains, reaching to Oeta, made dreadful by unpalialle woods, on the well; leading from Thefialy to Locris and Eicotia. Thefe moun-

THISTLE, a name applied to different genera and fpecies of plants belonging chiefly to the fyngenefia clafs. See Carduus, Onopordum, Serratula, Sonchus, and alfo Dipsacus, Botany Index.

Order of the Thistle, or of St Andrew, a military order of knighthood in Scolland, the rife and inftitution of which is varioufly related by different authors. Lefley bifhop of Rofs reports, that the night before the battle between Athelftan king of Northumberland and Hungus king of the Piets, a bright crofs, in form of that whereon St Andrew (the tutelar faint of Scotland) fuffered martyrdom, appeared to Hungus; who having gained the vicory, ever after bore the figure of that crofs on his banners. Others affert, that Achaius king of Scotland firl inflituted this order, after having made the famous league offenfive and defenfive with Charlemagne king of France. But although the thiftle had been acknowledged as the fymbol of the kingdom of Scotland from the reign of Achaius, yet fome refer the beginning of this order to Charles VII. of France. Others place the foundation of it as low as the year 1500.

The chief and principal enfign is a gold collar compofed of thillles and fprigs of rue interlinked with amulets of gold, having pendent thereto the image of St Andrew with his crofs, and the motto, Nemo me im: pune f.acesset. "No body thall provoke me with impunity."

The ordinary or common enfign worn by the knights is a flar of four filver points, and over them a green circle, bordered and lettered with gold, containing the faid motto, and in the centre is a thinle; all which is embroidered on their left brealt, and worn with the collar, with a green ribhand over the left fhoulder, and brought under the right arm ; pendent thereto is the image of St Andrew, with his crofs, in a purple robe, within an oval of gold enamelled vert, with the former motto ; but fometimes they wear, encircled in the fame suanner, a thille crowned.

About the time of the Reformation, this order was dropped, till James II. of Great Britain refumed it, by creating eight knights. The Revolution unfettled it again; and it lay neglected, till Queen Anne, in \(\mathrm{s}^{7} 03\), reflored it to the primitive defign, of twelve knights of St Andrew.

THLAPSI, Bastard-cress, or milhridate-mufard; a genus of plants belonging to the clafs of tetiadynamia, See Botany Index.

ThOLOUSE, See Toulouse.
THOMEANS, Thomis's. See Christlans of St Thomas.

Thomas Aquinas. See Aquinas.
St Thomits's Day, a feftival of the Chriftian church, obferved un Dicember 21. in commemoration of St Thomas the apoftle.

St THOMA AS of Canterbury's Day, a feftival of the Romilh church, obferved on December 29. in memory of Thomas Becket archbihhop of Canterbury, who was murdered, or, as the Romanifts fay, martyred, in the reign of King Henry II.

Thomas the Reymour, called alfo Thamas Lermont, and Thomas of Erceldon, was born at Erceldon, a village near Melrofe in Tweedale, in what year is uncertain; but he was an old man when Edward I, was carrying on war in Scotland.

The character of Lermont as a prophet, and which was common to him with Linus, Orpheus, and other early poets in many countries, arofe, if we may believe Mackenyie in his Lives of Scottih Writers, from his having confererices with Eliza, a nun and prophetefs at Haddington. Lermont put her predictions into verfe, and thus came in for his fhare of the prophetic fpirit. None of thefe ancient prophecies now remain ; but the Pinkerton', following, which pretends to be one of them, is given Account of from a manufcript of the time of Edward I. or II., The Scottijo countefs of Dunbar is the lady famous for the defence of Pocts. her cafte againt the Englifh. Her proper title was Countefs of March; but it was common in thefe times to ftyle a nobleman from his chief refidence. Thus Gilbert Strongbow, earl of Pembroke, is called Earl of Striguil, from his refidence at Striguil-caftle, near Chepfow, Monmouthfhire, \&c.

La Counteffe de Donbar demande a Thomas de Efedoune, quant la gucre d'Efcoce prendreit fyn. E yl la repoundy, et dyt.

When man as mad a kyng of a capped mon.
When mon is levere other mons thyng than is owen.
When londe thouys foreft, and foreft ys felde.

Nouther in thyne tyme, ne in myne.
Ah comen, ant gone,
Withime twenty wynter ant on.
Ir. fact, the prophecies of Lermont appear to have been merely traditional; nay, it feems doubtful if he ever pretended to fuch folly, notwithitanding Mackenyie's ftory of Eliza. The reverence of the people for a learned and reipectabie character feems to lave been the fole foundation of Thomas's claim to prophecy. But, in the 16 th century, prophecies were made, and afcribed to lim, as well as others given to Bede, Merlin, \&c. (A). They were printed at Edinburgl, 1615 ; reprinted 1680 , and \(174^{2}\).

THOMISM. See Aquinas.
THOMSON, James, an excellent Britifh poet, the fon of a Scotch divine, was born in the flire of Roxburgh in 1700 , and was educated in the univerfity of Edinburgh with a view to the miniftry. But his genius inclining him to the ftudy of poetry, which he foon found would be incompatible with that of theology, or at leaft might prevent his being provided for in that way in his own country, he relinquifhed his views of engaging in the facred function, and repaired to London in conlequence of fome encouragement which he had received from a lady of quality there, a friend of his mother.

The reception he met with wherever he was introduced, emboldened him to rifk the publication of his excellent poem on Winter.-This piece was publithed in 1726 ; and from the univerfal applaufe it met with, Mr Thomfon's acquaintance was courted by people of the firf talte and fathion. But the chief advantage which it procured him was the acquaintance of Dr Rundle, afterward bilhop of Derry, who introduced him to the late lord chancellor Talbot; and fome years after, when the eldeft fon of that nobleman was to make his tour on the continent, Mr Thomfon was chofen as a proper companion for him. The expectations which his Winter had raifed, were fully fatisfied by the fucceffive publications of the other feafons; of Summer, in the year 1727 ; of Spring, in the following year; and of Autumn, in a quarto edition of his works, in 1730. Befide the Seafons, and his tragedy of Sophonisba, written and acted with applaufe in the year 1729, he had, in 1727, publifhed his poem to the memory of Sir Ifaac Newton, with an account of his chief difcoveries; in which he was affitted by his friend Mr Gray, a gentleman well verfed in the Newtonian philofophy. That fame year the refentment of our merchants, for the interruntion of their trade by the Spaniards in America, munning very high, Mr Thomfon zcaloully took part in it, and wrote his Britannia, to roufe the nation to revenge.

With the honourable Charles Talbot, our author vi- Thomfon: fited moft of the courts in Europe, and returned with his view's greatly enlarged; not only of exterior mature and the works of art, but of human life and manners, and of the conflitution and policy of the feveral fates, their connections, and their religious inftitutions. How particular and judicious his obfervations were, we fee in his poem on Liberty, begun foon after his return to England. We fee at the fame time to what a high pitch his care of his country was raifed, by the companifous he had all along been making of our happy govermment with thofe of other nations. To infpire his fellow-fubjects with the like fentiments, and fow them by what means the precious freedom we enjoy may be preferved, and how it may be abufed or loft, he employed two years in compoling that noble work, upon which he valued himfelf more than upon all his other writings. On his return to England with Mr Talbot (who foon after died), the chancellor made him his fecretary of briefs; a place of little attendance, fuiting his retired indolent way of life, and equal to all his wants. From this office he was removed, when death, not long after, deprived him of his noble patron. He then found himfelf reduced to a ftate of a precarious dependence. In this fituation, having created fome few debts, and his creditors finding that he had no longer any certain fupport, became inexorable; and imagined by confinement to force that from his friends, which his modefty would. not permit him to ath. One of thefe occafions furnifhed Quin, the celebrated actor, with an opportunity of difplaying the natural goodnefs of his heart, and the difintereftednefs of his friendihip. Hearing that Thomfon was confined in a fpunging houfe for a debt of about 701 . he repaired to the place; and, having inquire ed for him, was introduced to the bard. Thomifon was a good deal difconcerted at feeing Quin, as he had al. ways taken pains to conceal his wants; and the more fo, as Quin told him he was come to fup with him. His anxiety upon this head was however removed, upon Quin's informing him, that, as he fuppofed it would have been inconvenient to have had the fupper dreffed in the place they were in, he had ordered it from an adjacent tavern; and, as a prelude, half a dozen of claret was introduced. Supper being over, and the botlle circulating pretty brikly, Quin faid, "It is time now we thould balance accounts." This aftonifhed Thomfon, who imagined he had fome demand upon him; but Quin perceiving it, continued, " Mr Thomion, the pleafure I have had in perufing your works I cannot cftimate at lefs than a hundred pounds, and I infilt upon now acquitting the debt." On faving this, he put down a note of that value, and took his leave, without waiting for a reply.

The profits arifing from his works were not inconfiderable ; his tragedy of Agamemnon, afted in r738, yielded a good fum. But his chief dependence was upon the prince of Wales, who fettled on him a handfome allowance, and honoured him with many marks of particular favour. Notwithfanding, this, however, he

(A) Sibilla and Banifter Anglicus are mentioned in the time of Edward IV. (MSS. Cot. Dom. A. IX.) A Iorg Latin prophecy of Bridlington is there given. Whaldhave and Eltraine feem alfo Englih prophets. In the whole collection, therefore; Thomas is the only Scottih one,
igrs \({ }^{[5}\)

Thmonfor. was refufed a licence for his tragedy of Edward and Eleanora, which he had prepared for the fiage in the year 1736, for fome political reafons. Mr Thomfon's next performance was the Marque of Alried, written in the year \(17 \not 4_{0}\) jointly with Mr Mallet, by the cemmand of the priuce of Wales, for the entertainment of his royal highnefs's court at Clifden, his fummer refidence.

Mr Thomfon's poem, entitled the Cafle of Indolence, was his laft work pubiifhed by himiflf; his tragedy. of Coriolanus being only prepared for the theatre, when a fatal a.ccident robbed the world of one of the beft of men and beff of poets. He would commonly walk the diftance between London and Kiclumond ("here he lived) with any acquaintance that offered, with whom he might chat and reft himfelf, or perhaps dine by the way. One fummer evening being alone in his walk from town to Hammerfmith, he had over-heated himfelf, and in that condition imprudently took a boat to carry him to Kew; apprehending no bad confequence from the chill ait on the river, which his walk to his houfe, towards the upper end of Kew-lane, had always hitherto prevented. But now the cold had fo feized him, that the next day he was in a ligh fever. This, however, by the ufe of proper medicines, was removed, fo that he was thought out of danger; till the fine weather having tempted him to expofe himfelf once roore to the evening dews, his fever returned with violence, and with fuch fymptoms as left no hopes of a cure. His death happened on the 27 h of Augult 1748.

Mr Thomfon had improved his tafte upon the fineft originals, ancient and modern. The autumn was his favourite ieafon for poetical compofition, and the deep filence of the night he commonly chofe for his fludics. The amufement of his leifure homs were civil and natusal hiflory, voyages, and the beft relations of travellers. Though he perfurmed on no inftrument, he was paffionately fond of mufic, and would fometimes lifen a full hour at his winclow to the nightingales in Richmond gardens; nor was his tafte lefs exquifite in the arts of painting, fculpture, and architecure. As for the more diflinguifhing qualities of his mind and heart, they belt appear in lis writings. There his devotion to the Suf:eme Being, his leve of mankind, of his country, and friends, mine out in cuery page; his tendernefs of heart was fo unsounded, that it took in even the brute creation. It is not known, that through his whole life he cver gave any perfon a moment's pain, either by his writings or o!herwifc. He took no part in the political iquabbies of his time, and was therefore refpected and left undifturbed by both fides. Theefe amiable virtues did not fail of their due reward; the applatife of the public attended all his productions, and his fiends loved him with an entlufinflic ardour.
"A. a witer (Gays 1): Johnfon), he is entitled to one praife of the highett kind; his mode of thinking, and of exprefling his thoughts, is original. His blank verfe is tio more the blank veife of Miton, or of any other poet, than the rhymes of Prior are the rhymes of Couley. His numbers, his paufes, his diction, are of his own growth, without trarifcription, witheut insitatio:). He thinks in a pecu' ar trai, and thinks always as a man of genius; he looks sound on Nature and on life with the eyc which Nature leflows only on a poct;
the eye that dininguilices, in every thing reprefented 10 Tucanc: its view, whatever there is on which imagination can deli, hht to be detained, and wi.tr a mind that at once comprehends the valt, and attends to the minute. The reader of the Seafons wonders that he never faw before what Thomfon ftews him, and that he never yet has fett what Thomion imprefis."

His teflamentary executors were the lord Lytulton, whofe care of our poet's fortune and fame ceafed not with his life; and Mr Mitchell, a gentleman equally noted for the arroth and conllaticy of has private frimidthip, and for lis addrefs and fprint as a public minitler. By their united interetts, the orphan play of Coriolanus was brought on the flage to the belt advantage; from the profits of which, and the fale of manufcripts and other effects, a handfome fum was remitted to his fifters. His remains were depofited in the church of Richnond, under a plain ftone, without any infeription. A handfome \(n\) :onument was erected to him in Weflmintler abbey in the year 1762 , the charge of which was defrayed by the profits arifing from a Splendid edition of all his works in \(4^{10}\); Mr Millar the bookfeller, who had purchafed alt Mr Thomion's copies, giving up his property on this grateful occafion. A monument has alfo been erected to him at the place of his birth.

THOR, the eldeft and bravelt of the fons of Odin and Frea, was, after his parents, the greatelt god ot the Saxons and Danes while they continued heathens. They Henry's believed, that Thor reigned over all the acrial regions, Hillort of which compofed his immenfe palace, confifting of 540 halls; that he launched the thunder, pointed the lightning, and directed the meteors, winds, and forms. To hin they addrefied their prayers for favourable winds, refrefting rains, and fruifful feafons; and to him the fifth day of the week, which fill bears his name, was confecrated.

White or haw Tholn. See Crategeus, Botany Index.

Thorn, a town of Poland, in Regal Pruffia, and in the palatinate of Culm. It was formerly a Hanfeatic town, and Aill enjoys great privileges; is large and well fortified; but part of the fortifications, and a great number of houfes, were ruined by the Swedes, in 1703. It is feated on the Viftula, and contains 10,000 inhabitants. E. Long. 18 42. N. Lat. 53. 6.

THORNBACK. See Rala, Ichthyologr Inden.
THORNHILI, Sir lames, an eminent Englifi Ditionary painter, was born in Dorfethire in 1676 , of an ancient of Painter family; but was conftrained to apply to fome profeflion by the diftreffes of his father, who had been reduced to the neceffity of felling his family eftate. His inclination direficd him to the art of painting; and on his arrival at London he applicd to his uncle, the famous Dr Sydenham, who enabled him to proceed in the fludy of the art under the direction of a painter who was not very eminent. However, the genius of Thornhill made ample amends for the infufficiency of his inllructor, and by a happy application of his talents he made fo great a progrcts, that he gradually rofe to the higheft reputation.

His genius was well adapted to hiflorical and allegorical compofitions; lie poffefled a fertile and fine invention; ond he tketched his thoughts with great eafe, freedom, and Cpirit. He excelled alfo equally in por-

\section*{T H R [ 409 ] T If R}
trat, perfpective, and archice?ure; flewed an excellent taile for defign, and had a free and firm pencil. Had he been fo fortunate as to have ftudied at lome and Venice, to arquire greater corrctuefs at the one, and a more exact knowledge of the perfection of colouring at the other, no artift among the moderns might perhaps have been his fuperior. Nevcrthelefs, he was to eminent in many parts of his profeffion, that he mut for cucr Le ranked among the beil painters of his time; and his performances in the dome of St Paut's church at London, in the hofpital at Greenwich, and at Hamp-ton-court, are fuch public proots of his merit as will convey his name to pofterity with great honour.

Lhis painter lived in general efteem; he enriched himielf by the excellence of his works; was appointed ftate-painter to Queen Anne, from whom he received the henour of knighthood; had the fingular fatisfaction \(t 0\) repurchafe his family eftate; and was fo much diflinguilhed as to be elected one of the members of parliment. He died in 17.32.

Thorough-wax, in Botany. See Buplfuruar.
THOMH, or 'jueur, (called by the Phonicians Tanu, by the Greeks IIcrmes, and by the Romans Mer(zary), was a Phenician of very fuperiar talents, and one of the civilizes of mankind. He was prime minifler to Ofiris, whom, after his death, he deified ; and he was himfelf deified by his countrymen the Egyptians, for the benefits that he had rendered to the human race. See Myrcury, Mythology, \(N^{\circ} 34\). and Polythe15M, \(\mathrm{N}^{0} 18\).

THOUGH' , a general name for all the ideas confequent on the operations of the mind, and cven on the operations themfelves. See Metaphysics.

Thoucht, in compofition. See Oratory, Part I. and II.

THOUINIA, a genus of plants belonging to the clafs of diandria, and order of monogynia. Sce Butany In iex.

THRACE, a country very frequently mentioned by the Greek and Latin writers, deriving its name, according to Jofephus, from Tiras one of the fons of Japhet. It was bounded on the north by Mount Hiemus; on the fouth, by the Agean fea; on the weft, by Macedon and the river Strymon; and on the eaft, by the Ensine fea, the Hellcfpont, and the Propontis.-The Thracian Cherfonefus is a peuinfula inclofed on the fouth by the Ægean fea, on the well by the gulf of Melas, and on the eaft by the Hellefpont; being joined on the north to the continent by a neck of land about 37 furlongs broad. The inland parts of Thrace are very cold and barren, the fnow lying on the mountains the greatet? part of the year ; but the maritime provinces are produlive of all forts of grain and neceffaries for life; and withal fo pleafant, that Mela compares thom to the moft fruifful and agreeable countries of Afi?.

The ancient Thracians were deemed a brave and warlike nation, but of a rrucl and favege temper; being, according to the Greek writers, frangers to all humanity and gond nature. It was to the Thracians, however, that the Greeks were chicfly indebted for the polite arts that flourifhed among them; for Orphaus, Linus, Muræus, Thamyris, and Eumolpus, all Thracians, were the firft, as Eufathins informs us, who charmed the inhabitants of Greece with their eloquence Vol. XX. Part II.
and melody, and perfliaded them to exchange their fiercenefs fur a fociable life and peaceful mamers; nay, Ithanhinso great part of Grece was anciently peopled by 1 hascians. Tereus, a Thracian, governed at Daulis in Jhocis, where the tragical ftory of Philomela and l'rogne was acted. From thence a body of ' 1 hracians pailled over to Euboea, and pollefled themfelves of that intand. Of the fame nation were the Aones, I embices, and Hyanthians, who made themfelves mafters of Bice lia: and great part of Attica itfelf was inhabited by lhracians, under the command of the celcbrated Eumulpus. It is not therefore without the utmof ingratitude and injuflice that the Grecks ftyle then Bartaricns, fince to them chiefly they were indebted both for the peopling and polifling of theit coumtry.

Thrace was anciently divided into a number of petty flates, which were firf fubdued by Philip of Macedon. On the decline of the Macedonian empire, the countty fell under the power of the Romans. It cominned under fubjection to them till the irluption of the 'Iurks, in whofe hands it fill remains.

THRASHING, in Agriculture, the operation by which corn is feparated from the thrav. 'His operation is performed in a varicty of ways, fometimes by the feet of animals, fometimes by a flail, and fometimes by a machine.
The molt ancient method of feparating the corn from the llraw was by the hoofs of cattle or horfes. This was practifed by the Ifraelites, as we find from the books of Mofes; it was alfo common among the Greeks and Komans*. Flails and thrathing machines were al-* Piony, fo not uncommon among thefe nationst. The flail xisii. 30. which was ufed by the Komans, called bactulus, fufits, Virgil, or portica, was probably nothing more than a cudgel or \({ }_{132}\). Col. 1 pole. The thrafoing machine, which was called tribula 21. Tamet. or tribulum, and fometimes trahn, was a limul of fledge i. 5. 21. made of boards joined together, and loaded with fone or friti. \(2 \%\) iron. Horfes werc yoked to this machine, and a man was H mer, I. fcated upon it to drive them over the fheaves of corn. xx. 405

Different methods are emploged in different countries for feparating the corn from the falk. In the greateft part of France the flail is ufed; but in the fouthern diftricts it is generally performed by the feet of animals. Animals are allo uted for the fame purpofe in Spain, in Italy, in the Morea, in the Canaries, in China, and in the vicinity of Catiton, where the flail is allo fmetimes uled. It appears that in hot climates the grains do not adhere fo firmly to the ftalk as in cold countries, and therefore may be more eafily feparated. This will explain the reafon why animals are fo frequently employed in hot countries for treading out the corn; whereas in cold climates we know they are feldom tried, and have no reafon to fuppofe that they would anfwer the purpofe. In the Ille of France in Africa, rice and wheat are thrafhed with poles, and maize with flicks; for it has not been polfible to teach the negroes the ufe of the flail.

The animals uled for treading out corn are, osen, cows, horfes, mules, and even affes when the quantity is not great. The operation is performed in this manner: The fhcaves, after being opened, are fread in fuch a manner that the ears of the corn are laid as much uppermoft as pollible, and a man, ftanding in the centre, holds the hatters of the cattle, which are made to trot round as in a manege; whilf other men with
forks

Thrafing. forks fhake the fraw up from time to time, and the cattle are trotted orer it again and again till they have beaten out all the grain. This method is expeditious enough ; but befides bruifing a confiderable quantity of corn, it requires a great many cattle, and injures the legs of the horfes and mules, which are preferred before cows and oxen for this work.

The flail is undoubtedly a much better inftrument for thrathing corn than the feet of animals, for it feparates the grain from the ftraw and hufks both more effectually and more expeditioully; yet it is liable to many objections. It is a vesy laborious employment, too levere indeed even for a ftrong man; and as it is ufually the intereft of the thrather rather to thrafh much than to thratt clean, a good deal of corn will generally be left uporr the flaw. It is therefore an object of great importance in hufbandey to procure a proper machine for leparating the com from the flraw.

The firf thrafhing machine attempted in modern times, of which we have received any account, was invented in Edinburgh by Mr Michael Menzies about the year 1732. It conffled of a number of inftruments like Hails, fixed in a roveable beam, and inclined to it at an angle of ten degrees. On each fide of the beam in which the flails were fixed, floors or benches were placed for fpreading the theaves on. The flails were moved backwards and forwards upen the benches by means of a crark fived on the end of an axle, which made about 30 revolutions in a minute.

The fecond thrafing machine was invented by Mr Michael Stirling, a farmer in the parifh of Dunblane, Perthmire. Of this difcovery we have received a very. accurate and authentic account from his fon, the revesend Mr Robert Stirling minifter of Crieff.

It is an old proverb, that necelfity is the mother of invention. This was verified on the prefent occafion. Befides his ordinary domeftic fervants, Mr M. Stirling had occafion fometimes to hire an additional number to thrafh out his grain, and frequently found it difficult to procure fo many as he needed. This naturally led him to reflect whether the operation of thrathing could not eafily be performed by machinery. Accordingly, fo carly as the year 1753 , under the pretence of joining in the amufements of his children, he formed in miniature a water mill, in which two iron fprings, made to rife and fall alternately, reprefented the motion of two flails, hy which a few falks of corn put under them might be fpeedily thrafled. This plan he executed on a fcale fulliciently large within two years after, making the fprings about ten feet long, each of which had one end firmly forewed into a folid plank, and the other terminated in a round batoon of folid iron, two feet long and above an incli in diameter. Under thefe the Theaves were conveyed gradually forward in a narrow channel or trough, by paffing between two indented horizontal cylinders, fimilar to thofe now ufed in the moft of the thrathing mills in that part of the country, and called fecders. In this manner the thrafhing was executed completely, and with confiderable rapidity; but as the operation was performed on a low floor, and no method contrived for carrying off the fraw, the accumulation of it produced fuch confufion, and the removal of it was attended with fuch danger, that this fcheme was very foon entircly abandoned. The mortification arifing from difappointment, and efpecially the fooffs of
his neighbours, for what was univerfally accounted an Thraflina. abfurd and ridiculous attempt, ferved only to fimulate the exertions of the inventor to accomplifh his defigns on another plan.

Laying alide therefore the iron Cprings with the feeders, and all the apparatus adapted to them, he retained only an outer or water wheel, with an inner or cog wheel moving on the fame axle: to this imer wheel, which had 48 teeth or cogs, he applied a vertical crundle or pinion, with feven notches, the axle of whicl paffed through a floor above the wheel, and having its upper pivot lecured in a beam fix feet above that floor. At the diftance of three feet three inches above the floor two Atraight pieces of fquared wood, each four feet long, paffed through the axle of the trundle at right angles, forming four arms, to be moved round horizontally. To the extremities of thefe arms were fixed four iron plates, each 20 inches long, and eight broad at the end next the arms, but tapering towards a point at the other end. This large horizontal fly, conftuting four thrafhers, was incloled within a wooden cylindrical box three feet and a half high and eight in diameter. On the top of the box was an opening or port (two or three ports nere made at firf, but one was found fufficient) eight inches wide, and extending from the circumference a foot and a half towards its centre, through which the corn theaves defcended, being firft opened and laid one by one on a board with two ledges gently declining towards the port; on which board they were moderately preffed down with a boy's hand, to prevent therr from being 100 haftily drawn in by the repeated 13 rokes of the thrafters. Within the box was an inclined plane, along which the ftraw and grain fell down into a wide wire riddle two feet fquare, placed immediately under a hole of nearly the fame fize. The riddle reccived a jerk at every revolution of the fpindle from a knob placed on the fide of it, and was inftantly thruft backward by a fmall fpring prefling it in the oppofite direction. The fhort Araw, with the grain and chaff which paffed through the wide riddle, fell immediately into an oblong frait riddle, which hung with one end raifed and the other depreffed, and was moved by a contrivance equally fimple as the other; and having no ledge at the lower end, the long chaff which could not pafs through the riddle dropped from thence to the ground; while the grain and moft of the chaff falling through the riddle into a pair of common barnfanners that food under it on the ground floor, the frong grain, the weak, and the chaff, were all feparated with great exactnefs. The fanners were moved by a rope or band running circuitoully in a fhallow niche cut on the circumference of the cog-wheel. The flraw collected gradually in the bottom of the box over the wide riddle, and through an opening two and a half feet wide, and as much in height, left in that fide of the bos neareft the brink of the upper floor, was drawn down to the ground with a rake by the perfon or perfons employed to form it into meaves or colls.

Such was the thrafhing mill invented by Mr Michael Stirling, which, after various alterations and improvements he completed in the form now defcribed, A. D. 1758. By experiment it was found that four bolls of oats, Linlithgow meafure, could be thrafhed by it in 25 minutes. From that period he never ufed a common flail in thrafhing, except for humbling or bearding bar-

- Caule of Y̌ort.

- \(19 \%\)

Thrafing. ley. In every other kind of grain he performed the whole operation of thrallhing with the mill; and continued always to ufe it till 1772, when he retired from bufinefs, and his thrafhing mill became the propecty of his fecond fon, who continues to ufe it with equal advantage and fatisfaction. Several machines were conflructed on the fame plan, particularly one near Stirling, under Mr Stirling's direction, for Mr Moir of Leckie, in 1765 , which, we underftand, has heen ufed ever fince, and gives complete fatisfaction to the proprietor. There was another crected in \(1777^{8}\) by Mr Thomas Keir (in the parihh of Muthil and county of Perth), who has contrived a method of bearding banley with it: and by the addition of a fmall findle with Thort arms contiguous to the front of the box, and moved by a band common to it and the great fpindle to which it is parallel, the ftraw is flaken and whirled out of the box to the ground. That this machine did not come immediately into general ufe, was owing partly to the fmallnefs of the farms in that part of the country, whofe crops could eafily be thrathed by the few hands neceffarily retained on them for other purpofes; and chiclly to an apprehenfion that the machine could only be moved by water; an apprehenfion which experience proves to be entirely groundlefs. The machine however, was, ingenious, and did great credit to the worthy inventor, and certainly deferved a better fate than it was deftined to undergo.

A third thrafhing mill was invented in 1772 , by two perfons nearly about the fame time, and upon the fame principles. The inventors were, Mr Alderton who lived near Alnwick, and Mr Smart at Wark in Northumberland. The operation was performed by rubbing. The theaves were carried round between an indented drum of about fix feet diameter, and a number of indented rollers arranged round the circumference of the drum, and attached to it by means of fprings; fo that while the drum revolved, the fluted rollers rubbed the corn off from the ftraw by rubbing againt the flutings of the drum. But as a confiderable quantity of the grain was bruifed in paffing between the rollers, the machine was foon laid afide.

In 1776 an attempt was made by Mr Andrew Meikle , an ingenious millwright in the parifh of Tyningham, Laft Lothian, to confruct a new machine upon the principles which had been adopted by Mr Menzies already mentioned. This confifted in making joints in the flails, which Mr Menzies had formed without any. But this machine, after much labour and expence, was foon laid afide, on account of the difficulty of keeping it in repair, and the fmall quantity of work performed, which did not exceed one boll or fi.x Winchefter buftels of barley per hour.

Some time after this, Mr Francis Kinloch, then junior of Gilmerton, having vifited the machine invented in Northumberland, attempted an improvement upon it. He inclofed the drum in a fluted cover; and infead of making the drum itfelf lated, he fised upon the outfide of it four fluted pieces of wood, which by means of fprings could be raifed a little above the circumference of the drum, fo as to prefs againft the fluted covering, and thus rub off the ears of corn as the fleaves paficd round between the drum and the fluted covering. But not finding this machine to anfwer his expectation (for it bruifed the grain in the fame mamer as the Northum-
berland machine did), he fent it to Mr Meikle, that he Thrathingz. might, if pofible, rectify its errors.

Mr Meikle, wha had long directed his thoughts to this fubject, applied himfelf with much ardour and perfeverance to the improvement and correllion of this macline; and after fpending a good deal of time upon it, found it was conflructed upon principles fo crroncous, that to improve it was impracticable.

At length, however, Mr Meikle's own genius invented a model, different in principle from the machines which had already been conftructed. This model was made in the year 1785 ; and in the following year the firft thrafhing machine on the fame principles was crected in the neighbourhood of Alloa, in the county of Stirling, by Mr George Meikle the fon of the inventor. This machine anfwered completely the winhes of Mr Stein, the gentleman for whom it was erected, who gave the moft ample teftimony of his fatisfaction bath to the inventor and to the public. The fame of this difcovery foon fpread over the whole country, and a great many farmers immediately applied to Mr Meiklc, defiring to have thrafhing mills erected on their farms. The difcovery, it appeared, would be profitable, and it was reafonable that the inventor fhould enjoy the profits of his invention. He accordingly applied for a patent; which, after confiderable expence, arifing from the oppofition of fome perfons, who clained a thare in the difcovery, was granted.-Thefe machines are now becoming very common in many parts of Scotland, and are increafing very confiderably in number every year over all the united kingdom.

We will now endeavour to defcribe this machine in its moft improved fate; which is fo fimple that with the affiftance of a plate, exhibiting the plan of elcvation, fig. I. the ground plan, fig. 2. and the 3 d howing its effential parts in a diftinct manner, we hope it will be eafily underfood by all our readers who have not had an opportunity of feeing it. The power employed for turning that part of the machine which feparates the corn from the ftraw is produced by four wheels (when moved by horfes), the teeth of which move in one another and turn the drum, on which four feutchers are fixed. The fheaves are introduced between two fluted rollers, which hold them firm, and draw them in gradually , while the fcutchers frike of the grain from the fraw as it paffes through. This will fuffice for a general idea of this machine. We will now be more particular.

The large fpur-wheel A, fig. I. and 2. which has Fig. x. and 276 cogs, is horizontal, and moves the pinion \(B\), which 2 . has 14 teeth. The pinion \(B\) moves the crown-wheel C, which has 84 tecth; the wheel C moves a fecond pinion D , which has 16 teeth; and the pinion D moves the drum HIKL. The drum is a hollow cylinder three feet and a half diameter, and placed horizonially; on the outlide of which the fcutchers are fived by ftrong fcrew bolts. The fcutchers confift of four pieces of wood, faced on one fide with a thin plate of iron, placed at an equal diftance from each other, and at right angles to the axis of the drum.

The fheaves are fpread on an inclired board F, fig. 3. Fig. : from which they are introduced between two fluted rollers GG made of cal iron, about three inches and a half in diameter, and making about 35 revolutions in a minute. As thefc rollers are only about three ģuarters

Plate Dxxyp.

Thraning. of an inch diftant from the feutchers or leaves of the drum HIKL, they lerve to hold the fleaves faft, while the fcutchers \(a, b, c, d\), moving with prodigious velocity, feparate the grain completely from the llraw, and at the fame time throw out both grain and flraw upon the concave rack M, Jying horizontally with ilender parallel fibs, fo that the corn palies through them into a hopper N placed below. From the hopper it paffes through a harp or riddle O into a pair of fanners P, from which, in the molt improved machines, it comes out clean and fit for the market. The ftraw, after being thrown by the foutclers \(a, b, c, d\), into the rack, is removed from it by a rake \(\mathbf{Q R S T}\) into a place contiguous V . The sake confifts of four thin pieces of wood or leaves; on the end of each of thefe leaves is ranged a row of teeth \(e, f, g, h\), five inches long. The rake moves in a circular manner in the concave rack, while the teeth catch hold of the ftraw, and throw it out of the rack. Thefe are all the effential parts of the machine; the refl may be eafily underfiood by the references to the Plate. W is the horfe-courfe, \(\mathrm{N}^{\mathrm{D}} \mathrm{I}\), which is 27 fect diameter. X is the pillar for lupporting the beams on which the axle of the fpur-wheel is fixed. YYY are three fpindles for moving the two fluted rollers, the rake, and fanners. To the defcription now given we have only to add, that the drum has a covering of wood Z at a fmall diflance above it , for the purpoie of keeping the fieaves clofe to the fcutchers.

The advantages of this machine are many. As the drum makes \(\hat{3}^{\circ 0}\) revolutions in a minute, the four fcutchers together make 200 flrokes in the fame face of time. From fuch power and velocity, it is evident that much work mult be performed. When the horfes go at the rate of two and onc-third miles per hour, fiom three to fix bolls will be thrafthed; but as the quantity thrafied will be lefs when the flraw is long than when it is fhort, we flall take the average at four bolls. One gentleman, whofe veracity and accuacy we can depend on, aflures us, that his mill thrafhed 63 bolls in a diy ; by which, we fuppofe, he meant 10 hours. To prove the fuperior advantage of this machine to the common method of thraflhing with flails, a gentleman ordercd two equal quantities of oats to be thrathed by the mill and by flails. When the corn was cleaned and meafurid, he ohiained one-fixteenth more from the fleaves thrathed by the mill than from thofe thrafled by the flail. We are ahio informed by another gentleman who has fudied this machine with nouch attention, and calculated its advantages with care, that, independently of having the corn much cleaner feparated foom the fraw than is ufually done by llails, there is a laving of 30 or 40 yer cent. in the experice of thraflaing.

The number of perfons requilite for attending the mill when wouking is fix: One perfon dives the harles; a fecond hands the fheaves to a third, who unties them, while a fourth fpreads them on the inclined boards and prefles them gently between the rullers; a fifth parlon
is neceflary to vidule the cornas it falls from the fanncis, Thraningt and a fixth to remove the ftraw (A).

This machine can be moved equally well by water, Throne. w:nd, or horics. Mr Merkle has made fuch imprurements on the wind-mill as to render it much more managcable and convenient than formerly; ard we are informed many wind-mills are now ereating in diffesent parts of the country. As to the comparative expence of thefe different machines, the erection of the horfe machine is leaft; but then the expence of employing horfes mult be taken into confideration. One of this kind may be erected for 701 . A water mill will coft 1ol. more on account of the expence of the water-wheel. A wind-mill will cofl from 2001 , to 3001 . fferling.

THRAVE of COAN, an expretion denoting 24 flueaves or fuur thocks of fix fheaves to the fhock; thomy in fome countries they only recton 12 fheaves to the thrave.

THRASYBULUS, a renowned Athenian general and patriot, the deliverer of his country from the yoke of the 30 tyrants, lived about \(294 \mathrm{~B} . \dot{C}^{*}\).
* See At

THRASYMENUS lacus, in Ancient Geography, tira, No a lake of Etruria, near Perufia, and not far from the 95-174. Tiber, fatal to the Romans in the Punic war. Now Il Lago de Perugia in the Ecclefiallical State.

THREAD, a fmall line made up of a number of fine fibres of any regetable or arimal lutflance, fuch as tlax, colton, or filk; from which it takes its name of linen; cotton, or filk thread.

THREATENING letters. Krowingly to fend any letter without a mame, or with a ficiiiious nane, demanding moncy, or any other valuable thing, or threatening (without ary denard) to kill or fire the houfe of ary perfon, is made felony without benefit of clergy. And fending letters, threatening to accufe my perion of a crime punillable with death, tranfinertation, pillory, or other infamous punillment, with a view to extort from him any money or otler valuable chattels, is punilhatle by flatute 30 Geo. II. cap. 24. at the difcretion of the court, with fine, impriforment, pillory, whipping, or tranfportation for feven ycars.

THUANUS, Iacobus Aueustus, youngeft fon of the prefident de Thou, was famus for his erudition. He was born in 1553 ; and having finifhed his Atudics and travels, was made prefident a-mortier, and took poffeffion thereof in 1595. He was employed in feveral important offices of itate, ard in reforming the univerfity of Paris. He wrote the hiftory of his own time in Latin, from the year 1543 to 1608 , in 138 books; a work, both for fubject and ilyle, worthy of the ancients. He alro left memoirs of his own life, belides poenss; and died at Paris, 1617.
THUCYIDIDES, a celebrated Greek hiforian, was born at Athens 471 B. C. He was the fon of Olorus, and grandfon of Miltiades, who is thought to have been defcended from Miltiades the famous Athenian general, and to have married the king of Thrace's daughter. He was educated in a manner luitable to his quality, that is, in the ftudy of philofophy and eloquence. His mafter in the former was Anaxagoras, in the latter Antiphon; one, by his defcription in the eighth book of his Hiftory, for power of fecech almoft a miracle, and feared by the people on that account. Suidas and Photius relate, that when Herodotus recited his hiltory in public, a fafhion in ufe then and many ages after, Thucydides felt fo great a fling of emulation, that it deew tears from hin ; infomuch that Herodotus himfelf took notice of it, and congratulated his father on having a fon who thowed fo wonderful an affection to the Mufcs. Herodotus was then 29 years of age, Thucydides about 16 .

When the Pelopounefian war began to break out, Thucydides conjectured tuly, that it would prove a fubject worthy of his labour; and it no fooner commenced than he began to keep a journal. This explains the reafon why he has attended more to chronological order than to unity of defign. During the fame war he was commiffioned by his countrymen to relieve Amphipolis; but the quick march of Brafidas the Lacedrmonian general defeated his operations; and Thucydides, unfucceffful in his expedition, was banilhed from A. thens. This happened in the eighth year of this celebrated war; and in the place of his banifhment the general began to write an impartial hiftory of the important events which had happened during his adminiftration, and which Aill continued to agitate the feveral flates of Greece. This famous hifory is continued only to the 21 ft year of the war, and the remaining part of the time till the demolition of the walls of thens was delcribed by the pen of Theopompus and Xennphon. 'Thucydides wrote in the Attic dialect, as being pofferfed of molt visour, purity, elegance, and energy. He fpared neither time ror money to procure authentic materials; and the Athenians, as well as their enemies, furnifhed him with many valuable communications, which contributed to throw great light on the different tranfactions of the war. His hiftory has been divided into eight books; the laft of which is innerfect, and fuppofed to have been written by his daughter.

The hillorian of Halicarnaflus has often been comparcd with the fon of Olorus, but each has his peculiar excellence. Sweetnels of flyle, grace and elegance of expreffion, may be called the claracterittics of the forexpremon, may be called the charactenitics of the for-
mer; while lliucydides flands unequalled for the fire of his defriptions, the concilenefs, and at the fame time the ftrong and energetic manmer of his narratives. His relations are authentic, as he himfelf was interefted in the events he mentions; his impartality is indubitable, as he nowhere betrays the lealt refentment agant his countrymen, and the factions partizans of Cleon, who had banified him from Athens. The hittory of Thucydides was fo admired by Demoflhenes, that he tranfcribed it eight different times, and read it with fuch attention, that he could almott repeat it by heart. Them cydides died at Athens, where he had been secalled from his exile about 411 years B. C.

The be!! edition of Thucydides is that of Oxford, publifhed in \(\mathbf{1 6 9 6}\), follo, and that of Duker, publizhed at Amtlerdana in 1731 , fulio.

THUlA, the arbor Vite; a genus of plants belonging to the clafs of monadelphia, and order of monoccia; and in the natural fytem ranging under the 5 in order, Coniferc. See Botavy Index.

THUle, or Thrle, in Ancient Geography, an illand in the moft northern parts of the Germath ocean. Its fituation was never accurately afcertained by the ancients, hence its prefent name is unknown by modern hiltorians. Some luppofe that it is the ifland now called Iceland, or part of Greenland, and others that it was Fouta. See Foula.

THUMB, in Anatomy, one of the extremities of the hand.

Tiuvir-Cap, an uninhabited illand in the South fea, lies about feven leagues north-welt of Lagoon illand; it is low, woody, of a circular form, and not much above a mile in compafs.

Thumailm. See Urim.
THUNBERGIA, a genus of plants belonging to the clafs of didynamia. See Botany Inder.

THUNDEIf, the noife occafioned by the explofion of a flath of lighining echoed back from the inequalities on the furface of the earth, in like manner as the noife of a cannon is echoed, and in particular circumftances forms a rolling lengthened found. See Electricity.

THUNDERBOLC. When lightning acts with extraordinary violence, and breaks or fhatters any thing, it is called a thlunderbolt; which the vulgar, to fit it for, fuch effects, fuppofe to be a hard body, and even a Atone. But that we need not have recourfe to a hard folid body to account for the effects commonly altributed to the thunderbolt, will be evident to any one wha confiders thofe of tha pulvis fulmianas and of gunpowder; and more efpecially the aftonifling powers of electricity. It has been fuppofed that meteoric ftones may. have given rife to the notion of a thunderbolt.

THUNDER-Hou/e. Sie Electricity.
THURINGIA, a divifion of the circle of Upper Saxony in Germany. It is a fruitful tract, abounding in corn, efpecially wheat ; in black cattle, heeep, and horfes. It is about 73 miles in length, and as much in breadth. It contains 47 towns, I \(\ddagger\) boroughs, betwive 703 and 800 villages, 300 noble eflates, 7 fuperintendencics, and 5 uade-conittories. Thuringia, the country of the ancient Thuringi, or Catti, a branclr of thee Vandals,

Thuringia Pandals, mentioned by Tacitus, was formerly a kingII Tiber. dom, afterwards a county, then a landgravate, and was governed by its own princes for many ages, till 1124 , when it devolved to the marquis of Mifnia, and, with that country, afterwards to the duke of Saxony. But the modern Thuringia is only a part of the ancient, nay, but a part of the ancient South Thuringia, which comprehends befides, a large thare of the modern Franconia, Heffe, \&c. On the extinction of the male line of the ancient landgraves in \(\mathbf{1 2 4 7}\), it carse to the margraves of Meifen, anceitors to the prefent electoral family. The elector has no voice in the diet, on account of his fhare in the landgravate or circle of Thuringia, Erfurt is the capital.

THURSDAY, the fifth day of the Chriftian week, but the fixth of that of the Jews.

THUS, Frankincense, a folid brittle refin, brought to us in little globes or maffes, of a brownifh or yellowill colour on the outfide, internally whitifh or variegated with whitifh fpecks. It is fuppofed to be the produce of the pine that yields the common turpentine, and to concrete upon the furface of the terebinthinate juice foon after it has iffued from the tree. See Incense.

\section*{THUYA. See THuJa.}

THYMUS, Thyme; a genus of plants belonging to the clafs of didynamia, and in the natural fyftem ranging under the 42 d order, Verticillatie. See Botany Index.

\section*{Thymus. See Anatomy Index.}

THYRSUS, in antiquity, the fceptre which the poets put into the hand of Bacchus, and wherewith they furnifhed the menades in their Bacchanalia.

Tiyrsus, a mode of flowering rcfembling the cone of a pine. It is, fays Linnæus, a panicle contracted into an oval or egg-fiaped form. The lower footfalks, which are longer, extend horizontally, whilf the upper ones are fhorter and mount vertically. Lilac and but-ter-bur furnifh examples.

TIARA, an ornament or habit wherewith the ancient Perfians covered their head; and with which the Armenians and kings of Pontus are reprefented on medals; thefe lant, becaufe they were defcended from the Perfians. Latin authors call it indifferently tiara and cidaris. Strabo fays, the tiara was in form of a tower ; and the fcholialt on Ariftophanes's comedy, A Xogns, aft i. Icene 2, affirms, that it was adomed with peacocks feathers.

Trara is alfo the name of the pope's triple crown. The tiara and keys are the badges of the papal dignity; the tiara of his civil rauk, and the keys of his jurifdiction: for as foon as the pope is dead, his arms are repiefented with the tiara alone, without the keys. The ancient tiara was a round high cap. John XXIII. firft encompaffed it with a crown. Boniface VIII, added a fecond crown; and Benedict XII. a third.

TIARELLA, a genus of plants belonging to the clafs of decandria; and in the natural fyftem ranging under the \(13^{\text {th }}\) order, Succulentie. See Rotany Index.

TIBLR, a great river of Italy, which runs through the pope's territories, paffing by Perugia and Otvietto; and having vifited Rome, falls into the Tufcan fea at Oftia, 15 miles below that city.

IIREI, called by the Tartars Barantola, Bootan, or Tangoot, and by the Clincfe TJang, is fituated be-
tween \(27^{\circ}\) and \(35^{\circ}\) north latitude; and is reckoned to be 1350 miles from eaft to weit, and 480 from north to fouth. It is bounded on the north by the country of the Mongols and the defert of Kobi ; on the eaft by China; on the wefl by Hindoftan, and on the fouth by the fame country and the kingdom of Ava. In the valleys lying between the lower mountains are many tribes of Indian people; and a difpute happening between the heirs of one of the rajahs or petty princes, one party cailed to their affitance the Routaners, and the other the Britih. The latter prevailed; and the fame of Britifh valour being carried to the court of Tibet, the Teefhoo Lama, who ruled the flate under the Delai-Lama, at that time in his minority, fent a deputation to Bengal, defiring peace for the prince who had been engaged in war with the Britifh. This was readily granted by the governor ; and Mr Bogle was fent ambaffador to the court of Tibet, where he refided feveral months; and after an abfence of a year and a quarter, returned to Calcutta. The account of this gentleman's expedition hath not been publifhed by himfelf; but from Mr Stewart's letter to Sir John Pringle, publifhed in the Philofophical Tranfactions, vol. lxvii. we learn the following particulars, collected from his papers.
" Mr Bogle divides the territories of the Delai-Lama into two different parts. 'That which lies immediately contiguous to Bengal, and which is called by the inhabitants Doopo, he diftinguifhes by the name of Bootan; and the other, which extends to the northward as far as the frontiers of Tartary, called by the natives \(P u\), he Atyles Tibet. Bootan is ruled by the Dah Terriah, or Deb Rajah. It is a country of feep and inacceffible mountains, whofe fummits are crowned with eternal fnow; they are interfected with deep valleys, througl2 which pour numberlefs torrents that increafe in their courfe, and at laft, gaining the plains, lofe themfelves in the great rivers of Bengal. Thefe mountains are covered down their fides with forefts of flately trees of various forts; fome (fuch as pines, \&c.) which are known in Europe ; others, fuch as are peculiar to the country and climate. The valleys and fides of the hills which admit of cultivation are not unfruitful, but produce crops of wheat, barley, and rice. The inhabitants are a flout and warlike people, of a copper complexion, in fize rather above the middle European fature, hafty and quarrelfome in their temper, and addicted to the ufe of fpirituous liquors; but honeft in their dealings, robbery by violence being almoft unknown among them. The chief city is Taffey Seddein, fituated on the Patchoo. Tibet begins properly from the top of the great ridge of the Caucafus, and extends from thence in breadth to the confines of Great Tartary, and perhaps to fome of the dominions of the Riffian empire. The woods, which everywhere cover the mountains in Boatan, are here totally unknown; and, except a few ftraggling trees near the villages, nothing of the fort is to be feen. The climate is extremely fevere and rudc. At Chamnanning, where he wintered, although it be in latitude \(31^{\circ} 39^{\prime}\), only \(8^{\circ}\) to the northward of Calcutta, he often found the thermometer in his room at \(29^{\circ}\) by Palırenheit's fcale ; and in the middle of April the ftanding waters were all frozen, and heavy fhowers of fnow perpetually fell. This, no doubt, mun be owing to the great elevation of the country, and to the

Tisct. Yaft frozen fpace over which the north wind blows uninterrupted from the pole, through the vaft deferts of Siberia and Tartary, till it is fopped by this formidable wall.
"The Tibetians are of a fmaller fize than their fouthern neighbours, and of a lefs robult make. 'Their complexions are alfo fairer, and many of them have even a ruddinefs in their countenances unknown to the other climates of the eaft. Thole whom Mr Bogle faw at Calculta appeared to have quite the Tartar face. 'Ihey are of a mild and cheerful temper; the higher ranks are polite and entertaining in converfation, in which they never mix either flrained compliments or flattery. The common people, both is, Bootan and Tibet, are clothed in coarfe woollen fuffs of their own manufacture, lined with fuch fkins as they can procure: but the better orders of men are dreffed in European cloth, or China filk, lined with the finef Siberian furs. The ufe of linen is totally unknown among them. The chief food of the inhabitants is the milk of their cattle, prepared into cheefe, butter, or mixed with the four of a coarfe barley or of peafe, the only grain which their foil produces; and even thefe articles are in a fanty proportion: but they are furnithed with rice and wheat from Bengal and other countries in their neighbourhood. They alfo are fupplied with fifh from the rivers in their own and the neighbouring provinces, falted and fent into the interior parts. They have no want of animal food from the cattle, theep, and hogs, which are railed on their hills; and are not deftitute of game. They have a fingular method of preparing their mutton, by expofing the carcafe entire, after the bowels are taken out, to the fun and bleak northern winds which blow in the months of Augult and September, without froft, and fo dry up the juices and parch the ixin, that the meat will keep uncorrupted for the year round. This they generally eat raw, without any other preparation.
"The religion and political conftitution of this country, which are intimately blended together, would make a confiderable chapter in its hiftory. It fuffices to fay, that at prefent, and ever fince the expulfion of the Eluth Tartars, the kingdom of Tibet is regarded as depending on the empire of Clina, which they call Cathay; and there actually refide two mandarins, with a garrifon of a thoufand Chinefe, at Lahaffa the capital, to fupport the government; but their power does not eitend far : and in fact the Lama, whofe empire is founded on the furelt grounds, perfonal affection and religious reverence, governs every thing internally with unbounded authority. Every body knows that the Delai Lama is the great object of adoration for the various tribes of heathen 'Tartars, who roam through the vaft tract of continent which fretches from the banks of the Volga to Correa on the fea of Japan, the moft extenfive religious dominion, perhaps, on the face of the globe. See Linia.
" It is an old notion, that the religion of Tibet is a corrupted Chriftianity: and even Father Difederii, a Jefuit (but not of the Chinefe miffion) who vifited the country about the beginning of this century, thinks he can refolve all their myfteries into ours; and afferts, with a truly myftical penetration, that they have certainly a good notion of the Trinity, fince in their ad-
drefs to the Deity, they fay as often lonciok-oik in the plural askonciok in the fingular, and with their rofaries pronounce thefe words om, ha, hum. 'Ihe truth is, that the religion of 'libet, from whatever fource it fprung, is pure and fimple in its fource, conveying very exalted notions of the Deity, with no contemptible fyftem of morality: but in its progrefs it has been greatly altered and corrupted by the inventions of worldly men; a fate we cat hardly 1 egret in a fyftem of error, fince we know that that of truth has been fubject to the fame. Polygamy, at lean in the fenfe we commonly receive the word, is not in practice among them; but it exifts in a manner ftill more repugnant to Luropean ideas; for there is a plurality of hufoands, which is firmly eftablifhed and highly relpected there. In a country where the means of fubfitting a family are not cafily found, it feems not impolitic to allow a fet of brothers to agree in railing one, which is to be maintained by their joint ef. forts. In thort, it is ufual in Tibet for the brothers in the family to have a wife in common, and they generally live in great harmony and comfort with her; not but tometimes little difienfions will arife (as may happen in families conftituted upon different principles), an inflance of which Mir Bogle mentions in the cafe of a modefl and virtucus lady, the wife of half a dozen of the Teefhoo Lama's nephews, who complained to the uncle that the two youngelt of her hufbands did not furnifh that thare of love and benevolence to the common ftock which duty and religion required of them. In thort, however Atrange this cuftom may appear to us, it is an undoubied fact that it prevails in Tibet.
"The dead are expoled on the pinnacle of fome neighbouring mountain, to be devoured by wild beals and birds of prey, or walled away by time and the viciflitudes of the weather in which they lie. The mangled carcales and bleached bones lie fcattered about; and amidn this fcene ot horrot. Come miferable old wretch, man or wosan, lof to all feelings but thole of luperltition, generally fets up an abode, to perform the difmal office of receiving the bodies, affigning each a place, and gathering up the remains when too widely difperled."

Tho the account of Tibet which we have given from the communications of Mr Bogle, we may add the information which we have obtained from a later traveller, Mr Saunders* furgeon at Boglepoer in Bengal, who * Paper ize made a journey into Iibet in the year 1783 . His ob-the Phil. fervations chiefly refpect the natural productions and dif- Tranf. Frxiz. eafes of the country.

The plants which Mr Saunders found were almof all Eurupean plants, a great number of them being natives of Britain. From the appearance of the hills he concludes that they muf contain many ores of metal and pyrites. There are inexhaultible quantities of tincal or borax, and rock-falt is plentiful; gold-duf is found in great quantities in the beds of rivers, and fometimes in large maffes, lumps, and irregular veins; lead, cinnabar containing a large proportion of quickfilver, copper, and iron, he thinks, might eafily be procured. But the inhabitants of Tibet have no better fuel than the dung of animals. A coal mine would be a valuable difcovery. We are told, that in fome parts of China bordering on Tibet coal is found and ufed as fuel.

It is remarkable that the fame difeafe prevails at the
foot of the mountains of Tibet as in Switzerland at the foot of the Alps, a glandular fivelling in the thoat commonly called goirre.

The language jpoken in Tibet is different from that of the Tartars. The aftronomers are acquainted with the motion of the heavenly bodies, and able to calculate eclipfes; but the lamas are generally ignorant; few of them can read, much lefs underitand their ancient books.

Tibullus, Aurus Alfius, a Roman knight, and a celebrated Latin pott, was born at Rome 43 B . C. He was the friend of Horace, Ovid, Macer, and olher great men in the reign of Auguftus. He accompanied Melfala Corvinus in his expectition againt the ifland of Corcyra: but falling fick, and being unable to fupport the fatigues of war on account of the weaknefs of his conflitution, he quitted the profelion of arms, and returred to Rone, where he died before the year \({ }^{17}\); when Ovid thowed his grief for his death by writing a fine elegy upon him. Tibullus wrote four books of elegies, which are fill extant: they are written in a tcnder and agreeable fyle, and in very elegant Latin. Muret and Jofeph Scaliger have written learned and curious commentaries on the works of this poet. The beft edition of Tibullus is that of Janus Bronckhufius, publifhed at Amflerdam in 1708 , in one volume quarto. We have an Englifh poetical verfion by Mr Grainger.

TIBUR, in Ancient Geography, a town of Latium, pleafantly fituated on the Anio. Here Horace had his villa and houfe; and here he wifhed to end his days. Here Adrian built an extraordinary villa called Tiburina, infcribed with the names of the provinces and of the moft confiderable places, (Spartian); near which Zenobia had a houfe called Zenobia, (Trebellius, Pollio). Hither Auguflus often retreated on account of its falubrity. (Sueionius): for which it is greatly reconmended, (Martial). Anciently, when the Romans had far extended their territory, it was the utmoof place of banifhment, (Ovid). It had a temple of Hercules; and therefore called Herculeum. In the temple was a lihrary, (A. Gellius). Now Tivoli in the Campagna di Roma, on the Teverone.

TICiNUS, in Ancient Geograply, a river in Infubria, rifing in Mount Adula, traverfing the Lacus Verbanus fouthwards, and falling into the Po near licinum. Between this river and the Po Hannibal gained his firt victory over the Romans under P. Scipio. The general himfelf efcaped with the urmoft difficulty, and that by the bravery of his fon the fi:A Scipio A fricanus. Now the Tefino, rifing in Mount Godard, running fouth through the Lago Maggiorc and Milan, by Pawia, into the Po.

Tick. See Acarus, Entomohogy Index.
'fickell, Tuomas, an excellent Englifh poet, was the fon of the Revercnel Riclard 'Tickell, and was born in 1686, at Bridekirk in Cumberland. He was educated at Qucen's college, Oxford, of which he was made fellow ; and while he continued at that univerfity, he addrefled to Mr Addifon a complimentary copy of verfes on his Opera of Rofamond, which introduced him to an acquaintance with that gentleman, who difcovering his merit, became his fincere friend. On Mr Addifon being made fecretary of flate, he appointed Mr Tickell his under-fecretary; and on his being ol liged to refign that office on account of his ill healh, be ic-
commended him fo effeclually to Mr Craggs his fucceffor, that he was continued in his pooft till that gencleman's death. In \({ }^{1724}\), Mr ' 'Tickell was appointed fecretary to the lords jutices in Ireland, and enjoyed that place as long as he lived. He wrote fonse poems, which, when feparately pullifhed, met with a favourable reception, and paffed through feveral aditions: they are now printed in the fecond volume of the Minor P'oels. After Mr Addifon's death Mr Tickell had the care of the edition of his works primed in 4 vols. 4 to; to which he prefixed an account of Mr Addifon's life, and a poem on his death. Mr tickell died in the year 1740.

TICKERA, a confiderable article ofmerchandife in Fezzan in Africa; it is valued by travellers as a portabie and highly falubrious tood. It is a preparation of pounded dates, and the meal of Indian corn, formed into a pafte, and highly dried in an oven.

TICKSEED, Sun-flower. See Coreopsis, Lotany Index.

TICUNAS. See Porson.
TIDE, is a word which exprefies that rifing and falling of the waters which are obferved on all manilune coafts.

Thcre is a certain depth of the waters of the occan which would obtain if all nere at relt : but obfervation flows that they are continually varying from this level, and that fome of thefe variations are regular and perivdical.
\(1 / f\), It is obferved, that on the fhores of the ocean, and in bays, creeks, and harbours, which communicate freely with the ocean, the waters rife up above this mean height twice a-day, and as often fink Lelow it, forming what is called a floon and an EbB, a hich and Low watle. The whole interval between high and low water is called a TIDE; the water is faid to FIow and to EBb; and the rifing is calied the rlocd-Tide, and the falling is called the leb tide.
\(2 d\), It is obferved, that this rife and fall of the waters is variable in quantily. At Piymouth, for inflance, it is fometimes 21 feet between the greateft and leaft depth of the water in one day, and iometimes only 12 feet.

Thefe different heights of tide are oblerved to fucceed each other in a regular feries, diminihing from the greatelt to the leaft, and then increaling from the leaft to the greatef. The greatef is called a SPRING TIDE, and the leaft is called a Rear tide.
\(3^{d}\), This feries is completed in about 55 days. More careful obfervation fhows that two feries are completed in the exact time of a lunation. For the fpring tide in any place is obferved to happen precifly at a certain interval of time (generally between two and three days) after new or full moon; and the neap tide at a certain interval after half moon: or, more accurately fpeaking, it is obferved that the fpring tide always happens when the moon has got a certain number of degrees eaflward of the line of conjunction and oppofition, and the neap tide happens when fhe is a cestain number of degrees from her firt or lat quadrature. Thus the whole feries of tides appears to be regulated by the moon.

4 th, It is oblerved that high water haprens at new and full moon, when the moon has a certain determined pofition with refpes to the maridian of the place of obfervation, preceding or following the moon's
fouthing a cerlain interval of time; which is conflant with refpect to that place, but very different in different places.
\(5^{\prime} h\), The time of high water in any place appears to be regulated by the moon; for the interval between the time of high water and the moon's fouthing never changes above three quarters of an hour, whereas the interval between the time of high water and noon clanges fix hours in the courfe of a fortnight.

6th, The interval between two fucceeding high waters is variable. It is leaft of all about new and full moon, and greateft when the moon is in her quadraturcs. As two high watcrs happen every day, we may call the double of their interval a mide day, as we call the diurnal revolution of the moon a lunar day. The tide is fhortelt about new and full moon, being then about \(24^{\mathrm{h}} 37^{\prime}\); about the time of the moon's quadratures it is \(25^{\text {h }} 27^{\prime}\). Thefe values are taken from a mean of many oblervations made at Barbadoes by Dr Malkelyne.
\(7^{\prime} h\), The tides in fimilar eircumftances are greateft when the moon is at her fmalleit diftance from the earth, or in her periges, and, gradually diminilting, are fmalleft when the is in her apogee.
\(8 t h\), The fame remark is made with refpect to the fun's diftance, and the greateft tides are obferved during the winter months of Europe.
\(9^{0 / h}\), The tides in any part of the ocean increale as the moon, by changing her declination, approaches the zenith of that place.

10th, The tides which happen while the moon is above the horizon are greater than the tides of the fame day when the moon is below the horizon.

Such are the regular phenomena of the tides. They are important to all commercial nations, and have therefore been much attended to. It is of the tides, in all probability, that the Bible fpeaks, when God is faid to fet bounds to the fea, and to fay, "thus far fhall it go, and no farther."

Homer is the earlieft profane author who fpeaks of the tides. Indeed it is not very clear that it is of them that he fpeaks (in the 12 th book of the Odyffey) when lef feaks of Charybdis, which riles and retires thrice in cvery daj. Herodotus and Diodorus Siculus fpeak more diftinetly of the tides in the Red fea. Pytheas of Marfilles is the firlt who fays any thing of their caufe. According to Strabo he had been in Britain, where he mult have obferved the tides of the ocean. Plutarch fays exprefly that Pytheas afcribed them to the moon. It is fomewhat wonderful that Arifotle fays fo little about the tides. The army of Alexander, his pupil, were ftartled at their firt appearance to them near the Perfian gulf; and we fhould have thought that Ariftotle would be well informed of all that had been obferved there. But there are only three paffages concerning them in all Ariffotle's writings, and they are very trivial. In one place he fpeaks of great tides obferved in the north of Europe; in another, he mentions their having been afcribed by fome to the moon; and in a third, he fays, that the tide in a great fea exceeds that in a fmall one.

The Greelis had little opportunity of obferving the tides. The conquefts and the commerce of the Romans gave them more acquaintance with them. Cefar fpeaks of them in the \(4^{\text {th }}\) book of his Gallic War. Strabo, after Pofidonius, claffes the phenomena into daily, month-

VoL., XX. Part II.
ly, and annual. He obferves, that the fea rifes as the moon gets near the meridian, whether above or below the horizon, and falls again as the rifes or falls; allo, that the tides increate at the time of new and full moon, and are greateft at the fummer follicc. Dliny explains the phenomer a at fome length; and fays, that both the fun and moon are their caule, drasging the waters along with them (B. I1. c. 97). Seneca (Nat. शueff. I11.28.) fpeaks of the tide with correctnets; and Macrobius (Somn. Scip. I. 6.) gives a very accurate delcription of their motions.

It is impolible that fucl phenomena flould not cexercife human curiofity as to their caufe. Plutarch (Plam. Plil. IlI. 17.), Galilco (Syff. Nund. Dial. 4.), Riccioli in his Almagefl, ii. p. 374 , and Gafiendi, ii. p. 27. have collected nolt of the notions of their predecefiors un the fubject ; but they are of to little importance, that they do not deferve our nolict. Kepler fpeaks more like a philofopher ( De Stella Marits, and Epit. Allron. p. 555.). He fays that all bodies attract each other, and that the waters of the ocean would all go to the moon were they not retained by the attaction of the earth; and then goes on to explain their elevation under the moon and on the oppofite fide, becaufe the earth is lefs atcracted by the moon than the nearer waters, but more than the waters which are more remote.

The honour of a complete explanation of the tides was referved for Sir Ifaac Newton. He laid hold of this clafs of phenomena as the moft inconteffable proof of univerfal gravitation, and has given a mont beautiful and fynoptical view of the whole fubject ; contenting himfelf, however, with merely exhibiting the chief confequences of the general principle, and applying it to the phenomena with fingular addrefs. But the wide fteps taken hy this great philofopher in his invefigation leave ordinary readers frequently at fault : many of his affumptions require the greatef mathematical knowledge to fatisfy us of their truth. The academy of Paris therefore propofed to illuftrate this among other parts of the principles of natural philofoply, and publifted the theory of the tides as a prize problem. This produced three excellent differtations by M‘Laurin, Dan. Bernoulli, and Euler. Aided by thefe, and chiefly by the fecond, we flall here give a phyfieal theory, and accommodate it to the purpofes of navigation by giving the rules of calculation. We have demonftrated in our difierta. tions on the phyfical principles of the celeftial n:otions, that it is an unexcepted fact, that every particle of matter in the folar fyftem is actually deflected toward every other particle; and that the deflection of a particle of matter toward any diftant fphere is proportional to the quantity of matter in that fphere directly, and to the fquare of the diftance of the particle from the centre of that fphere inverfely: and having found that the hea. vinefs of a piece of terreftrial matter is nothing but the fuppofed opponent to the force which we exert in carrying this piece of matter, we conceive it as poffefling a property, that is, diftinguifhing quality, manifefled by its being gravis or heavg. This is heavinefs, gravitas, gravity; and the manifeftation of this quality, or the event in which it is feen, whether it be dirently falling, or dellecting in a parabolic curve, or ftretching a coiled fpring, or breaking a rope, or fimply preffing on its fupport, is gravitatio, gravitation ; and the body is faid to gravitate. When all obftacles are remored from the 3 G
body,

\section*{T I D}
body, as when wc cut the fring by which a fone is hung, it moves directly downwards, tendit ad icrram. Si dijcindatur funis tenderet lapis ad turam. Dim vero funts integer perflct, lapis terram verfius niti cenfetur. By fome metaphyfical procefs, which it is needlets at prefent to trace, this myfus ad motum has been called a tendency in our language. Indeed the word has now come to fignify the energy of any ative quality in thole cafes where its fimpleft and molt immediate manifeftation is prevented by fome obftacle. The tone is now faid to terd towards the earth, though it does not aciually approach it, being withheld by the ftring. The ffretching the Itring in a direction perpendiculat to the horizon is corceived as a full manifcltation of this tendenicy. This tendency, this energy of its heavinefs, is therefore named by the word which diltinguilhes the quality; and it is called gravitation, and it is faid to gravitate.

But Sir Ifaac Newton difcovered that this deflection of a heavy body differs in no relpect from that gencral defletlion obferved in all the bodies of the folar fyftem. For 16 feet, which is the deflection of a fone in one fecond, has the very fame proportion to \(\frac{1}{x}\) th of an inch, which is the fimultaneous deflection of the moon, that the fquare of the moon's diffance from the centre of the ear:h has to the 'quare of the itone's diftance from it, namely, that of 3600 to 1.

Thus we are enabled to compare all the effects of the mutual tendencies of the heavenly bodies with the tendency of gravity, whote effects and meafures are familiar to us.

If the earth were a fophere covered to a great depth with water, the water would form a concentric fiphenical Aiell ; for the gravitation of every particle of its furface would then be directed to the centre, and would be equal. The curvature of its furface therefore would be every where the fame, that is, it would be the unilom curvature of a fphere.

It has been demonftrated in former articles, after Sir Ifaac Neston, that the gravitation of a particle C (big. 1.) to the centre \(O\), is to that of a particle \(E\) at Dxxxyl. the furface as CO to EO . In like manner the gravita-
Fig. 1. tion of \(o\) is to that of \(p\) as oto \(p \mathrm{O}\). If therelore EO and \(O p\) are two communicating canals, of equal lengths, the water in both would be in equilibrio, becaufe each column would exert the fame total preflire at O. But if the gravitation of each particle in \(p O\) be diminithed by a certain proportion, fuch as \(\frac{1}{300}\) th of its whole weight, it is plain that the total preflure of the column pO will be roth part lel's than that of the column EO. Therefore they will no longer be in equilibrio. The weight of the column EO will prevail ; and if a hollow tower \(I^{2} p\) be built at the mouth of the pit \(p o\), the water will fink in EO and rift in Op, till both are again in equilibrio, exerting equal total pieflues at \(O\). Or we may prevent the finking at E by pruring in mole water into the tower \(\mathrm{P}_{\mathrm{P}}\). The lame thing muft happer in the canal \(f c\) perpendicular to EO, if the pravitation of every particle be diminified by a lorce acting in the direct:on CF , and proportional to the diftance of the particle from C , and fuch, that when 6 C is cqual to \(=\mathrm{O}\), the force acting on \(c\) is equal to the force acting on 0. In ordes that the former equilititium may be reAtored after this dimirution of the gravitation of the coIumo \(f \mathrm{C}\), it is plain that more water mult be poured in-
to the oblique tower \(f \mathrm{~F}\). All this is evident when we confider the matter bydroflatically. The gravitation of the particle \(c\) may be reprefented by 0 O ; but the diminution of the preffure occafioned by this at \(O\) is repre. fented by C \(c\).

Hence we can collect this much, that the whole diminution of prelfure at \(C\) is to the whole diminution of preffure at \(O\) as the fum of all the lines \(c \mathrm{C}\) to the fum of all the lines 0 O , that is, as \(f \mathrm{C}^{2}\) to \(\mathrm{PO}^{2}\). But the weight of the fmall quantity of water added in each tower is diminifhed in the lame proportion; therefore the quantity added at Ff muit be to the quantity added at \(\mathrm{P}^{p}\) as \(f \mathrm{C}\) to \(p \mathrm{O}\). Thenefore we mult have Ff : \(\mathrm{P} p=f \mathrm{C}: p \mathrm{O}\), and the points \(\mathrm{E}, \mathrm{F}, \mathrm{P}\), mult be in the circumference of an elliple, of which PO and EO are the thanferfe and conjugate femi-axes.

What we have here luppofed concerning the diminution of gravity in the fe canals is a thing which really obtains in nature. It was demonflrated, when treating of the PRECESSION of the Equinoxes, that if the fun or moon lie in the diredion OP, at a very great diftance, there relults from the unequal gravitation of the different particles of the earth a diminution of the gravity of each particle; which diminution is in a direction paral. lel to OP, and proportional to the diflance of the particle from a plane paffing through the centre of the earth at right angles to the line OP.

Ihus it happens that the waters of the ocean have their equilibrium difturbed by the unequal gravitation of their different particles to the fun or to the moon; and this equilibrium cannot be reflored till the waters come in trom all hands, and rife up around the line joining the centres of the earth and of the luminary. The pherical ocean muft acquire the form of a prolate fpheroid generated by the revolution of an elijpfe round its tranlvelfe axis. The waters will be highef in that place which has the luminaty in its zenith, and in the antipodes to that place; and they will be moft depreffed in all thole places which have the luminary in their honizon. P and \(\mathrm{P}^{\prime}\) will be the poles, and EOQ will be the equator of this prolate fpheroid.

Mr Ferguion, in his Aftionomy, affigns another caufe of this arrangement, viz. the difference of the centhifugal forces of the different particles of water, while the earth is turning round the common centre of gravity of the earth and moon. This, however, is a miftake. It would be juft if the earth and moon were attached to the end of a rod, and the eattb kept always the fane face toward the moon.

It is evident that the accumulation at \(P\) and \(P^{\prime}\), and the depreflion at the equator, muft augment and diminith in the fame proportion with the difturbing force. It is allo evident that its abfolute guantity may be dilcovered by our knowledge of the proportion of the difturbing force to the lorce of gravity. - Now this proportion is known; for the proportion of the gravitation of the earth's contre to the fun or moon, to the force of gravity at the earth's lurface, is known; and the propotion of the gravitation of the earth's centre to the luminary, to the difference of the gravitations of the centre and of the furface, is alfo known, being very nearly the proportion of the dillance of the luminasy to twice the radius of the earth.

Although this reafoning, by which we have afcertained the elligtical form of the watery fpheroid, be lufti-

\section*{T I D} ciently convincing, it is very imperfect, being accommodated to one condition only of equilibrium, viz. the equilibriun of the canals \(f c\) and \(c o\). There are feveral other conditions equally neceffary to which this lax reafoning will not apply, fuch as the dircction of the whole remaining gravitation in any point \(F\). This mult be perpendicular to the furface, \&cc. \&c. Nor will this mode of inveftigation afcertain the eccentricity of the fpheroid without a molt intricate procefs. We muft therefore take the fubject more generally, and thow the proportion and directions of gravity in every point of the fpheroid. We need not, however, again demonArate that the gravitation of a particle placed any where without a perfeet fpherical hhell, or a fphere confilling of concentric fplerical theils, either of uniform denfiry, or of denfities varying according to fome function of the radius, is the fame as if the whole matter of the fhell or fphere were collected in the centre. This has been demonftrated in the article Astronomy. We need only remind the reader of fome confequences of this theorem which are of continual ule in the prefent inveltigation.

1: The gravitation to a fphere is proportional to its quantity of matter directly, and to the fquare of the diftance of its centre from the gravitating particle inverfely.
2. If the fpheres be homogeneous and of the fame denfity, the gravitations of particles placed on their furfaces, or at dillances which are proportional to their diameters, are as the radii ; for the quantities of matter are as the cubes of the radii, and the attractions are inverfely as the fquares of the radii; and therefore the whole gravitations are as \(\frac{r^{3}}{r^{2}}\), or as \(r\).
3. A particle placed within a fplere has no tendency to the matter of the flell which lies without it, hecaufe jts tendency to any part is balanced by an oppofite tendency to the oppofite part. Therefore,
4. A particle placed any where within a homogeneous fphere gravitates to its centre with a force proportional to its difance from it.

It is a much more dilficult problem to determine the gravitation of particles to a fpheroid. To do this in general terms, and for every fituation of the particle, would require a train of propofitions which our limits will by no means admit; we mult content ourfelves with as much as is neceffary for merely afcertaining the ratio of the axes. This will be obtained by knowing the ratio of the gravitation at the pole to that at the equator. Therefore.

Let \(\mathrm{Nm} \mathrm{S} q \mathrm{~N}\) (fig. 2.) be a fection through the axis of an oblate homogeneous fpheroid, which differs very little from a fphere. NS is the axis, \(m q\) is the equatorial diameter, O is the centre, and NMSQ is the fection of the infcribed fphere. Let \(P\) be a particle fituated at any diftance without the fohere in its axis produced; it'is required to determine the gravitation of this particle to the whole matter of the fpheroid?

Draw two lines PAC, PBD, very near to each other, cutting off two fmall arches \(\mathrm{AB}, \mathrm{CD}\); draw GA \(a\), \(\mathrm{HB} h, 1 \mathrm{C} c, \overline{\mathrm{KD}} d\), ferpendicular to the axis; allo draw OE and AL nerpendicular to PAC, and OF perpendicular in PD , cutting PC in \(f\). Join OA.

Let OA, the radius of the infcribed fphere be \(r\), and OP the diftance of the gravitating particle be \(d\), and

MI \(n\), the elevation of the equator of the fpheroid, Tide. or the ellipticity, be \(c\). Alfo make \(\mathrm{AE}=x\), and \(\mathrm{OE}=y,=\sqrt{r^{2}-r^{2}}\). Then \(A E-B F=x\) and \(\mathrm{F} f=y\), \(=\frac{a x}{\sqrt{r^{2}-x^{2}}}\).

Suppofe the whole figurc to turn round the axis OP. The little frace \(\Lambda B b a\) will generate a ring of the redundant matter; to will \(\mathrm{CD} d c\). This ring may be confidered as confifting of a number of thin rings generated by the revolution of \(\mathrm{A} a\). The ring generated by A \(a\) is equal to a parallelogram whofe bate is the circumference defcribed by \(A\) and whole height is \(A a\). Therefore let \(c\) be the circum'erence of a circle whofe radius is 1 . The ring will be \(A a \times c \times A G\). But becaule \(m n \mathrm{~N}\) is an arch of an elliple, we have \(\mathrm{MI} m: \mathrm{A} a\) \(=\mathrm{MO}: \mathrm{AG}=r: \mathrm{AG}\), and \(\mathrm{A} a=\mathrm{M} m \times \frac{\mathrm{AG}}{r},=\frac{r}{r}\)

\section*{AG. Therefore the furface of this ring is \(=c \frac{e}{r} A G^{3}\)}

We have fuppofed the fpheroid to be very nearly fphcrical, that is, e exceedingly fmall in comparifon of \(r\). This being the cafe, all the particles in \(\Lambda a\), and confequently all the particles in the ring generated by the revolution of \(\Lambda a\), will attract the remote particle \(P\) with the fame force that A does very nearly. We majo fay the fame thing of the whole matter of the ring generated by the revolution of \(\triangle \mathrm{B} b a\). This attraction is exerted in the direction PA by each individual particle. But every action of a particle A is accompanied by the action of a particle \(A^{\prime}\) in the direction \(\mathrm{PA}^{\prime}\). Thefe two compofe an attraction in the direction PO. The whole attraction in the directions fimilar to PA is \(=c \times \frac{e}{r}\) \(\frac{\mathrm{AG}^{2}}{\mathrm{PA}^{2}} \times \mathrm{GH}\), for GH meafures the number of parallel plates of which the folid ring is compored. This being decompofed in the direction PG is \(=c \times \frac{e}{r} \times\) \(\frac{\mathrm{AG}^{2} \cdot \mathrm{PG}}{\mathrm{P} \mathrm{A}^{3}} \times \mathrm{GH} . \quad \operatorname{But} \frac{\mathrm{AG}^{2}}{\mathrm{PA}^{3}}=\frac{\mathrm{OE}^{2}}{\mathrm{PO}^{2}}\), and \(\frac{\mathrm{PG}}{\mathrm{PA}}=\frac{\mathrm{PE}}{\mathrm{PO}}\). Therefore the attraction of the ring, eflimated in the direction PO , is \(=c \times \frac{e}{r} \times \frac{\mathrm{OE}^{2} \cdot \mathrm{PE}}{\mathrm{PO}^{3}} \times \mathrm{GH}\).

Further, by the nature of the circle, we have HG : \(\mathrm{AB}=\mathrm{AG}: \mathrm{AO}\); allo \(\mathrm{AB}: \mathrm{BL}=\mathrm{AO}: O E\). But PA: \(A G=P O: O E\), and \(O E=\frac{A G \times P O}{P A}\). Therefore
\(A B: B L=A O: \frac{A G \cdot P O}{P A}, A O \cdot P A: P O \cdot A G\) Alro BL: LA=EO: EA,
And LA: Ff=PA:Pf,=ultimately \(\mathrm{PA}: \mathrm{PE}\). Therefore, by cquality, FIG:Ff=AG:AO.PA. EO. PA: AO. PO. AG.EA. PE.
Or HG: E \(f=E O\). PA \({ }^{2}:\) PO.EA. PE.
And \(\mathrm{HG}=\mathrm{F} f \times \frac{\mathrm{EO} \cdot \mathrm{PA}{ }^{2}}{\mathrm{PO} \overline{\mathrm{PE}} \cdot \mathrm{EA}}\).
Now fubftitute this value of HG in the formula exprefing the attraction of the ring. This changes it to
\(c \frac{e}{r} \times \frac{\mathrm{OE}^{3} \cdot \mathrm{PE}}{\mathrm{PQ}} \times \frac{\mathrm{OE} \cdot \mathrm{PA}^{2}}{\mathrm{PO} \cdot \mathrm{PE} \cdot \mathrm{EA}} \times \mathrm{F} f\), or \(c \frac{e}{r} \times\)
\(\frac{\mathrm{OF}^{3} \cdot \mathrm{PA}^{2}}{\mathrm{PO}^{4} \cdot \mathrm{EA}} \times \mathrm{Ff}\). In like manner, the attraction of \(3 G 2\)

\section*{Tide.} the ring generated by the revolution of \(\mathrm{CD} d c\) is \(c \frac{c}{r} x\) \(\frac{\mathrm{OE}^{3} \cdot \mathrm{PC}^{3}}{\mathrm{PO}^{4} \cdot \mathrm{EA}} \times \mathrm{Ff}\). Therefore the attraction of both is
 \(\frac{y^{3}}{a^{4} \cdot x} \times \overline{\mathrm{PA}^{3}+\mathrm{PC}^{2}}\). But \(\mathrm{PA}^{2}+\mathrm{PC}^{2}=2 \mathrm{PE}^{2}+\) \(2 \mathrm{EA}^{2},={ }_{2} \mathrm{PE}^{2}+2 x^{2}\). Therefore the attraction is \(2 c \frac{e}{r d^{4}} \times \mathrm{Ff} \frac{y^{3}}{x^{2}} \times \overline{\mathrm{PE}^{2}+x^{2}} . \quad\) But \(\mathrm{F} f=\dot{y},=\frac{x}{y} \dot{x}\). Therefore \(\mathrm{F} f \frac{y^{3}}{x}=\frac{x}{y} \dot{x} \times \frac{y^{3}}{x},=y^{2} \dot{x},=\overline{r^{2}-x^{2}} \dot{x}\). Therefore the attraction of the two rings is \(2 c \frac{e}{r d^{4}} \times\) \(\overline{r^{2}-x^{2}} \times \overline{\mathrm{PE}^{2}+x^{2}} \times \dot{x}\). But \(\mathrm{PE}^{2} \underline{\mathrm{PO}^{3}}-\mathrm{OE}^{3},=\) \(d^{2}-\left(r^{3}-x^{2}\right)=d^{2}-r^{2}+x^{2}\). Therefore the attraction of the two rings is
\(2 c \frac{e}{r d^{4}} \times \overline{r^{3}-x^{2}} \times \overline{d^{2}-r^{2}+2 x^{2}} \dot{x},=2 c \frac{e}{r d^{4}} \times\)
\(r^{2} d^{2} x-r^{4} x+2 r^{2} x^{2} x-d^{1} x^{2} x+r^{2} x^{2} x-2 x^{4} x=2 c\)
\(\frac{c}{5 d^{4}} \times \frac{*}{r^{2} d^{2} \dot{x}+3 r^{2} x^{2} x-r^{4} \dot{x}-d^{2} x^{2} \dot{x}-2 x^{4} x .}\)
The attraction of the whole flell of redundant matter will be had by taking the fluent of this formula, which is
\[
=c \frac{e}{r d^{4}} \times\left(r^{2} d^{2} x+\frac{3^{r^{2}} x^{3}}{3}-r^{4} x-\frac{d^{2} x^{3}}{3}-\frac{2 x^{-5}}{5}\right)
\]
and then make \(x=r\). This gives \(2 c \frac{e}{r a^{4}}\left(d^{2} r^{3}+r^{5}-\right.\) \(\left.r^{5}-\frac{1}{3} d^{2} r^{3}-\frac{2}{5} r^{5}\right)\), which is \(=2 c \frac{e}{r \cdot d^{4}}\left(\frac{2}{3} d^{2} r^{3}-\frac{2}{5} r^{5}\right)\), \(=\frac{4 c e r^{2}}{3 d^{2}}-\frac{4 r^{4}}{5 d^{4}}\). To this add the attraction of the infcribed fphere, which is \(\frac{ \pm}{3} \frac{c r^{3}}{d^{2}}\), and we have the attraction of the whole fpheroid
\[
=\frac{2}{3} \frac{c r^{3}}{d^{2}}+\frac{4}{3} \frac{c e r^{2}}{d^{2}}-\frac{4}{6} \frac{c e r^{4}}{d^{4}}
\]

Cor. I. If the particle \(\mathbf{P}\) is fituated precifely in \(\mathbf{N}\), the pole of the fpheraid, the attraction of the fpheroid is \(\frac{2}{3} c r+{ }^{8} 5 c e\).

If the fpleroid is not oblate, but oblong, and if the greater femiaxis be \(r\), and the depreffion at the equator be \(e\), the analy fis is the fame, taking \(e\) negatively. Therefore the attraction for a particle in the pole, or the gravitation of a particle in the pole, is \(\frac{2}{3} \mathrm{cr}-{ }_{-1}^{5} \mathrm{ce}\).

But if the polar femiaxis be \(r+e\), and the equatorial radius be \(r\), fo that this oblong fpheroid has the fame axis with the former oblate one, the gravitation of a particle in the pole is \(\frac{3}{3} c r+\frac{3}{15} c e\).

Cor. 2. If a number of parallel planes are drawn perpendicular to the equator of an oblong fpheroid, whofe longer femiaxis is \(r+e\), and equatorial radius \(r\), they will divide the fpheroid into a number of fimilar ellipfes; and fince the ellipfe through the axis has \(r+c\) and \(r\) for its two femiaxes, and the radius of a circle of equal area with this ellipfe is a mean proportional between \(r\) and \(r+c\), and therefore very nearly \(=r+\frac{r}{2} c\), when \(e\) is very
fmall in comparifon of \(r\), a particle on the equator of the oblong fpheroid will be as much attracted by thefe circles of equal areas, with their correfponding ellipfes, as by the ellipfes. Now the attraction at the pole of an oblate f pheroid was \(\frac{2}{3} c r+\frac{8}{7} c c e\). Therefore putting \(\frac{1}{2} e\) in place of \(e\), the attraction on the equator of the oblong fpheroid will be equal to \(\frac{2}{3} c r+\frac{4}{15} c c\).

Thus we have afcertained the gravitations of a particle fituated in the pole, and of one fituated in the equator, of a homogencous oblong fpheroid. This will enable us to folve the following problem:

If the particles of a homogencous oblong fluid \(\{\) pheroid attract each other with a force inverfely as the fquares of their diftances, and if they are attracted by a very diftant body by the fame law, and if the ratio of the equatorial gravity to this external force be given; to find what muft be the proportion of the femi-axis, fo that all may be in equilibrio, and the fpheroid preferve its form?

Let \(r\) be the equatorial radius, and \(r+e\) be the polar femi-axis. Then the gravitation at the pole \(m\) is \(\frac{2}{3} c r\) \(+\frac{1}{1} c e\), and the gravitation at the equator is \(\frac{2}{3} c r+\) \(\frac{4}{7} \mathrm{ce}\). Now by the gravitation towards the diftant body placed in the direction of the polar axis, the polar gravitation is diminifhed, and the equatorial gravitation is increafed; and the increafe of the equatorial gravitation is to the diminution of the polar gravitation as NO to 2 mO . Therefore if the whole attraction of the oblong ipheroid for a particle on its equator be to the force which the diftant body exerts there, as \(G\) to \(P\), and if the fpheroid is very nearly fpherical, the abfolute weight at the equator will be \(\frac{2}{3} c r+\frac{4}{35} c e+\frac{2}{3} c r \frac{P}{G}\). And the abfolute weight at the pole will be \(\frac{2}{3} c r+\frac{2}{3} c c-\) \(\frac{z}{3} \cos \frac{2 \mathrm{P}}{\mathrm{G}}\). Their difference is \(\frac{2}{35} \cot +2 \operatorname{co} \frac{\mathrm{P}}{\mathrm{G}}\).

Now if we fuppole this fpheroid to be compoled of fimilar concentric thells, all the forces will decreafe irr the fame ratio. Therefore the weight of a particle in a column reaching from the equator to the centre will be to the weight of a fimilarly fituated particle of a columrs reaching from the pole to the centre, as the weight of a particle at the equator to the weight of a particle at the pole. But the whole weights of the two columns mutt be equal, that they may balance each other at the centre. Their lengths muft therefore be reciprocally as the weights of fimilarly fituated particles; that is, the polar femi-axis muft be to the equatorial radius, as the weight of a particle at the equator to the weight of a particle at the pole. Therefore we mult have \(\frac{2}{\frac{2}{5}} c e+2 c r \frac{P}{G}: \frac{2}{3}\) \(c r+{ }^{2}{ }^{2} c e-\frac{1}{3} \operatorname{cr} \frac{\mathrm{P}}{\mathrm{G}}=e: r\).

Hence we denive \(2 r \frac{P}{G}=\frac{8}{15} c\), or \(4 G: 15 P=r: c\). This determines the form of the fluid fpheroid when the ratio of G to P is given.

It is well known that the gravitation of the moon to the earth is to the difturbing force of the fun as 178,725 to 1 very nearly. The lunar gravitation is increafed as the approaches the earth in the reciprocal duplicate ratio of the diftances. The difturbing force of the fun diminifhes in the fimple ratio of the diftances; therefore the weight of a budy on the furface of the earth is to the dillurbing:

\section*{T I D}
diturbing force of the fun on the fance body, in a ratio compounded of the ratio of 178,725 to 5 , the. ratio of 3600 to 1 , and the ratio of 60 to 1 ; that is, in the ratio of 38604600 to I . If the mean radius of the carth be 20934500 fect, the difference of the axis, or the elevation of the pole of the watery \(f_{\mathrm{y}}\) hervid produced by
 or very nearly \(24 \frac{\pi}{2}\) inches. This is the tide produced by the fun on a homogeneous fluid fphere.

It is plain, that if the earth confilts of a folid nucleus of the fame denfity with the water, the form of the folar tide will be the fame. But if the denfity of the nucleus be different, the form of the tide will be different, and will depend both on the denfity and on the figure of the nucleus.

If the nucleus be of the fame form as the furrounding fluid, the whole will Alill maintain its form with the fame proportion of the axis. If the nucleus be fpherical, its action on the furrounding fluid will be the fame as if all the matter of the nucleus by which it exceeds an equal bulk of the fluid were collected at the centre. In this cafe, the ocean cannot maintain the fanse form: fur the action of this central body being proportional to the fquare of the diftance inverfely, will augment the gravity of the equatorial fluid more thanit augments that of the circumpolar fluid ; and the ocean, which was in equilibrio (by fuppofition), mult now become more proluberant at the poles. It may, however, be again balanced in an elliptical form, when it has acquired a juft proportion of the axes. The procefs for determining this is tedious, but precifely finilar to the preceding.

If the denfity of the nucleus exceed that of the fluid about \(\frac{1}{5^{\frac{1}{2}}}\); we fhall have \(r: e=\mathrm{G}: 3 \mathrm{P}\), which is nearly the form which has been determined for the earth, by the menfuration of degrees of the meridian, and by the vibration of pendulums.. The curious reader will do well to confult the excellent differtations by Clairaut and Bofcovich on the Figure of the Earth, where this curious problem is treated in the moft complete manner. Mr Bernoulli, in his differtation on the Tides, has committed a great miftake in this particular. On the other hand, if the nucleus be lefs denfe than the waters, or if there be a great central hollow, the elevation produced by the fun will exceed \(2 \frac{1}{2}\) inches.

It is needlefs to examine this any farther. We have collected enough for explaining the chief affections of the tides.

It is known that the earth is not a fphere, but fwelled out at the equator by the diurnal rotation. But the change of form is fo very finall in proportion to the whole bulk, that it cannot fenfibly affect the change of form afterwards induced by the fun on the waters of the ocean. For the dillurbing force of the fun would produce a certain protuberance on a fluid fphere; and this protuberance depends on the atio of the difturbing force to the force of gravity at the furface of this fyhere. If the gravity be changed in any proportion, the protuberance will change in the fame proportion. Therefore if the body be a fpheroid, the protuberance produced at any point by the fun will increafe or diminill in the fame proportion that the gravity at this point has been changed by the change of form. Now the change of gravity, even at the pole of the terreftrial fpheroid, is
extremely fmall in comparifon with the whole gravity. "Iherefore the change produced on the fpheroid will not fenfibly differ from that produced on the fphere; and the elevations of the waters above the furface, which they would have affumed independent of the fun's action, will he the fame on the fpheroid as on the fphere. For the fame reafon, the moon will change the furface al. ready changed by the fun, in the fame manner as the would have changed the furface of the undifurbed occan. Therefore the change produced by both thefe. luminaries in any place will be the fame when acting together as when acting feparately; and it will be equal to the fum, or the difference of their feparate changes, according as thefe would have been in the fame or in oppofite directions.

Let us now confider the moft interefting circumflances of the form of an elliptical tide, which differs very litllefrom a fphere.

Let I' (fig. 2.) be a point in the furface of the in-Fig. 2. fcribed fphere, and let \(Z\) exprefs the angular diftance TOQ from the longer axis of the furrounding fpheroid \(\mathrm{S} m \mathrm{~N} q\). Lot TR, TW be perpendicular to the equatorial diameter and to the axis, fo that they are the cofine and the fine of TOQ to the radius TO or QO. Let \(S^{\prime} q N^{\prime}\) be a fection of the circumferibed fphere. Draw OT cutting the fpheroid in \(Z\) and the circumfrribed fphere in \(\%\). Alfo let son be a fection of a fphere which has the fame capacity with the fpheroid, and let it cut the radius in \(r\). Tben,
1. The elevation \(T Z\) of the point \(Z\) of the fpheroid above the infcribed fpherc is \(=Q q \times \operatorname{cof}^{2} Z\), and the depreffion \(t Z\) below the circumferibed fphere is \(=Q q\) \(x\) fine \({ }^{2} Z\). Produce RT till it meet the furface of the fpheroid in V. The minute triangle VTZ may be confidered as rectilineal, right-angled at \(Z\), and therefore fimilar to OTR. Therefore O'T : TR=TV : TZ. But in the ellipfe OQ, or OT:TR=Qq: TV. Therefore \(\mathrm{OT}^{2}: T K^{2}=Q q: T Z\), and \(T Z=\frac{Q q \cdot \mathrm{TR}^{2}}{O T^{3}}\), \(=Q_{q}: \frac{O q \times \operatorname{cof}{ }^{2} Z}{1},=Q q \times \operatorname{cof}^{*} Z\).

And in the very fame manner it may be fhown, that \(\mathrm{Z}=\mathbf{Q} q \times\) fin. \({ }^{\mathbf{Z}} \mathrm{Z}\).
2. The elevation of the point \(T\) above another point ' \(\mathrm{T}^{\prime}\), whofe angular difance ' \(\mathrm{COT}^{\prime}\) from the point T ' is \(90^{\circ}\), is \(=\Omega q \times \overline{\operatorname{col}^{2} 2-\operatorname{lin}^{2} Z}\). Call the angle \(Q \mathrm{OT}^{\prime}\) \(Z!\). Then \(\Gamma^{\prime} Z=0 q \times \operatorname{cof}^{*} Z^{\prime}\), and 'IZ-T', \(Z\) ', \(=Q_{q} \times \operatorname{col}^{2} Z-\operatorname{cof}^{2} Z^{\prime}\). But the arch \(Q^{\prime}\) is the complement of \(Q T\), and therefore cof. \({ }^{2} Z^{\prime}=f i n .{ }^{2} Z\) Therefore \(\mathrm{TZ}-\mathrm{T}^{\prime}, Z=Q q \times \overline{\operatorname{cof}^{2} Z-\operatorname{lin} .^{2} Z}\).
3. \(Q 0=\frac{1}{3} Q q\). For the infcribed fphere is to the fpheroid as \(O Q\) to \(O q\). But the infcribed fphere is to the fphere son as \(\mathrm{OQ}^{3}\) to \(\mathrm{O}^{3}{ }^{3}\). Therefore becaufe the fphere . 0 on is equal to the fpheroid Sq N , we have \(\mathrm{OQ}: \mathrm{O} q=\mathrm{OQ}^{3}: \mathrm{O}^{3}\), and O 0 is the filt of two mean proportionals between \(O Q\) and \(O g\). But \(Q q\) is very fmall in comparifon with OQ. Therefore \(Q O\) is very nearly \(\frac{7}{3}\) of \(Q q\).
Since son is the fphere of equal capacity, it is the form of the undifurbed ocean. The beft way therefore of conceiving the changes of form produced by the fun or moon, or by both together, is to confider the elevations or depreffions which they produce above or below this furface, Therefore,
4. The elevation \(r Z\) of the point \(Z\) above the equicapacious fohere is evidently \(=Q q \times \operatorname{cof}^{2} Z-\frac{r}{3} Q q\). Ain the depreflion \(r^{\prime} Z^{\prime}\) of the point \(Z^{\prime}\) is \(=\Omega q \times\) fin \({ }^{2} \mathrm{Z}^{\prime}-\frac{2^{2}}{3}\) Q \(q\).
N. B. Either of thefe formulæ will anfwer for either the elevation above, of the depreffion below, the natural ocean : For if cof. \({ }^{2} \mathrm{Z}\) is lefs than \(\frac{\frac{r}{3} \text {, the elevation given }}{}\) by the formula will be negative; that is, the point is beiver the natural furface. In like manner, when \(f_{1}:^{2} Z\) ' is lefs thar \(\frac{2}{3}\), the depreffion is negative, and the ment is above the furface. But if col. Z be \(=\frac{\mathrm{T}}{\mathrm{T}}\), or fin. ' \(Z\) ' be \(=\frac{2}{3}\), the point is in the natural furface. This marks the place where the fpheroid and the equal fphere inte:foct each other, viz. in \(\mathrm{P}^{\prime}\), the arch \(\mathrm{P}^{\prime}\) obeing \(54^{\circ} 44^{\prime}\) very nearly, and PS \(=35^{\circ} 16^{\prime}\).

Lel \(S\) reprefent the whole elevation of the pole of the folar tide above its equator, or the difference between high and low water produced by the fun; and let M reprefent the whole elevation produced by the moon. Let \(x\) and \(y\) reprefent the zenith diftances of the fun and moon with refpect to any point whatever on the ocean. Then \(x\) and \(y\) will be the arches intercepted between that point and the fummits of the folar and lurar tides. Then the elevation produced by both lumisaries in that plane is \(\mathrm{S} \cdot \mathrm{cof}^{2} x-\frac{r^{2}}{3} \mathrm{~S}+\mathrm{MI} \cdot \operatorname{cof}^{2} y\) \(-\frac{1}{3} \mathrm{M}\); or, more concifely, \(\mathrm{S} \cdot \operatorname{cof} .^{3} x+\mathrm{MI} \cdot \operatorname{cof}^{2}{ }^{2} y-\frac{2}{3}\) \(\overline{S+M}\), and the deprefion is \(S \cdot \sin ^{3} x+\mathrm{M} \cdot \operatorname{lin}^{2} y-\frac{2}{3}\) S+M.
Let the fun and moon be in the fame point of the heavens. The folar and lunar tides will have the fame axis ; the colines of \(x\) and \(y\) will each be 1 , and the elevation at the compound pole will be \(\mathrm{S}+\mathrm{NI}-\frac{1}{3}\) \(\overline{S+M}=\frac{2}{3} \overline{S+M}\). The depreffion at any point \(90^{\circ}\) from this pole will be \(\frac{1}{3} \overline{\mathrm{~S}+\mathrm{MT}}\), and the whole tide is \(S+\mathrm{M}\).

Let the moon be in quadrature, as in a (fig. 3.). The appearance at \(s\) will be known, by confidering that in this place the cofine of \(x\) is \(\mathbf{1}\), and the cofine of \(y\) is 0 . Therefore the elevation at \(s=S-\frac{5}{3} \overline{S+M},=\frac{2}{3} S-\frac{1}{3} \mathrm{M}\). The depreflion at \(a=S-\frac{1}{3} \overline{S+M}=\frac{1}{3} \frac{S-\frac{2}{3} M}{S-M}\).
The difierence or whole tide \(=\) In like manner, the whole elevation at \(a\) above the infcribed fohere is M-S.

Hence we fee that the whole tide, when the moon is in quadrature, is the difference of \(S\) and MI. TWe alfo fee, that if MT exceeds S , the water will be higher at a than at \(s\). Now it is a matter of obfervation, that in the quadratures it is high water under the moon, and low water under the fun. It is alfo a matter of obfervation, that in the free ocean, the ebb tide, or the water at \(s\), immediately under the fun, is below the natural furface of the ocean. Hence we mult conclude, that \(\frac{2}{5} S\) is lefs than \(\frac{+}{3} \mathrm{M}\), or that M is more than double of S . This agrees with the phenomena of nutation and precefion, which feem to make \(S=\frac{2}{5}\) of M .

In all other pofitions nf the fun and moon, the place of high water will be different. It is high water where the fum of the elevations produced by both luminaries above the natural occan is greaten; and the place nf low water is where the deprefion below the natural occan is greacicf. Therefore, in order that it may be high water, we mult have \(S \cdot \operatorname{cof}^{2} x+11 \cdot \operatorname{cof}^{2} y y-\frac{1}{3}\) \(\overline{S+M}\) a maximum; or, neglecting the confant quan-
tity \(\frac{S+M}{3}\), we mutt have \(S \cdot \cos ^{2} x+M \cdot \cos ^{2} y\) moximum.

In like manner, to have low water in a place where the zenith diftances of the fun and moon are \(v\) and \(w\), we muft have \(\mathrm{S} \cdot \mathrm{fin}^{3} v+\mathrm{M} \cdot\) fin. \({ }^{2} w\) a maxinum.

Lemma I. If we confider the fines and cofines of angles as numeral fractions of the radius 1 , then we have cof. \(=Z=\frac{1}{2}+\frac{x}{2}\) cof. \({ }^{2} Z\), and fin. \({ }^{2} Z=\frac{1}{2}-\frac{x}{2} \operatorname{cof} .^{2} Z\).

Let \(a \mathrm{~ms}\) (fig. 3.) be a quadrant of a curcle of which O is the centre, and Os is the radius. On Os de. Fig. \(3^{\circ}\) frribe the femicircle OMS, cutting \(\mathrm{O} m\) in M . Draw \(s \mathrm{M}\), and produce it till it cut the quadrant in \(n\). Alfo draw MC to the centre of the femicircle, and MD and \(n d\) perpendicular to \(\mathrm{O} s\).

It is plain that \(s \mathrm{M}\) is perpendicular to OM ; and if \(\mathrm{O} s\) be radius, \(s \mathrm{M}\) is the fine of the angle \(s \mathrm{OM}\), which we may call Z ; OM is its cofine: and becaufe \(\mathrm{O} s\) : \(\mathrm{OM}=\mathrm{OM}: \mathrm{OD}\), and \(\mathrm{Os}: \mathrm{OD}=\mathrm{Os}^{2}: \mathrm{OM}^{2}\), and OD may reprefent cof. \({ }^{3} \mathrm{Z}\). Now \(\mathrm{OD}=\mathrm{OC}+\mathrm{CD}\). If \(\mathrm{O} s=\mathrm{r}\), then \(\mathrm{OC}=\frac{\mathrm{x}}{2} . \quad \mathrm{CD}=\mathrm{CM} \cdot \operatorname{cof} . \mathrm{MCD},=\) \(\mathrm{CM} \cdot \operatorname{cof}, 2 \mathrm{MOD},=\frac{\pi^{2}}{2} \cdot \operatorname{cof} 2 \mathrm{Z}\). Therefore \(\operatorname{cof}^{2} \mathrm{Z}\) \(=\frac{x}{2}+\frac{1}{2} \operatorname{cof}, 2 \mathrm{Z}\).

In like manner, becaufe \(\mathrm{O} s: s \mathrm{M}=s \mathrm{M}: s \mathrm{D}, s \mathrm{D}\) is \(=\operatorname{fin}^{2} Z\). This is evidently \(=\frac{x}{2}-\frac{x}{2}\) cof. 2 Z .

Lemma 2. Cof. \({ }^{2} \mathrm{Z}-\mathrm{fin} .^{2} \mathrm{Z}=\operatorname{cof.} 2 \mathrm{Z}\). For, becaufe \(s \mathrm{M}\) is perpendicular to OM, the arch \(s n\) is double of the arch \(s m\), and becaufe MD is parallel to \(n d, s d\) is \(=2 s \mathrm{D}\), and \(d \mathrm{D}=\) fin. \({ }^{2} \mathrm{Z}\). Therefore \(\mathrm{O} d=\operatorname{cof} .{ }^{2} \mathrm{Z}\)一fin. \({ }^{2}\) Z. But \(\mathrm{O} d\) is the confine of \(n s,=\operatorname{col} .2 \mathrm{Z}\) and cof. \({ }^{2} Z\)-fin. \({ }^{2} Z=\operatorname{cof}\). 2 Z .

By the fifit Lemma we fee, that in order that there may be high watcr at any place, when the zenith diftances of the fur and moon arc \(x\) and \(y\), we mult have \(\mathrm{S} \cdot \mathrm{cof} .2 x+\mathrm{NI} \cdot \operatorname{cof} .2 y\) a maxinum.

That this may be the cafe, the fluxion of this formula muft be \(=0\). Now we know that the fluxions of the cofines of two arches are as the fines of thofe arches. Therefore we mult have \(\mathrm{S} \cdot \operatorname{fin}, 2 x+\mathrm{M} \cdot \operatorname{fin} .2 y=0\), or \(\mathrm{S} \cdot \operatorname{fin} .2 x=-\mathrm{M} \cdot \mathrm{fin} .2 y\), which gives us fin. \(2 x\) : fin. \(2 y=\mathrm{M}: \mathrm{S}\).

In like manner, the place of low water requires fin. \(2 v:\) fin. \(2 w=M: S\).

From this laft circumftance we learn, that the place of low water is 0 , removed \(90^{\circ}\) from the place of high water; whereas we might have expected, that the fplic. roid would have been moft protuberant on that fide on which the moon is: For the fines of \(2 v\) and of \(2 w\) have the fame proportion with the fines of \(2 x\) and of \(2 y\). Now we know that the fine of the double of any arch is the fame with the fine of the double of its complement. Therefore if low water be really diftant \(90^{\circ}\) from bigh water, we thall have fin, \(2 x:\) fin. \(2 y=\) fin, \(2 v:\) fin. \(2 w\). But if it is at any other place, the fines cannot have this proportion.

Now let \(s\) be the point of the cath's furface which has the fun in the zenith, and \(m\) the point which has the moon in the zenith. Let \(h\) be any other point. Draw \(\mathrm{O} h\) cutting the femicircle OMs in H. Make CM to CS as the diflurbing force of the moon to that of the fun; and draw So narallel, and \(\mathrm{S} /, \mathrm{Mr}\) perpendicular to HH'. Join MH and MH'. 'The angle HCs is double of the angle \(\mathrm{HO} s\), and MCH is double of MH'H, or of its equal MOH. Becaufe HMH is a femicircle, HM is perpendicular to MO. Thete-

\section*{T I D}
fore if HH' be confidered as radius, IMM is the fine, and \(\mathrm{H}^{\prime} \mathrm{M}\) is the cofine of \(\mathrm{MH}^{\prime} \mathrm{H}\). And \(\mathrm{C} r\) is \(=\mathrm{MC}\). cof. \(2 y\), \(=\mathrm{M} \cdot \operatorname{col} .2 \%\). And C 6 is \(\mathrm{SC} \cdot \operatorname{col} 2 \%\). Therefore \(t r\) or \(\mathrm{S}^{\prime} \boldsymbol{y}\) is \(=\mathrm{S} \cdot \operatorname{cof} \cdot 2 x+\mathrm{M} \cdot \operatorname{cof} \cdot 2 y\). 'I'herefore \(t r\) or \(\mathrm{S} v\) will exprefs the whole difference of elevation between \(h\) and the points that are \(9 \rho\) degrees from it on either fide (by Lemma 2.); and it \(h\) be the place of high water, it will exprefs the whole tide, becaufe the high and low waters were ftown to be \(90^{\circ}\) alunder. But when \(h\) is the place of high water, \(\mathrm{S} v\) is a maximum. Becaufe the place of the moon, and therefore the point \(M\), is given, \(S\) a will be a maximum when it coincides with SM , and CH is parallel to SM.

This fuggefted to us the following new, and not inelegant, folution of the problem for determining the place of high water.

Let sQops (fig. 4. and 5) be a fection of the terraqueous glube, by a plane palling through the fun and moon, and let \(O\) be its centre. Let s be the point which is immediately under the fun, and \(m\) the place immediately under the moon. Bilect Os in C , and defcribe round C the circle OMs LO, cutting \(\mathrm{O} m\) in M. Take C s to reprefent the difturbing force of the moon, and make C sto CS as the force of the moon to that of the fun (fujpoling this ratio to be known). Join MS, and draw CH parallel to it. Draw OHh, and / OL \(l^{\prime \prime}\) perpendicular to it. And lafty, draw CI perpendicular to SM. Then we fay that \(m\) and its oppofite \(m t^{\prime}\) are the places of high water, \(l\) and \(/ /\) are the places of low water, MS is the height of the tide, and MI, SI are the portions of this tide produced by the moon and fun.

For it is plain, that in this cafe the line \(S v\) of the laft propoftion coincides with MS, and is a maximum. We may alfo obferve, that MC : CS=fin. MSC : fin. \(\mathrm{SMC},=\) fin. \(\mathrm{HCS}:\) fin. \(\mathrm{MCH},=\) fin. \(2 / \mathrm{Os}:\) fin. \(2 h \mathrm{O} m\), \(=\) fin. \(2 x:\) fin. \(2 y\), or \(\mathrm{M}: \mathrm{S}=\) fin. \(2 x:\) fin. \(2 y\), agreeably to what was required for the maximum.

It is alfo evident, that \(M I=M C \cdot \operatorname{cof} . \mathrm{CMI}_{1}=\) \(\mathrm{M} \cdot \operatorname{cof} \cdot 2 y\), and \(\mathrm{SI}=\mathrm{SC} \cdot \operatorname{cof.} \mathrm{ISC},=\mathrm{S} \cdot \operatorname{cof} .2 w ;\) and therefore MS is the difference of elevation between \(h\) and the points \(l\) and \(l\), which arc \(90^{\circ}\) from it, and is therefore the place of low water; that is, MS is the whole tide.

The elevation of every other point may be determined in the fame way, and thus may the form of the Spheroid be completely determined.

If we fuppofe the figure to reprefent a fection through the earth's equator (which is the cafe when the fun and moon are in the equato:), and farther fuppofe the two luminaries to be in conjunction, the ocean is an oblong fpheroid, whofe axis is in the line of the fuzigies, and whofe equator coincides with the fix hour circle. But if the moon be in any other point of the equator, the Ggure of the ocean will be very complicated. It will not be any figure of revolution; becaufe neither its equator (or mof deprefled part) nor its meridians are circles. The mof depreffed part of its eq̧uator will be in that fection through the axis which is perpendicular to the plane in which the luminaries are fituated. And this greateft depreffion, and its thortelt equatoriel dia. meter, will be conftant, while its other dimenfions vaty with the moon's place. We need not inquire more mi-
nutely into its form ; and it is fufficient to know that all the fections perpendicular to the plane paffing through the lin and moon ate clliples.

This confruction will aftord us a very fimple, and, we hope, a very perfuicuous explanation of the chicf phenomena of the tides. The well informed reader will be pleafed with obferving its coincidence with the algebraic folution of the problem given by Daniel Bernoulli, in his excellent diflertation on the Jides, which flared with M. Laurin and Euler the prize given by the Academy of Sciences at Paris, and with the eafe and perficuity with which the phenomena are deducible from it, being in fome fort exhibited to the eye.

In our application, we thall begin with the fimpleft cafes, and gradually introduce the complicating circumflances which accommodate the theory to the true flate of things.

We begin, therefore, by fuppofing the earth covered, to a proper depth, with water, forming an ocean concentric with its folid nucleas.

In the next place, we fuppofe that this ocean adopts in an intant the form which is conffitent with the equilibrium of gravity and the difturbing forces.

Thirdly, We fuppofe the fun ftationary, and the moon to move eaft ward fiom him above \(12^{\frac{1}{2}}{ }^{\circ}\) every day.

Fourthly, We fuppofe that the folid nucleus turns round its proper axis to the eaftward, making a rotation in 24 folar hours. Thus any place of obfervation will fuccellively experience all the different depths of water.

Thus we fhall obtain a certain Succession of phenomena, precifely limilar to the fucceflion obferved in nature, with this fole difference, that they do not correfpond to the contemporancous fituations of the fun and moon. When we flall have accounted for this difierence, we fhall prefume to think that we have given a juft theory of the tides.

We begin with the firmpleft cafe, fuppofing the fun and moon to be always in the equator. Let the feries begin with the fun and moon in conjunction in the line \(O_{s}\). In this cafe the points \(s, m\), and \(h\) coincide, and we have high water at I2 o'clock noon and midnight.

While the moon moves from \(s\) to \(Q, O m\) cuts the upper femicircle in M ; and therefore CH , which is always parallel to MS , lies beiween MC and C s. Therefore \(h\) is between \(m\) and \(s\), and we have high water after \(120^{\circ}\) clock, but before the moon's fouthing. The fame thing happens while the moon moves from o to \(q\), during her third quarter.

But while the moon moves from her fift quadrature in \(Q\) to oppofition in 0 (as in fig. 5 .), the line \(m \mathrm{O}\) drawn from the moon's place, cuts the lower femicircle in MI and CH, parallel to SM, again lies between MI and \(s\), and therefore \(h\) lies between \(m\) and \(o\). The place of high water is to the ealtward of the moon, and we have high water after the moon's fouthing. The fame thing happens while the moon is moving from her laft quadrature in \(q\) to the next fyzigy. In fhort, the point \(H\) is always between \(\mathbb{M}\) and \(s\), and the place of high water is always between the moon and the neareft fyzigy. The p!ace of high water overtakes the moon in each quadrature, and is overtaken by the moon in each fyzigy. Therefore during the firt and third quarters, the place of high water gradually falls behind the moon for fome time, and then gains upon her again, fo

\section*{I I D}

Tide. as to overtake her in the next quadrature. But during the fecond and fourth quarters, the place of high water advances before the moon to a certain diftance, and then the moon gains upon it, and overtakes it in the next fyzigy.

If therefore we fuppofe the moon to advance uniformly along the equator, the place of high water moves unequally, flowelt in the times of new and full moon, and fwiftelt in the time of the quadratures. There mult be fome intermediate fituations where the place of high water neither gains nor lofes upon the moon, but moves with the fame velocity.

The rate of motion of the point \(/ 2\) may be determined as foliows: Draw \(C i, S n\), making very fmall and equal angles with HC and MS. Draw \(n \mathrm{C}\), and about S , with the diftance \(S n\), defcribe the arch \(n v\), which may be confidered as a fraight line perpendicular to \(n \mathrm{~S}\), or to MS.

Then, becaufe SM and \(\mathrm{S} n\) are parallel to CH and \(\mathrm{C} i\), the points \(n\) and \(i\) are contemporaneous fituations of M and H , and the arches \(n \mathrm{M}, i \mathrm{H}\), are in the ratio of the angular motions of \(m\) and \(h\). Alfo, becaufe \(n v\) and \(n \mathrm{M}\) are perpendicular to \(n \mathrm{~S}\) and \(n \mathrm{C}\), the angle of \(n\) is equal to the angle \(\mathrm{S} n \mathrm{C}\), or SMC. Alfo, becaufe the angles \(n v \mathrm{M}\) and MIC are right angles, and the angles \(v n \mathrm{M}, \mathrm{CMI}\), are allo equal, the triangles ข \(n \mathrm{M}, \mathrm{CMI}\), are fimilar. Therefore
\(n \mathrm{M}: n v=\mathrm{MC}: \mathrm{MI}\). And
\({ }_{n}\) v: \(i \mathrm{H}=n \mathrm{~S}: i \mathrm{C}\), or \(=\mathrm{MS}: \mathrm{MC}\); therefore n M1: \(i \mathrm{H}=\mathrm{MS}: \mathrm{MI}\). Therefore the angular motion of the moon is to the angular motion of the place of high water as MS to MI.
'Thercfore, when M'S is perpendicular to SC, and the point I coincides with \(S\), the motion of high water is cqual to that of the moon. But when \(M^{\prime} S\) is perpendicular to \(\mathrm{SC}, \mathrm{H}^{\prime} \mathrm{C}\) is alfo perpendicular to \(\mathrm{C} s\), and the angle \(h^{\prime} \mathrm{O} s\) is \(45^{\circ}\), and the high water is in the octant. While the moon paffes from \(s\) to \(m^{\prime}\), or the high water from s to \(l\) ', the point I falls between M and S , and the motion of high water is flower than that of the moon. The contrary obtains while the moon moves from \(n^{\prime}\) to \(Q\), or the high water from the octant to the quadrature.

It is evident, that the motion of \(h\) in the third quarter of the lunation, that is, in paffing from o to \(q\), is fimilar to its motion from \(s\) to \(Q\). Alfo, that its motion from () to o muft retard by the fame degrees as it accelcrated in palfing from \(s\) to \(Q\), and that its motion in the laft quarter from \(q\) to \(s\) is fimilar to its motion from \(Q\) to 0 .

At new and full moon the point I coincides with C , and the point M coincides with \(s\). Therefore the motion of the ligh water at full and change is to the motion of the moon as \(s C\) to \(s \mathrm{~S}\). But when the moon is in quadrature, 1 coincides with \(C\), and M with \(o\). Therefore the motion of the moon is to that of high water as OS to OC or sC. Therefore the motion of high watcr at full and rhange is to its motion in the unadratures as \(O S\) to \(\mathrm{S} s\), or as the difference of the linurbing forces to thair fum. The motion of the tide is therefore flowef in the fyzigies and fuiftef in the quadratures; yet even in the fyzigies it paffes the fun along with the moon, but more flowly.

Let the interval between the morning tide of one say end that of the next day be called a side-day.

This is always' greater than a folar day, or 24 bours, becaufe the place of high water is muving fafter to the ealtward than the fun. It is lefs than a lunar day, or \(2{ }_{4}\) h. \(50^{\prime}\), while the high water paffes from the lecond to the third octant, or from the fourth to the firt. It is equal to a lunar day when high water is in the octants, and it exceeds a lunar day while high water paffes from the firlt to the fecond octant, or from the third to the fourth.

The difference between a folar day and a tide day is called the friming or the retardation of the tides. This is evidently equal to the time of the earth's deferibing in its rotation an angle equal to the motion of the high water in a day from the fun. The fmalleft of thefe retardations is to the greatef as the difference of the difturbing forces to their fum. Of all the phenomena of the tides, this feems liable to the feweft and moft inconfiderable derangements from local and accidental circumflances. It therefore affords the ben means for determining the proportion of the difturbing furces. By a comparifon of a great number of obfervations made by Dr Mafkelyne at St. Helena, and at Barbadoes (places fituated in the open iea), it appears that the fhorleft tide day is \(24 \mathrm{~h} .37^{\prime}\), and the longeft is 25 . \(27^{\prime}\). This gives \(\mathrm{M}-\mathrm{S}: \mathrm{M}+\mathrm{S}=37: 87\), and \(\mathrm{S}: \mathrm{M}\) \(=2: 4.96\); which differs only 1 part in 124 from the proportion of 2 to 5, which Daniel Bernoulli colledted from a variety of different obfervations. We fuall therefore adopt the proportion of 2 to 5 as abundantly evact. It alfo agrees exactly with the phenomena of the nuta. tion of the earth's axis and the preceffion of the equinoxes; and the attronomers aftect to have deduced this propotion from thefe phenomena. But an intelligent reader of their writings will perceive more finefle than juftice in this affertion. The nutation and precef. fion do not afford phenomena of which we can aflign the flare to each luminary with fufficient precifion for determining the proportion of their dilturbing forces; and it is by means of many arbitrary combinations, and without necellity, that D'Alembert has made nut this ratio. We cannot help being of opinion, that D'Alembert has accommodated his diftribution of the phenomena to this ratio of 2 to 5 , which Daniel Bernoulli (the beft philofopher and the noof candid man of that illuftrious family of mathematicians) had, with fo much fagacity and jufnefs of inference, deduced from the phenomena of the tides. D'Alembert could not hut fee the value of this inference; but he wanted to flow his own addrefs in deducing it proprio marte forfooth from the nutation and preceffion. His procedure in this refembles that of his no lefs vain countryman De la Place, who affects to be highly pleafed with finding that Mr Bode's difcovery that Meyer had feen the Georgium Sidus in 1556 , perfectly agreed with the theory of its motions which he (De la Place) had deduced from his own doct tines. Any well informed mathematician will fee, that De la Place's data afforded no fuch precifion; and the book on the Elliptical Motions of the Plancts, to which he alludes, contains no grounds for his inference. This obfervation we owe to the author of a aper on that fubject in the Tranfactions of the Royal Society of Edinburgh. We hope that our readers will excufe this occafional obfervation, by which we wifh to do juftice to the merit of a modent man, and one of the greatef philofophers of his time. Our only cham in the preicnt differtation is the making his excellent per-
formance

Tiide. furmance on the tides acceffible to an Englifh reader not much verfant in mathematical refearches; and we are forry that our limits do not admit any thing more than a thetch of it. But to proceed.
- Affuming \(2: 5\) as the ratio of \(S C\) to \(\mathrm{CM}^{\prime}\), we have the angle CMI'S \(=23^{\circ} 34^{\prime}\) nearly, and \(m^{\prime} \circ h^{\prime}=11^{\circ} 47^{\prime}\); and this is the greatert difference between the moon's place and the place of high water. And when this obtains, the moon's elongation \(m^{\prime}\) os is \(56^{\circ} 47^{\prime}\) from the nearef fyzigy. Hence it follows, that while the monn moves unifurmly from \(56^{\circ} 47^{\prime}\) weft elongation to \(56^{\circ}\) \(47^{\prime}\) eaff, or' from \(123^{\circ} 13^{\prime}\) eall to \(123^{\circ} 13^{\prime}\) welf, the tide day is therier than the lunar day; and while fle moves from \(56^{\circ} 47^{\prime}\) eafl to \(123^{\circ} 13^{\prime}\), or from \(123^{\circ} 13^{\prime}\) weft to \(56^{\circ} 47^{\prime}\), the tide-day is lunger than the lumarday.
We now fee the reafon why

> _The fwelling tides obey the moon.

The time of high water, when the fun and moon are in the eq tator, is never more than 47 minutes different from that of the moon's fouthing ( + or - a certain fixed quantity, to be determined once for all by obfervation).

It is now an eafy matter to determine the hour of high water correfponding to any pofition of the fun and moon in the equator. Suppofe that on the noon of a certain day the moon's difance from the fun is \(m s\). The conflruction of this problem gives us \(s h\), and the length of the tide-day. Call this T. "Then fay \(360^{\circ}\) : \(s m=\Gamma: t\), and \(t\) is the hour of high water.

Or, if we choofe to refer the tinue of high water to the moon's fouthing, we muft find the value of \(m h\) at the time of the moon's fouthing, and the difference \(d\) between the tide-day and a mean lunar day L , and fay \(360: m h=d: \delta\), the time of high water before the moon's fouthing in the firf and third quarters, but after it in the fecond and fourth. The following table by Daniel Bernoulli exhibits thefe times for every 10 th degree of the moon's elongation from the fun. The firt or leading column is the moon's elongation from the fun or from the point of oppofition. The fecond column is the minutes of time between the moon's fouthing and the place of high water. The marks - and + diftinguifh whether the high water is before or after the moon's fouthing. The third colunin is the hour and minute of high wate:. But we mulf remark, that the firft column exhibits the elongation, not on the noon of any day, but'at the very time of high water. The two remaiaing columns exprefs the hcights of the tides and their daily variations.

The height of high water above the low water confitutes what is ufually called the tide. This is thi interefting circumftance in practice. Many circumflances render it almoft impoffible to fay what is the elevation of high water above the natural furface of the ocean. In many places the furface at low water is above the natural furface of the ocean. This is the cafe in rivers at a great diflance from their mouths. This may appear abfurd, and is certainly very paradoxical ; but it is a fact effablilhed on the moft unexceptionable authority. One inflance fell under our owis obfervation. The low. water mark at fpring tide in the hatbour of Alloa was found by accurate levelling to be three feet higher than the top of the fone pier at Leith, which is feveral feet above the high-water mark of this harbour. A litile attention to the motion of running waters will explain this completely. Whatever checks the motion of water in a canal mult raifc its furface. Water in a canal runs only in comequence of the declivity of this furface: (See River). Therefore a thoud tide coming to the mouth of a river checks the current of its waters, and they accumulate at the mouth. This checks the current farther up, and therefore the waters accumulate there alfo; and this checking of the freart, and confequent rifing of the waters, is gradually communicated up the river to a great ditance. The water rifes everywhere, though its furface fill has a flope. In the mean time, the tood tide at the mouth pafles by, and an ebb fucceeds. This muft accelerate even the ordinary courfe of the river. It will more remarkably accelerate the river now raifed above it ordinary level, becaufe the declivity at the mouth will be fo much gfeater. Therefore the waters near the mouth, by accelerating, will fink in their channel, and increafe the declivity of the canal beyond them. This will accelerate the waters beyond them; and thus a ftream more rapid than ordinary will be produced along the whole river, and the waters will fink below their ordinary level. Thus there will be an ebb below the ordinary furface as well as a flood above it, however floping that furface may be.
Hence it follorrs, that we cannot tell what is the natural furface of the occan by any obfervations made in a river, even though near its mouth. Yet even in rivers we have regular tides, fubjected to all the varieties deduced from this theory.

We have feen that the tide is always proportional to MS. It is greatelt therefore when the moon is in conjunction or oppofition, being then \(S s\), the fum of the feparate tides produced by the fun and moon. It gradually decreafes as the moon approaches to quadrature; and when the is at \(Q\) or \(q\), it is \(S O\), or the difference of the feparate tides. Suppofing \(S s\) divided into 1000 equal parts, the length of MS is expreffed in thefe parts in the fourth column of the foregoing table, and their differences are expreffed in the fifth column.

We may here oblerve, that the variations of the tides in equal fmall times are proportional to the fine of twice the diftance of the place of bigh water from the moon. For fince \(\mathrm{M} n\) is a conflant quantity, on the fuppofition of the moon's uniform motion, Mv is proportional to the variation of MS. Now \(\mathrm{M} n: \mathrm{M} v=\mathrm{MC}\) : \(\mathrm{CI}=1\) : fin. \(2 y\), and \(\mathrm{M} n\) and MC are comflant quantities.

Thus we have feen with what eafe the geometrical confruetion of this problem not only explains all the intereiting circumflances of the tides, but alfo points them out, almolt without enploying the judgement, and exhibits to the eye the gradual progrefs of each phenomenon. In thefe refpects it has great advantages over the very elegant algebraic analyfis of Mr Bernoulli. In that procefs we advance almoft without ideas, and obtain our folutions as detached fact, without perceiving their regular feries. This is the ufual pre-eminence of geometrical analyfis; and we regret that Mr Bernoulli, who was eminent in this branch, did not rather employ it. We doube not but that he would have fhown ftill more clearly the connection and gradual progrefs of every particular. His aim, however, being to inftruct thofe who were to calculate tables of the different affections of the tides, he adhered to the algebraic method. Unfortunately it did not prefent him with the eafieft formulæ for practice. But the geometrical confruction which we have given fuggefts feveral formule which are exceedingly fimple, and afford a very ready mode of calculation.

The fundamental problems are to determine the angle \(s \mathrm{Oh}\) or \(\mathrm{m} \mathrm{O} h\), having \(m \mathrm{Os}\) given; and to determine MS.

Let the given angle \(m \mathrm{Os}\) be called \(a\); and, to avoid the ambiguity of algebraic figns, let it always be reckoned from the nearen fyzigy, fo that we may always have \(a\) equal to the furm of \(x\) and \(y\). Alfo make \(d^{2}=\frac{S^{2} \times \text { fin. }{ }^{2} 2 a}{\mathrm{~S}^{2}+\mathrm{S}^{2}+2 \mathrm{M} \times \mathrm{S} \times \operatorname{col} \cdot 2 a^{2}}\), which reprefents the \(\frac{S c^{2}}{S \mathrm{I}^{2}}\) of fig. 4 . or fin. \({ }^{2} 2 y\), and make \(p=\frac{\mathrm{S} \times \mathrm{fin} .2 a}{\mathrm{M}+\mathrm{S} \times \operatorname{col} .2 a,}\), which is the expreflion of \(\frac{S \dot{C}}{\mathrm{M}_{c}}\) of that figure, or of tan. zy. Then we fhill have,

\(2 y=\sqrt{1-d^{2}} . \quad\) But fin. \({ }^{2} y=\frac{1}{2}-\frac{1}{2} \cos .2 y=\) \(1-\frac{\sqrt{1-d^{2}}}{2}\), and fin. \(y=\sqrt{\frac{1-\sqrt{1-d^{2}}}{2}}\).
2. Tan. \(y=\frac{p}{1+\sqrt{1+p^{2}}}\). For becaufe \(p\) is \(=\tan\). \(2 y, \sqrt{1+p^{2}}\) is the fecant of \(2 y\), and \(I+\sqrt{1+p^{2}}:\) I \(=p: \tan y\).

Thefe proceffes for obtaining \(y\) direetly are abundantly fimple. But it will be much more expeditious and ealy to content ourfelves with obtaining \(2 y\) by neans of the value of its tangent, viz. \(\frac{\mathrm{S} \cdot \text { fin. } 2 a}{\mathrm{M}+\mathrm{S} \cdot \operatorname{cof} \cdot 2 a}\). Or, we may find \(x\) by means of the fimilar value of its tangent \(\frac{\mathrm{M} d}{\mathrm{~S} d}\) of fig. 4 .

There is fill an eafier method of finding both \(2 \%\) and \(2 y\), as follows.

Make \(\mathrm{M}+\mathrm{S}: \mathrm{M}-\mathrm{S}=\tan . a: \tan , b\). Then \(b\) is the difference of \(x\) and \(y\), as \(a\) is their fum. For this analogy evidently gives the tangent of half the difference of the angles CSM and CMS of fig. 4 . or of \(2 x\) and \(2 y\). Therefore to \(a\), which is half the fum of \(2 x\) \(+2 y\), add \(b\), and we have \(2 x=a+b\), or \(x=\frac{a+b}{2}\), and \(y=\frac{a-b}{2}\).

By either of thefe methods a table may be readily computed of the value of \(x\) or \(y\) for every value of \(a\).

But we muft recollect that the values of \(S\) and MI are by no means conflant, but vary in the inverfe triplicate ratio of the earth's diftance from the fun and moon; and the ratio of 2 to 5 obtains only when thefe luminaries are at their mean diftances from the earth. The forces correfponding to the perigean, medium, and apogean diftances are as follow.
\begin{tabular}{llll} 
& & \multicolumn{1}{c}{ Sun. } & Mcon. \\
Apogean & - & 1.901 & 4.258 \\
Medium & - & 2. & 5. \\
Perigean & - & 2.105 & 5.925
\end{tabular}

Hence we fee that the ratio of \(S\) to \(M\) may vary from 1.901: 5.925 to \(2.105: 4.258\), that is, nearly from \(1: 3\) to \(1: 2\), or from 2: 6 to \(2: 4\). The folar force does not vary much, and may be retained as conflant without any great error. But the change of the moon's force has great effeets on the tides both as to their time and their quantity.

\section*{I. In refpeet of their Time.}
1. The tide day following a fpring tide is \(24 \mathrm{~h} .27^{7}\) when the moon is in perigee, but \(24 \mathrm{~h} .33^{\prime}\) when the is in apogee.
2. The tide day following neap tide is \(25 \mathrm{~h} .1 \mathrm{~s}^{\prime}\), and \(25 \mathrm{~h} .40^{\prime}\) in thele two fituations of the moon.
3. The greateft interval of time between high water and the moon's fouthing is \(39^{\prime}\) and \(6 \mathbf{1}^{\prime}\); the angle

\section*{T I D [ 427 1 T I D}

Tide. \(y\) being \(9^{\circ} 45^{\prime}\) in the firt cale, and \(15^{3} 15^{\prime}\) in the \(\{\mathrm{c}\). cond.

\section*{II. In refpect of their Heights.}
1. If the moon is in perigee when new or full, the fpring tide will be 8 feet inftead of 7 , which correfponds to her mean difance. The very next fring tide happens when the is near her apogee, and will be 6 fect inftead of 7. The neap tides happen when the is at her mean diliance, and will therefore be 3 feet.

But if the moon be at her mean diftance when new or full, the two fucceeding fpring tides will be regular or 7 feet, and one of the neap tides will be 4 feet and the other only 2 feet.

Mr Bernoulli has given us the following table of the time of higls water for thefe three chief fituations of the moon, namely, her perigee, mean diftance, and apogee. It may be had by interpolation for all intermediate pofitions with as great accuracy as can be hoped for in phenomena which are fubject to fuch a complication of difturbances. The firit column contains the moon's elongation from the fun. The columns \(\mathrm{P}, \mathrm{M}\), A, contain the minutes of time which elaple betwcen the moon's fouthing and high water, according as the is in perigee, at her mean diftance, or in apogee. The fign - indicates the priority, and + the pofteriority, of high water to the moon's fouthing.

\end{tabular}

The reader will undoubtedly be making fome comparifon in his own mind of the deductions from this theary with the actual ftate of things. He will find fome confiderable refemblances; but he will alfo find fuch great differences as will make him very doubtful of its juftnefs, In very few places does the high water happen within three-fourths of an hour of the moon's fouthing, as the theory leads him to expect ; and in no place whatever does the fpring tide fall on the day of new and full moon, nor the neap tide on the day of her quadrature.

Thefe always happen two or three days later, By comparing the difference of high water and the moon's fouthing in different places, he will hardly find any connecting principle. This flows evidently that the caufe of this irregularity is local, and that the juftnefs of the theory is nut affected byit. By conlidening the phenomena in a navigable river, he will leam the real caufe of the deviation. A flool tide arrives at the mouth of a river. The true theoretical tide differs in no refpect from a wave. Suppole a fpring tide actually formed on a fluid fohere, and the fun and moon then annibilated. The elevation mut fink, prefing the under waters afide, and caufing them to rife where they were depreffed. The motion will not fop when the furface comes to a level; for the waters arrived at that pofition with a motion continually accelerated. They will therefore pafs this pofition as a pendulum paffes the perpendicular, and will rife as far on the other fide, forming a high water where it was low water, and a low water where it was high water; and this would go on for ever, ofcillating in a time which mathematicians can determine, if it were not for the vifcidity, or fomething like friction, of the waters. If the fuhere is not fluid to the centre, the motion of this wave will be different. The elevated waters cannot fink without diffufing themfelves fidewife, and occafioning a great horizontal motion, in order to fill up the hollow at the place of low water. This motion will be greateft about half way between the places of high and low water. The fhallower we fuppole the ocean, the greater mult this horizontal motion be. The refiftance of the bottom (though perfectly fmooth and even) will greatly retard it all the way to the furface. Still, however, it will move till all be level, and will even move a hittle farther, and produce a fmall flood and ebb where the ebb and flood had been. Then a contrary motion will obtain; and after a few ofcillations, which can be calculated, it will be infenfible. If the bottom of the ocean (which we ftill fuppofe to cover the whole earth) be uneven, with long extended valleys running in various directions, and with elevations reaching near the furface, it is evident that this mult occafion great irregularities in the motion of the undermof waters, both in refpect of velocity and direction, and even occafion fmall inequalities on the furface, as we fee in a river with a rugged bottom and rapid current. The deviations of the under currents will drag with them the contiguous incumbent waters, and thus occafion greater fuperficial irregularities.

Now a flood arriving at the mouth of a river, muf aft precifely as this great wave docs. It mult be propagated up the rivcr (or along it, even though perfectly level) in a certain time, and we thall have high water at all the different places in fuccefion. This is difinctly feen in all rivers. It is high water at the mouth of the Thames at three o'clock, and later as we go up the river, till at London bridge we have not ligh water till three o'clock in the morning, at which time it is again high water at the Nore. But, in the mean time, there has been low water at the Nore, and high water about half way to London; and while the high water is proceeding to London, it is ebbing at this intermediate place, and is low water there when it is high water at London and at the Nore. Did the tide extend as far beyord London as London is from the Nore, we
thould
\[

\end{array} \mathrm{I} \mathrm{D}\right.
\]

Gould have three high waters with two low waters interpoled. The molt remarkable infance of this kind is the Naragnon or Amazon river in South America. \({ }^{\circ}\) It appears by the obfervations ot Condamine and others, that between Para, at the mouth of the river, and the conflux of the Madera and Maragnon, there are feven coexiftent high waters, with fix low waters between them. Nuthing can more evidently fhow that the tides in thefe places are nothing but the propagation of a wave. The velocity of its fuperficiai motion, and the diftance to which it will fenfibly go, muft depend on many circumftances. A deep channel and gentle acclivity will allow it to proceed much farther up the siver, and the diftance between the fucceffive funmits will be greater than when the channel is thallow and fleep. If we apply the ingenious theory of Chevalier Ruat, delivered in the article Rivfr, we may tell both. the velocity of the motion and the interval of the fucceflive high waters. It may be imitated in artificial canals, and experiments of this kind would be very infructive. We have faid enough at prefent for our puipofe of explaining the irregularity of the times of high water in different places, with refpect to the moon's fouthing. For we now fee clearly, that fomething of the fame kind mut happen in all great arms of the fea which are of an oblong fhape, and communicate by one end with the open ocean. The gencral tide in this vecan muft procced along this channel, and the high water will happen on its hores in fucceffion. This alfo is diftinetly feen. The tide in the Atlantic ocean produces high water at new and full moon at a later and later hour alcng the fouth coatt of Great Britain in proportion as we proceed from Scilly iflands to Dover. In the fame mauner it is later ard later as we come along the eaft coaft from Onkey to Dover. Yet even in this progrels there are confiderable irregulanties, owing to the finuofities of the fhores, deep indented bays, prominent eapes, and extenfive ridges and valleys in the channel: A fimilar progrefs is obferved along the coafts of Spain and France, the tide advancing gradually from the fouth, turning sound Cape Finifterre, ranging along the north coaft of Spain, and along the weft and north coalts of France.

The attentive confideration of thele facts will not only fatisfy us with refpect to this dificulty, but will enable us to trace a principle of connection amidn all the irregularities that we oblerve.

We now add, that if we note the difference between the time of high water of fpring tide, as given by theory, for any place, and the obferved sime of high water, we faall find this interval to be very nearly confant through the whole feries of tides during a lunation. Suppofe this interval to be 40 hours. We flall find every other phenomenon fucceed after the fame interval. And if we fuppofe the moon to be in the place where flse was 40 hours before, the obfervation will agree pretty well rith the theory, as to the fuccrefion of tides, the length of tide day, the retardations of the lides, and their gradual diminution from fring to neap tule. We fay pretty well; for there ftill remain fevewal fmall irregularities, different in different places, and not fullowing any oblervable law. Thefe are thereforc local, and owing to local cautes. Some of thefe we fhall afterwards point out. '1'here is alfo a peneral deviation of the theory from the real ferics of tides. The
neap tides, and thofe adjoining, happea a little earlier than the corrected theory points out. Thus at Breft (where more numerous and accurate obfervations have been made than at any other place in Europe), when the moon changes precilely at noon, it is high water at \(3 \mathrm{~h} .28^{\prime}\). When the moon enters her fecond quarter at noon, it is high water at \(8 \mathrm{~h} .4^{\prime}\), inftead of \(9 \mathrm{~h} .4^{8 \prime}\), which theory affigns.

Something fimilar, and within a very few minutes equal, to this is obferved in every place on the fea-coaft. This is therefore fomething general, and indicates a real defeet in the theory.

But this arifes from the fame caufe with the other general deviation, viz. that the greatef and leaft tides do not happen on the days of full and half moon, but a certain time after. We thall attempt to explain this.

We fet out with the fuppofition, that the water acquired in an infant the elevation competent to its equilibrium. But this is not true. No motion is inftantaneous, however great the force ; and every motion and change of motion produced by a fenfible or, finite force increafes from nothing to a fenfible quantity by infinitely fmall degrees. Tine elaples before the body can acquire any fenfible velocity; and in order to acquire the fame fenfible velocity by the action of different forces acting fimilarly, a time muft elapfe inverfely propor. tional to the force. An infinitely fmall force reņuires a finite time for communicating even an infinitely fmall velocity; and a finite force, in an infinitely finall lime, communicates only an infinitely fmall velocity; and if there be any kind of motion which changes by intenfible degrees, it requires a finite force to prevent this change. Thus a bucket of water, hanging by a cord lapped round a light and eafily moveable cylinder, will run down with a motion uniformly accelerated; but this motion will be prevented by hanging an equal bucket on the other fide, fo as to act with a finite force. This force prevents only infinitely fmail accelerations.

Now let ALKF (fig. 6.) be the folid nucleus of the Fig. 6. earth, furrounded by the fpherical ocean \(b \mathrm{hdg}\). Let this be raifed to a fpheroid BHDG by the action of the moon at M, or in the direction of the axis CM. If all be at relt, this fpheroid may have the form precifely competent to its equilibrium. But let the nucleus, with its fpheroidal ocean, have a motion round C in the direction AFKL from well to eaf. When the line of water \(B A\) is carried into the fituation \(s q\) infinitely near to BA , it is no longer in equilibrio; for s is too elevated, and the part now come to B is too much depreficd. There is a force tending to deprefs the waters at \(s\), and to raife thofe now at B ; but this force is infinitely fnall. It cannot therefore reftore the fhape competent to equilibrium till a fenfible time has elapfed; therefore the difturbing force of the moon cannot heep the fummit of the ocean in the line MC. The force munt be of a certain determinate magniturle before it can in an inflant undo the inftantaneous effect of the rotation of the watess and keep the fummit of the ocean in the fame place. But this effect is poltible; for the depref. fion at s neceffiry for this purpofe is nearly as the difance from B , being a denreflion, not from a flaight line, but from a circle defcribed with the radius \(\mathrm{CB}^{2}\). It is therefore an infantefirnal of the frrt order, and may be reflored in an intant, or the continuation of the depreflion

\section*{T I D}

Tidé" preffion prevented by a certain finite force. Therefore there is fome dillance, fuch as \(B y\), where the dilturbing force of the moon may have the neceflary intenfity. Therefore the fpherical oceart, inftead of being kept continually accumulated at B and D , as the waters turn round, will be liept accumulated at \(y\) and \(y^{\prime}\), but at a height fomewhat fmaller. It is much in this way that we keep melted pitch or other clammy matter from running off from a brunt, by continnally turning it round, and it hangs protuberant, not from the loweft point, but from a point beyond it, in the ditection of its motion. The facts are very fimilar. The following experiment will illuftrate this completely, and is quite a parallel fact. Conceive GDII, the lower half of the ellipfe, to be a fupple heavy rope or chain hanging from a roller with a handle. The weight of the rope makes it hang in an oblong curve, jult as the force of the moon taies the waters of the ocear. Tum the roller very flowly, and the rope, unwinding at one fide and winding up on the other fide of the roller, will continue to form the fame curve : but turn the roller very brikly in the direction FKI, and the rope will now hang like the curve \(u y^{\prime} v\), confiderably advanced from the perpendicular, fo far, to wit, that the force of gravity may be able in an inftant to undo the infinitely fmall elevation produced by the turning.

We are very anxious to have this circumftance clearly conceived, and its truth firmly eftablifhed; becaufe we bave oblerved it to puzzle many perfons not unaccuftomed to fuch difcufions: we therefore hope that our readers, who have got over the difficulty, will indulge us while we give yet another view of this matter, which leads to the fame conclufion.

It is certain that the interval between high and low water is not fufficient for producing all the accumulation necellary for equilibrium in an ocean fo very thallow. The horizontal motion neceffaty for gathering together fo much water along a fhallow fea would be prodigious. Therefore it never attains its full height; and when the waters, already raifed to a certain degree, have paffed the fituation immediately under the moon, they are ftill under the action of accumulating forces, although thefe forces are now diminifhed. They will continue rifing, till they have fo far paft the moon, that their fituation fubjects them to depreffing forces. If they have acquired this fituation with an accelerated motion, they will rife fill farther by their inherent motion, till the depreffing forces have deftroyed all their acceleration, and then they will begin to fink again. It is in this way that the nutation of the earth's axis' produces the greateft incliration, not when the inclining forces are greateft, but three months after. It is thus that the warmelt time of the day is a confiderable while after noon, and that the narmeft feafon is confiderably after midfuminer. 'The warmth increafes till the momentary wafte of heat exceeds the momentary fuoply. We conclude by faying, that it may be demonftrated, that, in a fphere fluid to the centre, the time of high water cannot be lefs, and may be more, than three lunar hours after tha moon's fouthing. As the depth of the ocean diminifhes, this interval alfo diminifhes.

It is perhaps impofible to affign the diftance \(B y\) at which the furmmit of the ocean may be kept while the carth turns round its axis. We can only fee, that it
mun be lefs when the accumulating force is greater, and therefore lefs in fpring tides than in neap tides; but the difference may be infenfible. All this depends on circumtlances which we are little acquainted with: many of thefe citcumftances are local; and the fitwation of the fummit of the ocean, with relpest to the moon, may be different in different places.

Nor have we been able to determine theoretically what will be the height of the fummit. It will certainly be lefs than the height neceffary for perfect equilibrium. Daniel Bernoulli fays, that, after very attentive confideration, he is convinced that the beight at new or full moon will be to the theoretical height as the cofine of the angle \(\mathrm{BC} y\) to radius, or that the height at \(y\) will be \(B b \times \frac{\mathrm{C}}{\mathrm{C}} 6\)

The refult of all this reafoning is, that we mult always fuppofe the fummit of the tide is at a certain diftance eaftward from the place affigned by the theory. Mr Bernoulli concludes, from a very copious comparifon of obfervations at different places, that the place of bigh water is about 20 degrees to the eaftwand of the place afligned by the throry. Therefore the table for merly given will cornefpond with obfervation, if the leading colurm of the mons's elongation from the fun be altered accordingly. We have incerted it again in this place, with this alteration, and added three culumns for the times of high water. Thus changed it will be of great ufe.

We have now an explanstion of the acceleration of the neap tides, which fhould happen 6 hours later than the foring tides. They are in fact tides correfponding to pofitions of the moon, which are \(20^{\circ}\) more, and not tice real fpring and neap tides. Thefe do not happea till two days after; and if the really greateft and leaft tides be obferved, the leat will be found 6 hours later than the firit

This table is geneal, and exhibits the time of high.

\section*{T I D}

Tile. water, and their difference from thofe of the moon's fouthing, in the open fea, from all local obftructions. If therefore the time of high water in any place on the earth's equator (for we have hitherto confidered no other) be different from this table (fuppofed correct), we mult attribute the difference to the diftinguifhing circumfances of the fituation. Thus every place on the equator thould have high water on the day that the moon, fituated at her mean diftance, changes precifely at noon, at 22 minutes palt noon; becaufe the moon paffes the meridian along with the fun by fuppofition. Therefore, to make ufe of this table, we muft take the difference between the firf number of the column, intitled time of ligh water, from the time of high water at full and change peculiar to any place, and add this to all the numbers of that column. This adapts the table to the given place. Thus, to know the time of high water at Leith, when the moon is \(50^{\circ}\) eaft of the fun, at her mean diftance from the earth, take \(22^{\prime}\) from \(4 \mathrm{~h} \cdot 30^{\prime}\), there remains 4.08. Add this to \(2 \mathrm{~h} .4^{8^{\prime}}\) and we have \(6^{\circ}\) \(56^{\prime}\) for the hour of high water. The hour of high water at new and full moon for Edimburgh is marked 4 h. \(30^{\prime}\) in Makselyne's tables, but we do not pretend to give it as the exact determination. This would require a feries of accurate obfervations.

It is by no means an eafy matter to afcertain the time of high water with precifion. It changes fo very flowly, that we may eafily miftake the exact minute. The beft method is to have a pipe with a fmall hole near its bottom, and a float with a long graduated rod. The water gets in by the fmall hole, and raifes the float, and the fmallnefs of the hole prevents the fudden and irregular ftarts which waves would occafion. Inftead of obferving the moment of high water, oblerve the height of the rod about half an hour before, and wait after high water till the rod comes again to that height. Take the middle between them. The water rifes fenfibly half an hour before the top of the tide, and quickly changes the height of the rod, fo that we cannot make a great miftake in the time.

Mr Bernoulli has made a very careful comparifon of the theory thus corrected, with the great collection of oblervations preferved in the Depot de la Marine at Breft

Sce Mr Calfini, Mem. Aca Par. 1734. and Rochefort *; and finds the coincidence very great, and far exceeding any rule which he had ever feen. InPar. 173. deed we have no rules but what are purely empirical, or which fuppofe a uniform progreffion of the tides.
The heights of the tides are much more affected by local circumftances than the regular feries of their times. The regular fpring tide fhould be to the neap tide in the fame proportion in all places; but nothing is more different than this proportion. In fome places the fpring ticle is not double of the neap tide, and in other places it is more than quadruple. This prevented Bernoulli from attempting to fix the proportion of M to S by means of the heights of the tides. Newton had, however, done it by the tides at Briftol, and made the lunar force almoft five times greater than the folar force. But this was very ill-founded, for the reafon now given.

Yet Bemoulli faw, that in all places the tides gradually decreafed from the fyzigies to the quadratures. He therefore prefumed, that they decreafed by a fimilar law with the theoretical tides, and has given a very ingenious method of accommodating the theory to any tides which may be obferved. Let \(A\) be the
fpring tide, and \(B\) the neap tide in any place. Then form an \(M\) and an \(S\) from thefe, by making \(M=\frac{A+B}{2}\), and \(S=\frac{A-B}{2}\); fo that \(M+S\) may be \(=A\), and \(\mathrm{M}-\mathrm{S}=\mathrm{B}\) agreeable to the theory. Then with this M and S compofe the general tide T , agreeable to the confluction of the problcm. We may be perfuaded that the refult cannot be far from the truth. The following table is calculated for the three chief diftances of the moon from the earth.
\begin{tabular}{|c|c|c|c|}
\hline \multirow[t]{2}{*}{} & \multicolumn{3}{|c|}{Height of the Tide.} \\

0.79 \mathrm{~A}+0.08 \mathrm{~B}
\] \\
\hline
\end{tabular}

Obferve that this table is corrected for the retardation arifing from the inertia of the waters. Thus when the moon is 20 degrees from the fun, the mean diffance tide is \(1.00 \mathrm{~A}+0.00 \mathrm{~B}\), which is the theoretical tide correfponding to conjunction or oppofition.

We have now given in fufficient detail the phenomena of the tides along the equator, when the fun and moon are both in the equator, fhewing both their times and their magnitude. When we recollect that all the fections of an oblong fpheroid by a plane paffing through an equatorial diameter are ellipres, and that the compound tide is a combination of two fuch fpheroids, we perceive that every fection of it through the centre, and perpendicular to the plane in which the fun and moon are fituated, is alfo an ellipfe, whofe thorter axis is the equatorial diameter of a fpring tide. This is the greateft depreffion in all fituations of the luminaries; and the points of greateft depreffion are the lower poles of every compound tide. When the luminaries are in the equator, thefe lower poles coincide with the poles of the earth. The equator, therefore, of every compound tide is alfo an ellipfe: the whole circumference of which is lower than any other fection of this tide, and gives the place of low water in every part of the earth. In like manner, the fection through the four poles, upper and lower, gives the place of high watcr. Thefe two fections are terreftial meridians or hour circles, when the luminaries are in the equator,

\section*{T I D [ 431 ] T 1 D}
the times of high and low water may be applied to every place on the furface of the earth, when the fun and moon are in the equator. But the heights of tide will diminilh as we recede from the equator. The heights mult be reduced in the proportion of radius to the cofine of the latitude of the place. But in every other fituation of the fun and moon all the circumflances vary exceedingly. It is very true, that the determination of the elevation of the waters in any place whatever is equally eafy. The difliculty is, to exhibit for that place a connected view of the whole tide, with the hours of Hood and ebb, and the difference between high and low water. This is not indeed difticult; but the procefs by the ordinary rules of foherical trigonometry is tedious. When the fun and moon are not near conjunction or oppofition, the hape of the ocean refembles a turnip, which is that and not round in its broadeft part. Before we can determine with precifion the different plenomena in comection, we mult afcertain the pofition or attitude of this turnip; marking on the furface of the earth both its elliptical equators. One of thefe is the plane palfing through the fun and moon, and the other is perpendicular to it , and marks the place of low water. And we muft mark in like manner its firft meridian, which paffes through all the four poles, and marks on the furface of the earth the place of high water. The pofition of the greateft fection of this compound fpheroid is frequently much inclined to the earth's equator; nay fometimes it is at right angles to it, when the moon has the fame right afcenfion with the fun, but a different declination. In thefe cafes the ebb tide on the equator is the greateft poffible; for the lower poles of the compound fpheroid are in the equator. Such fituations occafion a very complicated calculus. We mult therefore content ourfelves with a good approximation.

And firlt, with refpect to the times of high water. It will be fufficient to conccive the fun and moon as always in one plane, viz. the ecliptic. The orbits of the fun and moon are never more inclined than \(5^{\frac{7}{7}}\) degrees. 'Ihis will make very little difference; for when the luminaries are fo fituated that the great circle through them is much inclined to the equator, they are then very near to each other, and the form of the fpheroid is little different from what it would be if they were really in conjunction or oppofition. It will therefore be fuff. cient to confider the moon in three different fituations.
r. In the equator. The point of highelt water is never farther from the moon than \(15^{\circ}\), when the is in apogee, and the fun in perigce. Therefure if a meridian be drawn through the point of higheft water to the equator, the arch \(m h\) of fig. 4. will be reprefented on the equator by another arch about \(\frac{9}{100}\) of this by reafon of the inclination of the equator and ecliptic. Therefore, to have the time of high water, multiply the numbers of the columns which exprefs the difference of high water and the moon's fouthing by \(\frac{92}{100}\), and the products give the real difference.
2. Let the moon be in her greateft declination. The arch of right afcenfion correfponding to \(m h\) will be had by multiplying \(m h\), or the time correfponding to it in the table, by \(\frac{102^{2}}{9^{2}}\).
3. When the moon is in a middle fituation between thefe two extremes, the numbers of the table will give the right afcenfion correfponding to \(\mathrm{m} / \mathrm{s}\) without any
correction, the diflance from the equator compenfating for the obliquity of the ecliptic archenh. of

The time of low water is not fo eafily found ; and we mull either go through the whole trigonometrical procefs, or content ourfelves with a lefs perfect approximation. The trigonometrical procefs is not indeed difficult : we mult find the pofition of the plane through the fun and moon. A great circle through the moon perpendicular to this is the line of high water; and another perpendicular circle cutting this at right angles is the circle of low water.

But it will be abundantly exact to confider the tide as accompanying the moon only.

Let NQSE (fig. 7.) be a fection of the terraqueous Fig. 7 globe, of which \(N\) and \(S\) are the north and fouth poles and EOQ the equator. L.et the moors be in the direction OM, having the declination BQ. Let \(D\) be any place on the earth's furface. Draw the parallel LDC of latitude. Let \(\mathrm{B}^{\prime} \mathrm{F} b^{\prime} f\) be the ocean, formed into a fpheroid, of which \(B b\) is the axis and \(f \mathrm{~F}\) the equator.

As the place D is carried along the parallel CDL by the rotation of the earth, it will pals in fucceflion through different depths of the watery fpheroid. It will have ligh water when at \(C\) and \(L\), and low water when it crolfes the circle \(f\) OF. Draw the meridian \(\mathrm{N} d \mathrm{G}\), and the great circle \(B d b\). The arch \(G Q\), when converted into lunar hours (each about 62 minutes \({ }^{\text {j }}\), gives the duration of the flood \(d c\) and of the fublequent ebb \(c d\), which happen while the moon is above the horizon: and the arch EG will give the durations of the flood and of the ebb which happen when the moon is below the horizon. It is evident, that thefe two floods and two cbbs have unequal durations. When D is at C it has high water, and the height of the tide is \(C C^{\prime}\). For, the fphe roid is fuppofed to touch the fphere on the equator \(f O T\), fo that of \(\mathrm{CC}^{\prime}\) is the difference between high and low water. At \(L\) the the height of the tide is \(L^{\prime} L^{\prime}\); and if we defcribe the circle \(\mathrm{LN} q, \mathrm{C} q\) is the difference of thefe high waters, or of thele tides.

Hence it appears, that the two tides of one lunar day may be confiderably different, and it is proper to difinguifh them by different names. We fhall call that a \(\sqrt{u}\) perior tide which happens when the moon is above the hoizon during high water. The other may be called the inferior tide. The duration of the fuperior tide is meafured by 2 GQ , and that of the inferior tide by 2 EG ; and \({ }_{4} \mathrm{GO}\) meafures the difference between the whole duration of a fuperior and of an inferior tide."

From this conftuction we may learn in general, 1. When the moon has no declination, the durations and allo the heights of the fuperior and inferior tides are equal in all parts of the world. For in this cafe the tide equator \(f \mathrm{~F}\) coincides with the meridian NOS, and the poles \(\mathrm{B}^{\prime} b^{\prime}\) of the watery fpheroid are on the earth's equator.
2. When the moon has declination, the duration and allo the height of a fuperior tide at any place is greater than that of the inferior ; or is lefs than it, according as the moon's declination and the latitude of the place are of the fame or oppofite names.

This is an important circumftance. It frequently happens that the inferior tide is found the greateft when it thould be the leaft; which is particularly the cafe at the Nore. This fhows, without further reafoning, that the tide at the Nore is only a branch of the regula:

\section*{I I D [432] T I D}

Tide. tide. The regular tide comes in between Scotland and the continent; and after travelling along the coaft reaches the Thames, while the regular tide is juft coming in again between Scotland and the continent.
3. If the moon's declination is equal to the colatitude of the place, or exceeds it, there will be only one tide in a lunar day. It will be a fuperior or an inferior tide, according as the declination of the moon and the latiture of the place are of the fame or oppofite kinds. For the equator of the tide cuts the meridian in \(f\) and F. Therefore a place which moves in the parallel of has high water when at \(c\); and 12 lunar hours afterwards has low water when at \(f\). And any place \(k\) which is fill nearer to the pole N has high water when at \(k\), and.12 lunar hours afterwards has low water at m. Therefore, as the moon's declination extends to \(33^{\circ}\), all places farther north or fouth than the latitude \(60^{\circ}\) will fometimes have only one tide in a lunar day.
4. The fine of the arch GO, which meafures \(\frac{1}{4}\) th of the difference between the duration of a fuperior and inferior tide, is \(=\tan\). lat. \(\times\) tan. decl. For in the f.pherical triangle \(d\) OG

Rad. : cotan. \(d \mathrm{OG}=\tan , d \mathrm{G}:\) fin. GO , and
\(\operatorname{Sin} . \mathrm{GO}=\tan . d \mathrm{OQ} \times \tan . d \mathrm{G},=\tan\). decl. \(\times \tan\). lat.
Hence we fee, that the difference of the durations of the fuperior and inferior tides of the fame day increale both with the moon's declination and with the latitude of the place.

The different fituations of the moon and of the place of obfervation affect the lieights of the tides no lefs remarkably. When the point D comes under the meridian NBQ in which the moon is fituated, there is a fuperior ligh water, and the height of the tide above the low water of that day is CC . When D is at L , the height of the inferior tide is LL'. The elevation above the infcribed fphere is \(\mathrm{M} \times\) cof. \({ }^{2} y, y\) being the zenith diflance of the moon at the place of obfervation. Therefore at high water, which by the theory is in the place directly under the moon, the height of the tide is as the fquare of the cofine of the moon's zenith or nadir diftance.

Hence we derive a confruction which folves all queSions relation to the height of the tides with great facility, free from all the intricacy and ambiguities of the aigebraic analy fis employed by Bernoulli.

With : the radius \(\mathrm{CQ}=\mathrm{M}\) (the elevation produced by the moon aloove the infcribed fphere) defcribe the circle \(p\) QPE (fig. 8.) to reprefent a meridian, of which P and \(p\) are the poles, and EQ the equator. Bifect CP in O ; and round O defcribe the circle PBCD . Let \(M\) be the place over which the moon is vertical, and Z be the place of obfervation. MQ is the moon's declination, and \(7, Q\) is the latitude of the place. Draw \(\mathrm{MC}, Z \subset \mathrm{~N}\), cutting the fmall circle in A and B . Draw AGI perpendicular to CP , and draw \(\mathrm{CI} \mu\), which will cut off an arch \(\mathrm{E} \mu=\mathrm{QM} . \mathrm{M} Z\) and \(\mu \mathrm{N}\) are the moon's zenith and nadir dillances. Draw the diameter BD, and the perpendiculars \(\mathrm{IK}, \mathrm{GH}\), and AF. Alfo drau OA. PA, AB, ID.

Then DF is the fuperior tide, DK is the inferior tide, and DH is the arithmetical mean tide.

For the angles BCA, MDA, flanding on BA, are equal. Alfo the angles IDB, \(\mu \mathrm{CN}\), are equal, being
fupplements of the angle ICB. Therefore, if BD be made radius, DA and DI are the fines of the zenith and nadir diftances of the moon.
But \(\mathrm{BD}: \mathrm{DA}=\mathrm{DA}: \mathrm{DF}\). Therefore \(\mathrm{DF}=\) \(\mathrm{M} \times \operatorname{cor}^{2} y\), \(=\) the height Zz of the fuperior tide. Alto \(\mathrm{DK}=\mathrm{M} \cdot \operatorname{cof}\). \({ }^{2} y^{\prime}\), 二 the height \(n n^{\prime}\) of the inferior tidc.

Alfo, becaufe IA is bifected in G, KF is bifected in H , and \(\mathrm{DH}=\frac{\mathrm{DK}+\mathrm{DF}}{2}\), the medium tide.

Let us trace the relation of the confequences of the various pofitions of Z and M , as we formerly confider. ed the refults of the various fituations of the fun and moun.

Firlt, then, let Z retain its place, and let M gradual. ly approach it from the equator. When \(M\) is in the equator, A and I coincide with C , and the three points \(\mathrm{F}, \mathrm{K}\), and H , coincide in \(i\).

As M approaches to Z, A and I approach to B and \(\mathrm{D} ; \mathrm{DF}\) increafes, and DK diminilhes. The fuperior or inferior tide is greatef when the moon is in M or in N ; and DF is then \(=\mathrm{M}\). As the moon paffes to the northward of the place, the fuperior and inferior tides both diminifh till I comes to D ; at which time \(M Q\) is equal to \(Z P\), and there is no inferior tide. This however cannot happen if \(\approx P\) is greater than \(3^{\circ}\), becaufe the moon never goes farther from the equator. M ftill going north, we have again a perpendicular from I on BD , but below I, indicating that the inferior tide, now meafured by DK, belongs to the henifpheroid next the moon. Alfo, as M adrances from the equator northward, DH diminiflies continually. Firft, whole H lies hetween O and P , becaufe G approaches O ; and afterwards, when G is above O and H lies between O and D . It is otherwife, however, if ZQ is greater than \(45^{\prime \prime}\); for then DB is inclined to EQ the other way, and DH increales as the point \(G\) rifes.

In the next place, let M retais its pofition, and Z proceed along the meridian.

Let us begin at the equator, or fuppofe \(\Omega\) the place of obfervation. BD then coincides with \(\widehat{\mathrm{CP}}\), and the three lines DF, DK, and DH, all coincide with PG, denoting the two equal tides \(Q_{q}\) and \(E e\) and their medium, equal to either. As \(Z\) goes northward from \(Q\), HOD detaches it felf from COP; the line DF increates, while DK and DH diminifh. When \(Z\) has come to \(\mathrm{M}, \mathrm{F}\) and B coincide with A , and DK and DH ase fill more diminified. When Z paffes M , all the three lines DF, DK, and DH, continue to diminifl. When Z comes to latitudes \(45^{\circ}, \mathrm{DB}\) is parallel to 1 A and EQ, and the point H coincides with O . This fituation of \(Z\) has the peculiar property that DH (now DO) is the fame, whatever be the declination of the moon. For IA being always parallel to DR, OK and OF will be equal, and DO will be half of DK and DF, however they may vary. When \(Z\) gets fo far north that ZP is \(=\mathrm{MQ}\), the diameter \(b d\) falls on I ; fo that \(d k\) vanifles, and we have only \(d f\). And when Z goes fill farther north, \(d k\) appears on the other fide of I . When Z arrives at the pole, BD again coincides with PC. D with C, and DF, DK, and DH, coincide with CG.

Thefe variations of the points \(\mathrm{F}, \mathrm{K}\), and H , indicate the fellowing phenomena.

\section*{T I D [ 433 ] T I D}
ide. I. The greateft lides happen when the moon is in the zenith or nadir of the place of obfervation : for then the point B coincides with A , and DF becomes DB ; that \(\mathrm{is}_{;}=\mathrm{M}\), indicating the full tide \(\mathrm{BB}^{\prime}\).
2. When the moon is in the equator, the fuperior and inferior tides have equal heights, \(=\mathbf{M} \cdot \operatorname{cof}{ }^{2}\) lat. Fur then A and I coincide with C , and the points F and K coincide in \(i\), and \(\mathrm{D}, i\) is \(=\mathrm{DB} \cdot \operatorname{cof}^{3} \mathrm{BDC},=\mathrm{M} \cdot \operatorname{cof}{ }^{3}\) lat.
3. If the place of oblervation is in the equator, the inferior and fuperior tides are again equal, whatever is the moon's declination: For then B coincides with C, and the points \(F, K\), and \(H\), coincide with \(G\); and \(P G\) \(\times \mathrm{PC} \cdot \mathrm{cof}^{2} \mathrm{APG},=\mathrm{M} \cdot\) cof.\({ }^{2}\) decl. moun.
4. The fuperior tides are greater or lefs than the inferior tides according as the latitude and declination are of the fame or of oppofite names: For by making \(Q \zeta\) \(=Q Z\), and drawing \(\zeta\) C \(n\), cutting the fmall circle \(11 \beta\), we fee that the figure is reverfed. The difference letween the fuperior and inferior tides is KF , or \(\mathrm{IA} \times\) cofin. of the angle formed by IA and DB ; that is, of the angle \(\mathrm{BD} \delta\), which is the complement of twice \(Z Q\); bccaufe \(B O C=2 Z C Q\). Now IA is \(2 G A\), \(=20 A \cdot\) fin. \(2 M Q=P C \cdot f i n .2 M Q,=M \cdot\) fin. 2 decl. Therefore the difference of the fuperior and inferier tides is M• fin. 2 declin. fin. 2 lat.
5. If the colatitude be equal to the declination, or lefs than it, there will be no interior ticle, or no fuperior tide, according as the latitude of the place and declination of the moon are of the fame or oppofite names.

For when \(P Z=M Q, D\) coincides with \(I\), and \(I K\) vanifhes. When PZ is lefs than MQ , the point D is between \(C\) and \(I\), and the point \(Z\) never paffes through the equator of the watery fpheroid; and the low water of its only tide is really the fummit of the inferior tide.
6. At the pole there is no daily tide: but there are two monthly tides \(=\mathrm{M} \cdot\) fin. \({ }^{2}\) declin. and it is low water when the moon is in the equator.
7. The medium tide, reprefented by DH , is \(=\mathrm{M} \times\) \(\frac{\mathrm{I}+\mathrm{cof} .2 \text { lar. } x \text { cof. } 2 \text { declin. }}{2}\). For \(\mathrm{DH}=\mathrm{DO}+\mathrm{OH}\).
Now OH is equal to \(\mathrm{OG} \times\) cof. \(\mathrm{GOH}=\mathrm{OG} \cdot\) cof. 2 ZQ . And \(O G=O A \cdot\) cof. \(G O A,=O 4 \cdot c o f\). \(2 M Q\). Therefore \(\mathrm{OH}=\mathrm{OA} \cdot\) cof. \(3 Z Q \cdot \operatorname{cof}, 2 \mathrm{MQ}\). Therefore DH \(=\mathrm{OA}+\mathrm{OA} \cdot \operatorname{col.} 22()^{\circ} \operatorname{cof} \cdot 2 \mathrm{MQ}=\)
\(M \times \frac{1+\operatorname{cof} .2 Z Q \cdots o{ }^{\tau} 2 M Q}{2}\). Let this for the fu-

\section*{ture be called \(m\).}
N. B. The moon's declination never exceeds \(30^{\circ}\). Therefore cof. 2 MQ is always a pofitive quantity, and never lefs than \(\frac{7}{2}\), which is the cofne of \(60^{\circ}\). While the latitude is lefs than \(45^{\circ}\), cof, a lat is allo a politive quantity. When it is precifely \(45^{\circ}\) the cofme of its double is 0 ; and when it is greater than 45 , the cofine of its double is negative. Hence we fee,
1. That the medium tides are equally affected by the northern and fouthem declinations of the moon.
2. If the latitude of the place is \(45^{\circ}\), the medium tide is always \(\frac{\pi}{2} \mathrm{M}\). This is the reafon why the tides along the coafts of France and Spain are fo little affected by the declination of the morn.
3. If the latitude is lefs than \(45^{\circ}\), the mean tides increafe as the mnon's declination diminithes. The contrary happens if ZO is greater than \(45^{\circ}\). For DHI inVor. XX, PartII.
creafes or diminimes while the point \(G\) feparates from \(C\) according as the angle COD is greater or leds than COB ; that is, according as PCZ is greater or lefs than ZCQ.
4. When \(Z\) is in the equator, \(H\) coincides with \(G\), and the effect of the moon's declination on the height of the tides is the molt fenfible. The mean tide is then \(=\mathrm{M}\) \(1+\operatorname{col} 2 M Q\)

All that we have now faid may be faid of the folat tide, putting \(S\) in place of \(M\).

Alfo the fame things hold true of foring tides putting \(\mathrm{M}+\mathrm{S}\) in place of M .

But in order to afcertain the effects of declination and latitude on other tides, we mult make a much more complicated conftruction, even though we fuppole both luminaries in the ecliptic. For in this cafe the two depreffed pules of the watery fpheroid are not in the poles of the earth; and therefore the fections of the ocean, made by moridians, are by no means ellipfes.

In a neap tide, the m, un is vertical at B (fig. 7. or 8.), Fiog. 7. or \% and the fun at fome point of \(f \mathrm{~F} .90^{\circ}\) from B. If O be this point, the conitruation for the heights of the tides may be made by adding 10 both the fuperior ano interor tides for any point \(D\), the quantity \(\overline{M+5-D^{\prime} F \text { or } D K}\) \(x \operatorname{lin}^{2} d \mathrm{O}=\overline{\mathrm{M}+5-\text { tide }} \times \frac{\operatorname{lin}^{2} 2 Q}{\cos \int^{2} \mathrm{MQ}}\), as is evi. dent.

But if the fun be verical at \(d, d\) will be the higheft part of the circle \(f \mathrm{OF}\), and no conection is neceffary. But in this cale the circle of high water will be inclined to the meridian in an angle equal to \(d \mathrm{BO}\) (fig. 7 .), and neither the times nor elevations of high water will be properly afcertained, and the crror in time may be confiderable in high latitudes.

The inaccuracies are not fo great in intermediate tides, and refpect chiefly the time of high water and the height of low water.

The exact computation is very tedious and peculiar, fo that it is hardly polfible to give any account of a regular progrefs of phenomena; and all we can do is, to afcertain the precife heights of detached points. For which reafons, we mult content ourfelves with the confruction alrcady given. It is the exact geometrical expreffion of Bernoulli's analyfis, and its confequences now related contain all that he has inveftigated. We may accommodate it very nearly to the real ftate of things, by fuppofing PC equal, not to CO of fig. 4. but to MS, exhibiting the whole compound tide. And the point \(B\), inftead of reprefenting the moon's place, muft reprefent the place of high water.

Thus have we obtained a general, though not very accurate, view of the phenomena which muft take place in different latitudes and in different declinations of the fun and moon, provided that the phyfical theory which determines the form and pofition of the watery fpheroid be jatt. We have only to compute, by a very fimple procels of fuherical trigonometry, the place of the pole of this fpheraid. The fecond contruction, in fi . 8. fhows us all the circumftances of the time and leight of high water at any point. It will be recolleced, that in computing this place of the pole, the anticiortion of 20 degree, ariing from the inertia of the watets, mult be attended to,

Tidr.
\(\qquad\) --
\(\qquad\)

\section*{T I D [ 434 ] T I D}

Were we to inftitute a comparifon of this theory with oblervation, without farther confideration, we fhould fill find it unfavourable, partly in refpeet of the heights of the tides, and more remarkably in refpect of the time of low water. We muft again confider the effects of the inertia of the waters, and recollect, that a regular theorctical tide differs very little in its progrefs from the motion of a wave. Even along the free ocean, its motion much refembles that of any other wave. All waves are propagated by an ofcillatory motion of the waters, precifely fimilar to that of a pendulum. It is well known, that if a pendulum receive a fmall impulfe in the time of every defcent, its vibrations may be increafed to infinity. Did the fucceffive actions of the fun or moon juf keep time with the natural propagation of the tides, or the natural ofcillations of the waters, the tides would alfo augment to infinity: But there is an infinite odds againf this exact adjuftment. It is much more probable that the action of to day interrupts or checks the ofcillation produced by yefterday's action, and that the motion which we perceive in this day's tide is what remains, and is compounded with the action of to-day. 'This being the cafe, we hould expect that the nature of any tide will depend much on the nature of the preceding tide. Therefore we fhould expeet that the fuperior and inferior tides of the lame day will be more nearly equal than the theory determines. The whole courfe of obfervation confirms this. In latitude \(45^{\circ}\), the fuperior and inferior tides of one day may differ in the proportion of \(2 \frac{1}{2}\) to 1 , and the tides correfponding to the greateft and leaft declinations of the moon may differ nearly as much. But the difference of the fuperior and inferior tides, as they occar in the lift of Obfervations at Rochefort, is not the third part of this, and the changes made by the moon's declination is not above one-half. Therefore we thall come mucli nearer the true meafure of a fpring tide, by taking the arithmetical mean, than by taking either the fuperior or inferior.

We fhould expect lefs deviation from the theory in the gradual diminution of the tides from fpring tide to neap tide, and in the gradual changes of the medium tide by the declination of the moon; becaufe the fucceffive changes are very fmall; and when they change in kind, that is, diminifh after having for fome time augmented, the change is by infenfille degrees. This is moft accurately confirmed by obfervation. The valt collection made by Caflmi of the Obfervations at Breft being examined by Bernoulli, and the medium of the two tides in one day being taken for the tide of that day, he found fuch an agreement between the progreftion of thefe medium tides and the progreffion of the lines MS of fig. 4. that the one feemed to be calculated by the other. He found no lefs agreement in the changes of the medium tides by the moon's declination.

In like manner, the changes produced by the different diftances of the moon from the earth, were found abundantly conformable to the theory, although not fo exael as the other. This difference or inferiority is eafly acrounted for: When the moon changes in her mean difance, one of the neap tides is uncommonly fmall, and therefore the fucceffive diminutions are very great, and one tide fenfibly affecs another. The fame circumfance operates when the changes in apogee, by reafon
of a very large fpring tide. And the changes correfponding both to the fun's diflance from the earth and his declination agreed almoft exactly.

All thefe things confidered together, we have abundant reafon to conclude, that not only the theory itfelf is juft in principle (a thing which no intelligent naturalift can doubt), but alfo that the data which are affumed in the application are properly chofen; that is, that the proportion of two to five is very nearly the ture propor. tion of the mean folar and lunar forces. If we now compute the medium tide for any place in fuccefion, from fpring tide to neap tide, and fill more, if we compute the feries of times of their occurrence, we thall find as great an agreement as can be defired. Not but that there are many irregularities; but thefe are evidently fo anomalous, that we can afcribe them to nothing but circumftances which are purely local.

This general rule of computation mult be formed in the following manner:

The fpring tide, according to theory, being called \(A\), and the neap tide \(B\), recollect that the fpring tide, according to the regular theory, is meafured by \(\mathrm{M}+\mathrm{S}\). Recolleet alfo, that when the lunar tide only is confidered the fuperior fpring tide is \(M \times\) fin. \({ }^{2}\), ZM (fig. 8.), But when we confider the ution of two adjoining tides on each other, we find it fafer to take the medium of the fuperior and inferior tides for the meafure; and this is \(\mathrm{M} \times \frac{1+\operatorname{cof.}^{2}{ }_{2} \mathrm{ZQ} \times \operatorname{cof} .2 \mathrm{MQ}}{2}\). Let this be call. ed \(m\). This being totally the effect of M as modified by latitude and declination, may be taken as its proper meafure, by which we are to calculate the other tides of the monthly feries from fpring tide to neap tide.

In like manner, we muft compute a value for \(S\), as modified by declination and latitude; call this \(s\). Then fay,
\[
\mathrm{M}+\mathrm{S}: \mathrm{A}=m+s: \mathrm{A} \times \frac{m+s}{\mathrm{M}+\mathrm{S}}
\]

This fourth proportional will give the fpring tide as modified for the given declination of the luminaries, and the latitude of the place.

Now recollect, that the medium tide, when the luminaries are in the equator, is \(A \times\) col. \({ }^{2}\) lat. Therefore let \(F\) be the fpring tide obferved at any place when the luminaries are in the equator; and let this be the medium of a great many obfervations made in thefe circumftances. This gives \(A\) - cof. \({ }^{2}\) lat. (as modified by the peculiar circumflances of the place) \(=\mathrm{F}\). Therefore the fourth proportional now given changes to \(\mathrm{F} \times\) \(\frac{m+s}{\mathrm{M}+\mathrm{S}} \cdot\) cof. \(^{2}\) lat. And a fimilar fubtitute for B is (
\[
\times \frac{m-s}{\overline{\mathrm{M}-\mathrm{S}} \cdot \mathrm{col}{ }^{2} \text { lat. }}
\]

Lafty, To accommodate our formule to every diAance of the earth from the fun and moon, let D and \(\Delta\) be the mean diftances of the lim and moon, and \(d\) and \(\delta\) their diftances at the given time; and then the two fubfitutes become
\[
\begin{aligned}
& \frac{\Delta^{3} d^{3} M+\frac{\delta^{3} D^{3} 8}{d^{3} \delta^{3}(M+S)} \times \mathrm{S} \times \frac{m+s}{(M+S) \operatorname{col} .^{2} l a t}}{\Delta^{3} d^{3} M-\delta^{3} D^{3} S} \\
& d^{3} \delta^{3}(M-S)
\end{aligned} .
\]

\section*{T I D}
ride. The half fum of thefe two quantities will be the MC, and their half difference will be the SC, of fig. 4 . with which we may now operate, in order to find the tide for any other day of the menftrual feries, by means of the elongation \(a\) of the moon from the fun; that is, we mult fay \(\mathrm{MC}+\mathrm{CS}: \mathrm{MC}-\mathrm{CS}=\tan , a: \tan . b\); then \(x=\) \(\frac{a+b}{2}\), and \(y=\frac{a-b}{2}\). And MS, the height of the tide, is \(\mathrm{MC} \times\) col. \(2 y+\mathrm{CS} \times\) cof. \(2 x\).

Suces is the general theory of the tides, deduced from the principle of univerfal gravitation, and adjufted to that proportion of the folar and lunar forces which is moft confiftent with other celeftial phenomena. The comparifon of the greateft and leatt daily retardations of the tides was with great judgement preferred to the proportion of fpring and neap tides, felected by Sir Iface Neivton for this puspofe. This proportion mutt depend on many local circumftances. When a wave or tide comes to the mouths of two rivers, and fends a tide up each, and another tide of half the magnitude comes a fortnight after; the proportion of tides fent up to any given places of thefe rivers may be extremely different. Nay, the proportion of tides fent up to two ditant places of the fame river can hardly be the fame; nor are they the fame in any river that we know. It can be demonltrated, in the ftricteft manner, that the farther we go up the river, where the declivity is greater, the neap tide will be fmaller in proportion to the. Spring tide. But it does not appear that the time of fuccelfion of the different tides will be much affected by local circumfances. The tide of the fecond day of the moon being very little lefs than that of the firft, will be nearIy as much retarded, and the intervals between their arrivals cannot be very different from the real intervals of the undifturbed tides; accordingly, the fucceffion of the highelt to the higheft but one is found to be the fame in all places, when not diffurbed by different winds. In like manner, the fucceflion of the lowelt and the loweft but one is found equally invariable; and the higheft and the loweft tides obferved in any place mu/l be accour ted the fpring and neap tides of that place, whether they happen on the day of full and half moon or not. Nay, we can fee here the explanation of a general deviation of the theory which we formerly noticed. A low tide, being lefs able to overcone obftructions, will be fooner flopped, and the neap tides Thould happen a little earlier than by the undifturbed theory.

With all thefe corrections, the theory now delivered will be found to correfpond with obfervation, with all the exactnefs that we can reatonably expect. We had an opportunity of comparing it with the phenomena in a place where they are very fingular, viz. in the harbour of Biffeftedt in Iceland. The equator of the watery fpheroid frequently paffes through the neighbourhood of this place, in a variety of pofitions with refpect to its parallel of diurnal revolution, and the differences of fuperior and inferior tides are moft remarkable and various. We found a wonderful conformity to the maft diverfified circunflances of the theory.

There is a period of 18 years, refpecting the tides in Iceland, taken notice of by the ancient Saxons; but it is not diftinetly defcribed. Now this is the period of the moon's nodes, and of the greateft and leaft incli-
nation of her orbit to the cquator. It is therefore the period of the pofitions of the equator of the tides which ranges round this ifland, and very fenfibly affects them.

Hitherto we have fuppofed the tides to be formed on an ocean completely covering the earth. Let us fee how thofe may be determined which happen in a fmall and confined fea, fuch as the Cafpian or the Black fea. The determination in this cafe is very fimple. As no fupply of water is fuppofed to come into the bafon, it is fufceptible of a tide only by linking at one end and rifing at the other. 'Ilis may be illullrated by fig. 6 . where \(\mathrm{C} 5, \mathrm{C} \%\), are two perpendicular planes bounding a fmall portion of the natural ocean. The water will fink at \(z\) and rife at \(x\), and form a furface o o \(r\) parallel to the equilibrated furface \(\eta / s\). It is evident that there will be high water, or the greateft polfible rife, at \(r\), when the bafon comes to that pofition where the tangent is moft of all inclined to the diameter. This will be when the angle \(t \mathrm{CB}\) is \(45^{\circ}\) nearly, and therefore three lunar hours after the moon's fouthing; at the fame lime, it will be low water at the other end. It is plain that the rife and fall muft be exceedingly fmall, and that there will be no change in the middle. The tides of this kind in the Cafpian fea, in latitude \(45^{\circ}\), whofe extent in longitude does not exceed eight degrees, are not above feven inches; a quantity fo fnall, that a flight breeze of wind is fufficient to check it, and even to produce a rife of the waters in the oppofite direction. We have not met with any accounts of a tide being obferved in this fea.

It fhould be much greater, though ffill very fmall, in the Mediterranean fed. Accordingly, tides are ooferved there, but Aill more remarkably in the Adriatic, for a reafon which will be given by and by. We do not know that tides have been obferved in the great lakes of North America. Theie tides, though fmall, thould be very regular.

Should there be another great bafon in the neighbourhood of \(z x\), lying eaft or weft of it, we hould obferve a curious phenomenon. It would be low water on one fide of the fhore \(z\) when it is high water on the other fide of this partition. If the tides in the Euxine and Cafpian feas, or in the American lakes which are near each other, could be oblerved, this phenomenon thould appear, and would be one of the prettief examples of univerfal gravitation that can be conccived. Something like it is to be feen at Gibraltar. It is high water on the eaft fide of the rock about io o'clock at full and change, and it is high water on the weft fide, not a mile diftant, at I2. This difference is perhaps the chief caufe of the fingular current which is obferved in the Straits mouth. There are three currents oblerved at the fame time, which clange their directions every 12 hours. The fmall tide of the NIediterranean proceeds along the Barbary fhore, which is rery u.iform all the way from Egypt, with tolerable regularity. But along the northern fide, where it is greatly obftructed by Italy, the illands, and the eaft coant of Spain, it fers very irregularly; and the perceptible high water on the Spanifi coaft diliers four hours from that of the foithem coalt. Thus it happens, that one tide rantes round Europa point, and another along the Chore near Ceuta, and there is a third current in the middle different from both. Its general direction is from the

Atlantic

\section*{T I D [ \(43^{6}\) ] T I D} Atlantic ocean into the Mediterranean fea, but it fometimes comes out when the cbb tide in the Atlantic is confiderabie.

Suppore the moon over the middle of the Mrditerranean. The furface of the fea will be level, and it will be half tide at both ends, and therefore within the Strats of Gibraltar. But without the Straits it is within haif an hour of high watcr. Therefore there will be a current fetting in from the Atlantic. About three and an half hours after, it is high water within and half ch!. without The current now fets out from the Mediterranean. Three hours later, it is low water without the Straits and half ebb within; therefore the current has been etting out all this while. Three hours later, it is haif flood without the Straits and low water within, and the current is again fetting in, \&c.

Were the earth fluid to the centre, the only fenfible motion of the waters would be up and down, like the waves on the open ocran, which are not brulhed along by frong gales. But the fiallownefs of the channel mikes a horizontal motion neceffary, that water may be fupplied to form the accumulation of the tide. When this is formed on a flat fhelving coaft, the water mutt flow in and out, on the flats and fands, while it rifes and falls. Thefe horizontal motions mult be greatly modified by the channel or bed along which they move. When the channel contracts along the line of flowing water, the wave, as it moves up the channcl, and is checked by the narrowing thores, mult be reflected back, and keep a-top of the waters ftill fowing in underneath. Thus it may rife ligher in thefe narrow feas than in the open ocean. This may ferve to explain a little the great tides which happen on fone coafts, fuch as the coaft of Normandy. At St Malo the flood frequeatly rifes 50 feet. But we cannot give any thing like a full or fatisfactory account of thefe fingularities. In the bay of Fundy, and particularly at Annapolis Royal, the water fometimes rifes above 100 fect. This feems quite inexplicable by any force of the fun and moon, which cannot raife the waters of the free ocean more than eight feet. Thefe great floods äre unqueftionably owing to the proper timing of certain ofcillations or currents adjoining, by which they unite, and form one of great force. Such violent motions of water are frcquently feen on a fmall fcale in the motions of bronks and rivers; but we are too little acquainted with hydraulics to explain them with any precifion.

We have feen that there is an ofcillation of waters formed under the fun and moon; and that in ronfequence of the rotation of the earth, the inertia and the want of perfect huidity of the waters, and ohtructions in the channcl, this accumulation never reaches the plase where it would finally fettle if the earth did not turn round its axis. The confequence of this mun he a general current of the waters from eaft to weft. This inay be feen in another way. The moon in her orbit round the carth has her gravity to the earth diminifhed by the fun's dillurbing force, and therefore maves in an orb"t lefs incurvated than fhe would defcribe independent of the fun's action. She therefnre employs a longer time. If the monn were fo near the eartla as almoft to touch it, the fame thing would happen. Therefore fuppofe the monn 'uming round the eath. Imon in rontact with the equator, with her natural undifturbed pe-
riodic time, and that the earth is revolving round its axis in the fame time, the moon would remain continually above the fame foot of the earth's furface (fuppofe the city of Quito), and a fpectator in another planet would fee the monn always corering the fame fpot. Now let the fun act. This will not affect the rotation of the earth, becaufe the action on one part is exactly balanced by the action on another. But it will affect the moon. It will move more fowly round the earth's centre, and at a greater diffance. It will be left behind by the city of Quito, which it formerly covered. And as the earth moves round from welt to eaft, the moon, moving more flowly, will have a motion to the welt with refpect to Quito. In like manner, every particle of water has its gravity diminifted, and its diurnal motion retarded; and hence arifes a general motion or current from eaft to wefl. This is very diftinctly ferceived in the Atlantic and Pacific occans. It comes round the Cape of Good Hope, ranges along the coaft of Africa, and them fets directly over to America, where it meets a fimilar ftream which comes in by the north of Europe, Meet.. ing the thores of America, it is deflected both to the fouth along the coaft of Brazil, and to the north along the North American fhores, where it forms what is call. ed the Gulf Stream, becaufe it comes from the gulf of Mexico. This motion is indeed very flow, this being fufficient for the accumulation of feven or eight feet on the deep ocean; but it is not altogether infenfible.

We may expect differences in the appearances on the weftern Mores of Europe and Africa, and on the weftern Shore of America, from the appearances on the eaftern coalls of America and of Afia, for the general current obfructs the waters from the weftern finores, and fends them to the eaftern flores. Alfo when we compare the wide opening of the northern extremity of the Atlantic ocean with the narrow opening between Kamtfchatka and America, we hoould expect difirences between the appearances on the weft coalts of Europe and of America. 'The obfervations made during the circumnavigations of Captain Cook and others Phow a remarkable difference. All along the weft coaft of North America the inferior tide is very trifing, and frequently is not perceived.

In the very fame manner, the difturbing forces of the fun and moon form a tide in the fluid air which furrounds this globe, confitting of an eleration and depreffion, which move gradually from eaft to weft. Neither does this tide ever attain that pofition with refpect to the difturbing planets which it would do were the earth at reft on its axis. Hence arifes a motion of the whole air from eaft to weft; and this is the principal caufe of the trade-winds. They are a little accelerated by being heated, and therefore expanding. They expand more to the weftward than in the oppofite dircetion, becaufe the air expands on that fide into air which is now cooling and contracting. Thefe winds very evidently follow the fun's mntion, tending more to the fouth or north as he goes fouth or north. Were this motion confiderably affected by the expanfion of heated air. we flould find the air rather coming northward and fonibward from the torrid zone, in confequence of its expanfon in that climatc. We repeat it, it is almont folely procluced be the artial tide, and is neceffary for the ver formation of this tide. We cannot perceive the accumblation. It cannot affeet the barometer, as

\section*{T I D [ 437 ] T I L}

Tide. many think, becaufe, though the air becomes deeper, it becomes deeper only becaule it is made lighter by the gravitation to the fun. Inlkead of prefling more on the ciftern of the barometer, we imagine that it preffes lefs; becaufe, like the ocean, it never attains the height to which it tends. It remains always too low for equilibriun, and therefore it thould prefls with lefs force on the ciltern of a barometer.

There is an appearance precifely fimilar to this in the planct Jupiter. He is furrounded by an atmofphere which is arranged in zones or belts, probably owing to climate differences of the different latitudes, by which each feems to have a different kind of iky. Sumething like this will appear to a fpectator in the moon looking at this earth. The general weather and appearance of the 0 ky is confiderably different in the torrid and temperate zones. Jupiter's belts are not of a conllant flape and coluur; but there often appear large fpots or tracts of cloud, which retain their flape during feveral revolutions of Jupiter round his axis. To judge of his rotition by one of thefe, we ghould fay that he turns round in 9.55 . There is alfo a brighter fpot which is frequently feen, occupying one certain fituation on the body of Jupiter. This is furely adherent to his body, and is either a bright coloured country, or perhaps a tract of clouds hovering over fome volcano. This fpot turns round in \(9.5 \frac{1}{4}\). And thus there is a general current in his atmorphere from eaft to well.

Both the motion of the air and of the water tend to diminifh the rotation of the earth round its axis; for they move flower than the earth, becaufe they are retarded by the luminaries. They mult communicate this retardation to the earth, and muft take from it a quantity of motion precifely equal to what they want, in order to make up the equilibrated tidc. In all probability this retardation is compenfated by other caufes; for no retardation can be obferved. This would have altered the length of the year fince the time of Hipparchus, giving it a fmaller number of days. We fee caufes of compenfation. The continual wafhing down of foil from the elevated parts of the earth muft produce this effect, by communicating to the valley on which it is brought to reft the excefs of diurnal velocity which it had on the mnuntain top.

While we were employed on this article, a book was put into our hands called Studies of Nature, hy a Mr Saint Pierre. This author fcouts the Newtonian theory of the tides, as erroneous in principle, and as quite infufficient for explaining the phenomena; and he afcribes all phenomena of the tides to the liquefaction of the ices and frows of the circumpolar regions, and the greater length of the polar than of the equatorial axis of the earth. He is a man of whom we wifh to fperk with reSpect, for his conftant attention to final crufes, and the proof thence refulting of the wifdom and goodnefs of God. For this he is entitled to the greater praife, that it required no fmal' degree of fortitude to refift the influence of national example, and to retain his piety in the midft of a people who have drunk the very dregs of the atheifm of ancient Greece. This is a fpecies of merit rarely to be met with in a F.enchman of the prefent day ; but as a philofonher, -N. de S: Pierre can lay claim to no other merit pxrept that of having colleceded many important facts. The argument which he employs to prove that the earch is a prolate fyheroid, is a
direct demonfration of the truth of the contrary opinion; and the melting of the ice and fnows at the poles cannot produce the finalleff motion in the waters. Were there cven ten times more ice and fnow lloating on the northern fea than there is, and were it all to melt in one minute, there would be no flux from it; for it would only fill up the fpace which it formerly occupied in the water. Of this any perfon will be convinced, who thall put a handful of fnow fyueezed hard into a jar of water, and note the exact hicight of the water. Let the fnow melt, and he will find the water of the fame height as before.

Tide-Waiters, or Tidefinen, are inferior officers belonging to the cuflomhoure, whofe employment is to watch or attend upon fhips until the cuftoms be paid: they get this name from their going on board thips on their arrival in the mouth of the Thames or other ports, and fo come up with the tide.

TIEND, in Scots Law. See Teind.
TIERCE, or Teirce, at meafure of liquid things, as wine, oil, \&c. containing the third part of a pipe, or \(42^{-}\) gallons.

TIERCED, in Heraldry, denotes the flield to be divided by any part of the partition-lines, as party, coupy, tranchy, or tailly, into thiee equal parts of different colours or metals.

Tiger. See Felis, Mammalia Index.
TIGER-IVolf, the name of the hyæna at the Cape of Good Hone. Sie Canis, Mammalia Index.

TIGRIS, a river of Afia, which has its fource near that of the Euphrates in the mountain Tchildir in Tur. komania : afterwaro's it feparates Diarbeck from Erzerum, and Khufinan from Irac-Arabia; and uniting uith the Euphrates at Gorno, it falls into the gulf of Baffurah, under the name of Schat el-Arab. This river paffes by Diarbekir, Gexira, Mouful, Bagdad, Gorno, and Bafforah.

Tilia, Lime or Linden-tree, a genus of plants belonging to the clafs of polyandria; and in the natural fyllem ranging under the Columnificre. See Botany Index.
'Tillemont, Sebastian le Nain de. See Nain

TILLER of a SHIP, a ftoong picce of wood faftened in the head of the rudder, and in fmall hips and boats called the helm.

TILLOEA, a genus of plants belonging to the clafs of tetrandia; and in the natural fyttem ranging under the 13 th order. Succulenta. Sce Botany Index.

TILLOTSON, Joun, a celebrated archbifhop of Canterbury, was the fon of Robert Tilloton of Sowerby, in the parifh of Halifax in York:fhire, clothier; and was born there in the year 1630 . He fludied in Clare-hall, Cambridge; and in 1656 left this coliege, in order to become tutor to the fon of Edmund Prideaux, Efq. of Ford abbey in Devonfhire. He was afterwards curate to Dr Hacket vicar of Chefhunt, in Hertfordfhire. In 1663, be was prefented by Sir Thomas Barnard:fon to the rectory of Ketton or Keddington in the cnunty of Suffolk; but was the next year chofen preacher to Lincoln's Inn, when he procured Ketton to be beftuwed on his curate. He was greatly admired in London for his fermons; and in the fame year was chofen Tuefday-lecturer at St Lawrence's church, London, where his lectures were frcquented by
meafures, chiefly by the motion and revolution of the fun.

The general idea which time gives in every thing to which it is applied, is that of limited duration. Thus we cannot fay of the Deity, that he exifts in time ; becaufe eternity, which he inhabits, is abfolutely uniform, neither admitting limitation nor fucceffion. See MeraPHYSICS, \(\mathrm{N}^{\circ} 209\).

Trame, in Mufic, is an affection of found, by which it is faid to be long or fhort, with regard to its continuance in the fame tone or degree of tune.

Mufical time is diftinguified into common or duple time, and triple time.

Double, duple, or common time, is when the notes are in a duple duration of each other, viz. a femibreve equal to two minims, a minim to two crotchets, a crotch. et to two quavers, \&xc.

Common or double time is of two kinds. The firft when every bar or meafure is equal to a femibreve, or its value in any combination of notes of a lefs quantity. The fecond is where every bar is equal to a minim, or its value in lefs notes. The movements of this kind of meafure are various, but there are three common diftinctions; the firft flow, denoted at the beginning of the line by the mark \(C\); the fecond brifk, marked thus \(\bar{Z}\); and the third very brifk, thus marked \(\overline{\mathbb{E}}\)

Triple time is when the durations of the notes are triple of each other, that is, when the femibreve is equal to three minims, the minim to three crotchets, \&c. and it is marked T .

TIME-Kecpers, or Influments for meafuring Time. Sce Clock, Dlal, Watch, \&c.

TIMOLEON, a celebrated Corinthian general, who reftored the Syracufans to their liberty, and drove the Carthaginians out of Sicily. See.Syracuse, No \(50-\) 54.

TIMON the Sceplic, who is not to be confounded with Timon the Mifanthrope, was a Phliafian, a difciple of Pyrrho, and lived in the time of Ptolemy Philadelphus. He took fo little pains to invite difciples to his fchool, that it has been faid of him, that as the Scy. thians fhot flying, Timon gained pupils by running from them. He was fond of rural retirement ; and was fo much addicted to wine, that he heid a fuccefsful conteft with feveral celebrated champions in drinking. Like Lucian, he wrote with farcaftic humour againf the whole body of philofophers. The fragments of his fatirical poem Silli, of en quoted by the ancients, have been carefully collected by Henry Siephens in his Poefis Philofophica. Timon lived to the age of 90 years.

Tminn, furnamed Mifantiropos, or the Man-hater, a famous Athenian, who lived about 420 B. C. He was one day afked, why he loved the young Alcibiades while he detefled all the rell of the human race? on which he replied, "It is becaufe I forcfee that he will be the ruin of the Athemians." He carefully avoided all for:s of company; yet went one day to an affembly of the people, and cried with a loud voice, "That he had a fig-tree on which feveral perfons had hanged themfelves;

\section*{T I M [ 4.39 ] \\ T I P}
rimon, themfelves; but as he intended to cut it down, in order motheus. to build a houfe on the place where it ftood, he gave
them notice of it, that if any of them had a mind to hang themfelves, they mult make halle and do it fpeedily." He had an epitaph engraved on his tomb, filled with imprecations againt thofe who read it. Shakefpeare has formed a tragedy on his tlory.

TIMOR, an illand of Afia, in the Eat Indian fea, to the fouth of the Moluccas, and to the ealt of the ifland of Java, being 150 miles in length, and 37 in breadth. It abounds in fandal-wood, wax and honey; and the Dutch have a fort here. The inhabitants are Pagans, and are little better than favages; and fome pretend they had not the ufe of fire many years ago.

TIMOTHEUS, one of the mof celebrated poet-muficians of antiquity, was born at Miletus, an Ionian city of Caria, 446 years' J3. C. He was contemporary with Philip of Macedon and Euripides; and not only excelled in lyric and dithyrambic poetry, but in his performance upon the cithara. According to Paufanias, he perfected that inftrument by the addition of four new flrings to the feven which it had hefore; though Suidas fays it had rine before, and that 'Timotheus only added two, the Ioth and IIth, to that number. See Lyre.

With refpect to the number of ftrings upon the lyre of 'limotheus: The account of Paufanias and Suidas is confirmed in the famous fenatus-confultum againft him, ftill extant, preferved at full length in Boethius. Mr Stillingfleet has given an extract from it, in proof of the fimplicity of the ancient Spartan mufic. . The fad is mentioned in Athenxus; and Cafaubon, in his notes upon that author, has inferted the whole original text from Boethius, with corrections. The following is a faithful tranflation of this extraordinary Spartan af of parliament. "Whereas Timotheus the Milefian, coming to our city, has difhonoured our ancient mufic, and, defpifing the lyre of feven ftrings, has, by the introduction of a greater variety of notes, corrupted the ears of our youth; and by the number of his Arings, and the novelty of his melody, has given to our mufic an effeminate and artificial drefs, inftead of the plain and orderly one in which it has hitherto appeared; rendering meIody infamous, by compofing in the chromatic infead of the enharmonic :-The kings and the ephori have therefore refolved to pafs cenfure upon Timotheus for thefe things: and, farther, to oblige him lo cut all the fuperfluous ftrings of his eleven, leaving only the feven tones; and to banifh him from our city; that men may be warned for the future not to introduce into Sparta any unbecoming cultom."

The fame ftory, as related in Athenaus, has this additional circumftance, That when the public executioner was on the point of fulfilling the fentence, by cutting off the new frings, Timotheus, perceiving a little ftatue in the fame place, with a lyre in his hand of as many ftrings as that which had given the offence, and nowing it to the judges, was acquitted.

It appears from Suidas, that the poetical and mufical comnofitions of Timotheus were very numerous, and of various kinds. He attributes to him 19 nomes, or canticles, in hexameters; 36 proems, or preludes; 18 dithyrambics; 21 hymns; the poem in praife of Diana; one panegyric ; three tragedies, the Perfians, Phinidas, and

Lacrtes; to which muft be added a fourth, mentioned Timatheus by feveral ancient authors, called Niobe, without forget. ting the pocm on the birth of Bacchus. Stephen of Hyzantium makes him author of 18 books of nomes, or airs, for the cithara, to 8000 verfes; and of I000 \(\Pi_{\xi}\) ooupes, or prcludes, for the nomes of the Hutcs.

Innotheus died in Macedonia, according to Suidas, at the age of 97 ; though the Marhles, much better authority, lay at 90 ; and Stephen of Byzantium fixes his death in the fourth year of the 105 th Olympiad, two years before the birth of Alexander the Great; whence it appears, that this Timothcus was not the famous player on the flute fo much efleemed by that prince, who was animated to fuch a degree by his perforinance as to feize his arms; and who employed him, as Atheneus informs us, together with the other great muficians of his time, at his nuptials. However, by an inattention to dates, and by forgetting that of thefe two muficians of the fame name the one was a Milefian and the other a Theban, they have been hitherto often confounded.

Carriter's Britannia about \(4^{2}\) miles in length, 27 in breadth, containing 599,500 acres, divided into 12 baronies, in which are feveral market towns and boroughs. It fends eight members to parliment, viz. two for the county, two for the city of Cathel, and two for each of the boroughs of Clmmell, Feiherd, and Thurles. The north part of it is mountainous and cold; but in the fouth the air is milder, and the foil much more fertile, producing plenty of corn, and good pafture for the numerous herds of cattle and flocks of fheep with which it abounds. The north part is called Ormond, and for a long time gave the title of earl, and afterwards of marquis and duke, to the nobie family of Butler, defcended from a fitter of Thomas a Becket archbifhop of Canterbury, till, at the acceffion of George I. the laft duke was attainted of high-treafon, and died abroad. In that part of the county, the family had great prerogatives and privileges granted them by Edward I!I. Another diftriet in this county was anciently called the County of the Holy Croos of Tipperary, from a famcus abbey in it ftyled Holy Crofs, on account of a piece of Chrifts crofs that was faid to be preferved there. This abbey and diftrict enjoyed alfo fpecial privileges in former times. The remains of the abbey, or rather the fpot where it ftood, are ftill held in great veneration, and much reforted to by the Roman Catholics.

TIPSTAFF, an officer who attends the judges with a kind of flaff tipped with filver, and takes into his charge all prifoners who are committed or turned over at a judge's chambers.

TIPULA, the CRaNE-FLY゙; a genus of infects belonging to the order of diptera. See Entomology Index.
'PlRE, in the fea language, is a row of cannon placed along a fhip's fide, either above upon deck, or below, diftinguifhed by the epithets of upper and lower tires.

TIROL, or TYROL, a county of Germany in the circle of Auftria, under which may be included the territorics belonging to the bihops of Brixen, Trent, and Chur, the Teutonic Order, and the prince of Deitrichitein, the Auftrian feigniories before the Arlberg, and the Auftrian diftricts in Swabia. It is 150 miles in length, and 120 in breadth, and contains 28 large towns.

The face of the country is very nountainous. Of thefe mountains, fome have their tops always buried in fnow; others are covered with woods, abounding with a variety of game; and others are rich in metals, and marble of all colours. Of the lorer, fome yield plenty of corn, others wine, and woods of chefnut trees. The valleys are excceding fertile alfo, and pleafant. In fome places confiderable quantitics of flax are saifed, in others there is a grood breed of horfes and horned cattle; and, among the mountains, abundance of chamois and wild goais. In this coun'ry are alfo found precious fones of feveral forts; as ģarnets, rubies, amethyfts, emeralds, and a fuecies of diamends, agates, carnclians, calcedonies, malachites, \&c.; nor is it without hot bathe, acid waters, falt pits, mines of filver, copper, and lead, mineral colours, alum, and vitriol. The principal river of Pirol is the Inn, which, after traverfing the country, and receiving a number of leffer ftreams into it, enters

Bavarin, in which, at Paffau, it falls into the Danube. The men here are very tall, robuft, and vigorous; the women alfo are flout, and gencrally fair; and both lexes have a misture of the Italian and German in their tempers and characters. As there is little trade or manufacture in the country, except what is occalioned by the mines and falt works, many of the common people are obliged to feek a fubfiftence elfewhere. A particular kind of falutation is ufed all over Tirol. When a perfon comes into a houfe, he fays, "Hail! Jefus Chrilt :" the anfwer is, "May Chrift be raifed, and the Holy Virgin his mother." Then the mafter of the houle takes the vifitor by the hand. This falutation is fixed up in print at all the doors, with an advertilement tacked to it, importing, that Pope Clement XI. granted 100 days indulgence, and a plenary abfolution, to thole who fhould pronounce the falutation and anfrier, as often as they did it. The emperor has forts and citadels to advantageoufly fituated on rocks and mountains all over the country, that they command all the valleys, avenues, and paffes that lead unto it. The inhabitants, however, to keep them in good humour, are more gently treated, and not fo highly taxed as thofe of the other hereditary countries. As to the ftates, they are much the fame in this country as in the other 'Auftrian territol s, except that the peafants here fend deputies to the diets. Tirol came to the houfe of Auftria in the year 1363 , when Margaret, countefs thereol, bequeathed it to her uncles the dukes of Auftria. The arms of Tirol are an eagle gules, in a field argent. The counts of Trap are bereditary ftewards; the lords of Glofz, chamberlains; the princes of Trautfon, marmals; the counts of Wolkenftein, mafters of the horie and caivers; the houfe of Spaur, cup-bearers; the counts of KungI, fewers and rangers; the counts of Brandis, keepers of the jewels; the houfe of Welfperg, purveyors and ftaff-bearers; and the counts of Coalto, falconers. Betides the governor, here are three fovereign colleges, fuboidinate to the court at Vienna, which fit at Infpruck, and have their different departments. Towards the expences of the military eftablifhment of this country, the proportion is 100,000 florins yearly; but no more tham one regiment of foot is generally quartered in it.

Tirol is divided into fix quarters, as they are called; namely, thofe of the Lower and Upper InnthaI, Vintfgow, Etch, Eifack, and Puiterthal.

TITAN, in fabulous hiftory, the fon of Coclus and Terra, and the elder brother of Saturn, fuffered the latter to enjoy the crown, on condition that he fhould bring up none of his male iffue, by which means the crown fhould at length revert to him ; but Jupiter being fpared by the addrefs of Rhea, Saturn's wile, Titan and his children were fo enraged at feeing their hopes fruftrated, that they took up arms to revenge the injury; and not only defeated Saturn, but kept him and his wife prifoncrs till he was delivered by Jupiter, who defeated the 'l itans; when from the bloud ofthefe Titans llain in the battle, procecded ferpents, fcorpions, and all venomous reptiles. See Saturn.

Such is the account given by the poets of this family of Grecian and Koman gods. From the fragments of Sanchoniatho, however, and other ancient writers, many learned mon have inferred that the Titans were an early race of ambitious heroes, who laid the foundation of that idolatry which quickly overfpread the world, and

\section*{T I T [ 44i ] T I T.}

Titun. that by affuming the names of the Juminaries of heaven they contrived to get themielves every where adored as the Dii majorum gentium. That the word Titan fignifies the lum, there can indeed be very little doubt. Every one knows that fuch was its fignification in the Nolic dialect; and as it is evidently compounded of i \(i\), , which, in fome oriental tongues, fignifies bright or clear, and Tan, which ignifies a country or the earth, it anay befafely concluded that Titon was the name of the fun betore the word was imported into Greece. But the great queltion among antiquarians is, of what country was that race which, afluming to themfelves the names of the heavenly bodies, introduced into the world that fecies of idolatry which is known by the appeliation of Hero-wor/bip ?
M. Pezron, in a work publinhed many years ago, and entitled The Antiquitios of Nations, maintains that the Titans were a family of Sacæ or Scythians, who made their firlt appearance beyond Media and Mount Imaus, in the upper regions of Alia; that they were the defcendants of Goincr the fon of Japhetb and grandfon of Noah; and that after conquering a great part of the world, upon entering Upper Phrygia, they quitted their ancient name of Gomerians or Cimmerians, and aflumed that of Titans. All this, he fays, happened before the birth of Abralaam and the foundation of the Alfyrian monarchy; and he makes Uranus, their fecond prince in the order of fucceffion, to have conquered Thrace, Greece, the illand of Crete, and a great part of Europe. Uranus was fucceeded by Saturn, and Saturn by Jupiter, who flourihed, he lays, 300 years before Mufes, and divided his valt empire between himfelf, his brother Pluto, and his coufin-german Atlas, who was called Telamon. For the truth of this genealogy of the Titans M. Pezron appeals to the molt approved Greek hiAtorians; but unluckily for bis hypothefis, thele writers have not a fingle fentence by which it can be fairly fupported. It fuppofes not only the great antiquity of the Scythians, but likewife their early progrefs in arts and feiences, contrary to what we have proved in other articles of this work. See Sculpture, \(n^{\circ} 4\) and 5 . and Scythia.

Others, taking the fragment of Sanchoniatho's Phe. nician hiltory for their guide, have fuppofed the Titans to have been the defcendanis of Ham. Of this opinion was Bihhop Cumberland; and our learned friend Dr Doig, to whom we have been indebted for greater favours, indulged us with the perufal of a manufcript, in which, with erudition and ingenuily Aruggling for the pre-eminence, he traces that impious family from the profane fon of Noah, and fhows by what means they fpread the idolatrous worfhip of themfelves over the greater part of the ancient world. Cronus, of whofe exploits fome account has been given elfewhere (fee Sanchoniatho), he holds to be Ham; and tracing the progrefs of the fauily from Phonicia to Cyprus, from Cyprus to Rhodes, thence to Crete, and from Crete to Samothrace, he finds reafon to conclude that the branch called Titans or Titanides flourifhed about the era of Abraham, with whom, or with his fon Ifaac, be thinks the Cretan Jupiter mult have been contemporary. As they proceeded from countries which were the original feat of civilization to others in which mankind had funk into the grofleft barbarifm, it was eafy for them to perfuade the ignorant inhabitants that they Vos. XX, Part II.
derived the eris of civil life from their parent the fun, and in confequence of their relation to him to afit me to themfelves divine honours. So ak how they came to think of fuch grofs impiety, is a quellion as foolinh as it would be to alk how Ham their ancellor became to wicked as to entail the curfe of God upon himelelf ard his pollerity. The origin of evil is involved in dif. ficulties; but leaving all inquiries into it to be prolecuted by the metaphylician and mosalitt, it is lurs.y more probabie that the worlhip of dead men originated among the defcendants of Ham than among thole of Shem and Japheth; and that the fragnent of Sanchoniatho, when giving an account of the origin of the Titans, the undoubicd authors of that worhip, is more deferving of credit than the fabulous and comparatively late writers of Greece and Rome.

IIIHES, in ecclefiattical law, are defined to be the tenth part of the increafe, yearly arifing and renewing from the profits of lands, the ftock upon lands, and the perIonal induftry of the inhabitants : the firf ipecies being ufually called predial, as of corn, grafs, hops, and wood; the fecond mixed, as of wool, mulk, pigs, \&c. confifting of natural products, but nurtured and preferved in part by the care of man; and of thefe the tenth muft be paid in grofs; the third perfonal, as of manual occupations, trades, fimeriec, and the like; and of thefe only the tenth-part of the clear gains and profits is due.

We thall, in this article, confider, I. The original of the right of tithes. 2. In whom that right at prefent fubfits. 3. Who may be difcharged, either totally or in part, from paying them.
1. As to their original, we will not put the title of the clergy to tithes upon any divine right; though fuch a right certainly commenced, and we believe as certainly ceafed, witl the Jewih thencracy. Yet an hunourable and competent maintenance for the minifters of the gnfpel is undoubtedly.jure divino, whatever the particu- Rl-ckf. lar mode of that maintenance may be. For, befides Conmento the pofitive precepts of the New Tellan nt, natural reafon will tell us, that an order of men who are Ceparated from the world, and excluded from other lucrative profeffions for the fake of the reft of mankind, have a right to be furnilhed with the nereflaries, conveniences, and moderate enjoyments of life, at their expence; for whofe benefit they forego the ufual means of providing them. Accordingly all municipal laws have provided a liberal and decent maintenance for their national priefts or clergy; ours, in particular, have eftablifhed this of tithes, probably in imitation of the Jewith law: and perhaps, confidering the degenerate flate of the world in general, it may be more beneficias to the Englith clergy to found their title on the law of the land, than upon any divine right whatfoever, unacknowledged and unfupported by temporal fanctions.

We eannot precifely afcertain the time when thes were firf intruduced into this country. Pofibly they were contemporary with the planting of Chriftianity among the Saxons by Auguftin the monk, about the end of the fixth century. But the firf mention of them which we have met with in any written Englifh law, is a conflitutional decree, made in a fynod held A. D. 786 , wherein the payment of tithes in general is frongly enjoined. This canon or decree, which at firft bound not the laity, was effectually confirmed by two \(3 \mathbb{K}\), kingdons

Titan。
lilus.

\section*{T I T [ 442 ] T I T}

Tithes. kingdoms of the heptarchy, in their parliamentary conventions of eftates, refpectively confifting of the kings of Mercia and Northumberland, the bifhops, dukes, ienators, and people. Which was a few years later than the time that Charlemagne eftablifhed the payment of thero in France, and made that famous divifion of them into four parts; one to maintain the edifice of the church, the fecond to fupport the poor, the third the bifhop, and the fourth the parochial clergy.

The next authentic mention of them is in the fadus Edwardi at Guthruni; or the laws agreed upon between King Guthrun the Dane, and Alfred and his fon Edward the Elder, fucceffive kings of England, about the year 900 . This was a kind of treaty between thofe monarchs, which may be found at large in the AngloSaxon laws: wherein it was neceffary, as Guthrun was a Pagan, to provide for the fubfiltence of the Chriftian clergy under his dominion; and accordingly, we find the payment of tithes not only enjoined, but a penalty sdded upon non-obfervance : which law is feconded by the laws of Athelftan, about the year 930. And this is as much as can certainly be traced out with regard to their legal original.
2. We are next to confider the perfons to whom tithes are due. Upon their firf introduction, though eva*y man was obliged to pay tithes in general, yet he might give them to what priefts he plealed; which were called arbitrary confecrations of tithes; or he might pay them into the hands of the bifhop, who diftributed among his diocefan clergy the revenucs of the church, which were then in common. But when diocefes were divided into parifhes, the tithes of each parifh were allotted to its cwn particular minifter ; firf by common confent or the appointments of lords of manors, and afterwards by the written law of the land.

Arbitrary confecrations of tithes took place again afterwards, and were in general ufe till the time of King John. This was probably owing to the intrigues of the regular clergy, or monks of the Benedictine and other orders, under Archbinhop Dunftan and his fucceffors; who endearoured to wean the people from paying their dues to the fecular or parochial clergy (a much more valuable fet of men than themfelves), and were then in hopes to have drawn, by fanctimonious pretences to extraordinary purity of life, all ecclefiaftical profis to the coffers of their own focietics. And this will naturally enough account for the number and riches of the monafteries and religious houfes which were founded in thofe days, and which were frequently endowed with tithes. For a layman, who was obliged to pay his tithes fomewhere, might think it good policy to erect an abbey, and there pay them to his own monks, or grent them to: fome abbey already erected: fince for this domation, which really coft the patron little or nothing, be might, according to the fuperfition of the times, have maffes for ever fung for his foul. But in proces of ycars, the income of the poor laborious parith-priefts being fcanclaloufly reduced by thefe arbitrary confecrations of tithes, it was remedied by Pope Innocent 111. ahout the year 1200 , in a decretal epille fent to the archbifhop of Canterbury, and dated from the palace of Latcran: which has occafioned Sir Hemry Hohart and others to miltake it for a decree of the council of Lateran, held A. D. 1179 , which only prohibited what was called the infodation of tithes, or their be-
ing granted to mere laymen; whereas this letter of Pope Innocent to the archbiftop enjoined the payment of tithes to the parfons of the refpective parifhes where every man inhabited, agrecable to what was afterwards directed by the fame pope in other countries. This epille, fays Sir Edward Coke, bound not the lay fubjtets of this realm; but being realonable and juft, it was allowed of, and to became ler terra. This put an effectual ilop to all the arbitraly confecrations of tithes; except fome footiteps which ftill continue in thofe portions of tithes which the parfon of one parifh hath, though rarely, a right to claim in another: for it is now univerfally held, that tithes are due, of common right, to the par. fon of the parifh, unlefs there be a fpecial exemption. This parfon of the parifh may be either the actual incumbent, or elfe the appropriator of the benefice; appropriations being a method of endowing monafteries, which feems to have bcen devifed by the regular clergy, by way of fubftitution to arbitrary confecrations of tithes.
3. We obferved that tithes are duc of common right to the parfon, unlefs by fecial cxemption; let us therefore fee, thirdly, who may be exempted from the payment of tithes, and how lands and their occupiers may be exempted or difcharged from the payment of tithes, either in part or totally; firft, by a real compofition; or, fecondly, by cuftom or prefcription.

Firf, A real compofition is when an agreement is made between the owner of the lands and the parfon or vicar, with the confent of the ordinary and the patron, that fuch lands thall for the future be difchanged from payment of tithes, by reaton of fome land or other real recompenfe given to the parfon in licu and fatisfaction thereof. This was permitted by law, becaufe it was fuppoled that the clergy would be no lofers by fuch compolition; fince the confent of the ordinary, whofe duty it is to take care of the church in general, and of the patron, whofe intereft it is to protect that particular church, were both made neceffary to render the compolition effectual: and hence have arifen all fuch compofitions as exif at this day by force of the common law. But experience fhowing that even this caution was ineffeciual, and the poffelfions of the church being by this and other means every day diminifhed, the dif. abling flatute 13 Eliz. c. 10 . was made; which prevents, among other fpiritual perfons, all parfons and vicars from making any conveyances of the eftates of their churches, other than for three lives of 21 yeais. So that now, by virtue of this ftatute, no real compofition made fince the 13 Eliz. is good for any longer term than three lives or 21 years, though made by conlent of the tpatron and ordinary : which has indeed effectually demoliftied this kind of traffic ; fuch compofitions being now rarely heard of, unlels by authority of parliament.

Seconily, a difcharge by cuftom or prefcription, is where time out of mind fuch perfons or fuch lands have been either partially or totally difcharged from the paymont of tithes. And this immenorial ufage is binding upon all partics; as it is in its nature an cvidence of unirerfal confent and acquiefcence, and with realon fuppofes a real compofition to have been formerly made. 'This cuftom or prefcription is cither de morlo decimandi, or de nen dicimando.

A modus decimandi, commonly called by the fimple name of a modur only, is where there is by cuftom a particular

\section*{T 1 T [. 443 ] T I T}

Tithes. particular mannes of tithing allowed, different from the general law of taking tithes in kind, which are the actual tenth-part of the annual increafc. This is fometimes a pecuniary compenfation, as twopence an acre for the tithe of land: fometimes it is a compenfation in work and labour, as that the parfon flall have only the twelfth cock of hay, and not the tenth, in conficeration of the owner's making it for him : fometimes, in lieu of a large quantity of crude or imperfect tithe, the parfon fhall have a lefs quantity when arrived at greater maturity, as a couple of fowls in lieu of tithe-eggs, and the like. Any means, in thort, whereby the general law of tithing is altered, and a new method of taking them is introduced, is called a modus decimandi, or fpecial manner of tithing.

A prefription de non decimando is a claim to be entirely difcharged of tithes, and to pay no componfation in lieu of them. Thus the king by his prerogative is difcharged from all tithes. So a vicar fhall pay no tithes to the rector, nor the rector to the vicar, for ecclefia desimas non folvit ecclefice. But thefe perfonal privileges (not arifing from or being annexed to the land) are perfonally confined to both the king and the clergy; for their tenant or leffee fhall pay tithes, though in their own occupation their lands are not generally tithable. And, generally fpeaking, it is an eftablifted rule, that in lay hands, modus de non decimando non valet. But fpiritual perfons or corporations, as monafteries, abbots, bifhops, and the like, were always capable of having their lands totally difcharged of tithes by various ways: as, r . By real compofition. 2. By the pope's bull of exemption. 3. By unity of poffeffion; as when the rectory of a parifh, and lands in the fame parifh, both belonged to a religious houfe, thofe lands were difcharged of tithes by this unity of poffeffion. 4. By prefrription ; having never been liable to tithes, by being always in fpiritual hands. 5. By virtue of their order; as the Knights Templars, Citercians, and others, whofe lands were privileged by the pope with a difcharge of tithes. Though, upon the diffolution of abbeys by Henry VIII. moft of thefe exemptions from tithes would have fallen with them, and the lands become tithable again, had they not been fupported and upheld by the !atute \(3_{1}\) Henry VIII. c. 13. which enacts, that all perfons who thould come to the poffefion of the lands of any abbey then diffolved, fhould hold them free and difcharged of tithes, in as large and ample a manner as the abbeys themfelves formerly held them. And from this original have £prung all the lands which being in lay hands, do at prefent claim to be tithe-free : for if a man can thow his lands to have been fuch ab-bey-lands, and alfo immemorially difcharged of tithes by any of the means before mentioned, this is now a good prefcription de non decimando. But he muft fhow bath thefe requifites: for abbey-lands, without a fpecial ground of difcharge, are not difcharged of courfe; neither will any prefrription de non decimando avail in total difcharge of tithes, unlefs it relates to fuch ab-bey-lands.

It is univerfally acknowledged that the paymient of tithes in kind is a great difcouragement to agriculture. They are inconvenient and vexatious to the hufhandman, and operate as an impolitic tax upon induftry. The clergyman, ton, frequently finds them troublefome and precarious; his expences in collecting are a confi-
derable drawback from their value, and his juf rights are with difficulty fecured : he is too often obliged to fubmit to impofition, or is embroiled with his parimion- ers in difputes and litigations, no lefs ish foune to his feelings than prcjudicial to his intereft, and tending to prevent thofe good effects which his precepts flould produce. It is therefore of the utmof importance to parochial tranquillity, and even to religion, that fome juf and reafonable flandard of compofition could be fixed. Land has been propoled, but is the prefent fate of the divifion of property this is impofible : and as money is continually changing in its value, it would alfo be a very improper ftandard, unlefs fome than could be formed by which the compofition could be increafed as the value of money diminifhes. A plan of this kind has been publifed in the Tranfactions of the Socieiy innituted at Bath, vol. iv. which thofe who are interefted in this fubject may confult for farther information.

TITHING, (Tithinga, from the Sax. Theothunge, i. e. Decuriam), a number or company of ten men, with their families, knit together in a kind of fociety, and ali bound to the king, for the peaceable behaviour of each other. Anciently no man was fuffered to abide in England above forty days, unlefs he were emolled in fome tithing. -One of the principal inhabitants of the tithing was annually appointed to prefide over the refl, being called the tithing-man, the head-borough, and in fome countries the borfelolder, or borough's ealder, being fuppofed the difcreeteft man in the borough, town, or tithing. The diftribution of England into tithings and hundreds is owing to King Alfred. See Borseholder.

Titiano Vecelli, or Titian, the moft univerfal genius for painting of all the Lombard-fchool, the beft colourift of all the moderns, and the moft eminent Filkirgtoris for hillories, portraits, and landfcapes, was born at Ca - \(D_{2} \not\) qionaz \(^{\circ}\) dore, in the province of Friuli, in the flate of Venice, of Painterso in \(\mathrm{I}_{477}\), or in 1480 according to Vafari and Sandrart. His parents fent him at ten years of age to one of his uncles at Venice, who finding that he had an inclination to painting, put him to the fchool of Giovanni Bellino.

But as foon as Titian had feen the works of Giorgione, whofe manner appeared to him abundantly more elegant, and lefs conltrained than that of Bellino, he determined to quite the llyle to which be had fo long been accuftomed, and to purfue the other that recommended itfelf to him, by having more force, more relief, more nature, and more truth. Some authors affirm, that he placed himfelf as a difciple with Giorgione; yet others only fay, that he cultivated an intimacy with him ; but it is undouhtedly certain that he fludied with that great mafter; that he learned his method of blending and uniting the colours; and practifed his manner fo effectually, that feveral of the paintings of Titian were taken for the performances of Giorgione; and then his fuccefs infpired that artif with an invincible jealoufy of Titian, which broke off their connection for ever after.

The reputation of Titian rofe continually; every new work contributed to extend his fame through all Europe; and he was confidered as the principal ormament of the age in which he flourifhed. And yet, Sandrart obferves that amidit all his applaufe, and confant employment at Venice, his income and fortune were inconfiderable;

Titionn and he was more remarkable for the extenfivenefs of his talents, than for the affluence of his circumitances. But. when his merit was made known to the emperor Charles V. that monarch knew how to fet a jult value on his fuperior abilities; he enriched him by repeated bounties, allowed him a confiderable penfion, conferred on him the honour of kuighihood, and what was fill mure, honotied him with ais friendhip. He painted the portrait fithat benciactor Teveral times; and it is recorded "by Sandraft, that une day, while the emperor was fituing för his piture, a percil happening to drop from the painter, he Itooped, took it up, and returned it; oblifingly anfwering to the moden apology of the artit (rtho bluthed at the condefenfion of to great a monarci1), that the merit of a Titian was worthy of the attendance of an emperor.
The excellence of Titian was not fo remarkably apparent in the hifforical compofitions which he painted as in his portraits and landfcapes, which feem to be fuperior to all competition; and even to this day, many of them preferve their original beauty, being as much the admiration of the prefent age as they have delervedly been of the ages paff.-It is obferved of Titiam by moft waters, that in the different periods of his life he had four different manners; one refembling his firft inftruttor Bellino, whicls was fomewhat fiff; another, in imitation of Giorginne, more bold, and full of force; his third manner was the refult of experience, knowledge, and jurdgement, beautifully natural, and finihhed with exquifite care, which manner was peculiarly his own; and in thofe pictures which he painted between the years of approaching old age and his death may be noticed his fouth manner. His portraits were very differently frothed in his ealy, and in his latter time, according to the teltimony of Sandrart. At firf he laboured his pi icures highly, and gave them a polifted beauty and luftre, fo as phoduce their effect full as well when they were cxamined clofely as when viewed at a diffance; but afierwards, he fo managed his penciling, that their greateft force and benuty appeared at a more remote viers, and they plealed lefs when they were beheld more nearly. So that many of thofe artifts who fludied to imitate him, being mifled by appearances which they did not fufficiently confider, have imagined that Titian executed his work with readinefs and a mafterly rapidity; and concluded that they thould imitate his manner moft effetually by a freedom of hand and a bold pencil: Whereas in reality, Titian took abundance of pains to work up his pictures to fo high a degree of perfection; and the freedom that appears in tbe handling was entirely effected by a Railful combination of labour and judgement.

It cannot be truly affirmed, that Titian equalled the great mafters of the Roman fchool in defign; but he always took care to difpore his figures in fuch attitudes as mowed the mof beautiful parts of the body. Histante in defiuning men was not generally fo correct or elegant as it appeared in his boys and. female figures; but his colouring had all the look of real Aefh, his figures breathe. He was not fo bold as Giorgione, but in tendernefs and delicacy he proved himfelf much fuperior to him and all other artitis. The expreffion of the paffions was not his excellence, though even in that refrect many of his figures merited the juftelt commendation; but he always gave his figures an air of eafe and digni-

1y. His landfcapes are univerfally allowed to bounequalled, whether we confider the forms of his trees, the grand adeas of nature which appear in his fcenery, ox, his diftances which agreeably delude and delight the eye of every obferver; and they are executed with alight, tender, and mellow pencil. He learned fromnature the harmony of colours, and his tints feems.afton: ifhing, not only for their force, but their fweetnefs; and in that relpect his colouring is accounted the flandard of excellence to all profeffors of the art.

It would prove almolt an endlels tafs to enumeraie the variety of works executed by this illuftrious artift at Rome, Venice, Bulogna, and Florence, as well as thofe which are to be feen in olter cities of Italy, in England, Spain, Germany, and Fra:ice; but there are two, which are mentioned as being truly, admiraole. One is, a Laft Supper, preferved in the retectory at the Efcurial in Spain, which is inimitably fine; the other is at Milan, reprefenting Chrif crowned with thorns. The principal figure in the latter has an atitude full of grace and digni.y more than mortal, and the countenance flows a benevolence and humility, combined with dignity and pain, which no pencil but that of Titian could fo feelingly have defcribed. It is admirably coloured, and tenderly and delicately penciled; the heads are wonderfully beautiful, the compofition excellent, and the whole has a charming effet by the chiarofcuro.

He was of fo happy a conflitution, that he was never ill till the year 1576, when he died of the plague, at 99 years of age. His difciples were Paulo Veronele, Giacono Tintoret, Giacomo de Porte Bafliano, and his fons.

Titllark. See Alauda, Ornithology Index.
TIT L.E, an appellation of dignity or rank given to princes and perfons of diftinction.

Titles were not fo commonamong the ancient Greeks or Romans as they are in modern times. Till the reign of Conftantine the title of Illu/frious was never given except to thofe who were diftinguifhed in arms or letters: But at length it became hereditary in the familics of princes, and every fon of a prince was illuftrious. The title of Highnefs was formerly given only to kings. The kings of England before the reign of Henry VIII. were addreffed by the title of your Grace. That monarch firft aflumed the title of Highnefs, and afterwards that of Mojely. The title of majefly was firf given him by Francis I. in their interview in \(1 ; 20\). Charles V. was the firft king of Spain who affuned the famer title.

Princes, nobles, and clergy, generally have one title derived from their teritories and ellates, and another derived from their rank or from fome other remarkable circumftance. The pope is called the Biflop of Rome, and has the tille of Holinefs. A cardinal has his name generally from forne church, and is faluted hy the name of Eminent, or maft Eminemt. An archbihop, befides being named from his diocefe, is called his Grace and mof Reverend:' a bifhop is alfo diftinguithed by the name of his diocefe, and has the title of his Lord/bip and right Reverend. Inferior clergymen are denominated Reverend.
The titles of crowned heads derived from their dominions it is muneceffary to mention., It will be fufficient to mention thofe by which they are addreffed. . I To an a
empero:

\section*{TTO B \\ T O B}
emperor is given the title of Imperial Majgfy; to kings, that of Majely; to the princes of Great Britain, Rotial His \(\operatorname{lne} f(s)\) lo thole of Spain, Infent; 10 clectors, E/ectoral:Highiefs; to the grand duke of Tukany, Mof Serenellighnefs; to the other princes of Italy and Germany, Highmef; to the doge of Vcnice, Moft Serene Prince; to the grand-malter of Malta, Eminence ; to nuticios and ambanadors of crowned heads, Excellency; to dukes, Grace; to marquifles, earls, and barons, LordHip.
siThe empetor of China,' among his titles, takes that of Tiens Su, "Son of Heaven." The Orientals, it is oblerved, are cxceedingly fond of titles : the fimple governor of Schiras, for inflance, after a pompous enumeration of qualities, lerdfinps, \&cc. adds the titles of Fiower of Couriefy, Nutmeg of Confolation, and Nofe of Delight.
\({ }_{13}\) 'rtres, in Laze, denotes any right which a perfon has to the poffeftion of a thing, or an authentic inftrument whereby he can prove his right. See the anticles Right, Propfrty, \&c.

Titte to the Crown in the Britifh Corfitution. See Succession.
'ITMOUSE. See Parus, Orntrhology Index.
TrTUL 1 , denotes' a pérlon invelled with a title, in virtue of which he holds an office or benefice, whether he perform the functions thereof or not.

TI'TUS Vespasianus, the Roman emporer, the fon of Vefpafian ; of whom it is related, that not being able to recollect any remarkable good action he had done on a certain day, he exclaimed, "I have loft a day!" He might truly: be called the father of his pcople; and though Rome laboured under various public calamities during his reign, fuch was his cquitable and mild adminiftration, that he conflantly preferved his popularity. He was a great lover of learning, and compofed feveral poems. He reigned but two years; and it is thought Domitian his brother poifoned him, A. D. 81. aged 4r. See (Hillory of) Rome.

Tobacco. Pipes, Manufaçure of. The art of making tobacco-pipes, or, as it is commonly called, pipe-making, though one of the fimpleft fpecies of pottery, is fufficiently curious to merit defcription in a dictionary of arts and friences.

The procefs of pipe-making mav be divided into fix flages; viz. I. Beating or preparing the clay; 2. Rollinz; 3. Moulding; 4.Trimming ; s. Drying; and 6. Burning.
:Preparation of the Clay.--The fine white clay employed by the pipe-makers, is ing from-the quaries in maffes of about a cubic foot each. Before it can be uled in the manufacture of tohacco-pipes, it mult be reduced to the conffitence of a tough pafte. To effect this, after its outer furface has been cleared from dirt or duft, is is broken into imall pieces about as large as -205 \(\frac{1}{2} .79\)
a goofe's egg, and thrown into a lub with fuch a quana goofe's egg, and thrown into a lub with Cuch a quan- Tolicca-
tity of foft water as experience has fhewn to be fuflicient to bring it to the proper confitence. Aficer lying till it has foaked up all the water, which ufually xe, quires from 12 to 24 hours, it is taken from the rub and laid on a thick flrong wooden bunch. Hese it is beaten by a heavy four-fquare iron inflrument, in fuch a manner as to cut it from one efid to the other into very thin flices. It requires confiderable addrefs to perform this operation, and it is furprifing how thin the workmen will fometimes cut the flices, ard how equally they will thus divide the clay. This beating is continued, alternatcly folding up the clay and licing it, till the whole is perfectly fmooth. It is then ready for rolling.

Rolling.- The operation of rolling reduces the clag into pieces of a proper fize and length for making pipes, and almolt to the proper form. The roller fits at a bench with a fmooth board betore him, and holds in his hand another fmooth boad alout 18 inches long, four broad, and about half an inch trick, having one end rounded off on one fide, to as to pruduce a correfponding hollow in the clay: He now takes a piece of the beaten clay, and rolis it out, firlt with his hands, and then with the board, till it acquire the form of \(z\) long flender cylinder, with one cna confiderably largs \(r\) than the reft. This large end is to form the bole, and the cylinder the thank of the future pipe. 'Lue pieces of clay thus formed are laid befide each other on a flat board, and are now ready for noulding.

Moulaing - This is the mutt complex operation, and requires the greateft number of influments. The principal of thefe is the mould, which is compofed of two long pieces of iron, formed \(\mathrm{fo}_{0}\) as to join together, and having their correfponding fides cut into the thape of half a tobacco pipe, each piece being hollowed fo as to form half a llender cylinder, with a larger cavity at the upper end, and at fuch an angle as it is intended the bole of the pipe fhall make with the fhank. Jut above that part of each fide of the mould. which flands beyond what is intended to form the bole, there is a notch for admitting a knife to cut off the fuperfluous clay. To receive the united mould there is a vice, having at one end two upright pofts, between which moves a long lever, and to this lever, near the ports, there is loofely attached a piece of iron ending below in a fmooth conical head, capable of entcring the large opening of the mould, but rather fmaller than that opening, fo as that when forced down into it, a fufficient thiclinefs of clay may be left between the cone and the fideș of the mould, to form the bole of the pipe. One fide of this vice is fixed, and the other moveable, towards the former. The moveable fide has attached to it an iron forew with a very long lever as its handle, fo that by turning the fcrew one way or the other, the moveable fide of the vice may be forced nearer the fixed fide, or fuffered to return to its original pofition.

Befdes thefe principal inftruments, the moulder requires a nender fteel wire, fixed-in a handle at one end, and having its other extremity formed into a very fmall head; a fatucer containing wool well impregnated with oil, and a fmall woollen or cotion brufh.

Then about to mountd his pipes, he lays hold of the ftank of ne of the rolled piecer, and rith great dexte rity, which practice alone can teach, he palles up it bl

\section*{T 0 B}

Tomaceo, oiled wire through its whole length, till he finds it arrived at the conmencement of the larger extremity of the clay. This extremity he then bends to the proper angle, and having oiled the infide of each part of his mould, he lays the piede of clay with the wire in j , into one part of the mould, and covers it with the other. He now puts the mould containing the clay into the vice, and with the left liand turning round the handle of the fcrew, fo as to fix the mould firmly within the vice, he, with the right hand, preffes down the lever with its conical head, and thus forms the cavity of the bole. He now withdraws the mould, cuts off with his knife the fuperfluous clay from the bole, opens the mould, takes out the pipe, and now only withdraws the wire. He then lays the moulded pipe on a flat board, in the fame manner as the rolled pieces before defcribed. The pipes thus moulded require to be trimmed, that is, to have the prominences arifing from the joining of the mould, and other fuperfluous pieces of clay taken off, fo as to render the furface fmooth and round.

Trimming.-The operation of trimming is generally performed by boys and girls, as it requires very little fiill. The trimmer has before him a fmooth block of wood, about the length of the pipe, and of confiderable thicknefs, elevated a little at the remote end. He has allo a thick piece of fmooth iron, one edge of which has acrofs it two or more femicylindrical grooves, capable of receiving half the fhank of a pipe. Taking one of the rough moulded pipes, the trimmer carefully paffes up the hollow of the fhank, a wire fimilar to that employed in moulding, and holding the pipe by the bole, while the fhank lies before him on the wooden block, he pares off with a blunt knife all the excrefcences of clay, both from the fhank and bole, and rubs the former, while lying on the block, with the grooved part of his iron, fo as to render it as fmooth as poffible. He now cuts off the ragged piece at the extremity of the thank, withdraws the wire, and lays the pipe on the drying frame. One great object of the trimmer is, to fee that the pipe is completely perforated, which he difcovers by blowing through it; and if he finds the hole choked up, he muft open it by puhhing the wire as far as poffible. If this does not fucceed, he breaks the pipe as ufelefs.

Drying.-The pipe has now received all the work that can be beftowed on it by the maker, previous to its being burned; but as the expofing of it to heat, while foft and pliable, would make it crack, it is neceffary that it be properly dried. For this purpofe, a frame is prepared, compofed of three or four long pieces of wood, faftened to two end pieces in fuch a manner, as that the middle of the frame fhall be the loweft, to give the fhanks of the pipes that curve which they generally poffers. After being trimmed, the pipes are laid befide each other in this concave frame, with their boles hanging down over the edges of the frame, and their thanks bending within its hollow. In this pofition they are expofed to the air till they are dry and firm. They are then ready for burning or baking.

Burning.-For burning or baking the pipes, there is to be prepared a kiln of a fimple but peculiar conftruction. It is built in the form of a cylinder, clofe at the bottom and on the fides, and open at the top. Below the bottom is a grate for receiving the fuel, and round the fides are conftructed vertical or fpiral flues, opening
at the top, and commuricating below with the grate. The fidcs of the furnace on its interior are pretly thin, and are formed of a cement compoled of clay mixed with frefh cow dung. In the middle of the cavity is placed a pedeftal compofed of the fame materials, for the pipes to lean againft. When the pipes are fufficiently dried, they are arranged round this pedeltal, refting againt it, and againft each other, with their boles next the bottom of the furnace. They are thus placed in fucceffive layers, till the furnace be fufficiently full, when the open fpace at top is filled up with bricks placed over each other, fo as to leave interflices for the free circulation of the air, and of the fmoke and flame which iffue through the flues. In thefc interfices are laid feveral pieces of broken dried pipes, to ferve as pyrometers for afcertaining the flate of the included pipcs during the burning. The fire is now lighted, and kept up, till, on examining the pieces of clay laid in the interftices of the bricks, it is concluded that the pipes within the furnace are fufficiently baked. The fire is then fuffered to go out, and the whole to cool till the next day, when the bricks are taken down, the pipes removed, and packed in barrels for fale.

Afier being burnt, the pipes are fometimes glazed, which is done by rubbing them, while warm, with flannel and a little white wax. In fome places the extremities of the flanks are rendered fmooth by dipping them before burning in the ordinary potters glazing, which prevents that adhefion to the lips fo umpleafant in new unglazed pipes.
TOBAGO, one of the Caribbee iflands, ceded to Great Britain by the treaty of Paris in 1763 , taken by the French in 178 r , and retaken by the Britifh in 1793. It lies in the latitude of 11 degrees 10 minutes north, and 59 degrees 40 minutes longitude weft from London, about 40 leagues fouth-by-weff from Barbadoes, 35 fouth-eaft from St Vincents, 20 fouth-eaft from Grenada, 12 north-ealt from the Spanifh illand of Trinidada, and between 30 and 40 north-eaft from the Spanifh main. According to the lateft accounts, it is fomewhat more than 30 miles in length from north-eaft to fouth-weff, between 8 and 9 in breadth, and from 23 to 25 leagues in circumference. The Englifh vifited this illand very early, Sir Robert Dudley being therc in the reign of Queen Elizabeth. In that of Charles I. William earl of Pembroke procured a grant of this, with two other fmall iflands; but died before he was able to carry into execution his defign of fettling them. In A. D. \(16_{32}\) fome merchants of Zealand fent over a fmall colony thither, and gave it the name of New Walcheren; but before they were able thoroughly to cftablifh themfelves, they were deftroyed by the Indians affifted by the Spaniards. Ten years after, James duke of Courland fent a colony thither, who fettled themfelves upon Great Courland bay, and made a confiderable progrel's in planting. A. D. 1654, Meffieurs Adrian and Cornelius Lampfius, two opulent merchants of Flufhing, fent a confiderable number of people thither, who fettled on the other fide of the ifland, and lived in amity with the Courlanders, until they learned that the king of Sweden had feized the perfon of their duke and difpoffeffeal him of his dominions, when they attacked and forced his fubjeets to fubmit. The dukic being afterwards reftored, he obtained from Charles II. a grant of this illand, dated the sjth of Novemtics

\section*{T O B [ 447 ] T O K}
1664. In the fecond Dutch war the count d'efrecs, by order of his mafter, totally uined it at the clofe of the year 1677 ; and from that time it continued walle till Britain took poffeffion of it after the treaty of Paris. The clinate, notwithtanding its vicinity to the line, is fo tempered by the breezes from the lea, as to be very fupportable even to Europeans; and hath the fame advantages with that of Grenada, in having regular feafons, and allo in being exempt from the hurricaues. There are throughout the ifland many rifing grounds, though, except at the north-eafl extremity, there is no part of it that can be flyled mountainous; and even there the country is far from being rugged or impaflable. The foil, if we may credit either Dutch or French writers, is as fertile and luxuriant as any of the iflands, and very finely diverfified. Ground provifions of all forts have been raifed in great plenty, a vall variety of vegetables, excellent in their kind, fome for food, fome for phyfic. Almoft every fpecies of uleful timber is to be found here, and fome of an enormous fize ; amongft others, the true cinnamon and nutmeg tree, as the Dutch confefs, and of which none conld be better judges; whole greves of laffafras, and of trees that bear the true gum copal, with other odoriferous plants that render the air wholefome and pleafant. It is as well watered as can be wifhed, by rivers that fall into the fea on both fides, many fmaller ftreams, and fine frefh fprings in almoft every part of the illand. The feacoaft is indented by 10 or 12 fair and fpacioss bays, and there are amongtt thefe one or two ports capable of receiving as large fhips as ever vifited thofe leas. There are wild hogs in great plenty, abundance of fowls of different kinds, and a vaft variety of fea and river filh. At the north-ealt extremity lies Little Tobago, which is two miles long, and about half a mile broad, very capable of improvement.

TOBOLSKI, the capital of Siberia, is fituated at the confluence of the rivers Tobol and Irtifl, in N. Lat. \(5^{8^{\circ}} 12^{\prime}\), E. Long. \(68^{\circ} 18^{\prime}\). The city ftands upon the afcent of a high hill, the lower part of which is inhabited by Mahometan 'rartars, who carry on a confiderable traffic upon the river lrtifh, and convey their merchandife quite acrofs Great Tartary, as far as China. The river Irtioh is reckoned as rapid as the Danube; runs from the fouth, and empties itfelf into the Oby: the Tobol waftes the other fide of the lown, and a little below it falls into the Irtift. By means of thefe two rivers, there is a conftant flow of merchandife into the city during the fummer feafon. Toholki is therefore a great mart for the commoditics of Mulcovy, Tartary, and other countries: and here is a great concourfe of merchants. All iorts of provifions are plentiful and cheap. An hundred weight of rice is fold for 16 copecs, equal to about eightpence fterling; a fturgeon weighing 40 pounds, for half that money; an ox for two rix-dollars, and every other article in proportion: the adjacent country abounds with game in great variety. The fupreme court of judicature for all Siberia is held in this city, which is alfo the feat of a metropolitan, fent hither from Mofcow to exercife firitual jurifdiAion over the whole kingdom. Tobollki is well fortified, and defended by a flrong garrifon, under the command of the waiwode, who refides in the place, and takes charge of the fur tribute, which is here depofited in proper magazines. This governor enjoys a very cx-
tenfive rommand, and can occafionally bring into the field 9000 men, befides a ftrong body of Tartars on horfeback, to make head againt the Kalmucks and Coffacks, in their repeated incurlions. A fufficient num. ber of Rultians, called Jcmfloiks, are kept in continual pay by the government, on the banks of the Irtifh, to lupply travellers on the czar's account with men, boats, or carriages, to convey them as far as Surgut on the Oby, a voyage of 200 teagues by water. 'This is the common method of travelling in the fummer; but in winter the journey by land is not half fo long, being performed in fleds over the ice and fnow, with which the country is covered. Thefe fleds are moved by a pair of dogs, which will draw a load of 300 pounds with furprifing expedition. They are hired at eafy rates, and during one half of the year may be feen alying over the fnow in great numbers. The city is fuppofcd to contain 15,000 inhabitants. It is 800 miles eal from Mofcow, and 1000 from Peterlburgh.

TODDA Panna. See Cycas, Botany Index.
TODDY \({ }^{+}\), a name given to the juice of the cocoanut tree. See Arack. - Toddy is alfo a name given to a mixture of fpirits, water, and fugar.

Todir-Bird. See Loxia, Ornithology Index.
TODUS, the TODX; a genus of birds belonging to the order of picre. See Ornithology Index.

TOGA, in Roman antiquity, a wide woollen gown or mantle, which feems to have been of a femicircular form, without fleeves; differing both in richnefs and largenefs, according to the circumftances of the wearer, and ufed only upon occafion of appearing in public.

Every body knows that the toga was the diffinguifhed mask of a Koman : hence, the jus togce, or privilege of a Roman citizen ; i. e. the right of wearing a Roman habit, and of taking, as they explain it, fire and water through the Roman empire.

TOKAY wine, derives its name from a town of Hungary, where it is produced. There are four forts of wine made from the fame grapes, diffinguilhed at Tokay by the names of effence, aujpruch, majslach, and the common wine. The effence is made by picking out the hall-dried and fhrivelled grapes, and putting them into a perforated veffel, where they remain as long as any juice runs off by the mere prefluire of their own weight. This is put into fmall caiks. The autpruch is made by pouring the exprefled juice of the grapes from which the former had been pucked on thole that yielded the clience, and treading them with the feet. The liquor thus obtained flands for a day or two to ferment, and then is poured into linall cafks, which are kept in the air for about a month, and atierwards put into cafks. The fame procefs is again repeated by thic adition of more juice to the grapes which have alteady undergone the two former preflures, and they are now wrung sith the hands; and thus is had the malslach. The fourth kind is made by taking all the grafos lugether at fist, and fubmitting them to the greatel proflure: this is chiefly prepared by the peafants. The effence is thick, and very fueet and lofcious: it is chietly ufed to mis: with the other kinds. The aufpruch is the wine commonly exported, and which is known in foreign countries by the name of Tokny.

The goodnefs of it is determined by the following rales. The colour flould neither be teddifin nor very pale, but a light flver: in trying it, the palate and lip

Tobolikis
Tokay
Wine.
of the tongue fhould be wetted without fwallowing it, and if it manifeft any acrimony to the tongue it is not good; bu: the tafte ought to be foft and mild: when poured out, it chould form glubules in the glafs, and have an oily appearance: when genuine, the ftrongeft is always of the beft quality: when fwallowed, it ihould have an earthy aftringent talle in the mouth, which is called the tafte of the root. All tokay wine has an aromatic tatte, which difinguimes it from every other feecies of wine. It keeps to any age, and improves by time: but is never good till about three years old. It is the beft way to tranfport it in cafks; for when it is on the feas, it ferments three times every feafon, and thus refines itfelf. When in bottles, there mult be an empty face left between the wine and the cork, otherwife it would burft the bottle. A little oil is put upon the furface, and a piece of bladder tied over the cork. The bottles are always laid on their fides in fand. Phil. Tratif. vol. lxiii. part ii. p. 292, \&c.

TOKENS. See Trididsilens Tokens.
TOISE, a French meafure containing fix of their feet, or a fathom.

TOLAND, JoHN, a famous writer, was born near Londonderry in lreland in 1670 , and educated in the Popifh religion; but at 16 years of age embraced the principles of the Proteftants. He fludied three years at the univerfity of Glafgow; was created mafter of arts in the univerfity of Edinburgh; and afterwards completed his ftudies at Leyden, where he refided two years. He then went to Oxford, where, having the advantage of the public library, he colleeted materials upon various fubjects, and compored fome pieces; among which was, A Differtation to prove the received hiftory of the traSical death of Atilius Regulus, the Roman conful, to be a fable. He hegan likewife a work of greater consequence, in which he undertook to thow that there are -no myfteries in the Chriftian religion. He publifhed it in 1696 at London, under the tille of Chrifianity not mysterious. This book gave great offence, and was attacked by feveral writers. He afterward wrote in favour of the Hanoverian fucceflion, and many other pieces. In 1707 he wert into Germany, where he vifited \{everal courts; and in 1710 he was introduced to Prince Eugene, who gave him leveral masks of his generofity. Upon his return to Eugland he was for fome time fupported by the lilesality of the earl of Osford Ii rd-treafurer, and kept a countiy houfe at Epfom ; but foon lofing his lordhip's favour, be publified feveral pamphle:s againft that minitter's meafures. In the lant four years of his life he lived at Pulney, hut ufed to fpend moft part of the winter in Lundon. Mr Toland died at London in 1722. He was a man of uncommon abilities, publifked a number of curious tracts, and was perhaps the mof learned of all the infidel witers; but his private charafter was far from being an amiable one; for he was extremely vain, and wanted thofe focial virtues which are the chief ornaments as well as duties of life. His polthumous works, two volumes octavo, were publifhed in iy 6 , with an account of his life and writines, hy Mr Des Maizeaux.

TOLF.DO, an ancient and trading city of Spain in isourgoan- New Caftile, of which it was formerly the capital. te's Traved Ahout two certuries ago it is faid to have containcd in Srain, more than 200.000 inhabitants; but they are now di:as. ni.
vantageolly feated on the river Tajo, which furrounds it on two fides; and on the land fide, it has an ancient wall built by a Gothic king, and Aanked with 100 towers. It is fented on a mountain, which renders the flrcets uncven, and which are narrow; but thie huufes are fine, and there are a great number of fuperb ftruc. tures, befides 17 public fquares, where the markets are kept. The finelt buildings are the royal caftle and the cathedral church; which laft is the richeft and molt confiderable in Spain. It is feated in the middle of the city, joining to a handfome flreet, with a fine fquare before it. Several of the gates are very large, and of bronze. There is alfo a fuperb feeple, extrcmely high, from whence thele is a very diftant profpeet. "The Sagrariro, or principal chapel, is a real treafury, in which are 15 large cabinets let into the wall, full of prodigious quatuities of gold and filver veffels, and other works. There are two mitres of filver gilt, fet all over with pearls and preciuns fones, with three collars of mafly gold, enriched in like manner. There are two brace: lets and an imperial crown of the Virgin Mary, confift. ing of large diamonds and other jewels. The weight of the gold in the crown is 15 pounds. The vefiel which contains the confecrated wafer is of filver gilt, as high as a man, and fo heavy, that it requires 30 men to carry it; within it is another of pure gold enriched with jewels. Here are \(3^{8}\) religious houfes, mof of which are worthy a traveller's notice, with many other facred wuildings, a great number of churches belonging to 27 parimes, and fome hofpitals. Without the town are the remains of an amphitheatre, and other antiquities.

Toledo is an archbihop's fee, and the feat of the primate of Spain. His revenue is faid to be worth 400,000 ducats, but there are large deductions to be made from it. It pays 15,000 ducats to the monks of the Efcurial, befides foveral other penfions. Toledo has alfo a univerfity. It was formerly celebrated for the exquifite temper of the fword blades made there. It is fituated in E. Long. 3. 15. N. Lat. 39. 50. and is 37 miles fouth from Madrid.

TOLERATION, in matters of religion, is either civil or ecclefaftical. Civil toleration is an impunity and fafety granted by the flate to every fect that does not maintain doctrines inconfiftent with the public peace: and ecclefraftical toleration is the allowance which the church grants to its members to differ in certain opinions, not reputed fundamental.

As the gods of Paganifm were almoft all local and tutelary, and as it was a maxim univerfally received that it was the duty of every man to worlhip, together with his own deities, the tutelary gods of the conntry in which he might chance to refide, there was no room for perfecution in the Heathen wonld, on account of difo ferent fentiments in religion, or of the difterent dites with which the various deities were womipred. Had the primitive Chrifians joined their fellow-citizens in the worthip of Jupiter, Juno, and the reft of the rabble of Roman divinities, they would have been fuff red to wornhip, without moleftation, the Crator of the world and the Fedeemer of mankind; for in that cafe the God of the Chriftians would have been lonked upon as a Being of the fame kind with the gods of the empire; and the great principle of intercomminity would have remained unviolated. But the true God bad exprefsly
pruhibited

\section*{TO O [ 449 T O}

Wration. prohibited both Jewss and: Chrifians, from "worftipping any other god berides Flimelelf; and it was their relufal to, break that precept of their religion which made their Heathen mallers look upon them ns. Atheills, and perfecute them as a people inimical to the thate. Utility, and not truth, was the object for which the Heathen legillatures fupported the national religion. They well knew that the flories told by their poets of their different divinities, of the rewards of. Elyfiom, and of the punithments of Tartarus, were a collection of fenfelefs fables; but they had nothing better to propefe to the vulgar, and they were not fuch ftrangers to the human heart, as to fuppofe that mankind could live together in fncicly without being influenced in their conduct by fune religion.

Widely different from the senius of Paganifm was the fpirit of the Jewith difpenfation. Truth, which is in fact always coincident with general utility, was the great object of the Mnfaic law. The children of Irael were feparated from the reft of the world, to preferve the knowledge and worthip of the true God, at a time when all the other nations on earth, forget ting the Lord that made them, were falling proftrate to ftocks and flones, and workhipping devils and impure f firits. Such was the enntagion of idolatry, and fo tlrong the propenfity of the Ifraelites to the cuffoms and manners of the Ervptians, and other polytheific nations around them, that the purpofe of their leparation could not have heen ferved, had not Jeh wah condefeended to becone not only their tutelarv God, but even their fupreme civil Magitrate (fee Thfology, \(\mathrm{N}^{\circ}{ }^{151}\).) ; fo that under the Mufaic economy, idolatry was the crime of high treafon, and as fuch juftiy punithed by the laws of the flate. Among the Jews, the church ard flate were not indeed different focieties. They were fo thoroughly incorporated, that what was a fin in the one was a crinie is the othe! ; and the forfeiture of ecelefiaftical privileges was the for feiture of the rights of citizens.

In many refnects the Chrillian religion is directly oppofite to the ritual haw of Mofes. It is calculated for all nations, and intended to be propagated among all. Inttead of feparating one neople from another, one of its principal oliects is to diffeminate univerfal bencvolence, and to inculcate upon the whole human race, that mutual love which naturally frrings from the knowledge that all men are brethren. Its ultimate end being to train its volaries for heaven, it concerns itfelf no farther with the aflairs of earth than to enforce by eternal fanctions the laws of morality; and the kingdom of its Founder not being of this world, it leaves every nation at liberty to fabricate its own municipal laws. \(f_{0}\) as beft to ferve its own intereft in the various circumftances in which it may be placed ; and denounces a curfe unon all who pay not to thofe laws the fulleft obedience, when they are not obvinully inconfifitent with the laws of niety and virtue, which are of prior obligation. The Chriftian church therefore muft always remain a diffinct focietv from the flate; and though, till the prefent age of hazardous innovations, it has been deemed expedient in every country, where the truth of the gnfpel is admitted, to give to the religion of Chrift a leoal effahlifhment, and to confer immunities on its minifters, this meafure has been adopted, not to fecure the nurity of the faith, which appeals to the private judgement of each individual, but merely to preferve
the peace of fociety, and to put a reftraint upon thofe Tolieration. actions of which human laws cannot take cognizance. With religion, Chrillian governments have no farther concern than as it tends to promote the practice of virtue. 'Tlie early Chrillians, however, not underfanding the principle upon which penal laws were employed io preferve the purity of the lewifh religiun; and, as our bleffed Loord oblerved to two of his apofles, not knowing what fpirit they were of-hallily concluded that they had a right to enforce the doettines and worthip of the New Tellament, by the fame means which had been ufed to pieferve the Iftietites ficady to the doctrines and worlhip of the Old. Hence, thuagh they had fulfered the cruelleft perfecutions themielves (fee Plessecurio:i), they no fooner got the power of the Itate in their hands, than they perfecuted the Pdgans for their idolatry; and afterwards, when herefies arofe in the church, perfecuted one another for exprefling in different phrafes metaphyfical propofitions, of fuch a nature as no human mind can fully compreher:'. The apoille had forewarned them that there mult be herefies in the church, that they who \(:\) e approved may be made manifeft; but it did not occur to them that perfecution for opinion is the worlt of all herefics, as it violates at once truth and charity.

Hitherto thefe unlaallowed means of bringing Chrinians to uniformity of faith and practice, had been only occafionally employed, from their not accurately diftinguifhing between the fpirit of the gofpel and that of the law; but as foon as the bifhops of Rome had brought the inhahitants of Europe to recognize their infellibility in explaining articles of faith and deciding points of controverly, perfeculion became a regular and permanent inflrument of ecclefiatical difcipline. To dou't or to deny any doffrine to which thefe unerring influuctors had given the fanction of their approbation, was held to be not only a sefifting of the truth, but an act of rebellion againf their facred authority ; and the fecular power, of which, by various arts, they had acquired the abfolute direction, was inilantly employed to avenge both.
" Thus Europe had been accuftomed, during many R-Lerefonts centuries, to fee fpeculative opinions propagated or de Hivhers of fended by force; the charity and mutual forbearance which Chriftianity recommends with fo much warmth, were forgotten, the facred rights of confcience and of private judgement were unheard of, and not only the idea of toleration, but even the word ilfelf, in the fenfe now affived to it, was unknown. A right to extirpate error by force, was univerfally allowed to be the prerogative of tho f e who onfleffed the knowledge of truth; and thruzh the firf reformers did \(n b t\) arrogate to themfelves in direct terms that infallibility which they had refufed to the church of Rome, they were not lefs confident of the truth of their own doetrines, and reģured with eqुual adour the princes of their party to check fuch as prefumed to impugn or to oppofe them. To this requeft 100 many of thefe princes lent a willing ear. It fattered at once their pietv and their pride to be confidered as poffefling all the rights of Jewih princes; and Henry the Vill, of England, after Jabouring to make his divines declare that all authority ecclefiaftical as well as rivil flows from the crown, perfectited alternately the Papifts and Protellants. Many of his fucceffors, whofe characters were much better than his, thought themfelves duly Voz. XX. Part II.

Toleration authorized, in virtue of their acknowledged fupremacy over all ftates and conditions of men, to enforce by means of penal laws a unitormity of faith and worthip among their fubjects: and it was not till the revolution that any feet in England feems to have fully underflood, that all men have an unalienable right to worthip God' in the manner which to them may feem mof fuitable to his nature, and the relation in which they ftand to him ; or that it is impofible to produce unitomnity of opinion by any other means than candid difquifition and found reafoning. That the civil magiftrate has a right to check the propagation of opinions which tend only to fap the foundations of virtue, and to difurb the peace of fociety, cannot, we think, be queflioned ; but that he has no right to reftrain mankind from publicly profeffing any fyllem of faith, which comprehends the being and providence of God, the great laws of morality, and a future ftate of rewards and punifhments, is as evident as that it is the object of religion to fit mankind for heaven, and the whole duty of the magiftrates to maintain peace, liberty, and property, upon earth. We have elfewhere obfersed (fee TEST), that among a number of different fects of Chrifians, it is not the fuperior purity of the fytern of faith profeffed by one of them, that gives it a right to the immunities of an effablifhment in pteference to all its rivals; but though the legiflature is authorized, in certain circumftances, to make a lefs pure fyitem the religion of the ftate, it would be the heiglit of abfurdity to fuppofe that any man, or body of men, can have authority to prevent a purer fyftem from being acknowledged as the religion of individuals. For propagating opinions and purfuing practices which neceffarily create civil difturbance, every man is anfwerable to the laws of his country; but for the foundnefs of his faith, and the purity of his worfhip, he is anfwerable to no tribunal but that which can fearch the heart.

When churches are eftablifhed, and creeds drawn up as ruides to the preaching of the national clergy, it is obvious that every clergyman who teaches any thing directly contrasy to the doctrine of fuch creeds, violates the condition on which he holds his living, and may be jufly deprived of that living, whether his obnoxious opinion be in itfelf truc of falle, important or unimportant; but his punifhment fhould be extended no farther. To expel a Chrilian from private communion for teaching any doctrine which is neither injurious to the flate nor conerary to the few fimple articles which comprile the fum of the Chriftian faith, is the groffell tyramy ; and the governors of that church which is guilty of it, ufurp the prerogative of the bleffed Lord, who commanded the apontles themfilves not to be called mafters in this fenfe; for one (fays he) is your mafter (veay \(\dot{0}\) кalirymins), even Chrift. It is indeed a hardhip to deprive a man of his living for confcientioufly illuftrating what he believes to be a truth of the gofpel, only becaufe his illuftration nay he different from that which had formerly been given by mon fallihle like limfelf; but if the eftablinh. ment of human compilations of faith be neceffary, this liardhip cannot be removed, hut by making fuch compilations as fimple as poffible, and drawing them up in fcripture language. Such a reformation, could it be effefted peaceably, would ferve other good purpofes; for while it would fufficiently guard the purity of the faith, it would withdraw that temptation which too many efta-
bliflments throve in the way of men, to fublcrive to the Tvireatic truth of'what they do not really believe; and it would effectually baniff from the Chrillian church every thing which can be called by the name of porficution. Sec Nonconformists.

TOLL, a tax or cuftom paid for liberty to vend goods in a market or fair, or for keeping roads in proper repair. The firt appointment of a toll on highways of which we read, took place in 1346 . See Road.

TOLOUSE. See Toulouse.
TOLU, a town of South America in Terra Firma, and in the government of Carthagena; famous for the fine bilam of Tolu, brought into Europe from thence, and produced from a tree like a pine. It is feated on a bay of the North fea, 60 miles fouth of Carthagena. W. Long. 72. 55. N. Lat. 9. 40.

TOLUIFERA, the Balsam-of-Tolu tref; a genus of plants belonging to the clafs of decandria. See Botany, p. 182. and Chemistry, \(\mathrm{N}^{0} 2483\).

Tomatoes. See Solanum, Botany Inde.s.
TOMB, includes both the grave or fepulchre wherein a defunct is interred, and the monument erected to preferve his memory. The word is formed from the Greek тveuos, tumulus, "fepulchre;" or, according to Mcnage, from the Latin tumba, which fignifies the fame.

In many nations it has been cuftomary to burn the bodies of the dead, and to collect the allies with pious care into an urn, which was depofited in a tomb or fepulchre. See Burning. Among many nations it has alfo been the practice to lay the dead body in a tomb, without confuming it, after having wrapped it up decently, and fometimes placing it in a coffir. See Coffis.

The tombs of the Jews were generally hollow places hewn out of a rock. Abraham buried Saralh in a cave. Such was the place too in which the kings of Judah and Ifrael were interred: and fuch was the place in which the body of our Saviour was depofited by Jofeph of Arimathea. But it is probable that the common people buried their dead in graves; for our Saviour compares the Pharifees to "graves which appear not, and the men that walk over them are not aware of them." Over the tombs, perhaps only of people of diffinction, a flone or monument was erected, to intimate to paffengers that they were burying places, that they might not pollute themfelves by touching them. With the fame intention, as Lightfoot informs us, they whitened them every year on the \(15^{\text {th }}\) of February.

The Egyptians alfo buried their dead in caves, called catacombs. See Catacomb. The pyramids, as fome think, were alfo cinployed for the fame purpofe. Sometines alfo. after embalming their dead, they placed thenz in niches in fome magnificent apartment in their houfes.

The Greeks and Romans burned their dead, and depofited their ahtes in a tomb. The Greeks interred the athes without the cities, by the fides of their highways. Sometimes indeed, by way of particular honour, they wcre buricd in an elcvated part of the town; and the Lacedemonians were allowed by Lycurgus to bury in the city and round their temples: But this was forbidden aniong the liomans by the law of the twelve tables, In urbe ne feptlito, neve urito; yet Valerius Publicola, Pofthumus T'ubertius, and the family of the Claudii, were buried in the Capitol. To bury by the fides of

\section*{Tr O M [ 451 T \(\quad\) T O N}
omb. public roads was common among the Romans allu; hence their epitaphs frequently began with fifte viator. Highways were made choice of probably for two reafons: 1. That the dead might not be offenfive or injure the liealth of the living, which they certainly would if buried in towns or populous places; and, 2dly, That they might hold out to travellers a leffon of mortality, and teach the ruftic moralift to die.

As it would fwell this article to too great a fize to defcribe all the different kinds of tombs which have been ufed by different nations and ages, we mult content ourfelves with thortly defcribing the tombs of a few nations, and adding a few concomitant circumflances.

The tombs of the Parfees are fingular. The deceafed, after lying a proper time in his own houfe, for the purpofes of mourning, is carried, followed by his relations and friends, the females chanting a requiem, and depofited in a tomb of the following contruction. It is a circular building, open at top, about 55 feet diameter, and 25 feet in height, filled to within 5 feet of the top, excepting a well of 15 feet diameter in the centre. The part fo filled is terraced, with a flight declivity toward the well. Two circular grooves three inches deep are raifed round the well; the firl at the diftance of four, the fecond at ten, feet from the well. Grooves of the like depth or height, and four feet diftant from each other at the outer pait of the outer circle, are carried fraight from the wall to the well, communicating with the circular ones, for the purpofe of carrying off the water, \&c. The tomb, by this means, is divided into three circles of partitions : the outer, about feven feet by four : the middle fix by three : the inner, four by two: the outer for the men, the middle for the women, the inner for the children; in which the bodies are rcfpectively placed, wrapped loofely in a piece of cloth, and left to be devoured by the vultures; which is very foon done, as numbers of thofe animals are always feen lovering and watching about thefe charnel houfes, in expectation of their prey. The friends of the deceafed, or the perfons who have charge of the tomb, come at the proper time, and throw the bones into their receptacle, the well in the centre; for which purpofe, iron rakes and tongs are depofited in the tomb. The entrance is clofed by an iron door, four feet fquare, on the ealtern fide, as high up as the terrace, to which a road is raifed. Upon the wall, above the door, an additional wall is raifed, to prevent people from looking into the tomb, which the Parfees are particularly careful to prevent. A Perfian infcription is on a fone inferted over the door, which we once copied, but have forgotten its tenor. From the bottom of the wall fubterraneous paffages lead to receive the bones, \&cc. and prevent the well from filling.

Of the ancient fepulchres found in Iuffia and Siberia, fome are perfect tumuli, raifed to an enormous height, heoco- while others are almoft level with the ground. Some of vol. vii. them are encompaffed with a fquare wall of large quarry flones placed in an erect polition; others are covered only with a fmall heap of flones, or they are tumuli adorned with fones at top. Some are walled with brick within, and vaul:ed over; others are no more than pits or common graves. In fome the earth is excavated feveral fathons deep; others, and efpecially thofe which are topped by a lofty tumulus, are only dug of a fufficient
depth for covering the carcafe. In many of thefe fepulchres the bones of men, and frequently of horfes, are found, and in a condition that renders it probable the bodies were not burnt before they were inhumed. Other bones thow clearly that they have been previoufly burnt; becaufe a part of them is unconfumod, and becaule they lie in a difordered manner, and forne of theia are wauting. Urns, in which other nations of antiquity have depofited the afles of their dead, are never met with here. But fometimes what remained of their bodies after the combuftion, and even whole carcafes, are found wrapped up in thin plates of gold. Many dead bodies are frequently feen depofited together in one tomb; a certain indication that either a battle had been fought in the neiglibourhoud of the place, or that fome families buried their relations in an hereditay tomb.

The Moors, like all other Mahometans, hold it a thing irreverent, and contrary to the fpirit of religion, to bury their dead in mofques, and to profane the temple of the Moft High by the putrefaction of dead bnedies. In the infancy of the church the Chriftians had the like Cbenier's, piety, and gave example of the refpect in whith they Morocco, held temples dedicated to religious worflip; but illguided devotion, mingled with fuperfitious vanities, and that contagious fpirit of felf-intereft which pervades all human affairs, without refpecting the altar of God, have, together, infenfibly perverted men's ideac. The burial grounds of the Mahometans are moft of them without the city ; the emperors have their fepulchres difinct and diftant from the mofque, in fanctuarics, built by themfelves, or in places which they have indicated: their tombs are exceedingly fimple ; the Moors do not imitate the oflentation of Europeans, where fuperb monuments are raifed rather to gratify the pride of the living than the merit of the dead.

All Mahometans inter the dead at the hour fet apart for prayer. The defunct is not kept in the houfe, except he expires after funfet ; but the body is tranfported to the mofque, whither it is carnied by thofe who are going to prayer. Each, from a fpirit of devotion, is defrous to carry in his turn. The Moors fing at their burial fervice; which ufage perhaps they have imitated after the Chriftians of Spain, for the oriental Mahometans do not fing. They have no particular colour appropriated to mourning; their grief for the lofs of relations is a fenfation of the heart they do not attempt to exprefs by outward fymbols. Women regularly go on the Friday to weep over and pray at the fepulchres of the dead, whofe memory they hold dear.

Among the northern nations it was cuflomary to bury their dead under heaps of Rones called cairns, or under barrows: (See the articles Cairns and Barrow). The inhabitants of Tibet, it is faid, neither bury nor burn their dead, but expofe them on the tops of mountains. See Tibet.

TOMPION; a fort of bung or cork ufed to flop the mouth of a cannon. At fea this is carefully encircled with tallow or putty, to prevent the perietration of the water into the bore, whereby the powder contained in the chamber might be damaged or rendered incapable of fervice.

TON, a meafure nr weight. See Tur.
TONE, or Tune, in Mufic, a property of fnund, whereby it comes under the relation of grave and acrie;

\section*{\(T\) O N \([452] \quad T \quad O \quad N\)}

Tone or the degree of elevation any found has, from the degree of fiviftnets of the vibrations of the parts of the fonotous body.

The variety of tones in human voices arifes partly from the dimenfions of the windpipe, which, like a flute, the lenger and narrower it is, the iliarper the tone it gives; but principally from the head of the larynx or knot of the throat : the tone of the voice being more or lefs grave as the rima or cleft thereot is more or lefs open.

The word tone is taken in four different fenfes among the ancients: 1. For any found; 2. For a certain interva!, as when \(1 t\) is laid the difference between the diapente and diateffaron is a tone; 3. For a certain locus or compafs of the voice, in which fenfe they ufed the Dorian. Porggian, L.ydian tones; 4. For tenfion, as when they fpeak of an acute, grave, or a middle tone.

ToNe is more particularly ufed, in mufic, for a certain degree ol interval of tune, whereby a found may be either raifed or lowered from one extreme of a concord to the other, fo as fitl to produce true melody.

TOAGUE. See Anatomy, \(\mathrm{N}^{\circ} 102\).
TONIC, in Mu/ic, fignifies a certain degree of tenfoon, or the found produced by a vocal fring in a given degree of tenfion, or by any lonorous body when put in vibration.

Tonic, favs Rouffeau, is likewife the name given by Aritosenus to one of the three kinds of chromatic mufic, whofe divifions he explains, and which was the ordinary cluromatic of the Grecks, proceeding by two femitones in fucceffion, and afterwards a third minor.

Tontc Dmminne. See Dombant.
TONNAGE and Pousd.sce, an ancient duty on wine and other goods, the origin of which feems to have been this: About the 21 ft of Edward III. complaint was made that merchants were robbed and murdered on the feas. The kivg thercupon, with the confent of the peers, levied a duty of 2 s . on every ton of wine, and 12d. in the pound on all goods imported; which was treated as illegal by the commons. About 25 years after, the king, when the knights of theres were returned lome, obtained a like grant from the civizens and burgeffes, and the year after it was regularly granted in parliarrent. Thefe duties were diminifhed fometimes, and fometimes increafed; at length they feem to
aet, whereby he renounced all power in the crown of lovying the duty of tonnage and poundage, without the exprels confent of parliament ; and alfo all power of inpolition upon any merchandifes whatever. Upon the reforation this duty was granted to King Charles II. for life, and fo it was to his two immediate lucceffors; but now, by threc feveral fatutes, 9 Ann. c. 6. 1 Geo. I. c. 12. and 3 Geo. I. c. 7 . it is made perpetual, and mortgaged for the debt of the public.

TONQUIN, a kingdom of Alia, in the Ean Indies, beyond the Ganges; bounded on the north by the province of Yunnan in China, on the ealt by the province of Canton and the bay of Tonquin, on the South by Cochin China, and on the welt by the kingdom of Laos. It is about 1200 miles in length and 500 in breadth; and is one of the finelt and mott co.fiderable kingdoms of the Ean, as well on account of the number of inhabitants as the riches it contains and the trade it carries on. 'I he country is thick fet with villages; and the natives in general are of a middle tlature and clean limbed, with a tamy complexion. Their faces are oval and flattilh, and their nofes and lips well proportioned. Their hair is hack, long, lank, and coarfe; and they let it hang down their foouldens. They are general'y desterous, nimble, active, and ingenious in mechanic arts. They weave a mulitude of line filks, a.d make curious lacker-works, which are tranfported to other countries. There is fuch a number of people, that many want employment; for they feldom go to work but when foreign lhips arrive. The mones and goods brought hither by the Englifh and Dutch put them in action; for they have not moncy of their own fufficient to employ themfelves; and therefore one-third at leatt mutt be advanced beforehand by the merchants: and the thips muff thay here till the goods are finiflied, which is generally five or fix month. They are fo addeted to gaming, that when every thing elle is loft, they will flake their wives and children. The garments of the Toonguinefe are made either of filk or cotton; but the poor people and foldiers wear only cotton of a dark tawny colour. 'Their houles are finall and low; and the walls either of mud, or hurdles daubed over with clay. They have only a ground floor, with two or three partitions; and each room has a fquare hole to let in the light. The v.llages coufint of 30 or 40 houfes, furrounded with trees; and in fome places there are banks to keep the water from overflowing their gardens, where they hare oranges, betels, melons, and fa-lad-herbs. In the rainy !cafon they cannot pafs from one houfe to another without wading through the water; they fometimes have boats. In the capital city called Cacho there are about 20,000 houfes with mudwalls, and covered with thatch; a few are built with brick, and roofed with pan-tiles. In each yard is a fmall arched building like an oven, about fix feet high, made of brick, which ferves to fecure their goot's in cafe of fire. The principal ftreets are very wide, and paved with fmall fones. The king of Tonquiri has three palaces in it, fuch as they are; and near them are Rables for his horfes and elephants. The houfe of the Englifh fatory is feated at the noth end of the city, fronting the river, and is the beft in the city. The people in general are courteous, and civil to ftrangers; but the great men are proud, haughty, and ambitious; the foldies infolent, and the poor thievill. They buy all

\section*{}
ongain their wircs, of which the great men have feveral ; but thic poor are finted for want of mothey. In hard times the meti will fell both their wives and children to buy rice to mainain thenflves. The women offer themféves to 'Aranyers's as wive's white they thay, and agree with them for a cestain price. Even the great inen will offer their daughers to the merchants and officers who are likely to llay fix' months in the country. They are not afraid of being with child; for if they are girls they can fell theth well when they are young, becaufe they are fairer thas the other inhabitants. Thefe wo. mell are faid to be very faithful ; and are trulled with mon-y'and goods by the Europeans during their abfence, and will make great aodvantage with them. The firf new moon' in the year that happens atter the middile of January, is a great feftival; when they rejoice for 10 or 12 days together, and fpend their time in all mantire of foots. Their common driak is tea, but they make themelves merry with arrack. The language is fooken very much in the throat; and fome of the words are pronounced througl the teeth, and has a great refemblance to the Chinefe. They have feveral mechanic arts or trades; fuch as fmiths, carpenters, joiners, turners, weavers, taylors, potters, painters, money-changers, paper-makers, workers in lacker, and bell-founders.Their commodities are gold, munk, filks, calicues, drugs of many forts, roods for dyeing, lacquered wares, earthen wares, falt, anifeeds, and worm-feeds. The lacquered ware is not inferior to that of Japan, which is accounted the beft in the world. With all thefe merchandifes, one would expect the people to be very rich, but they are in general very poor; the chicf trade being carried on by the Chinefe, Englifh, and Dutch. The gnods imported, befides filver, are faltpetre, fulphur, Englifh broad-cloth, pepper, fipices, and great gurs.

\section*{TONSILS. See Anatomy, \({ }^{\circ}{ }_{10}{ }^{2}\).}
- TONSURE, in Ecclefiafical Hifory, a particular manner of having or elipping the hair of ecclefiaftics or moonks. The ancient tonfure of the elersy was nothing more than polling the head, and cutting the hair to a moderate degree, for the fake of decency and gravity: and the fame obfervation is true with refpect to the tonfure of the ancient monks. But the Romans have carried the affair of tonfure much father; the candidate for it kneeling before the binlop, who cuts the hair in five different parts of the head, viz. before, behind, on each fide, and on the crown.

TONTINE, a loan given for life annuities with benefit of furvivorthip; fo called from the inventor Laurence Tonti, a Neapolitain. He propofed his fcheme in 1653 to reconcile the people to Cardinal Mazarine's government, by amufing them with the hope of becoming fuddenly rich. He obtained the conlent of the court, but the parliament would net regifter the edict. He made attempts afterwards, but without fuccefs.

It was not till Louis XIV. was difrefied by the league of Aughurg, and by his own immenfe expences, that he had recourfe to the plans of Tonti, which, though long laid afide, were not forgotten. By an ed' \(\varepsilon\) t in 1689 he created a Tontine royale of \(1,100,000\) livers annual rent, divided into 14 clafles. The actions were 300 livres a-piece, and the proprietors were to receive iol.
per cent. with bencfit of furvivorfhip in every clafs. Tontine This fcheme was executed but very imperfeatly; for none of the clalies rofe to above 25,000 livres, intitead of 100,000 , according to the orighal intitution; though the annuities were very regularly paid. A few years afier, the peoplefeening in better humarn for projects of this kind, another tomatine was erected upon neatly the fame terms, but this was never above half fulf. They both fubfited in the year \(1 ; 26\), when the French king united the \(13^{\text {th }}\) claifs of the fillt tontine with the 14.h of the fecond; all tixe actions of which were polfelled by Charlotte Bonnomay, widow of Lewis Barbier, a furgeon of Pais, who died at the age of 96. This gentewoman had ventured 300 livres in each tontine; and in the laft year of lacr life the had for her annuity 73.500 livese, or about 36021 . a-year, for about 301.
'Ihe nature of the tontine is this; there is an annuity, after a certain rate of interelt, granted to a number of people; divided into clatics, accurding to their relpective ages; fo that annually the whole fund of each clafs is divided among the furvivors of that clats; till at laft it falls to one, and upon the extinction of that lify, reverts to the power by which the tontine was crected, and which becomes thereby fecurity for the due payment of the annuities.

TOOL, among mechanics, denotes in gencral any inftrument ufed for making other complex inftruments and maclines, or in other operations of the mechanic arts.

TOOTH, for a defcription of, fee Anatomy, \(\mathrm{N}^{\circ}\) 27.

TOOTHACH. See Medicine, \(N^{\circ} 210\), and Surgley Index.

Toothaci-Tree. See Zanthoxylum, 7 Botany
TOO IHWORT. See Plumbago, \(j\) Index:
TOP, a fort of platform, furrounding the lower mafthead, from which it projects on all fides like a fcaffold.

The principal intention of the top is to extend the topmat throuds, fo as to furm a greater angle with the maft, and thereby give additional fupport to the latter. It is fultained by certain timbers fised acrofs the haunds or fhoulders of the malls, and called the trefle:trees and crof stitces.

Befides the ufe above-mentioned, the top is otherwife extremely convenient to contain the materials neceffity for extending the fmall fails, and for fixing or repaising the rigging and machinery with more facility and expedition. In hips of war it is ufed as a kind of redoubt, and is accordingly fortified for attack or defence; being furnifhed with fivivels, mulketry, and other firc-arms, and guarded by a thick fence of corded hammocks. Finally, it is employed as a place for looking out, either in the day or night.

Top-Mof, the fecond 'divifion of'a main, or that part which fands between the upper and lower pieces. See the article Mast.

TOP-Saits, cettain' large fails extended acrofs the topmant by the topfail-yard above, and by the yard atiached to the lower malt beneath; being fallened to the former by robands, and to the latter by means of two great block fixed on its extremities, through wich the topfail-fleeto are infrted, paffing from thence to two other blocks fixed on the inner part of the yard

\section*{TOR \(\quad[454] \quad \mathrm{T} O \quad \mathrm{R}\)}

Topaz clofe by the mant; and from thefe latter the theets lead downwards to the deck, where they may be flackened or extended at pleafure. Sce the article Sail.

TOPAZ, a geni or precious fone. See Mineralogy Index.
TOPE, a fpecies of Squalus. See Ichtiyology Index.

Tophet. See Hinnom and Moloch.
TOPHUS, in Medicine, denotes a chalky or ftony concretion in any part of the body; as the bladder, kidney, \&c. but efpecially in the joints.

TOPIC, a general head or fubject of difcourfe.
Topics, in Oratory. See Oratory, No 10-13.
Topics, or Topical Medicines, are the fame with external remedies, or thofe applied outwardly to fome difeafed and painful part: fuch are plafters, cataplafms, unguents, \&c.
TOPOGRAPHY, a defcription or draught of fome particular place, or fmall tract of land, as that of a city or town, manor, or tenement, field, garden, houfe, cafte, or the like; fuch as furveyors fet out in their plots, or make draughts of, for the information and fatisfaction of the proprietors.

TOPSHAM, a town in Devonhlire, in England, feated on the river Exmouth, five miles fouth-eaft of Exeter, to which place the river was formerly navigable ; but in time of war was choaked up defignedly, fo that fhips are now obliged to load and unload at Topham. W. Long. 3. 26. N. Lat. 50. 39.

TORBAY, a fine bay of the Englifh channel, on the coaft of Devonhiire, a little to the eaf of Dartmouth, formed by two capes, called Bury Points, and Bob's Noofe.

Torda, or Rasor-bill. See Alca, OrnitholoGy Index:

CORDY LIUM, Hart-wort, a genus of plants belonging to the clafs of pentandria, and in the natural fyltem arranged under the 45 th order, Umbellata. See Botany Index.

TORIES, a political faction in Britain, oppofed to the Whigs.

The name of Tories was given to 2 fort of banditti in Ireland, and was thence transferred to the adherents of Charles I. by his enemies, under the pretence that he favoured the rebels in Ireland. His partifans, to be even with the republicans, gave them the name of Whigs, frem a word which fignifies whey, in derifion of their poor fare. The Tories, or cavaliers, as they were alfo called, had then principally in view the political interelt of the king, the crown, and the church of England; and the round-heads, or Whigs, propofed chiefly the maintaining of the rights and interefts of the prople, and of Proterantifm. This is the mof popular account ; and yet it is certain the names Whig and Tory were but little known till about the middle of the reign wf King Charles 11. M. de Cize relates, that it was in the year 1678 that the whole nation was firft obferved to be divided into Whigs and Tories; and that on occafion of the famous depofition of Titus Oates, who accufed the Catholics of having confpired againft the king and the ftate, the appellation of Whig was given to fuch as believed the plot real; and Tory to thofe who held it fictitious.

Thefe parties may be confidered either with regard
to the flate or to religion. The fate Tories are either violent or moderate : the firft would have the king to be abfolute, and therefore plead for paffive obedience, non-refiftance, and the hereditary right of the hioufe of Stuart. The moderate Tcries would not fuffer the king to lofe any of his prerogative; but then they would not facrifice thofe of the people. The fate Whigs are either Atrong repuplicans or moderate ones. The firft (fays Rapin) are the remains of the party of the long parlia ment, who attempted to change monarchy to a commonvealth: but thefe make fo flender a figure, that they only ferved to frengthen the party of other Whins. The Tories would perfuade the world, that all the Whigs are of this kind; as the Whigs would make us believe that all the Tories are violent. Thie modesate fate Whigs are much in the fame fentiments with the moderate Tories, and defire that the government may be maintained on the ancient foundation: all the difference is, that the firft bear a little more to the parliament and people, and the latter to that of the king. In fhort, the old Whigs were always jealous of the encroachments of the royal prerogative, and watchful over the prefervation of the liberties and properties of the people.

TORMENTILLA, Tormentil, a genus of plants belonging to the clafs of icofondria, and in the natural fyltem ranging under the \(35^{\text {th }}\) order, Senticofe. See Botany Index.

TORNADO, a fudden and vehement guft of wind from all points of the compafs, frequent on the coaft of Guinea.
TORPEDO, the Cramp-fish. See Raja, Ichthyology Index.

TORPOR, a numbnefs, or defect of feeling and motion. Galen fays it is a fort of intermediate diforder beiween palfy and health.
TORREFACTION, in Chemifry, is the roafting or fcorching of a body by the fire, in order to difcharge a part either unneceflary or hurtful in another operation. Sulphur is thus difcharged from an ore before it can be wrought to advantage.

TORRENT, denotes a temporary fream of water falling fuddenly from mountains, whereon there have been great rains, or an extraordinary thaw of fnow.

TORRICELLI, Evangeliste, an illuftrous Italian mathematician and philofopher, born at Faenza ini 608. He was trained in Latin literature by his uncle a monk; and after cultivating mathematical knowledge for fome time without a mafter, he fudied it under Father. Benedict Caftelii, profeflor of mathematics at home. Having read Galileo's dialogues, he compofed a treatife on motion, on his principles, whicla brought him acquainted with Galileo, who took him home as an alfiltant: but Galileo died in three months after. He becane profeffo: of mathematics at Florence, and greatly improved the art of making telefcopes and microfcopes: but he is beft known for finding out a method of afcertaining the weight of the atmofyhere by ģuick filver ; the barometer being called, from him, the Torricellian tube. He publifhed Opera Geomerrica, fto, 1644 ; and died in \(16+7\).

TORRICELLIAN Experminst, a famous experiment made by Torricelli, by which lie demonitrated the preffure of the atmofplaere in oppofition to the ductrines of fuction, \&x. finding that prefure able to lupport only

Turis a certain length of mercury, or any other fluid, in an inverted glal's tube. See Barometer.
'CORSK, or Tusk. See Gadus, Iciitiyolocy Inder.

TORTOISE. See Testudo, Lrpeitorogy Inder.
Torrorse-fbell, the Ahcll, or rather fealcs, of the teftaceous animal called a cortoife; uled in inlayin, and in various other works, as for fnuff-boxes, combs, \& \(\$\) c. Mr Catefly obferves, that the hard frong covering which incloles all forts of tortoifes, is very improperly called a flucll; being of a perfect bony contexture; but covered on the outfide with feales, or rather plates, of a horny fubfance; which are what the workmen call tortoife puell.

There are two general kinds of tortoifes, viz. the fand and fea tortoife, tefludo terreflris and marina. The fea-tortoife, again, is of leveral kinds; but it is the caret, or tefludo intricata of Linneus, alone which furnifhes that beautiful fhell fo much admired in Europe.

The fhell of the carctta, or hawhobill tortoife, is thick; and confilts of two parts, the upper, which covers the back, and the lower the belly: the two are joined together at the fides by ftrong ligaments, which yet allow of a little motion. In the fort-part is an aperture for the head and fore-legs, and behind for the hind-legs and tail. It is the under thell alone tbat is ufed : to feparate it, they make a little fire beneath it, and as foon as ever it is warm, the under flecll becomes eafily feparable with a point of a knife, and is taken off in laminx or leaves.

The whole fpoils of the caret confift in 13 leaves or fcales, eight of them llat, and five a little bent. Of the flat ones, there are four large ones, fometimes a foot long, and feven inches broad. The belt tortoife-flell is thick, clear, \(\operatorname{tran}\) [parent, of the colour of antimony, fprinkled with brown and white. When ufed in marquetry, \&zc. the workmen give it what colour they pleafe by means of coloured leaves, which they put underneath it.

Working and joining of TORTOISE-gbell-Tortoifethell and horn become foft in a moderate heat, as that of boiling water, fo as to be preffed, in a mould, into any form, the thell or horn being previoufly cut into plates of a proper fize. Plumier informs us, in his Art de Tourner, that two plates are likewile united into one by heating and prefling them; the edges being thoroughly cleaned, and made to fit clofe to one another. The tortoife-fhell is coiveniently heated for this purpole by applying a hot iron above and beneath the juncture, with the interpofition of a wet cloth to prevent the thell from being fcorched by the irons: thefe irons thould be pretty thick, that they may not lofe their heat before the union is effected. Both tortoife-fhell and horns may be ftained of a varicty of colours, by means of the colouring drugs commonly ufed in dying, and by certain metallic folutions.
'rORTURE, a violent pain inflicted on perfons to force them to cunfefs the crimes laid to their charge, or as a punifhment for crimes committed.

Torture was never permitted among the Romans except in the examination of ीares : it would therefore appear, that it was a general opinion among them, that a dave had fuch a tendency to falfehood, that the truth could only be extorted from him. To the difgrace of
the profelfors of Chriftianity, torture was long practifed by thofe who called themfelves Catholies, againt thofe whom they termed hereties; that is, thofe who differed in opinion from themfelves. Finding that they could not bring over others to adopt their fentiments by the force of argument, they judged it proper to compel them by the force of punihment. This praktice was very general among orthodox Chriftians, but efpecially among lioman Cathotics. See Inoussirion.

By the law of England, torture was at one period cmployed to compel thofe criminals who food ouftinately mute when brought to trial, and refufed either to plead guilty or not guilty; but it is now abolithed (fee \(\Lambda_{k}\) Rascimeite, and liack). A hiflory of the machines which have been invented to torture men, and an account of the intlances in which they have been employed, rould exhibit a difmal picture of the human characler.

TORUS, in Architecture, a large round moulding ufed in the bafes of columns. See Architecture.
toucan. See Rhamphastos, Ornithology Index.
'IOUCH-xred the bars of gold, filver, and copper, combined together, in all the different proportions and degrees of mixiure; the ufe of which is to difcover the degree of purity of any piece of gold or filver, by comparing the mark it leaves on the touch-ftone with thofe of the bars.

The metals ufually tried by the touch-ftone are gold, filver, and copper, either pure, or mised with one ar:other in different degrees and proportions, by fufion. In order to find out the purity or quantity of bafer metal in thefe various admixtures, when they are to be examined they are compared with thefe needles, which are mixed in a known proportion, and prepared for this ufe. The metals of thete needles, both pure and mixcd, are all made into laminæ or plates, one-twelfth of an inch broad, and of a fourth part of their breadth in thicknefs, and an irch and half long; thefe being thus prepared, you are to engrave on each a mark indicating its purity; or the nature and quantity of the admixture in it. The black rough marbles, the bafaltes, or the fofter kinds of black pebbles, are the moft proper for touch-thones.

The method of ufing the needles and ftune is thus: The piece of metal to be tried ought firft to be wiped well with a clean towel or piece of foft leather, that you may the better fee its true colour; for from this alone an experienced perfon, will in fome degree, judge beforehand what the principal metal is, and how and with what debafed.

Then choofe a convenient, not over large, part of the furface of the metal, and rub it feveral limes very hardly and flrongly againit the touchfone, that in cafe a deceitful coat or cruft thould have been laid upon it, it may be worn off by that friction: this, however, is more readily done by a grindifone or fmall file. Then wipe a flat and very clear part of the touchfone, and rub againft it, over and over, the juft mentioned part of the furface of the piece of metal, till you have, on the flat furface of the llone, a thin metallic crult, an inch long, and about an ejghth of an inch broad: this done, look out the needle that feems moft like to the metal mader trial, wipe the lower part of this seedle-

Torture !! TouchNectil.

\section*{\(T \circ\) U \([456] \quad T \quad 0 \quad U\)}

Tonch-
very clean, and then rub it againf the touchfone, as you did the metal, by the fide of the other line, and in a direction parallel to it.

When this is done, if you find no difference between the colours of the two maiks made by your needle and the metal under trial, you may with great probability pronounce that metal and your needle to be of the fame alloy, which is immediately known by the mak engraved on your needle. But if you find a difference between the colour of the mark given by the metal, and that by the needle yout have tried, choole out another needle, either of a darker or lighter colous than the former, as the difference of the tinge on the touchitone directs; and by one or more triais of this kind you will be able to determine which of your needles the metal anfivers, and thence what alloy it is of, by the mark of the needle; or elfe you will find that the alloy is extraordinary, and not to be determined by the comparifon of your needles.

Tocchsrone, a black, fmooth, glafly fone, ufed to examine the purity of metals. The ancients called it lapis Lydius, the Lydian fone, from the name of the country whence it was originally brought.

Any piece of pebble or black Aint will anfwer the purpofes of the beft lapis lyd us of Afia. Even a piece of glafs made rough with emeny is ufed with fuccefs, to diftinguifh true gold from fuch as is counterfeit; both by the metallic colour and the teft of aquafortis. The true toucliftone is of a black colour, and is not uncommon in many parts of the world.

TOUCHWOOD. See Boletus, Botany Index.
TOULON, a celebrated city and feaport of France, in that part of the late province of Provence which is now denominated the department of the Var. It is a very ancient place, having been founded, according to the common opin:on, by a Roman general. It is the chief town of the department, and before the great revolution in 1789 was an epifcopal fee. The inhabitants are computed at 8-,000. It is divided into the Old Quarter and the New Quarter. The firt, which is very ill built, has nothing remaskable in it but the Rue aux Arbres, the Tree-Street, which is a kind of courle or mall, and the town-houfe; the gate of this is furrounded ty a balcony, which is fupported by two termini, the malterpieces of the famous Pujet. The New Qinricr, which forms as it were a recond city, contains, befide the magnificent wotke conflucted in the reign of Louis XIV. many fine houfes (ameng which that of the late feminary merits besond comparifon the preference) and a grand oblong fquare, lined with trees, and ferving as a narade.

The Merchants Haven, aione which extends a noble quay, on which fands the trom-houfe is protedred by two moles, begun by Honiv IV. The New Haten was ennftructed by Le ui. XIV. as were the fortifications of the city. In the front of this haven is an arfenal, containing all the nlaces neceffiry for the conffruction and futing out of veffels: the firt object that appears is a rone- "alk, entirely arcted, extending as far as the eve can reach, and hult after the defigns of Vauban: here cablec are made, and ahove is a place for the prepamtion of temn. Here lkewife is the armoury for m"fkers. niftols, hallueds \&cc. In the path of artille y are raurene placed in nilcs, bombs, grenades, mortars, and balls of various kinds, ranged in wonder-
ful order. The lorg fail-room, the foundery for cannon, the dockyards, the bafoins, \&ic. are all worthy of oblervation.

Both the Old and New Port have an outlet into the fpacions outer road ir harbour, which is lurrounded by bills, and formed by nature almoft circular. Its circuit is of very great exient, and the entrance is deferded on both fides by a fort with ftrong batteries. In1 a word, the bafons, docks, and arfetal, at loulon, uarranted the remark of a foreigner that vifited them in the late reign, that " the king of France was greater there than at Verfailies." Toulon is the only mart in the Mcditerranean for the re-cxportation of the products of the Eaft Indies.

This place was deftroyed toward the end of the tonth century, and pillaged by the African pirates almoll as foon as rebuilt. The conftable of Bourbon, at the bead of the Imperial troops, obtained poffeffion of it in 1524 , as did Charles Vr. in 15.36 ; but in the next cenury Charles Emanuel duke of Savoy couid not enter it, and Prince Eugene in 1707 ineffectually laid fiege to it. This city was furrendered hy the inhabitants in Septem-
ber 1703 to the Brith admiral Lord Hood, as a conThis city was furrendered by the inhabitants in Septem-
ber 1793 to the Britifh admiral Lord Hood, as a condition and means of enabling them to effect the ic-ella. blifment of monarchy in Fiance, according to the conftution of 1789 . Lord Hood accordingly, in conjuncfitution of 1 y 89 . Lord Hood accordingly, in conjunc-
tion with the Spanifh land and naval forces, took poffeffion of the harbour and forts in trult for Louis XVII. It was garrifoned for fome time by the Britift troops,
and their allies the Spariard, Neapoltans, and SardiIt was garrifoned for fome time by the Britift troops,
and their allies tise Spariards, Neapolttans, and Sardinians; but the French having laid fiege to it, the garrifon was obliged to evacuate the place in the month of December following, after having defiroyed the grand December following, after having defiroyed the grand
arfenal, two thips of 84 guns, eight of 74 , and two frigates; and carried of the Commerce de Marfeilles, a thip of 120 guns, with an 80 and 74 fun hip. This thip of 120 guns, with an 80 and 74 gun hip. This
exploit was molt gallantly performed, after it was found impolfible to defend the town, or to carry off the fhips. Lord Hood entrufled the management of the afiai to
Sir Sydney Smith, fo dinlinevifled for his intrepidity. Lord Hood entrufled the management of the afiai to
Sir Sydney Smith, fo dininguifled lor his intrepidity. Captain Hare commanded the frefhip which was towed into the grand arfenal ; and fo eager was he to exccute his orders, that inftead of fetting fise to the train in the ufual cautious manner, he fired a piftol loaded with puxal cautious manner, he fired a pitol loaded uth
powe bowl of the train, compofed of 36 pounds of powder, and other combullibles. The confequence was, he was blown into the uater with fuch violence, as to knock a lieutenant of the Viblory's boat overboard, and narrowly eicaped with his life. A Spanith captain was appointed to fet fire to the fratll arfenith captain was appoimted to fet fire to the frall arfe-
nal, but cowardice prevented him from exccuting his orders; and this is the reaton why the whole French thips were not deflroved. We have bcen favoured with this :iccount by an efficer of the Britifh fleet.

Toulon is feated on a bay of the Mediterranean, \({ }^{17}\) lengues fouth-eaf of Aix, \(1 ;\) fouth-ealt of Narfeilles, and 217 fouth-caft of Paris. E. Long. 5. 56. N. Lat. 43.7. 1OULOUSE, a verv ancient city of France, in the department of Upper Garonne, and late province of Lonquedoc, with an archbifhop's fce. It is the mot confiderable city in France next to Paris and Lyons, although its ropulation hears no proportion to its cxtent. According to Mr Neckar's calculation, it contains 50,000 inhabitants. The ftreets are very handtains 50,000 inhabitants. The ftreets are very hand-
\(\qquad\)
 thips were not deflroved. We have been favoutd with ? .

\section*{TOU [457] TOU}
aloufe, fome, and the walls of the city, as well as the houfes, are built with bricks. The town-houfe, a modern ftructure, forms a perfect fquare, 324 feet long and 66 high. The principal front occupies an entire fide of the grand fquarc, lately called the Place Royale. In the great hall, called the Hall of Illuffious Men, is the Itatue of the Chevalier Iaure, and the bulls of all the great men to whom Touloufe has giveu birth. Communicating with the ocean on one fide by the river Garonne, and with the Meditcrranean on the other by the canal of Languedoc, Touloufe might have been a great commercial city; but the talte of the inhabitants has been directed to the fciences and belles-lettres. Of courle, there are two colleges, two public libraries, and three academies. The little commerce of Touloufe confifts in leather, drapery, blankets, mignionets, vil, iron, mercery, hardware, and books. The bridge over the Garonne is at leaft equal to thofe of Tours and Orleans; it forms the communication between the fuburb of St Cyprian and the city. 'The quays extend along the banks of the Garonne; and it has been in contemplation to line them with new and uniform houfes. 'Touloufe is 37 miles eaft of Auch, 125 fouth-eait of Bourdeaux, and 350 fouth-by-well of Paris. E. Long. 1. 27. N. L.at. \(43 \cdot 36\).

TOUR, Henry de la, Vifcount Turenne, a celebrated French general, was the fecond fon of Hemry de la Tour duke of Bouilton, and was born at Sedan in 1611. He made his fritt campaigns in Holiand, under Maurice and Frederic Henry princes of Orange; who were his uncles hy the mother's fide; and even then diflinguifhed himeelf by his bravery. In 1634 he marched with his regiment into Lorraine ; and having contributed to the taking of La Mothe, was, though very young, made marefchal de camp. In 1636 he took Saverne, and the year following the caftles of Hirfon and Sole; on which occafion he performed an action like that of Scipio's, with refpect to a very beautiful woman whom he fent back to her hufband. The vifcount Turenne continued to dilinguilh himfelf in feveral fieges and battles, and in \(16_{+4}\) was made marlhal of France; but had the misfortune to be defeated at the battle of Mariendal in 1645 . However, he gained the battle of Nartlingen three months after; reftored the elector of Treves to his dominions; and the following year made the famous junction of the French army with that of Sireden commanded by General Wrangel, which obliged the duke of Bavaria 10 demand a peace. Afterwards that duke breaking the treaty he had concluded with France, he was defeated by the vifoount Turenne at the battle of Zumarflaufen, and in 1648 driven entirely out of his dominions. Daring the civil wars in France he fided with the princes, and was defeated at the battle of Rhetel in 1650 ; but foon after was reftored to the favour of the king, who in 1652 gave him the command of his army. He acquired great honour at the battles of Jergeau, Gren, and the fuburbs of St Anthony, and by the retreat he made before the army commanded by the princes at Vitle Neuve St George. In 1654 he made the Spmiards raife the fiege of Arras: the next year he took Conde, St Guilian, and feveral other places; gained the famous battle of Dunes; and made himelf mafter of Duakirk, Oidenarde, and almoft all Flanders: this obliged the Spaniards to concludc, the peace of the Pyrences in 1660. Thefe im-

VoL, XX. Part II.
portant fervices occafioned his being made marnial-general of the king's camps and armies. The war being renewed with Spain in 1667 , Turenne commanded in Flanders; and took fo many places, that in 1668 the Spaniards were obliged to fue for peace. He commanded the French army in the war againit the Dutch in 1672 ; took 40 towns in 22 days; purlued the elcetor of Brandenburg even to Berlin; gained the battles of Slintheim, Ladenburg, Enfleeim, Mulhaufen, and 'lurkeim; and ooliged the Imperial army, which confilted of 70,000 men, to repals the Kinine. By this campaign the vifoount 'lurenne acquired immortal honour. He paffed the Rhine to give battle to General Montecuculi, whom he followed as far as Safpach ; but mounting upon an eminence to difcover the cnemy's camp, he was killed by a cannon-ball in 1675 . All France regretted the lois of this great man, who by his military exploits had raifed the admiration of Europe.

TOURAINE, a province of France, hounded on the north by Maine, on the cafl by Orleanois, on the louth by Berris, and on the weft by \(\mathrm{Anj}_{\mathrm{nj}} \mu\) and Poisou. It is about 58 miles in length, and 55 in breadth where it is broadeft. This country is watered by 17 rivers, befides many brooks, which not only render it delightful, but keep up a communication with the ncighbouring provinces. The air is temperate, and the foil is fo fruifful that it is called the garden of France. It now forms the department of Indre and Loire, of which Tours is the capital.
TOURMALINE, a fpecies of mineral belonging to the filicenus genus. See Mineralogy Index

TOURNAMEN \(\Gamma\), a martial fport or exercife which the ancient cavaliers ufed to perform, to thow their bravery and addiefs. It is derived from the French word tourner, i. e. " to turn round," becaufe to be expert in thefe exercifes, much agility both of horfe and man was requifite, they riding round a ring in imitation of the ancient Cicci.
The firit tournaments were only courfes on horleback, wherein the cavaliers tilted at each other with canes in manner of lances; and were dilinguilhed from jufts, which wcre courles or carcers, accompanied with attacks and combats, with blunted lances and fwords. See Just.
The prince who publified the tournament, ufed to fend a king at arms, with a fafe-condec, and a fword, to all the princes, knights, \&c. figuifying that he intended a tournament and clathing of fwords, in the prerence of ladies and damfels; which was the ufual formula of invitation.
They firt engaged man againft man, arid then troop aggainft troop; and after the combat, the judges allotted the prize to the beft cavalier, and the beff Ariker of fwords; who was accordingly conducted in pomp to the lady of the tournament; where, afier thanking her very reverently, he faluted her and likewife her two attendants.

Thefe tournaments made the principal diverfion of the \(13^{\text {th }}\) and \(14^{\text {th }}\) centuries. Munfter fays, it was Henry the Fowler, duke of Saxony, and afterwards emperor, who died in 936 , that firf introcuced them; but it appears from the chronicle of 'Tours, that the true inventur of this famous fport, at leaft in Frarice, was one. Geoffy, Iord of Preuilli, about the year 1066.

Intances of them occur among the Englina in the 3 M
reign

Tournament II Tournefort.
reign of King Stephen, about the year 1140 ; but they were not much in ule till Richard's time, towards the year II 49. After which period thefe diverfions were performed with extraordinary magnificence in the Tiltyard near St James's, Smithfield, and other places.

The following is the account of a toumament, from Maitland. King Richard II. defigning to hold a tcurnament at London on the Sunday after Michaelmas, fent divers teralds to make proclamations of it in all the principal courts of Europe; and accordingly not a few princes, and great numbers of the prime nobility, reforted hither from France, Germany, the Netherlands, \&c. This iolemnity began on Sunday af ernoon, from the Tower of London, with a pompous cavaicade of 60 Iadies, each leading an armed knight by a filver chain, being attended by their "quires of honout, and, paning through Cheapfide, rode to Smithfield, where the juits and tournaments continued leveral days with magnificent variety of entertainments; on which occation the king kept open houle at the bithop of London's palace for all peifons of diftinction, and every night concluded with a ball.

At laft, however, they were found to be productive of bad effects, and the occafions of feveral fatal mislor-tunes-as in the inltance of Henry II. of France, and of the tilt exhibited at Chalons, which, from the numbers killed on both fides, was called the litule war of Clalons. Thefe and other inconveniencies, relulting from thofe dangerous paftimes, gave the popes occafion to forbid them, and the princes of Europe gradually concurred in difcouraging and fupprefling them.

TOURNAY, a town of the Aultrian Netherlands in Flanders, and capital of a ditrict called Tournaysis, twitla a bilhop's fee. It is divided into two parts by the river Scheldt ; and is large, populous, well built, and carries on a great trane in woollen ftuffs and flockings. The cathedral is a very handfome ftructure, and contains a great many chapels, with rich ornaments, and feveral magnificent tom \({ }^{k}\) s of marble and brafs. The town was taken by the allies in 1709; but was ceded to the houfe of Auftia by the treaty of Utrecht, though the Dutch had a right to put in a garrifon. It was taken by the French in June 1745, who demolifhed the fortifications. In 1781 the emperor Jofeph II. obliged the Dutch to withdraw their garrifon. It was taken by the French in 1791, abandoned by them in 1793 , and again conquered by them in \(1794^{\circ}\). It is 14 miles fouth-eaft of Lifle, 30 fouth-weft of Ghent, and 135 north by eatt from Paris. E. Long. 3. 28. N. Lat. 50. 33.

TOURNEFORT, Joseph Pitton de, a famous French botanit, was born at Aix in Provence in 1656. He had a paftion for plants from his childhood, which overcame his father's views in putting him to fudy philofophy and divinity; therefore on his death he quilted theology, and gave kimfelf up entirely to phyfic, natural hiftory, an \(!\) botany. He wandered over the mountains of Daushinv, Savoy, Catalonia, the Pytenees, and the Alps, in fearch of new fpecies of plants, which he acquired with much fatigue and darger. Hlis fame in 1683 procured him the employment of botanic proteflor, in the king's garden; and by the king's order, he travelled into Spaiu, Portugal, Holland, and Fngland, where he made prodigious collections of plants. In 1700 , Mr Tournefort, in obedience to another coder,
fimpled over all the ifles of the Archipelago, upon the Tourneif coalls of the Black fea, in Bithynia, Puntus, Cappadoria, Armenia, and Georgia; making obletvations on natural hiltory at large, aucient and modern geography, religion, manners, and commerce. He fpent three years in this learued voyage; and then refuming his protelinon, was made profefior of phyfic in the collegeroyal. He died in confequence of an accidental crufh of his breaft ty a cart-wheel, which brought on a 1 pit. ting of blood and hydrothorax, that carred him off in 1708. He wrote Elements of Botany, buth in Frencli and Latin; A Relation of his Veyage into the Levant; with outher pieces of lefs conlideration.
'IOURNIQUE'T', in Surgery, an inftrument formed whth forews, for compteling any part with rollers, \&c. for the Itupping of hremorrhagies. See Surgery Index.

I OWER, a tall building confifing of feveral fories, ulualiy of a round form, though come are fquare or pulygonal. Towers are buili for fortreftes, \&ic. as the Tuner of London. See Loxdon, No 46.

TOWN, a place inhabited i.y a confiderable num. ber of people, being of a middle fize between a city and a village.

TOXICODENDRON. See Rhus, Botany Ifdex.

\section*{IRAAS. See Terras.}

TRACHEA. Sce ANatomy, No ing.
TRACHINUS, the Wefver, a genus of fifhes belonging to the order of jugulares. See Ichthyology Index.

TRAC' , in Geography, an extent of ground, or a portion of the earth's lurface.

Tract, in matters of literature, denotes a fmall trea. tife or written difcourfe upon any fubject.

TRADE, in general, denotes the fame with commerce, confifting in buying, felling, and exchanging of commodities, bills, money, \&c. See Commerce, Coin, Money, Company, \&c.

TRADE-Winds, denote certain regular winds at fea, biowing either confantly the fame way, or altennately this way and that; thus called from their ufe in navigation, and the Indian commerce. See Meteorology.

TRADESMEN's TOKENS, a term fynonymous among medalifls with provincial coins.

This is a fubject curicus enough to deferve attention, though we will not go fo far as Mr Pinkerton does, who fays that it is a lubject in which the perpetual glory of the nation is interefled. Since the year 1789 provincial halfpence have been made and circulated in confiderable quantity. As ancient medals and coins have been frequently of ufe to hiltorians, it is to be regretted that many of thefe provincial halfpence are rendered ulelefs in this refpect by unmeaning figures and puenile devices. Utility and elegance ought to be fudied: for this view it has been propofed by a gentleman of tefte on this fubjeet, that all coins thould be diftinsuifhed by one of the following five charactertlics. i. Fir finiles of magnificent beautiful buildings. 2. Reprefen ations of great and ufeful undertakings. 3. Emblems ot the indultry and commerce of the age. . 4. The illufrious men, \& \& . to whom the nation has given birth. 5. Important hillorical events.
'TRADI'l'ION, fomething handed down from one generation to another without being nritten. Thas the

Jews

\section*{\(T \mathrm{R} A \quad[459\) ] \\ TR A}
dition Jews pretended, that befides their written \({ }_{10 w}\) contained in the Old Teftament, Mofes had delivered an oral law which had been conveyed down from father to fon; and thus the floman Catholics are faid to value particular doctrines fuppofed to have defcended from the apofolic times by tradition.
tragacanth. See Astragalus, Materia Medica Inder.

TRAGEDY, a dramatic poem, reprefenting fome fignal action performed by illuftious perfons, and which has frequently a fatal iflue or end. See Poetry, Part II. fect. 1 .
TRAGI-comedy, a dramatic piece, partaking both of the nature of tragedy and comedy; in which a mixture of merry and ferious events is admitted.

TRAGOPOGON, Goat's-beard; a genus of plants belonging to the clafs of lyngenefia; and in the nateral fyftem ranging under the 49th order, Compoffec. See Botany Index.
Trajan, Marcus Ulpius, a celcbrated Roman emperor, who gained many vi\&ories over the Parthians and Germans, pulling the empire to its utmoft extent on the ealt and notth fides. He died at Silinumte, a city of Cilicia, which from him was called Trajanopolir, in the year 117 .
TRAIAN's Column, a famous hifnrical column erested in Rome, in honour of the emperor Trajan. It is of the Tufcan order, though fomewhat irregular: its height is eight diarreters, and its pedeltal Corinthian: it was huilt in a large fquare called Forun Romanum. Its hafe conlifts of iz ftones of an enormous fize, and is raifed on a fncle, or font, of eight Reps: withinfide is a ftaircafe illuminated with 44 windows. It is 140 feet high, which is 35 feet fhort of the Antonine column, but the irorkmanfluip of the former is much more valued. It is adorned from top to bottom with baffo relievos, reprefenting the great actions of the emperor againf the Dacians.

TRAIN, a line of gunpowder laid to give fire to a quintity thereof, in order to do execution by blowing wpearth, works, huildings, \&c.

Train of Artillery, includes the great guns and other pieces of ordnance belonging to an army in the field.

TRAIN-Oil, the oil procured from the blubber of a whente by boiling.
TRALlian, Alexander, a Greek writer on phyfic, a native of 'Tralles in Lydia, who lived about the middle of the fixth century. His wonks are divided into 12 books; in which he treas of diftempers as they occur, from head to foo". He was the firl who opened the jugular vein, and that ufed cantharides as a blifter for the gout. D: Freind, in his Hiftory of Pingfic, fyles him one of the mof valuable authors fince the time of Hippocrates. Though he appears on the whole to have been a rational pluyfician, yet there are things in his writings that favour of enthufiafm and fuperfiiion.

TRA-LOS-MONTES, a province of Portugal, called in Latin Tranfinmtana, becaufe fituated on the eaft fide of a chain of hills that feparate it from Entre Du-ero-e-Minho. It is bounded on the north he Galicia; on the fouth bv the provinces of Beira and Leon; hy the laft of which it is hounded alfo to the eat. Its length from north to fouth is upwards of 22 miles, and
its breadth about 82. It is full of mountains, and pro. Tranfacduces little corn, but plenty of wine, fruits of feveral tions forts, and abundance of game.

Transfufion.
IR \(\triangle N S A C T I O N S\), a name gencrally given to a \(\underbrace{\text { Transufion. }}\) collection of the papers read befure literary or philofo. phical focieties. The name of Plil. fiphical Tranfactions was firf adopted by the Royal suciety of Lemn. don.
The Philofophical 'ranfactions to the end of the year 1700 were abridged in thace volumes by Mr John Luwthorp: thofe from the year 1720 in 1720 were abridged in two volumes hy Mr Henry Jones: thole from 1719 to 1733 were abridged in two volumes by Mr John Eames and Mr John Martyn ; Mr Martyn continued the abridgement of thofe from 1732 to 1744 in two volunes, and of thafe from 1743 to 5750 in two volumes.

They were for many years publified in numbers, and the printing of them was always, from time to time, the fingle act of the refpedive fecretaries, tiil the year 1752 , when the faciety thought fit that a committee thuuld be appointed to reconfider the papers read before them, and to fulcet out of them fuch as they nould judge mont proper for publication in the future Tranfations. They ate publifhed annuatly in two parts at the expence of the fociety, and each fellow is entitled to receive one copy grofis of every vulume publifhed after his admiffion into the fociety.
They were firlt fet on foot in 1665 , by Mr Oldenburg, fecretary of the fociety, and were coninued by hin till the year 1677 . Upon his death, they were difcontinued till January 1678 , when Dr Grew refumed the publication of them, and continued it for the months of December 1678, and January and February 1679, after which they were intermitted till January 1683. Daring this laft interval they were fupplied in fome meafure by Dr Hooke's Philofophical Collectiors. They were allo interrupted for three yearc, from December 1687 to January 1691 , befide other fmaller interruptions amounting to near one year and a half more, before OAtober 1695 , fince which time the Tranfactions have been regularly carried on.
TRANSCENDENITAL, or Transcendent, fomething elevated, or raifed above other things; whiclt paffes and tranfcends the nature of other inferior things.

TRANSCRIPT, a copy of any original writing, particularly that of an act or inftrument inferted in the body of another.
TRANSFER, in commerce, an act wherely a perfon furrenders his right, interef, or property, in any thing moveatle or immoveatle to annther.

TRANSFORMATION, in general, denotes a ciange of form, or the affuming a new form different fromi a former one.

TRANSFUSION, the act of pouring a liquor out of one veffel into another.
Transfusion of Blond, an operation by which it was fome time ago imagined that the age of animals would be renewed, and immortality, or the next thing to it, conferred on tho 'e who had undergone it.

The method of transfufing De Lower gives us to the following effect : take up the carotid artery of the dog, or other animal, whofe blood is to he transfufed into another of the fame, or a different kind: feparate it from the nerve of the eightl pair, and lay it bare above 3 M 2

\section*{T R A}

Transffition. an inch. Make a flrong ligature on the upper part of the artery; and an inch nearer the heart another ligature with a running knot, to be loofened and faftened as occafion isquires. Draw two threads between the two ligatures, open the artery, put in a quill, and tie up the artery again upon the quill by the two threads, and ftop the quill by a ftick.

Then make bare the jugular vein of the other animal for about an inch and a half in length, and at each end make a ligature with a running knot; and in the fpace between the two knots draw under the veins two threads, as in the other. Open the vein, and put into it two quills, one into the defcending part of the vein, to receive the blood from the other dog, and carry it to the keart; the other quill put into the other part of the jugular, towards the head, through which the lecond animal's own blood is to run into difhes. The 'quills thus tied faft, fop them up with flicks till there be occalion to open them.

Things thus difpofed, faften the dogs on their fides towards one another, in fuch manner as that the quills may go into each other; then unflop the quill that goes down into the fecond dog's jugular vein, as alfo that coming out of the other dog's artery; and by the help of two or three other quills put into each other, as there fhall be occafion, infert them into one another. Then flip the running knots, and immediately the blood runs through the quills as through an artery, very impetuoufly. As the blood runs into the dog, unfop the quill in the upper part of his jugular, for his own blood to run out at, though not conflantly, but as you perceive him able to bear it, till the other dog begins to cry and faint, and at laft die. Lafly, Take both quills out of the jugular, tie the running knot fall, and cut the vein afunder, and few up the Riin: the dog, thus difinified, will run away as if nothing ailed him.

In the Philofophical Tranfactions we have accounts of the fuccefs of various transfufions practifed at London, §aris, in Italy, \&c. Sir Edmund King trausfufed fortyrine ounces of bload out of a calf into a fleep; the fheep, after the operation, appearing as well and as itrong as before.
M. Denis transfufed the blood of three calves into three dogs, which all continued brifs, and ate as well as before. The fame perfon transfufed the blood of Sour wethers into a horfe twenty-fix years old, which thence received much firength, and a more than ordi1:ary appetite.
- Soon after this operation was introduced at Paris, viz. in 1667 and 1668 , M. Denis performed it on five human fubjects, two of whom recovered of diforders under whicla they laboured, one being in perfect health fuffered no inconvenience fromit ; and two perfons who were ill, and fulmitted to the operation, died; in confequence of which the magiftrates iffued a fentence, prohibiting the transfufion o:i human bodies under pain of imprifonment.

Mr John Hunter, we are sold, made many ingenious experiments to determine the effects of transfufing blood, fome of which are fufficient to attrach attention. But whether fuch experiments can ever be made with fafety on the human body, is a point not eafily determined. They might be allowed in defperate cafes proceeding from a corruption of the thoort, from foifon \(\&\) \&ic. as in hydzophabiz.

TRANSIT, from tranft, "it paffes over," fignifics the paffage of any planet over the fun, moon, or llars.

TRANSITION, the paffage of any thing from one place to another.

Transition, in Oratory. See Oratory, \({ }^{\circ} 39\).
TR ANSITIVE, in Grammar, an epithet applied to fuch verbs as fignify an action which palfes from the fub. ject that does it, to or upon another fubject which receives it. Under the head of verbs tranfitive come what we ufually call verbs active and pafive; other verbs, whofe action does not pafs out of themfilves, are called neuters.

IRANSLATION, the act of transferring or removing a thing from one place to another; as we fay, the tranflation of a bifhop's fee, a council, a feat of juftice, \&c.

Translation is alfo ufed for the verfion of a book or writung out of one language into another.

The principles of tranilation have been clearly and accurately laid down by DI Campbell of Aberdeen in his invaluable Preliminary Differtations to his excellent tranflations of the gofpels. The fundamental rules which he eftablikes are three: 1. That the tranflation thould give a complete tranfcript of the ideas of the original. 2. That the fyle and manner of the origina! Chould be preferved in the tranflation. 3. That the tranflation frould have all the eafe of original compefition. The rules deducible from thefe general laws are explained and illuffrated with much judgement and tafte, in'an Eflay on the Principles of Tranllation, by Mr Tytler, judge-advocate of Scotland.

TRANSMARINE, fomething that comes from or belongs to the parts beyond fea.

TRANSMIGRATION, the removal or tranflation of a whole people into another country, by the power of a conqueror.

Transmigration is particularly ufed for the paffage of the foul out of one body into another. See Metempsychosis.

TRANSMUTATION, the af of changing one fubflance into another.

Nature, fay, Sir lfaac Newton, is delighted with tranfinutation: water, which is a fluid, volatile, taftelefs, falt, is, by heat, tranfmuted into vapour, which is a kind of air ; and by cold into ice, which is a cold, tranfparent, brittle ftone, eafily diffolvable; and this ftone is convertible again into water by heat, as vapour is by cold.-Earth, by heat, becomes fire, and, by cold, is turned into earth again : denfe bodies, by fermentation, are rarefied into various kinds of air; and that air, by fermentation alfo, and fometimes without it, reverts into grofs bodies. All bodies, bealts, fifhes, infects, plants, \&c. with all their various parts, grow and increafe out of water and aqueous and Caline tinclures; and, by putrefaction, all of them scvert into water, or an aqueous liquor again.

Transmutation, in alchomy, denotes the act of changing imperfeet metals into gold or filver. This :s alfo called the grand operation; and, they fay, it is to be effected with the plilolopher's ftene.

The trick of tranfruting cinnabar into filver is thus: the cinnabar, being bruifed grofsly, is ftratificd in a crucible with granulated filver, and the crucible placed in a great fine; and, after duc linc for calcination, taken off; then the mattor, being poured out, is found to be
cinnabas

Infnuta-cinnabar turned into real filver, though the filver grains tion appear in the fame number and form as when they were ranfyl-ranfyl-
Raiar put into the crucible; but the mifchief is, coming to handle the grains of filver, you find them nothing but light friable bladders, which will crumble to pieces between the fingers.

The tranfmutability of water into earth feems to have been believed by Mr Boyle; and Bihhop Watfon thinks that it has not yet been difproved. See his Chemical E!frys.

Transmutation of Acids, or of Metals, is the change of one acod or of one metal into anuther.

IRANSOM, among builders, denotes the piece that is framed acrofs a double-light window.

IRANSOMS, in a fhip, certain beams or timbers extended acrols the ftempoit of a thip, to fortify her afterpart, and give it the figure molt fuitable to the fervice for which the is calculated.
'IRANSPARENCY, in Physics, a quality in certain bodies, whereby they give paflage to the rays of liyht: in contradiftinction to opacity, or that quality of bodies which renders them impervious to the rays of light.

It has been generally fuppofed by philofophers, that tranfparent bodies have their pores difpofed in firaight lines, by which means the rays of light have an opportunity of penetrating them in all directions; but fome experiments in electricity have made it apparent, that by the aftion of this fluid the molt opaque bodies, fuch as fulphur, pitch, and fealing-wax, may be rendered tranfparent as glafs, while yet we cannot fuppofe the direction of their pores to be anyway altered from what it originally was (fee Electricity). There is a curious inftance of an increale of tranfparency in rubbing a piece of white paper over one that has been written upon or printed : while the white paper is at reit, the writing or print will perhaps fearce appear through it ; but when in motion, will be very eaffly legible, and continue fo till the motion is difcontinued.

TRANSPOSITION, in Grammar, a difturbing or diflocating the words of a difcourfe, or a changing their natural order of conftruction, to pleafe the ear by rendering the contexture more fmooth, eafy, and harmonious.

TFANSUBSTANTIATION, in Theology, the converfion or change of the fubftance of the bread and wine in the eucharift, into the body and blood of Jefus Chrift; which the Romih church fuppofe to be wrought by the confecration of the prien. See SUPPER of the Lord, \(\mathrm{N}^{0} 5\).

TR ANSVERSALIS, in Anatomy, a namé given to feveral mufcler. See Anatomy, Part II.

TRANSVERSE, fomething that goes acrofs another from corner to corner: thus bends and bars in heraldry are traniverfe pieces or bearings; the diagonals of a parallelogram or a fquare are tranfverfe lines.

TRANSYLVANIA, a province of Europe, annexed to Hungary, and bounded on the north by Uppcr Hungary and Poland, on the eaft by Moldavia and WValachia, on the fouth by Walachia, and on the welt by Upper and Lower Hungary. It is furrounded on all par:s by high mountains, which, however, are not barren. The inhabitants have as much corn and wine as they vant themfelves; and there are rich mines of gold, filver, lead, copper, quickfilver, and alum. It has usi-
dergone various revolutions; but it now belongs to the loule of Auftria. The inlabitants are of feveral forts of religions; as Papifts, Lutherans, Calvinitts, Socinians, Photinians, Arians, Greeks, and Mahometans. It is about 162 miles in length, and 150 in breadth. The. adminiftration of affairs is conducted by 12 perfons; namely, three Roman Catholics, three Lutherans, thres Calvinifts, and three Sucinians. The militia is commanded by the governor, whofe commiffion is the more imp.rtant, as Iranfylvania is the bulwark of Chriftendum. It is divided into feveral fmall diftricts, called palatinates and countics; and is inhabited by three different nations, Saxon‘, Silefians, aud Hungarians. Hermanitadt is the capital town.
'IRAPEZIUM, in Geometry, a plane figure con. taincd under four unequal right lines.

TRAPEZIUS, a mufcle. See Anatomy, Part II. ThAPP, a compound rock. See Geology.
TRAVELLERS joy. See Clematis, Botany Index.

ITRAVERSE, or 'lransverse, in general, denotes fomething that goes athwart another; that is, croffes and cuts it obliquely.

Traverse, in Navigation, implies a compound courfe, or an affemblage of vatious courfes, lying at different angles with the meridian. See Navigation.

Traiterse Board, a thin circular piece of board; marked with all the points of the compafs, and having eight holes bored in each, and eight frall pegs hanging from the centre of the board. It is ufed to determine the different courfes run by a flip during the period of the watch, and to afcertain the diftance of each courfe.

TRAVESTY, a name given to an humorous tranflation of any author. The word is derived from the French travefler "to difguife."

TREACle, or Melasses. See Sugar.
Treacle Beer. See Spruce.
Treacle Muflard. See Clypeola, Botany Indeza.
TREASON, a general appellation, made ufe of by the law, to denote not only offences againt the king and government, but alfo that accumulation of guit which arifes whenever a fuperior repofes a confidence in a fubject or inferior, between whom and himfelf there fubfilts a natural, a civil, or even a firitual relation; and the inferior fo abufes that confidence, fo forgets the obligations of duty, fubjection, and allegiance, as to deftroy the life of any fuch fuperior or lord. Hence treafon is of two kinds, liggh and petty.

High Treafon, or Treafon Paramount (which is equivalent to the crimen lafie majeflatis of the Romans, as Glanvil denominates it alfo in our Englifl law), is an offence committed againft the fecurity of the king or kingdom, whether by imagination, word, or deed. In order to prevent the inconveniences which arofe in England from a multitude of conflructive treafons, the ftatute 25 Edw. III. c. 2. was made; which defines what offences only for the future fhould be held to be treafon; and this flatute comprehends all kinds of high-treafon under feven diftinct branches.
" 1 . When a man doth compafs or imagine the death of our lord the liing, of our lady his queen, or of their eldeft fon and heir." Under this defcription it is held that a queen-regnant (fuch as Queen Elizabeth and

\section*{TRE. [ 462 ] T R E}

Treafon. Queen Anne) is within the words of the aft, beine invelted with royal power, and intitled to the allegiance of her fubjects: but the hulbind of fuch a queen is not comprifed within thefe words; and therefore no treafon can be committed agairift him.

Let us nest fee what is a compafing or imayining the death of the king, \&c. Thefe are fynonymous terms: the word compafs fignifying the purpofe or defign of the mind or will ; and not, as in common fpeech, the carrying fuch defign to effica. And therefore an accidental Atroke, which may mortally wound the fovereign, per i.fortunian, without any traitorous intent, is no treafon: as was the cafe of Sir Waler Tyrrel, who, by the command of \(\mathrm{K} \cdot \mathrm{ng}\) William Rufus, flooting at a hart, the arrow glanced againft a tree, and hilled the king upon the fpot. But as this compaffing or imagination is an act of the mind, it cannot poffibly fall under any judicial cognizance, unlefs it be demonftrated by fome open or overt act. The flatute exprefly requires, that the accufed "be thereof upon fufficient proof attainted of fome open att by men of his own condition." Thus, to provide weapons or ammunition for the purpofe of killing the king, is held to be a palpable overt act of trcafon in imagining his death. To confpite to imprifon the king by force, and move towards it by affembling company, is an overt act of compaffing the king's death; for all force ufed to the perfon of the king, in its confequence may tend to his death, and is a ftrong prefurmption of fomething worfe intended than the prefent force, by fuch as have fo far thrown off their bounden duty to their fovereign : it being an old obfervation, that there is generally but a flort interval between the prifons and the graves of princes. It feems clearly to be agreed, that by the common law and the Ratute of Edw. Ill. words fpoken amount only to a high mifdemeanor, and no treafon. For they may be fpoken in heat, without any intention ; or be miftaken, perverted, or mifremembered by the hearers; their meaning derends always on their connection with other words and things; they may fignify differently even according to the one of voice with which they are delivered; and fometimes filence itfelf is more expreffive than any difcourfe. As there. fore there can be nothing more equivocal and ambiguous than words, it would indeed be unreafonable to make them amount to high treafon. And accordingly, in \({ }_{4}\) Car. I. on a reference to all the judges, concerning fome very atrocious words fpoken by one Pyne, they cerlified to the king, "that though the words were as ruicked as might be, yet they were no treafon; for unlefs it be hy fome particular flatute, no words will be treaton." If the words ke fet down in writing, it argues more deliberate intention; and it has been held, that writing is an overt at of treafon; for fcribere oft agere. But even in this cafe the bare words are not the treafon, but the deliberate act of writing them.
2. The fecond frecies of treaton is, " if a man do violate the king's companion, or the king's eldelt daughter unmarricd, or the wife of the king's eldeft fon and heir." Byv the king's companion is meant his wife; and by vioJation is urderilood cannal knorvledge, as well without force as with it: and this is high treafon in both paries if \(h \circ \cdot 1\) he confenting: as fome of the wives of Hensy VIII. by fatal experience evinced.
3. The third fpecies of treafon is, "if a man do levy swar againft our lord the king in his realm." And this
may be done by taking arms, not only to dethrone the king, but under prctence to reform religion, or the laws, or to remove evil counfellors, or other grievances whether real or pretended. For the law does not, ncither can it, permit any private man, or fet of men, to interfere forcibly in matters of fuch high importance ; cipecially as it has eftablithed a fufficient power for thefe purpofes in the high court of parliament : neither does the conflitution jultify any private or particular refil. ance for private or particular grievances; though, in cafes of national oppreflion, the nation has very juftifiably rifen as one man, to vindicate the original comrad fubfinting between the king and his people.
4. "If a man be adherent to the king's enemies in his realm, giving to them aid and cumfurt in the realm or elfewhere," he is alfo declared gully of high-tiealon. This mult likewife be proved by fome overt act ; as by giving them intelligence, by fending them prowifions, by felling them arms, by treacherounly furrendering a fortrefs, or the like.
5. "If a man counterfeit the king's great or privy feal," this is alfo ligh-treafon. But if a man takes wax bearing the impreflion of the great leal off from one patent, and fixes it 10 another, this is held to be only an abufe of the feal, and not a counterfeiting of it: as was the cafe of a certain chaplain, who in flich a manner framed a difpenfation for non-refidence. But the knav. i h h arifice of a lawyer much exceeded this of the divine. One of the clerks in chancery glued together two preces of parchment ; on the uppermolt of which he wrote a patent, to which he regularly obtained the great leal, the label going throngh both the frins. He then dif. folved the cerrent, and taking off the written patent, on the blank 0 kin, wrote a freh patent of a different impost from the former, and publifhed it as true. This was held no counterfeiting of the great feal, but only a great mifprifion ; and Sir Edward Coke mentions it with fome indignation that the party was living at that day.
6. The fixth fpecies of trealon under this flatute is, "if a man counterfeit the king's money; and if a man bring falle money into the realm counterfeit to the money of England, knowing the money to be falle, in merchandife and make payment withal." As to the firt branch, counterteiting the king's money; this is treafon, whether the falle money be uttered in payment or not. Alfo if the king's own minters alter the ftandard or alloy eftablifhed by law, it is treafon. But gold and filver money only are held to be within this flatute. With regard likewife to the fecond branch, importing foreign counterfeit money in order to utter it here; it is held that uttering it, without importing it, is not within the flatute.
7. The laft fpecics of treafon afcertained by this ftatute is, "if a man flay the chancellor, treafurer, or the king's jullices of the one bencls or the other, juffices in eyre, or juntices of affize, and all other junfice affigned to hear and determine, being in their places doing their offices." Tluefe high magiftrates, as they reprefent the king's majefy duning the excoutio. of their rffices, are therefore fo: the time equally regarded by the law. Fut this ftatute extends only to the aclual kiling of them; and not to wnunding, or a hare attempt to kill hem. It extends alfo only to the fficers, 'erein (pecified; and therefore the batons of the exchequer, as luch, are not
within the protection of this act ; but the lond keeper or commilfoners of the great feal now feem to be within it, by viriue of the llatutes 5 Eliz. c. 18. and I W. and M. c. 21 .

The new treafons, created fince the flatute 1 M. c. I. and not comprchended under the defcription of flatute 25 Edw. 111. may be comprifed under three heads. The firt lipecies relates to Papifts; the fecond to fallifying the coin or other royal fignatures, as fallely forging the fign manual, privy fignct, or privy feal, which thatl be deemed high trealon (1 M. Atat. ii. c. 6.). The third new pecies of high treafon is luch as was created for the fecurity of the Proteftant fucceftion in the houfe of Hanover. For this purpnfe, after the ad of fettlement wa, made, it was enacted by flatute 13 and 14 W. III. c. 3. that the pretended prince of Wales, affuming the title of King James III, thould be attainted of hight treafon; and it was made high-treafon for any of the king's fubjects to hold correfpondence with him or any perfon employed by him, or to remit money for his ufe. And by 17 Geo. II. c. 39. it is enneled, that if any of the fons of the pretender fhall land or attempt to land in this kingdom, or be found in the kingdom or any of its dominions, he thall be adjudged attainted of high-treafon; and correlponding with them or remiting money to their ule is made high-treafon. By 1 Ann. flat. 2. c. 17. the offence of bindering the nest in fucceffion from lucceeding to the crown is high-treafon: and by 6 Ann. c. 7. if any perfon thall maliciounly, advifedly, and directly, by writing or printing, maintain, that any other perfon hath any iight to the crown of this realm, otherwife than according to the act of fettlement, or that the kings of this realm with the authority of parliament are not able to make laws to bind the crown and its defcent; fuch perfon fhall be guilty of hightreafon.

The punifhment of high treafon in general is very folemn and terrible. 1. That the offender be drawn to the gallows, and not be cantied or walk ; though ufually (by connivance, at length ripened by bumanity into law) a fledge or hurdle is allowed, to preferve the offender from the extreme torment of being dragged on the ground or pavement. 2. That he be hanged by the neck, and then cut down alive. 3. That his entrails be taken out, and burned while he is yet alive. 4. That his head be cut off. 5. That his body be divided into four parts. 6. That his head and quarters be at the kine's difpofal.

The king niay, and often doth, difcharge all the punifhment except beheading, efpecially where any of noble blond are attainted. For beheading being nart of the judgement, that may be executed, though all the reft be omitted by the king's command. But where bebeading is no part of the judgement, as in murder or other felonies, it hath been faid that the king cannot change the judgement, although at the sequelt of the party, from one [pecies of death to another.

In the cale of coining, which is a treafon of a different complexion from the reft, the punifhment is milder for male offenders; being only to be drawn and hanged by the neck till dead. But in treafons of every kind the punifhment of women is the fame, and different from that of men. For as the natural modefty of the fex forbids the expofing and publicly mangling their bodies, their fentence (which-is to the full as terrible to ferfe as
the other) is to be drawn to the gallows, and there to be burned alive.

For the conlequences of this judgement, fec Attaisder, Forferture, and Corbuistion of Blood.

Petty or Pctit Trenfor, according to the fatute 25 Edward 111. c. 2. may happen three ways: by a fervant killing his mafter, a wife ber hufband, or an ecclefiallical perfon (either lecular or regular) his fuperior, to whom he owes faith and obedience. A fervarit who kills his mafter whom he has left, upon a grudge conceived againf him during his fervice, is guilty of petty treafon: for the traitorous intention was hatched while the relation fubfilted between them, and this is only an execution of that intention. So if a wife be divarced a menfe et lloro, ftill the vinculum matrimonii fubfits; and if the kills fuch divorced hufband, the is a traitrefs, And a clergyman is underltood to owe canonical obedi. ence to the bihhop who ordained him, to him in whole diocele he is beneficed, and allo to the metropolitan of fuch fuffragan or diocefan bifhop; and therefore to kill any of thefe is petit treafon. As to the rett, whatever has been faid with refpect to wilful Murder, is alfo applicable to the crime of petit treafon, which is no other than murder in its moft odious degree; except that the trial fluall be as in cafes of high treafon, before the improvements therein made by the flatutes of William III. But a perfon indicted of petit treafon may be acquitted thereof, and found guilty of manhaughter or mutder: and in fuch cafe it thould feem that two witnefles are not necellary, as in cales of petit trealon they are. Which crime is allo diftinguithed from murder in its punithment.

The punifhment of petit treafon in a man, is to be drawn and hanged, and in a woman to be drawn and burned: the idea of which latter punifhment feems to have been handed down to us from the laws of the ancient Druids, which condernned a woman to be burned for murdering her huiband; and it is now the ufual punifhment for all forts of treafons committed by thole of the female fex. Perfons guilty of petit treafon were firl debarred the benefit of clergy by flatute 12 Henry VII. c. 7. which has fince been extended to their aiders, abettors, and counfellors, by fatutes 23 Henry VIII. c. 1,4 , and 5 P. and M. c. 4 .

TREASURE, in general, denotes a flore or flock of money in referve.

Treasure-Trove, in Law, derived from the Frencla word trover, " to find," called in Latin thefourus inverstus, is where any money or coin, gold, filver, plate, or bullion, is found hidden in the earth or other private place, the owner thereof being unknown; in which cale the trealure belongs to the king: but if he that had hid it be known, or afterwards found out, the owner and not the king is intilled to it.

TREASURER, an officer to whom the treafure of a prince or corporation is committed to be kept and duly difpoled of, in payment of officers and other expences. See Treasury.

Of thefe there is great variety. His majefty of Great Britain, in quality of elector of Hanover, is arch-treafurer of the Roman empire. In England, the principal officers under this denomination are, the loat high-ireafurer, the treafurer of the houfehold, treafurer of the navy, of the king's chamber, \&c.

The lord high-treafurer of Great Britain, or firf commilionct:

\section*{T R E}

Treafures miffioner of the treafury, when in commiffion, has under his charge and government all the king's revenue which is kept in the exchequer. He holds his place
during the king's pleafure ; being inftituted by the delivery of a white faff to him. He has the check of all the officers employed in collesting the cuftoms and royal revenues: and in his gift and difpofition are all the offices of the cuftoms in the feveral ports of the kingdom; efcheators in every county are nominated by him; he alfo makes leafes of the lands belonging to the crown.

The office of lord-treafurer is now in commiffion. The number of lords commifioners is five; one of whom is the firft lord, whofe annual falary was formerly 383 l. but is now 40001 .; and who, unlefs he be a peer, is alfo chancellor of the exchequer, and prime minifter in the government of this country; the other lords commiffioners have an annual falary of 16001 . each.

TREASC'RER of the Houfehold, is an officer who, in the abfence of the lord-lteward, has power, with the comin:oller and other officers of the green-cloth and the dteward of the Marftulifea, to hear and determine treafons, felonies, and other crimes committed within the ling's palace. See Household.

There is alfo a treafurer belonging to the eftablifhment of her majeity's hnufehold, \&<c.

TPEASURER of the Navy, is an officer who receives money out of the exchequer, by warrant from the lord high-treafurer, or the lords commifioners executing that place; and pays all charges of the navy, by warrant from the principal officers of the navy.

THEASCRER of the County, he that keeps the county ftock. There are two of them in each county, chofen by the major patt of the juftices of the peace, \&c. at their general quarter feffion; under previous fecurity given for the money entrufted with them, and the faithful execution of the trufts repofed in them.

TREASURY, the place wherein the revenues of a prince are received, preferved and difburfed. In England the treafury is a part of the exchequer; by fome called the lower exchequer. The officers of his majefty's treafury, or the lower exchequer, are the lords commiffioners, one of whom is chancellor, two joint fecretaries, private fecretary to the firfl lord, two chamberlains, an auditor, four tellers, a clerk of the pells, uhers of the receipt, a tally-cutter, \&c. See each officer under his proper article, Ciancellor, Tellifr, TalLY, \&c.

Lords of the Treasurir. In lieu of one fingle director and adminiltrator of his majefty's revenues under the titlc of lord ligh treafurer, it is at prefent thought proper to put that office in commifion, i. e. to apfoint fevcral perfons to difcharge it with equal anthority, under the title of lords commifioners of the trenfury.
TREATISE, a fet difcourfe in writing on any fubject.

TRIIATY, a covenant between two or more nations; or the feveral arlicles or conditions ftipulated and agreed unon ty two fovercign powers.

TRERLE, in Mnfic, the ligheft or moft acute of the four parts in fumbliony, or that which is heard the cleare? and fhrilleft in a concert.

Treduchel', 'Taenucket, Tribuch (Torbiche-
tum), a tumbrel or cucking ftool. Alfo a great engine to caft fiones to batter walls.

THEE, a large vegctable rifing with one woody ftem to a confiderable beight.

Trees may be divided into two claffer, timber and fruit-trees; the firft including all thufe trees which are ufed in machinery, hip building, \&c. or, in general, for purpofes of utility; and the fecond comprehending thofe trees valued only, or chietly, for their fruit. It is not necefiary to form a third clafs to include trees ufed for fuel, as timber is ufed for this purpofe where it is abundant; and where it is not abundant the branches of the timber trees, or fuch of them as are dwarfilh, unhealthy, or too fmall for mechanical purpofes, are ufed as fuel.

The anatomy and phyfiology of trees have already been given under the generic name Plant and Sap.

Certain trees, it is well known, are natives of particular diffricts; but many of them have been tranfplanted from their native foil, and now flourifh luxuriantly in diftant countries, fo that it becomes a matter of very confiderable difficulty to afcertain their original foil. The following rules are given for this purpofe by the Honourable Daines Barrington.
1. They muft grow in large maffes, and cover confiderable tracts of ground, the woods not ending abruptly, by a change to other trees, except the fituation and ffrata become totally different. 2. They muft grow kindly in copfes, and fhoot from the ftool, fo as to continue for ever, if not very carefully grubbed up. 3. The feed muft rip on kindly; rature never plants but where a fucceffion in the greatelt proiufion will continue. Laftly, trees that give names to many places are probably indigenous.

The growth of trees is a curious and interefting fub. jert; yet few experiments lave been made to determine what the additions are which a tree receives annually in difirent periods of its age. The only obfervations which we have feen on this furject worth repeating were made by the ingenious Mr Barker, to whom the Philofophical T anfactions are much indebted for paper: containing an accurate regifter of the weather, which he has kept for many years. He has drawn up a table to point out the growth of three kinds of trees, oaks, afhes, and elms; which may be feen in the Philofophical Tranfactions for 1788 . We flall give his conclufions.
"I find (fays he) the growth of oak and afl to be nearly the fame. I have form of both forts planted at the fame time, and in the fame hedges, of which the oaks are the largeft; but there is no certain rule as to that. The common growth of an oak or an all is about an inch in girth in a year; fome thriving ones will grow an inch and a half; the unthriving ones not fo much. Great trees grow more timber in a year than -fmall ones; for if the a'nual grow th be an inch, a coat of one.fixth of an inch is laid on all round, and the timber added to the body every year is its length multiplied into the thicknefs of the coat and into the girth, and thercfore the thicker the tree is, the more timber is added."

We will peefent our readers with a table, foowing the growth of 17 kinds of trees for two years. Thie trees grew at Cavenham in Suffolk.

10,k

See Ifusbandry, \(N^{0} 165\), where the growth of 1 I kiads of trees in 21 years is given.

Trees fornetimes altain a very great fize: this muf depend in a great meafure on the richnefs of foil, but no lefs on the degree of heat. Indeed heat is fo effential to the growth of trees, that as we go from the place within the polar circles where vegetation begins, and advance to the equator, we find the trees increafe in irze. Greenland, Iceland, and other places in the fame latitude, yield no trees at all ; and the flrubs which they produce are dwarfilh; wherens, in wam climates, they often grow to an immenfe fize. Mr Marlham faw fpruce and filver firs in the \(d\) ock sard in Venice above 40 yards long. and one of 39 y irds was 18 inches diameter at the fmall end. He was informed that they earae from Swizerland.

The largeft tree in Eirope, mentioned by travellers, is the chefrut thee on M mint Ena, already defaibed under the article Ets.a, \(N^{N}\) 18. It is a certain fact that trees acquire a very great fize in volcanic countries. Beficle the multitude of fine groves in the neishbourhond of Albano in Italy, there are many detached oaks 20 feet in circumference, and many elms of the fame fize, efpecially in the romantic way to E.ffelio, called the Galleria. In trivelling by the fide of the lake of Bolfena, the road leads through an immenle number of oaks, fpread upon beautiful hills. Where the lava has been fufficiently fortened, they are clean and ftraight, and of a confiderable fize; but where the lava has not been converted into a fuil proper for ftrong vegetation, they are round-headed, and of lefs fize; however, taken all together, they make a magnificent appearance; and the [pot itfelf ought to ive ranked among the fine parts of Italy. The fame may be obferved of the fina!l lake of Vico, encompaffed with gentle rifings, that are all clothed with foref-trees.

Some yews have been found in Britain 60 feet round. Palms in Jamica attain the height of 200 feet; and fome of the pines in Norfolk inand are 280 feet high.

Of all the different kinds known in Europe, oak is beft for building; and even when it lies expofed to air and "ater, there is rone equal to it. Fir-timber is the

Yol. XX. Part II.
nexi in degree of gnoducts for huilding, cfsecially in \(\qquad\) England, whese they build upon leafes. It difiers trom oak in this, that it iequires not much feafoning, and therefore no great llock is requised before-liard. Fir is ufed for tlooring, wainfooting, and the ornamental parts of building within doors. LIm is the next in ufe, elpecially in England and France: it is very tough and pliable, and therefure eafly worked: it does not readily fplit; and it bears driving of bolts and mails better than any other wood; for which reafon it is chielly ufed hy wheel-wights and coach-makers, for flafis, naves, \&ec. Beech is alfo ufed for many purpofes: it is very tough and white when young, and of great tlrength; but liable to warp very much when expoled to the weather, and to be worm eaten when uled within dooss; its greatelt ufe is for planks, bedileads, chairs, and other houlehold goods. Ath is likewife a very ufeful wood, but very lcarce in moft parts of Europe; it ferves in buildings, or for any other whe, when ferecned from the weather; handfikes and oars are chitfly nade of it. Wild chefnut timber is by many effeemed to be as good as oak, and feems to have been much uled in old buildings; but whether thele trees are more farce at prefent than formerly, or have been found not to anfieer lo well as was imagined, it is certain that this timber is now but little ufed. Walnut-tree is excellent for the joiner's ufe, it being of a more curious brown colour than becch, and not fo fubject to the worms. The poplar, abele, and afpen trees, which are very little different fiom each other, are much ufed inflead of fir; they look well, and are tougher and harder.

The goodnefs of timber not only depends on the foil and fituation in which it Aands, but likewife on the feafon wherein it is felled. In this people difagree very much; fome are for having it felled as foon as its fruit is ripe, others in the fpring, and many in the autumn. But as the fap and moillure of timber is certainly the caufe that it periftes much fooner than it otheruife would do, it feems evident, that timber fhould be felled where there is the leaft Cap in it, viz. from the time that the leaves begin to fall till the trees begin to hud. This work ufually commences about the end of April in England, becaufe the bark then rifes moff freely; for where a quantity of timber is to be felled, the fatue requires it to be done then, for the advantage of lanning. The ancients chittly regarded the age of the moon in felling their timber ; their rule was to fell it in the wane, or four days after the new moun, or fomelimes in the lafl quatter. Pliny advifes it to be in the very inftant of the change; which happening to be in the laft day of the winter folltice, the timber, fays he, will be incorruptible.

Timber fhould likewife be cut when of a proper ase; for when it is either too young or too old, it will not be fo durable as when cut at a proper age. It in faid that oak fhould not be cut under 63 yeas old, nor above 250 . Timber, however, thould he cut in its prime, when a!mof fully grown, and before it begins to deray; and this will be fooner or later ascording to the drynefs and moiftnefs of the foil where the rimber grows, as alfo according to the bignefs of the thees: for there are no fixed rules in felling of timber, experience and judgment muft diref here as in moft other cafes.

Great attention is neceffary in the feafoning of tim. 3 N

\section*{T R E [ 406 ] T R E}

Tree. ber. Some advife the planks of timber to be laid for a few days in fome pool or running flream, in order to extract the fap, and afterwards to dry them in the fun or air. By this means, it is faid, they will be prevented from either chopping, calting, or cleaving ; but againf Shrinking there is no remedy. Some again are for burying then in the earth, others in a heat ; and fome for foorching and feafoning them in fire, efpecially piles, ponf, \& c. which are to fland in water or earth. The Venetians firf found out the method of feafoning by fire ; which is done after this manner: They put the piece to be feafoned into a ftrong and violent flame; in this they continually turn it round by means of an engine, and take it out when it is everywhere covered with a black coaly cruft; the internal part of the wood is thereby fo hardened, that neither earth nor water can damage it for a long time afterwards.

Dr Plott fays, it is found by long experience, that the trunk or body of the trees, when barked in the fpring, and left flanding naked all the fummer expofed to the fun and wind, are fo dried and hardened, that the fappy part in a manner becomes as firm and durable as the heart itfelf. This is confirmed by M. Buffon, who, in 1738, prefented to the royal acaderny of fciences at Paris a memoir entitled, "An eafy method of increafing the folidity, ftrength, and duration of timber;" for which purpofe he obferves, " nothing more is neceffary than to ftrip the tree entirely of its bark during the feafon of the rifing of the fap, and to leave it to dry completely before it he cut down."

By many experiments, particulariy defribed in that effay, it appears, that the tree fhould not be felled till the third year after it has been ftripped of the bark; that it is then perfectly dry, and the fap become almoft as ffrong as the reff of the timber, and ftronger than the heart of any other oak tree which has not been fo ftripped; and the whole of the timber fronger, heavier, and harder; from which he thinks it fair to conclude, that it is alfo more durable. "It would no longer (he adds) be neceffary, if this method were practifed, to cut of the fap; the whole of the tree might be ufed as timber ; one of 40 years growth would ferve all the purpofes for which one of 60 years is now required ; and this prattice would have the double advantage of increafing the quantity, as well as the ftrength and folidity, of the timber."

The navy board, in anfwer to the inquiries of the commifioners of the land revenuc, in May 1789 , informed them, that they had then flanding fome trees fripped of their bark two years before, in order to try the experiment of building one half of a floop of war with that timber, and the other half with timber felled and ftripped in the common way. This very judicious mode of making the experiment, if it he properly executed, will undoubtedly go far to afcertain the effects of this practice. We are forry that we are not able to inform our readers what was the refult of the experisient.

After the planks of timber have been well feafoned and fixed in their places, care is to he taken to defend or preferve, them; to which the fmearing them with linfied oil, tar, or the like oleaginous matter, contributes rauch. The ancients, particularly Hefiod and Wirgil, advife the fmoke-drying of all inflruments made of wood, by hanging them op in the chimneys where
wood fires are ufed. The Dutch preferve their gates, portcullices, drawbridges, nuices, \&c. by coating them over with a mixture of pitch and tar whereon they Arew fmall pieces of cockle and other hells, beaten almolt to powder, and mised with fea-fand, which incrufls and arms them wonderfully againt all affaules of wind and weather. When timber is telled before the fap is perfectly at reit, it is very fubject to worms; but to prevent and cure this, Mr Evelyn recommends the following remedy as the mof approved : Put common fulphur into a cucubit, with as much aquafortis as will cover it three fingers deep; diftil it to drynefs, which is performed by two or three rectifications. Lay the fulphur that remains at bottom, being of a blackifh or fand-red colour, on a marble, or put it in a glafs, and it will diflolve into an oil; with this oil anoint the timber which is infected with worms.' This, he fays, will not only prevent worms, but preferve all kinds of woods, and many other things, as ropes, nets, and mafts, from putrefaction, either in water, air, or fnow.

An experiment to determine the comparative durability of different kinds of timber, when expofed to the weather, was made by a nobleman in Norfoik; of which an account is given by Sir Thomas Beevor. ' This nobleman, in the year 1774 , ordered three polls, forming two fides of a quadrangle, to be fixed in the earth on a rifing ground in his park. Into thefe polls were mortifed planks, an inch and a balf thick, cut out of trees from 30 to 45 years growth. Thefe, after ftanding 10 years, were examined, and found in the following fate and condition :

The cedar was perfectly found; larch, the heart found, but the fap quite decayed; fpruce fro found ; filver fir, in decay; Scotch fir, much decayed; pinafter, quite rotten; chefnut, perfectly found; abele, found ; beech, found; walnut, in decay ; fycamore, much decayed; birch, quile rotten. Sir Thomas Beevor juflly remarks, that the trees ought to have been of the fame age; and Mr Arthur Young adds, they ought to have been cut out of the fame plantation.

The immenfe quantity of timber confumed of late geats in fip-building and other purpofes has diminithed in a very great degree the quantity produced in this country. On this account, many gentlemen who with well to their country, alarmed with the fear of a fcarcity, have ftrongly recommended it to government to pay fome attention to the cultivation and prefervation of tim. ber.

We find, on the beft authority, that of Mr Irving infpector general of imports and exports, that the fhipping of England in 1760 amounted to 6107 in number, the tonnage being 433,922 ; and the fhipping in Scotland amounted to 976 in number, the tonnage being 52,818 . In 1788 the whole Shipping of Britain and Ireland and their colonies amounted to 13,800 , being \(1,359,75^{2}\) tons burden, and employing 107,925 men. The tonnage of the royal navy in the fame year was 413,667 . We are informed allo, on what we con. Elerents fider as the beft authority (the report of the commiffion- Report. crs of the land revenue), that the quantity of oak timber, of Englifh growth, delivered into the dockyards from 1760 to 1788 was no lefs than 768,676 loads, and that the quantity ufed in the merchants yards in the fame lime was 516,630 loads; in all \(1,285,306\) loads. The foreign oak ufed in the fame period was only 137,766

\section*{\(T \mathrm{I}\)}
loads. 'So that, after dedueting the quantity remaining in the dock-yards in \(1 j 60\) and 1788 , and the foreign oak, there will remain about 1,\(054 ; 284\) loads of Englifh oak, confumed in 28 years, which is at an average 37,653 loads per annum, befides from 8300 to 10,000 loads expended annually by the Eaft India company within the fame period ( A ).

The price of wood has rifen in proportion to the demand and to its diminution. At the conqueft, woods were valued, not by the quantity of timber which they contained, but the number of fwine which the acorns could fupport. In 1608, oak in the forefts was fold at 10 s . per load, and fire-wood for 25 . per load. In 1663 or 1665 , in navy contracts from 21. to 21.15 s .6 d . per lond was given. In 1756 it rofe to 4l. 5s. per load, and \(3^{5}\). in addition, becaufe no tops are received. Plank four inch fold in 1760 for 71 l a load, three inch 61. ; which prices were the fame in 1792.

So great an expenditure of valuable timber within fo Mort 2 period, gives reafon to fear that the forefts of this country will foon be entirely difmantled, unlefs fomething is done to raife frehh fupplies. The building of a 70 gun thip, it is faid, would take 40 acres of timber. This calculation is indeed fo exceffive, that it is fcarcely credible. This, however, is no exaggeration. According to the prevailing opinion of experienced furveyors, it will require a good foil and good management to produce 40 trees on an acre, which, in a hundred years, may, at an average, be computed at two loads each. Reckoning, therefore, two loads at 81. 16s. one acre will be worth 3501 . and confequently 40 acres will only be worth 14,2001 . Now a 70 gun thip is generally fuppofed to coft 90,0001 . ; and as hips do not laft a great many years, the navy continually requires new fhips, fo that the forefts muft be fripped in a century or two, unlefs young trees are planted to fupply their place.

Many plans have been propofed for recruiting the forefts. Premiums have been held forth to individuals; and it has been propofed that the crown-lands fhould be fet apart for the fpecial purpofe of raifing timber. With refpect to individuals, as they muft generally be difpofed to fow or plant their lands with thofe regetables which will beft reward their labours, it is not to be expected that they will fet apart their fields for planting trees unlefs they have a greater return from them than other crops. But bad mult that land be which will not yield much more than 3501 . produce in 100 years. But though it be evident that good land will produce crops much more lucrative to the proprietor than timber, yet fill there are lands or pieces of land which might be applied with very great advantage to the production of wood. Uneven ground, or the fides of fields where corn cannot be cultivated, might very properly be fet apart for this purpofe; barren lands, or fuch as cannot be cultivated without great labour and expence, might allo be planted. Hedge-rows and
clumps of trees, and little woods fentered up and down, would thelter and defend the fields from dellructive winds, would beautify the face of the country, render the climate warmer, improve harren lands, and furriilh wood for the arts and manufactures.

But to cultivate foreft tinber has alfo been thought of fucl national importance, that it has been deemed worthy of the attention of government. It has been propofed to appropriate fuch part of the crown-lands as are fit for the purpofe folely of producing timber for the navy. This appears a very proper fcheme in fpeculation but it has been objected, that for government to attempt the farming of forefts would be really to eltablifh groups of officers to pocket falaries for doing what, it is well known, will never be done at all. But to this objection we reply, that fuch an agreement inight be made with the infpectors of forefts, as to make it their own intereft to cultivate trees with as much care as poffible. Their falary might be fixed very low, and raifed in proportion to the number of trees which they could furnifh of fuch a fize in a certain number of years. Afier all, we mult acknowledge that we muft depend greatly on Ruffia, Sweden, Norway, and America, for fupplying us witle timber ; and while thefe countries take our manufactures in exchange, we have no reafon to complain. Still, however, we ought furely not to neglect the cultivation of what is of fo much importance to our exiftence as a nation, for it may often be impoffible in time of war to obtain timber from foreign countries.

In the beginning of this article we rentioned the general divifion of trees into timber or foreft-trees and fruit trees. We have already faid all that our limits will permit refpecting the former: we will now, therefore, fay fomething of the latter. Our obfervations fhall be confined to the methods of preferving fruit trees in bloffom from the effects of frof, and from other difcales to which they are liable.

The Chevalier de Dienenberg of Prague, we are told, Europeca:z has difcovered a method of effectually preferving trees in March bloflom from the fatal effects of thofe frofts which fome- \(\mathbf{~ M a r c h}\) I. times in the fpring deftroy the moft promifing hopes of a plentiful crop of fruit. His method is extremely fimple. He furrounds the trunk of the tree in bloffom with a wifp of ftraw or hemp. The end of this he finks, by means of a ftone tied to it, in a veffel of fpring water, at a little diffance from the tree. One veffel will conveniently ferve two trees: or the cord may be lengthened fo as to furround feveral, before its end is plunged into the water. It is neceffary that the vefiel be placed in an open fituation, and by no means lhaded by the branches of the neighbouring trees, that the froft may produce all its effect on the water, by means of the cord communicating with it.-This precaution is particularly necefiary for thofe trees thei flowers of which appear nearly at the fame time as the leaves; which trees are peculiarly expofed to the ravages of the frof. The proofs of its efficacy, which he had an opportunity of obferving in the

\footnotetext{
(4) A writer in the Bath Cranfactions fays, that the aggregate of oaks felled in England and Wales for 30 years palt has amounted to 320,200 loads a-year; and affirms that he has documerts in his poffeffion founded on indifputable facts. The difference between this account, and that which we have given in the text from the report of the commiftioners, we leaye to be recomiled by thofe who have proper oportunities. We give the fats merely on the authority of otheris.
}

\section*{\(\mathrm{T}+\mathrm{R}, \mathrm{E}\) [468, \(]\) T广 R E [}

Troe. fpring of 1787 , were remarkably friking. Seven apricot efpaliers in his garden began to bl ffom in the month of March. Fearing that they would fufier from the late frofts, he furrounded them with cords as above directed. In effeet, pretiy thap trofts took place fis or eight nighis: the apricot.trees in the neighbouring gardins were all frozen, and none of them produced any fruit, whilit each of the chevalier's produced fruit in abundance, which came to the greaten perfection.

The following is the method propofed by Mr William Forlyth for curing injuries and defects in trees; for which a reward was given to him by his Majely, on condition that he thould make it public. It is equally applicable to foreft as to fruit trees (B).

Take one bu hel of freft cow-dung, half a bufhel of lime rubbilh of old huildings (that from the ceilings of roons is preferable); halfa bufliel of woodaflies; and a fixteenth pait \(0^{*}\) a buthul of pit or river fand. The three laft articies are to be fifted fine before they are mised; then work them well together with a fpade, and atterwards with a wooden beater, until the fluff is very frooth, like fine plafter ufed for the ceilings of rooms. The compofition being thus made, care muft be taken to prepare the tree properly for its application by cutting away all the dead, decayed, and injured parts, till you come to the frelh found wood, leaving the furface of the wood very finooth, and rounding off the edres of the bark with a draw-kuife, or other infrument, perfectly finooth, which muft be particularly attended to. Then lay on the plaf. ter about one-eighth of an inch thick all over the part where the wood or bark has been fo cut away, finifhirig off the edges as thin as polfible. Then take a quantity of diy powder of wood afles, mixed with a fixth part of the fame quantity of the afles of burnt bones; put it into a tin box, with holes in the top, and farke the powdor on the furface of the plafter, till the whole is covered over with it, letting it remain for half an hour to abforb the moifure : then apply more powder, rubbing it on gently with the hand, and repeating the application of the powder, till the whule planer becomes a dry fmooth furface.

All trees cut down near the ground fhould have the furface made quite fmooth, rounding it off in a fmall degrec, as before mentioned; and the dry powder directed to be ufed afterwards flould have an equal quantity of powder of alabater mixed with it, in order the better to refift the dripping of trees and heavy rains. If any of the compcition be left for a future occafion, it fhould be kept in a tub or other veffel, and urine of any kind poured on it, fo as to cover the furface; otherwife the atmofphere will greatly hurt the efficacy of the application. Where lime rubbifh of old buildings cannot be cafily got, take powdered chalk, or common lime, after having been flaked a month at leaft. As the growth of the tree will gradually affect the plafer, by raifing up its edges next the bark, care fhould be taken, where that
happens, to rub it over with the finger when cecafiun T Tose in may require (which is, bett done when maithened wy " II rai..), that the plafier may be kept whole, to present \(\underbrace{\text { Trentol }}\) the air and wet from penetrating into the wound: \(1 A 1\)

By this procels, fome old wom-out pear trees, that For it th. bore only a few fralll, haxid truit, of a kemelly texture, Ubfercawere made to produce peass of the befl quality and fincfltyens cr the flavour the fecond fummer after the operation; and in lifeafes of four or five years they bore fuch pleittous crops, as a fiets. young heallyy tree would not have produced in four times that period.

By this procefs, too, fome large ancient elms, in a moll decayed flate, having all their upper parts booken, and a fmall portion only of the bark remaining, fhot out fiems from their tops, above thirty feet in leight, in fis or feven years from the firlt application of the compos. tion.
'Thus may valuable trees be renovated; and foreft trees, which are uleful or ornamental toom their particular fituation, be prcferved in a flourithing ftate. But what is far more interelling, a perfect cure has been made, and found timber produced, in oak trees, which had reccived very condiderable damage from blows, bruifes, cutting of dicep letteis, the rubling off the bark by the ends of rollers, or wheels of catts, or from the breaking of branclies ly forms.

TREFOIL See 'irmoliun, Botiny Inder.
TREMELLA, a gerus of planis belorging to the clafs of ciyplogamia. See Botany Indux.
TREMIOR, an involuntary thaking, chiefly of the hands and head, fometimes of the fect, and tometimes of the tongue and heart.-Tremors anfing from a too free ufe of firituous lifuors require the fame treatment as palfies.

TRENCHES, in fortification, are ditches cut by the befiegers, that they may approach the more fecurely to the place attacked, whence they are alio called lines of approach.

TRENT, Bishopric of, a province of Germany, in the circle of Auftia, near the frontiers of Italy; is bounded on the north by Tirol; on the eaf by the Feltrino and Bellanefe; on the fouth, by Vincentino, the Veronefe, Brefciano, and the lake de Garda; and on the weft, by the Brefciano and the lake de Garda. The foil is faid to be very fruifful, and to abound in wine and oil.
'Irent, a city of Germany, and capital of the biMopsic of that name, is a very ancient place, and ftands in a fertile and pleafant plain, in the midn of the high mountains of the Alps. The river Adige wafhes its walls, and creeping for fome time among the hills, rums fwifily into Italy. Trent has three corfiderable churches, the principal of which is the cathedral: this is a very regular picce of architecture. The church of St Maria Major is all of red and white marble; and is remarkable fur being the place where the famous council of Trent
(B) A pafte for covering the vounds of trees, and the place where grafts are inferted, was difoovered long ago. It is recommended in a Treatife on Fruit Trees, publifhed by Thomas Hitt in 1755; a third edition of which, with addition:s, was publifhed in 1768 . It confilts of a nixture of clay and cow's dung diluted with water This pafte he directs to be Jaid on the wound with a bruff ; it adheres frmly, he fays, without cracking till the wound hoals. We are informed by a gentleman, to whofe opinion and cepericuce we pay great refpect, that this pafte anfuers every purpofe which ILir Forly h's can ferve.

Trent was theid, whore decitions are now the finding rulc of the Rumith church. E.I. Iong. 11. 5. N. Lat. 46.10.

Trent, one of the largef rivers in England, which sifes in, the moortand of Staffordihire, and runs fouchwell by Newcalle under-hine; and afterwards divid.ng the county in two parts, runs to Burton, then to Nuttinghan and Newark: and fo continuing its courfe doe north ta Gainibarough un the con:fines of Lincolufhire, it joins feveral rivers, and falls into the Hunber.

Trent, Council of, in Eicclefinfical IIjfury, denotes the council aflembled by \(\mathrm{I}^{\prime}\) ul 111 . in 1545 , and continued by 25 !efims till the year 1563 , under Julius 11 I. and Pius IV. in order to correct, illullrate, and fix with perficuity, the doctrine of the church, to reflore the vigour of its difcipline, and to reform the lives of its minitters. The decree of this council, logether with the creed of Pope Pius 1V. contain a lummary of the duc. trines of the Roman Catholics. Thefe decrees were fubfcribed by 255 clergy, confifing of fon legates, 2 other cardinals, 3 patriarchs, 25 archbiftops, 168 bithops, befides inferior clergy. Of thele 150 came from Italy, of courfe the council was entirely under the influence of the pope. For a more particular account of the council of Trent, fee Mofheim's Church Hiltory, the Modern Univerfal Hittory, vol. sxiii, and Fathes Paul's Hittory of the Council of Trent.

TREN PON. See New Jerser:
TREPANVING. See Surgery Index.
TRES tablrne, in Ancient Geograply, a place in Latium, lving on the Via Appia, on the left or fouth fide of the river Altura, to the north of the Paludes Pumptinæ. Its ruins are now feen near Cifterna, a village in the Campagna di Roma, 21 miles from Rome, whence the Chrifians went out to meet St Paul.

ThESPASS, in Law, fignifies any tranfgreffion of the law, under trealon, felony, or mifprifion of either: but it is commonly ufed for any wrong or damage that is done by one private perfon to another, or to the king in his foreft.

TRESSLE TREES, in Ship-Building, two frong bars of timber fixed horizontally on the oppofite fides of the lower maft-head, to fupport the frame of the top and the weight of the top-maft.

TRESSURE, in Heraldry, a diminutive of an orle, ulunily held to be half the breadth thereof.

TRET, in Commerce, an allowance made for the wafte or the dirt that may be mixed with any commodily; which is commonly four pounds in every 104 pounds weight.
Trevert, or Treviri, in Ancient Geograply, an ancient and a powerful penple, both in horle and foot, according to Cæfar; extending far and wide between the Meufe and the Rhine. Their chief town was called Tregeris. Now Triers or Treves.
Treves, or Triers (in Latin Trevere, Trevers, Treviris, or Augufa Trevirorum), the capital of the German archbillopric of the fame name, flands 60 miles weft of Mentz, 52 fouth of Cologne, and 82 north of Strafburg. This city vies with moft in Europe for antiquity, having been a large and noted town before Auguftus fettled a colony in it. It was free and imperial till the year 1560 , when it was furprifed and fubjected by its archbithop James III. - It flands on the Meffelle, aver which it has a fair fone bridge. The cathedral is
a larye building; and near it flards' the clecton's patace, which notborg ago arest giate and five parith churches, thee collenes of wide thirteen monatienies and nunneries, an univerfity tounded in 1472, a houle of the 'I'cutonic order, and another of that of Malta, with fome renains of the anclent lioman theare. Roman coins and medals are uften tound in the ruins of the old city. In the cathedral they pretend to have our Savioun's coat and St Pcter's fiati, 10 which they afcribe miracles. The private houlcs here are mean ; and the city is neither well fortified nor inhabited. E. Long. 6. 4 I . N. Lat. 49. 4.5.

TMAAL, in Law, the examination, of a caufe according to the laws of the land betore a proper judge; or it is the manner and order obletwed in the hearing and. deterraining of caufes.

Trials are either civil or criminal.
I. Civit ThiAlLs. The fpecies of trials in civil cafes are feven: By record; by inpection or examination; by cortuficale; Ly witneffes; by wager of batcd; by waser of law ; and by ju'y. The firf fix are orly had in certain fepcial or cecentrical cafes, where the trial ty jury would not be fo proper or effectual : (See then explained under their refpective titles). The nature of the lafi, that principal criterion of trult in the law of England, flall be explained in this articte.

As trial by jury is efteemed one of the moft important privileges which members of fociety can enjoy, and the bulwark of the Britifl conflitution, every man of reflection mulf be ftimulated by the defire of is quiring into its origin and hiftory, as well as to be acquainted with the forms and advantages by which it is accompanied. We will therefore begin with tracing it to its origin. Its inflitution has been afcribcd to our Saxon an:ceftors by Sir William Blackntone.
"Some authors (Tays that illufrious lawyer) have en Plachendeavoured to trace the original of jurics up as high as the Conmmenta Britons themiclves, the firt inhabitants of our ifland; bot certain it is that they were in ufe among the earliett Saxon colonies, their inflitution being alcribed by Bithop Nicholfon to Woden himfelf, wheir great legiflator and captain. Hence it is, that we may find traces of juries in the laws of all thole nations which adopted the feodal fyltem, as in Germary, France, and Italy; who had all of them a tribunal compcfed of iwelve good men and true, boni homines, ufually the vaffats or tenants of the lord, being the equals or peers of the parties litigant; and, as the lord's vaffals judged each other in the lord's coorts, fo the king's vaffals, or the lords themfelves, judged each other in the king's court. In England we find actual mention of them fo early as the laws of King Etbelred, and that not as a new invention. Stiernhook afcribes the invention of the jury, which in the Teutonic language is denominated nembda, to Regner king of Sweden and Denmark, who was contemporary yith our King Egbert. Juft as we ase apt to impute the invention of this, and fome other pieces of juridical polity, to the fuperior genius of Alfred the Great; to whom, on account of his having done much, it is ufual to attibute every thing: and as the tradition of ancient Greece placed to the account of their own Hercules whatever atchicvement was petformed fuperior to the ordinary prowefs of manhind. Whereas the truch feem's to be, that this tribunal was univerfally ctablifhed among all the northern nations, and fo interwoven in their very

\section*{TRI [470] TRT}
- Iesic. contitution, that the earlieft accounts of the one give us alfo fome traces of the other."

This opinion has been controverted with much learning and ingenuity by Dr Pettingal in his Inquiry into the Ufe and Practice of Juries among the Gieeks and Romans, who deduces the origin of juries from thefe ancient nations.

He begins with determining the meaning of the word ioxass, in the Greek, and judices in the Roman, writers. "The common acceptation of thefe words (fays he), and the idea generally annexed to them, is that of prefidents of courts, or, as we call them, judges; as fuch they are underflood by commentators, and rendered by critics. Dr Middleton, in his life of Cicero, exprefsly calls the judices, judses of the bench: and Archbifhop Potter, and in fhort all modern writers upon the Greek or Roman orators, or authors in general, exprefs \(\delta_{i \times \alpha}\) sacs and judices by fuch terms as convey the idea of prefidents in courts of jufice. The propriety of this is doubted of, and hath given occafion for this inquiry; in which is fhown, from the bef Greek and Roman authorities, that neither the \(\delta \mathbf{x} \times x 506\) of the Greeks, or the judices of the Romans, ever fignified prefidents in courts of judicature, or judges of the bench; but, on the contrary, they were diftin. guifhed from each other, and the difference of their duty and function was carefully and clearly pointed out by the orators in their pleadings, who were the beff authorities in thofe cafes, where the queftion related to forms of law, and methods of proceeding in judicial affairs and criminal procefs.

The prefidents of the courts in criminal trials at Athens were the nine archons, or chief magiftrates, of which whoever prefided was called wrueay fixeosse!s, or prefident of the court. Thefe nine prefided in different caufes peculiar to each jurifdiction. The archon, properly fo called, had belonging to his department all pupillary and heritable'cafes; the \(\beta\) ectikvs or rex facrorum, the chief prief, all cafes where religion was concerned; the polemarchus, or general, the affairs of the army and all military matters; and the fix thefmothet \(x\), the other ordinary fuits.
Wherever then the avyegs dixasxu, or judicial men, are addrefled by the Greek orators in their fpeeches, they are not to be underfood to be the prefiding magiftrates, but another clafs of men, who were to inquire into the frate of the caufe before them, by witneffes and other methods of coming at truth; and after inquiry made and witneffes heard, to report their opinion and verdict to the prefident, who was to declare it.

The feveral fteps and circumftances attending this judicial proceeding are fo fimilar to the forms obferved by cur jury, that: the learned reader, for fuch I muft fuppofe him, cannot doubt but that the nature, intent, and proceedings of the \(\delta_{1 \times x}\) rreise among the Greeks were the fame with the Englifh jury; namely, for the protection of the lower people from the power and oppreffion of the great, by adminiffering equal law and juftice to all ranks; and therefore when the Greek orators directed their fpceches to the ard \(\xi_{5} \mathrm{o}\) oreasut, as we fee in Demothenes, Æfchines, and Lyfias, we are to underfland it in the fame fenfe as when our lawyers at the bar fay, Gentlemesy of the jury.
So likewife among the Romans, the jutices, in their pleadings at the bar, never fignificd judges of the bench, or prefidents of the court, but a body or order of men, whofe olfice in the courts of judicature was ditinet from
that of the pretor or judex quefionis, which anfiecrod to our judge of the bench, and was the fame with the
 duty of the judices confifted in being impannelled, as we call it, challenged, and fwore to try uprightly the cafe before them; and when they lad agreed upon their opinion or verdied, to deliver it to the prefident who was to pronounce it. This kind of judicial procefs was firft introduced into the Achenian polity by Solon, and thence copied into the Roman republic, as probable means of procuring juft judyement, and protecting the lower people from the oppreflion or arbitrary decifions of their fuperiors.

When the Romans were fettled in Britain as a province, they carried with them their jura and infituta, their laws and cufloms, which was a practice eifential to all colonies; hence the Britons, and other countries of Germany and Gaul, learned from them the Roman laws and cuftoms; and upon the irruption of the north. ern enations into the fouthern kingdoms of Europe, the laws and inflitutions of the Romans remained, when the power that introduced them was withdrawn: and Montefquieu tells us, that under the firft race of kings in France, about the fifth century, the Romans that remained, and the Burgundians their new mafters, lived together under the fame Roman laws and police, and particularly the fame forms of judicatare. How reafonable then is it to conclude, that in the Roman courts of judicature continued among the Burgundians, the form of a jury remained in the fame fate it was ufed at Rome. It is certain, Montefquieu, fpeaking of thofe times, mentions the paires or hommes de fief, homagers or peers, which in the fame chapter he calls juges, judges or jurymen: fo that we hence fee how at that time the hommes de fief, or "men of the fief," were called peers, and thofe peers were juges or jurymen. Thefe were the fame as are called in the laws of the Confeflor pers de la senare, the " peers of the tenure, or homagers," out of whom the jury of peers were chofen, to try a matter in difpute between the lord and his tenant, or any other point of controverfy in the manor. So likewife in all other parts of Europe, where the Roman colonies had been, the Goths fucceeding them, continued to make ufe of the fame laws and inftitutions, which they found to be effablifted there by the firt conquerors. This is a much more natural way of accounting for the origin of a jury in Europe, than having recourfe to the fabulous ftory of Woden and his favage Scythian companions, as the firf introducers of fo humane and beneficent an inllitution."

Trials by jury in civil caufes are of two kinds ; cxe sraordinary and ordinary.
1. The firf §pecies of extraordinary trial by jury is that of the grand affife, which was initituted by King Henry II. in parliament, by way of alternative offered to the choice of the telant or defendant in a writ of right infead of the barbarous and unchrifian cuflom of duelling. For this purpofe a writ do magina afifa elia genda is directed to the oberiff, to return foar knights, who are to eleft and choofe 12 others to be joined with them; and thefe all together form the grand aftife, or great jury, which is to try the matter of right, and muft now confint of 16 jurors. A A nothe? fpecies of extraordinary juries is the jury to try an attaint; which is a procefs commenced againft a former jury for bringing a falfe verdict. See the article Attaint.

\section*{T R I [ [ 471\(]\) T}
2. With regard to the ordinary trial by jury in civil cafes, thic moft clear and perfpicuous way of treating it will be by following the order and courfe of the proceedings themfelves.
2. When therefore an iffue is joined by thefe words, "And this the faid A prays may be inquired of by the country;":or, "And of this he puts himifelf upon the country, and the faid 13 does the like; "the court atvards a writ of venirc facias upon the roll or record, commanding the theriff " that he caufe to come here, on fuch a day, twelve free and lawful men, liberes et legales. homines, of the body of his country, by whom the truth of the matter may be better known, and who are neither of kin to the aforefaid A nor the aforefaid B , to recognize the truth of the iffue between the faid parties.? And fuch writ is accordingly iffued to the fheriff: It is made returnable on the laft return of the fame term wherein iffue is joined, viz, hilary or trinity terms; which, from the making up of the iflues therein, are ufually called ifiuable ternss. And he returns the names of the jurors in a panel (a little pane or oblong piece of parchment) annexed to the writ. This jury is not fummoned, and therefore not appearing at the day mult unavoidably make default. For which reafon a compulfive procefs is now awarded againt the jurors, called in the common pleas a writ of habeas corpora jusratorum, and in the King's Bench difringas, commanding the fheriff to have their bodies, or to diftrain them by their lands and goods, that they may appear upon the day appointed. The entry therefore on the roll of record is, "That the jury is refpited, through defect of the jurors, till the firf day of the next term, then to appear at Weftminfter; unlefs before that time, viz. on Wednefday the fourth of March, the juftices of our lord the king appointed to take affizes in that county fhall have come to Oxford, that is, to the place afligned for holding the affizes. Therefore the fheriff is commanded to have their bodies at Weftmintter on the faid firf day of next term, or before the faid juffice of affize, if before that time they come to Oxford, viz. on the fourth of March aforefaid." And as the judges are fure to come and open the circuit commiffions on the day mentioned in the writ, the fheriff returns and fummons this jury to appear at the aflizes; and there the trial is had before the juftices of affize and nif prius : among whom (as hath been faid*) are ufually two of the judges of the courts at Weftminfter, the whole kingdom being divided into fix circuits for this purpofe. And thus we may oblerve, that the trial of common iffues, at \(n i / i\) prius, was in its original only a collateral incident to the original bufinefs of the juftices of affize; though now, by the various revolutions of practice, it is hecome their principal civil employment; hardly any thing remaining in ure of the real affizes but the name.
If the fheriff he not an indifferent perfon, as if he he a party in the fuit, or be related by either blood ar affinity to either of the parties, he is not then trufted to return the jury; but the venire fhall be directed to the coroners, who in this, as in many other inftances, are the fubfitutes of the fheriff to execute procefs when he is deemed an improper perfon. If any exception lies to the coroners, the 'venire fhall be direfted to two clerks' of the court, or two perfons of the county named by the court, and fworn: A And thefetioo, who are called elifors, or electors, flall indifferently name the jury, and及urynix
their return is final ; no challenge being allowed to their array.

Let us now pause a while, and obfcrse (with Sir Matthew Hale *), in thefe firft preparatory flages of * Hip. the trial, how admirably this conflitution is adapted and C. L. framed for the inveftigation of truth beyond any other \({ }^{\text {c. }}\) I20 method of trial in the world. For, firft, the perfon returning the jurors is a man of fome fortune and confequence; that fo he may be not only the lefs tempted to commit wilful crrors, but likewife be refponfible for the faults of either limfelf or his officers: and he is alfo bound by the obligation of an oath faithfully to execute his duty. Nexi, as to the time of their return: the pancl is returned to the court upon the original venire, and the jurors are to be fummoned and brought in many weeks afterwards to the tiial, whereby the parties may have notice of the jurors, and of their fufficiency or infufficiency, characters, connections, and relations, that fo they may be challenged upon juft caufe; while, at the fame time, by means of the compulfory procels (of diflringas, or habcas corpora) the caufe is not like to be retarded through defect of jurors. Thirdly, As to the place of their appearance : which in caufes of weight and confequence is at the bar of the court ; but in ordinary cafes at the affifes, held in the county where the caufe of action arifes, and the witnefes and jurors live: a provifion moft excellently caiculated for the faving of expence to the parties. For though the preparation of the caufes in point of pleading is tranfacted at Weftminfter, wherehy the order and uniformity of proceeding is preferved throughout the kingdom, and multiplicity of forms is prevented; yet this is no great charge or trouble, one attorney being able to tranfact the bufinefs of 40 clients. But the troublefome and moft expenfive attendance is that of jurors and witnefles at the trial; which therefore is brought home to them, in the county where moft of them inhabit. Fourthly, The perfons before whom they are to appear, and before whom the trial is to be held, are the judges of the fuperior court, if it be a trial at bar; or the judges of affize, delegated from the courts at Wefminfter by the king, if the trial be held in the country : perfons, whof learriing and dignity fecure their jurifdiction from contempt, and the novelty and very parade of whofe appearance have no fmall influence upon the multitude. The very point of their being ftrangers in the county is of infinite fervice, in preventing thofe factions and parties which would intrude in every caufe of moment, were it tried only before perfons refident on the fpot, as juftices of the peace, and the like. And the better to remove all furpicion of partiality, it was wifely provided by the fatutes 4 Edx. III. c. 2. 8 Ric. II. c. 2. and 33 Hen. VIII. c. 24. that no judge of affife flould hold pleas in any county wherein he was born or inhabits. And as this inftitution prevents party and faction from intermingling in the trial of right, fo it keeps both the rule and the adminiftration of the laws uniform. Thefejuftices, though thus varied and fhifted at every affizes, are all fworn to the fame laws, have had the fame education, have purfued the fame fludies, converfe and confult together, communicate their decifions and refolutions, and prefide in thofe courts which are mutually connected, and their judgements blended together, as theyare interchangeably courts of appeal or adrice to each other - And hence their admiriftration of juftice, and: condueu

\section*{\(T \mathrm{R}\) I} conduct of trials, are confonant and uniform; whereby that contation and contrariety are avoided, which would naturally arife from a variety of uncommunicating judges, or from any provincial ellabluliment. But let us now retorn to the aflizes.

When the general day of tuial is fixed, the plaintiff or his attorney muft bring down the recold to the affizes, and enter it with the proper officer, in order to its being called on in courfe.

Theie fleps being taken, and the caufe called on in court, the record is then banded to the judge, to perufe and oblerve the pleadings, and what iffues the parties are to maintain and prove, while the jury is called and fwom. To this end the fheriff returns his compulfive procefs, the writ of habeas corpora, or dilfringas, with the panel of jurors anr.exed, to the judge's officer in court.

The jurors contained in the panel are either \{pecial or common jurors. Special jurits were originally introduced in trials at bar, when the caufes were of too great nicety for the difcultion of ordinary freeholders; or where the fheriff was fufpected of partiality, though not upon fuch afparent caufe as to warrant an exception to him. He is in fuch cafes, upon motion in cuurt, and a rule granted thereupon, to attend the prothonotary or other proper officer with his freeholder's book; and the officer is to take indifferently 48 of the principal freeholders, in the prefence of the attorneys on both fides: who are each of them to ftr.ke off 12 , and the remaining \(2^{2}+\) are returred upon the panel. By the flatute 3 Geo. II. c. 25 either party is entitled upon motion to have a \{pecial jury ifruck upon the trial of any iffue, as well at the affizes as at bar, he paying the extraordinary expence, unlefs the judge will ceriity (in purfuance of the flatute 24 Geo. II, c. 18.) that the caufe required fuch fpecial jury.
A common jury is one returned by the theriff according to the direntions of the flatute 3 Geo. II. c. 25 which appoints, that the theriff or officer thall not return a feparate panel for every feparate caufe, as formerly; but one and the fame panel for every caufe to be tried at the fame afizes, containing not lefs than 48 , nor more than 72 , jurors: and that their names being written on tickets, Mall be put into a box of ghafs; and when each caure is called, is of thefe perfons, whofe names flall be firth draun oat of the box, thall be fworn upon the juy, unlefs abfent, challenged, or excufed; or unlefs a previous wiew of the meffuages, lands, or place in quellion, hall have been thought neceflary by the court; in which calc, fix or more of the jurors returned, to be agreed on by the parties, or nan:ed by a judge or other proper officer of the court, flall he appointed by fiecial writ of habeas corpora or difringas, to have the matters in queflion thown to them I \(y\) two perfons named in the writ; and then fuch of the jury as have had the siew, or fo many of them as appear, thall be fworn on the inqueff previous to any other jurers. Thefe acts are well calculated to reftrain any fufpicion of partiality in the fletiff, or any tampeing with the jurors when returned.

As the jurors appear when called, they fall be from, unlefs challenged by either party. See the article ChazI. Enge.

I' by means of challenges or nther caufe, a feflicient number \(n^{\prime}\) unexceptionable jurora doch not appear at the trial, either party may pray a seles.

A tales is a fupply of fuch men as are fummoned uron the firt panel, in order to make up the deficiency. For this purpole a wit of diccm salcs, ofio tales, and the like, was wont to be iffued to the fleriff at common law, and mutt be fill fo done at a trial at bar, if the jurors make default. But at the enizes, or nifiprius, by vitue of the flatute 35 Hen . VIII. c. 6 . and cther lubfequent Ilatutes, the judge is emrowered at the prayer of eill.er party to anvard a tales de curcumfontious of perfons prelent in court, to be joined to the other jurors to try the caufe; who are liable, howcter, to the fame challenges as the principal jurers. This is ufually done till the legal number of 12 be completed ; in which patriarchal and apotholical number Sir Edward Cukic hath difcovered abundance of myilery.

When a fufficient number of perfons impanelled, or talefinen appear, they are then leparately fworn, well and truly to try the iffue between the parties, and a true verdict to give according to the evidence; and hence they are denominated "the jury," jurata, and " jurois," fc. jaratores.
the jury are now ready to hear the merits; and to fix their attention the clofer to the facts which they are impanelled and fworn to try, the pleadings are opened to them by couniel on that fide which holds the afirmative of the queftion in iffue. For the iffue is faid to lie, and proof is always firt required upon that fide which affirms the matter in queftion: in which our law agrees with the civil, ai incumbit probatio qui dicit, non qui negat; cam per rerum naturam factum-negantis prolatio mulla fit. The opening counfel brittly informs them what has teen tranfacted in the court above; the parties, the nature of the action, the declaration, the plea, replication, and other proceedings; and lafly, upon what point the ifue is joined, which is there fent down to be determined. Intlead of which, formerly the whole record and procefs of the pleadings were read to them in Englifh by the court, and the mattor of iflue clearly explained to their capacities. Tlie nature of the cale, and the evidence intended to be produced, are next laid before them by counfel alfo on the fame fide; and when their evidence is gone through, the advocate on the other fide opens the adverfe cale, and fupports it by evidence; and then the parly which began is heard by way of reply. Sce Pleidings.

Evidence in the trial by jury is of two kinds; either that which is given in prcof, or that which the jury may receive by their own private knowledge. The former, or proof \(f\), (to which in common fpecel) the name of evidence is ufually confined) are either written or parol ; that is, by word of mouth. Written proofs, or evidence, are, 1. Records; and 2. Ancient deeds of 30 years fanding, which prove themfelves; but, 3. Modern deeds; and, 4 . Other writings, mula be attefted and verified by parol evidence of witneffes. With regard to parol evidence or witncffes; it munt firf be remembered. that there is a procefs to bring them in by writ of fulpana ad iffificandum; which commands them, lying afide all pretences and excufes, to appear at the trial on pain of 1001 . to be forfeited to the king; to which the flatute 5 Eliz. c. 9. has added a penalty of 101 , to the party aggrieved, and damaces equivalent to the lofs fuftained by want of his evidence. But no witnefs. unlefs his reafonable expences be tendered him, is bound to appear at all; nor, if he appear, is he bound

Tini. to give evidence till fuch charges are actually paid him; except he refides within the bills of mortality, and is funmoned to give evidence within the fame. This compullory procefs, to bring in unwilling witnefies, and the adrlitional terrors of an attachment in cale of difobedience, are of excellent ure in the thorough invenigation of truth :- and, upon the fame principle, in the Athenian courts, the witneffes who were fummoned to at tend the thal had their choice of three things: either to fwear to the truth of the fact in quellion, to deny or abjure it, or elfe to pay a fine of 1000 drachmas.

All witnefles, of whatever religion or country, that have the ufe of their reafon, ate to be received and examined, except luch as are infamous, or fuch as are in. terefled in the event of the caufe. All others are competent witueffes; though the jury from other circumflances will judge of their credibility. Infamous perfons are fuch as may be challenged as jurors, propter delictum: and therefore never hall be admitted to give eviderice to inform that jury, with whom they were too fcandalous to affociate. Interefted witneffes may be examined upon a voir dire, if fufpected to be fecretly concerned in the event; or their interelt may be proved in conrt. Which laft is the only method of fupporting an objection to the former clafs; for no man is to be exa. mined to prove his own infamy. And no counfel, attorney, or other perfon, intrutted with the fecrets of the caufe by the party himfelf, thall be compelled, or perhaps allowed, to give evidence of fuch converfation or matters of privacy as came to his knowledge by virtue of fuch truf and confidence: but he may be examined as to mere matters of fact, as the execution of a deed or the like, which might have come to his knowledge without being intrufted in the caufe.

One witnefs (if credible) is futficient evidence to a jury of any fingle fact : though undoubtedly the concurrence of two or more corroborates the proof. Yet our law confiders that there are many tranfactions to which only one perfon is privy ; and therefore does not always demand the teftimony of two. Pofitive proof is always required, where, from the nature of the cafe, it sppears it might poffibly have been had. But, next to pofitive proof, circumftantial evidence, or the doctrine of prefumptions, muft take place : for when the fact itfelf cannot be demon?tratively evinced, that which comes neareft to the proof of the fact is the proof of fuch circumfances which either neceflarily or ufually attend fuch facts; and thefe are called prefumptions, which are only to be relied upon till the contrary be actually proved.

The oath adminiftered to the witnefs is not only that what he depofes fhall be true, but that he fiall alfo depofe the whole truth: fo that he is not to conceal any part of what he knows, whether interrogated particularly to that point or not. And all this evidence is to be given in open court, in the prefence of the parties, their attorneys, the counfel, and all bytanders; and before the judge and jury: each party having liberty to excent to its competency, which excentions are publicly fated, and by the judqe are openly and publicly allowed or difallowed, in the face of the country: which muft curb any fecret bias or partiality that might arife in his own breaf.

When the evidence is gone through on both fides, VoL. XX. Part II.
the judge, in the prefence of the partics, the counfl,
Trial. and all others, fums up the whole to the jury ; cant. ling all fupertluous circumflances, obferving wherein the main queftion and ptincipal iffue lics, thation what cvidence has been given to fuppurt it, wibl hoch :omak; as he thinks neceflary for their direclian, and giving them his opinion in matters of law ariling upon that cvidence.

The jury, after the proofs are fummed un, unlefs the cafe be very clear, withdraw lrom the bar to comfider of their verdict; and in order to avuid intemperance and caufelefs delay, are to be kept without incat, dimk, fire, or candle, unlefs by permifion of the judge, thle they are unanimoufly agreed. A method of accelerating unarimity not wholly unknown in other conflitutions of Eu. rope, and in matters of greater concen. For by the golden bull of the empire, if, after the congrefs is oren ed, the electors delay the election of a king of the Ro. mans for 30 days, they flall be fed only with bread and water till the fame is accomplihied. But if our juries cat or drink at all, or have any eatables about them, without confent of the coutt, and before verdiet, it is finable; and if they do fo at his charge for whom they afterwards find, it will fet alide the verdict. Alfo, if they fpeak with either of the partics or their agents ofter they are gone from the bar, or if they receive any freft evidence in private, or if, to prevent difputes, they ca!t lots for whom thicy fhall find, any of thefe circunıftances will entirely vitiate the verdict. And it has been held, that if the jurors do not agree in their verdiet before the judges are about to leave the torm, though they are not to be threatened or imprifuned, the judges are not bound to wait for them, but may carry them round the circuit from tuwn to town in a calt. This neceffity of a total unanimity feems to be peculiar to vur own confitution; or at leall, in the nembda or jury of the ancient Goths, there was required (cven in criminal cafes) only the confent of the major part ; and in cale of an equality, the defendant was held to be acquitred.

When they are all unanimouty agreed, the jury retum back to the bar; and before they deliver their verdict, the plaintiff is bound to appear in ceurt, by himfelf, altorney, or counfel, in order to anfwer the amercement to which by the old law he is liable, in cafe he fails in his fuit, as a punilhment for his falfe claim. To be amerced, or a mercie, is to be at the king's mercy with regard to the fine to be impofed; in mifericordia domin? regis pro falfo clamore fluo. The amercement is difuicd, but the form ftill continues; and if the plaintiff does not appear, no verdict can be given; but the phantiff is faid to be nonfuit, non fequitur clamorem fuum. 'Therefore it is ufual for a plaintiff, when he or his counfel perceives that he has not given evidence fefficient to maintain his iffue, to be voluntarily norfuited, or withdraw himfelf: whereupon the crier is ordered to call the plaintiff; and if neither he, nor any body for bim, appears, he is nonfuited, the jurors are difcharged, the action is at an end, and the defendant thall recover his colls. The reafon of this practice is, that a nonfuit is more eligible for the plaintiff than a verdict againft him : for after a nonfuit, which is only a default, he may commence the fame fuit again for the fame caufe of action ; but after a verdict had, and judgment confequent thereupon, he is for ever barred from attaching

\section*{T R I [ 474 ] T R I}

Trial. the defendant upon the fame ground of complaint. But in cafe the plaintiff appears, the jury by their foreman deliver in their verdict.

A verdict, vere dictum, is either privy or public. A privy verdict is when the judge hath left or adjourned the court : and the jury, being agreed, in order to be delivered from their confinement, obtain leave to give their verdict privily to the judge out of court : which privy verdict is of no force, unlefs afterwards affirmed by a public verdict given openly in court; wherein the jury may, if they pleafe, vary from their privy verdiet. So that the privy verdict is indeed a mere nullity; and yet it is a dangerous practice, allowing time for the parties to tamper with the jury, and thcrefore very feldom indulged. But the only effectual and legal verdict is the public verdict : in which they openly declare to have found the iffue for the plaintiff, or for the defendant ; and if for the plaintiff, they affefs the damages alfo fultained by the plaintiff, in confequence of the injury upon which the action is brought.

When the jury have delivered in their verdich, and it is recorded in court, they are then difcharged; and fo ends the trial by jury : a trial which ever has been, and it is hoped ever will be, looked upon as the glory of the Englifh law. It is certainly the moft tranfcendant privilege which any fubject can enjoy or wifh for, that he cannot be afected either in his property, his liberty, or his perfon, but by the unanimous confent of 12 of his neighbours and equals. A conflitution that we may venture to affirm has, under providence, fecuied the jult liberties of this nation for a long fucceffion of ages. And therefore a celebrated French writer*, who concludes, that becaufe Rome, Sparta, and Carthage, have lo!t their liberties, therefore thofe of England in time muft perifh, hould have recollected, that Rome, Sparta, and Carthage, at the time when their liberties were loft, were ftrangers to the trial by jury.

Great as this eulogium may feem, it is no more than this admirable conltitution, when traced to its principles, will be found in fober reafon to deferve.

The impartial adminiftration of juftice, which fecures both our perfons and our preperties, is the great end of civil fociety. But if that be entirely entrufted to the magiffracy, a felect body of men, and thofe generally feleeted by the prince or fuch as enjoy the higheft offices in the ftate, their decifions, in fpite of their own natural intcgrity, will have frequently an involuntary bias towards thofe of their own rank and dignity: it is not to be expected from human nature, that the few fhould be always attentive to the interefts and good of the many. On the other hand, if the power of judicature were placed at random in the hands of the multitude, their decifions would be wild and capricious, and a new rule of action would be every day eftablifned in our courts. It is wifely therefore ordered, that the primciples and axioms of law, which are general propofitions flowing from abltracted reafon, and not accommodated to times or to men, fhoult be depofited in the brealts of the judges, to be occafionally applied to fuch facts as come pproperly afcertained before then. For here partiality can have little fcope; the law is well known, and is the fame for all ranks and degrees: it follows as a regular -conclufion from the premiffes of fact pre-eftablihied. But in fettling and adjulfing a queftion of fact, when intruftId to any fingle magiftrate, pastiality and injuftice have
an ample field to range in, either by boldly afferting that to be proved which is not fo, or more artfully by fupprefing fome circumftances, frretching and warping others, and diftinguilhing away the remainder. Here therefore a competent number of fenfible and upright jurymen, chofen by lot from among thofe of the middle rank, will be found the beft inveftigators of truth, and the fureft guardians of public juftice. For the moft powerful individual in the fate will be cautious of committing any flagrant invation of another's right, when he knows that the fact of his oppreffion muft be examined and decided by 12 indifferent men not appointed till the hour of tial ; and that when once the fact is afcertained, the law muil of courfe redrefs it. This therefore preferves in the hands of the people that fhare which they ought to have in the adminiffration of public juftice, and prevents the encroachments of the more powerful and wealthy citizens.

Criminal TRIALLS. The regular and ordinary method of proceeding in the courts of criminal jurifdiction may be diftributed under 12 general heads, following each other in a progreflive order: viz. 1. Arreft; 2. Comniitment and bail ; 3. Profecution; 4. Procefs; 5. Arraignment, and its incidents; 6. Plea, and iflue; 7.Trial, and conviction ; 8. Clergy ; 9. Judgement, and its confequences; 10. Reverfal of judgement ; 11. Reprieve, or pardon; 12. Execution, See Arrest, Commimment, Presentment, Indictment, Information, Appeal, Processuponan IndiClment, Arraignment, and Pifa; in which articles all the forms which precede the trial are defribed, and are here enumerated in the proper order.

The feveral methods of trial and conviction of of fenders, eftablithed by the laws of England, were formerly more numerous than at prefent, through the fuperfition of our Saxon anceftors; who, like other northern nations, were extremely addicted to divination; a character which Tacitus obferves of the ancient Germans. They therefore invented a confiderable number of methods of purgation or trial, to preferve innocence from the danger of falfe witnefles, and in conicquence of a notion that God would always interpofe miraculouily to windicate the guiltlefs; as, i. By Ordear; 2. By Corsned; 3. By Battel. See thefe articles
4. A fourth method is that by the peers of Great Britain, in the Court of Parliantent; or the Court of the Lord High STELFARD, when a peer is capitally indicted; for in cafe of an appeal, a peer thall be tried by jury. This differs little from the trial per patriam, or by jury; except that the peers need not all agree in their verdiet ; and except alfo, that no fpecial verdift can be given in the trial of a peer; becaufe the lords of parliament, or the lord high fleward (if the trial be had in his court), are jutges fufficiently competent of the law that may arife from the fact; but the greater number, confifting of 12 at the leaft, will conclude, and bind the minority.

The trial by jury, or the country, per patriam, is alfo that trial by the peers of every Briton, which, as the gieat bulwark of his liberties, is fecured to him by the great charter: nullus liber homo capitatur, sel imprifonetur, ant exulet, aut aliquo alio modo dsifuatur, nifo per legale judicium parium fuorum, vel per legem terrac:

When thercfore a priforer on his Arraicniment has pleaded not guilty, and for his trial hath put him felf

\section*{T R I}

Trial: upon the country, which country the jury are, the flieriff of the county mult return a panel of jurors, liberos et. legales homines, devicencto; that is, frceholders without juft exception, and of the vifne or neighbourhood; which is interpreted to be of the county where the fact is committed. If the proceedings are before the court of King's bench, there is time allowed between the arraignment and the trial, for a jury to be impanelled by writ of venire facias to the theriff, as in civil caufes; and the trial in cale of a middemeanor is had at ni/iprius, unlefs it be of fuch confequence as to merit a trial at bar; which is always invariably had when the prifoner is tried for any capital offence. But, before commiffioners of oyer and terminer and goal-delivery, the fheriff, by vir* tue of a general precept directed to him beforehand, returns to the court a panel of \(4^{8}\) jurors, to try all felons that may be called upon their trial at that feffion; and therefore it is there ufual to try all felons immediately or foon after their arraignment. But it is not cultomary, nor agreeable to the general courfe of proceedings, unlefs by confent of parties, to try perfons indicted of imaller mifdemeanors at the fame court in which they have pleaded not guilty, or traverfed the indictment. But they ufually give fecurity to the court to appear at the next aflifes or feffion, and then and there to try the traverfe, giving notice to the profecutor of the fame.

In cafes of high-treafon, whereby corruption of blood may enfue (except treafon in counterfeiting the king's coin or feals), or mifprifion of fuch treafom, it is enacted by flatute 7 W. III. c. 3. firft, that no perfon thall be tried for any fuch treafon, except an attempt to affaffinate the king, unlefs the indictment be found within three years after the offence committed: next, that the prifoner thall have a copy of the indictment (which includes the caption), but not the names of the witnefles, five days at leaft before the trial, that is, upon the true conftruction of the act, before his arraignment ; for then is his time to take any exceptions thereto, by way of plea or demurrer; thirdly, that he fhall alfo have a copy of the panel of jurors two days before his trial : and, laftly, that he flall have the fame compulfive procefs to bring in his witnefles for him, as was ufual to compel their appearance againft him. And by fatute 7 Ann. c. 21. (which did not take place till after the deceafe of the late pretender) all perfons indicted for high-treafon, or mifprifions thereof, thall have not only a copy of the indictment, but a lift of all the wineffes to be produced, and of the jurors impanelled, with their profeflions and places of abode, delivered to him ten days before the trial, and in the prefence of two witneffes, the better to prepare him to make his challenges and defence. And no perfon indicted for felony is, or (as the law flands) ever can be, entitled to fuch copies before the time of his trial.

When the trial is called on, the jurors are to be fworn as they appear, to the number of 12 , unlefs they are challenged by the party.

Challenges may here be made, either on the part of the king, or on that of the prifoner; and either to the whole array, or to the feparate polls, for the very fame rcafons that they may he made in civil caufes. But in criminal cafes, or at leaft in capital ones, there is, in favorem wite, allowed to the prifoner an arbitrary and capricious fpecies of challenge, to a certain number of jurors, without fhowing any caule at all; which is called
a peremptory challenge ; a provifion full of that tender. nefs and humanity to prifoners for which our linglifh laws are juftly fanous. This is grounded on two rcafons. 1. As every one muft be fenfible what fudden impreffions and unaccountable prejudices we are apt tu conceive upon the bare looks and geftures of another; and how neceffary it is that a prifoner) when put to defend his life) fhould have a good opinion of his jury, tle want of which might totally difconcert him; the law wills not that he foould betried by any one man againit whom he has conceived a prejudice, ceen without being able to aflign a reafon for fuch his diflike. 2. Pecaule, upon challenges for caufe flown, if the reafon alligried prove infufficient to fet afide the juror, perhaps the bare quellioning his indifference may fometimes provoke a refentment; to prevent all ill confequences from which, the prifoner is ftill at liberty, if he pleafes, peremptorily to fet him afide.

The peremptory challenges of the prifoner muft, however, have fome reafonable boundary; otherwife he might never be tried. This reafonable boundary is fet. tled by the common law to be the number of 35 ; that is, one under the number of three full juries.

If by reafon of challenges or the default of the jurors, a fufficient number cannot be had of the original panel, a tales may be awarded as incivil caufes, till the number of 12 is fworn, "well and truly to try, and true deliverance make; between our fovereign lord the king and the prifoner whom they have in charge; and a true verdict to give, according to their evidence."

When the jury is fworn, if it be a caufe of any confequence, the Indictment is ufually opened, and the evidence marihalled, examined, and enforced by the counfel for the crown or profecution. But it is a fettled rule at common law, that no counfel fall be allowed a prifoner upon his trial upon the general iflue, in any rapital crime, unlefs fome point of law thall arife proper to be debated. A rule which (however it may be palliated under cover of that noble declaration of the law; when rightly underflood, that the judge tholl be counfel for the prifoner; that is, flall fec that the proceedings againft him are legal and frictly regular) feems to be not at all of a piece with the reft of the humane treatment of prifoners by the Englifh law. For uport what face of reafon can that afliftance be denied to fave the life of a man, which yet is allowed him in profecutions for every petty trefpafs? Nor indeed is it, ftrictly fpeaking, a part of our ancient law; for the Mirrour, having obferved the neceffity of counfel in civil fuits, "who know how to forward and defend the caule by the rules of law, and cuftoms of the realm," immedi. ately afterwards fubjoins, " and more neceffary are they for defence upon indictments and appeals of felony, than upon other venial caufes." And, to fay the truth, the judges themfelves are fo fenfible of this defect in our modern practice, that they feldom fcruple to allow a prifoner counfel to fland by him at the bar, and to inftruct him what queftions to alk, or even to afk queltions* for him, with regard to matters of fact; for as to matters of law arifing on the trial, they are entitled to the affitance of counfel. But fill this is a matter of too much importance to be left to the good pleafure of any judge, and is worthy the interpofition of the legitlature; which has fown its inclination to indulge.
prifoners

\section*{T R I}

Trial prifoners with this reafonable affifance, by enacting, in ftatute 7 W. HII. c. 3. that perfons indicted for luch high-treafon as works a corruption of the blood or mif- prifonment thereof (except treafon in counterfeiting the king's coins or feals), may make their full defence by couniel, not excceding two, to be named by the prifoner, and affigned by the court or judge; and this indulgence, by fatute 20 Geo . II. c. 30 . is extended to parliamentary impeachments for high-treafon, which were excepted in the former act.

Wherr the evidence on both fides is clofed, the jury cannot be difcharged (unlefs in cafes of evident neceffity) till they have given in their verdicr. If they find the prifoner not guilty, he is then for ever quit and difcharged of the acculation, except he be appealed of felony within the time limited by law. And upon fuch his acquittal, or difcharge for want of profecution, he thall be immediately fet at large without payment of any fee to the gaoler. But if the jury find him guilty, he is then faid to be convicted of the crime whereof he ftands indicted. See the article Conviction; and, fubfequent thereto, the articles Judgement, Attainder, Forfeiture, Execution, alfo Benefil of Clergi, Reprifye, Pardon.

\section*{Trial, in Scotland. See Scots Law.}
 or hurband)," the name of the third clafs in Linnaus's fexual fyftem, confifting of plants with hermaphrodite flowers, which have three flamina or male organs.

TRIANGLE, in Gcometry, a figure of three fides and three angles.

TRiBE, in antiquity, a certain quantity or number of perfons, when a divifion was made of a city or people into quarters or diffricts.

TRIBRACFYYS, in Ancient Poetry, a foot confinting of three fyllables, and thefe all hort; as, melius.
TRIBUNAL, in general, denotes the feat of a judge, called in our courts bench.

TRIBUNE, among the ancient Romans, a magifirate chofen out of the commons, to protect them againft the oppreffions of the great, and to defend the liberty of the people againft the attempts of the fenate and confuls.

The tribunes of the people were firt effablifhed in the year of the Rone 259. The firt defign of their creation was to thelter the people from the cruelty of ufurers, and to engage them to quit the Aventine mount, whither they had retired in difpleafure.

Their number at firl was but two ; but the next year, under the confulate of A. Pot humius Aruncius and Caffius Vifcellinus, there were three more added; and this number of tive was afterwards increafed by L. Trebonius to ten.

Military Tribune, an officer in the Roman army, commander in chief over'a body of forces, particularly the divilion of a legion; mach the fame with our colonel, or the French maitre de camp.

TRIBUIARY, one who pays tribute to another
in order to live in peace with or thare in his protection.
'IKIBUTE, a tax or impolt which one prince or Atrie is obliged to pay to another as a token of dcpendence, or in virtué of a treaty, and as a purchale of pacace.

IRICEPS, in Anatomy. See there, Tables of the Muscles.

Thichecus, Walrus; a genus of aquatic animals belonging to the clais of mammalia, and order of bruta. See Mammalia Index.

TRICHOMANES, a genus of plants belonging to the clais of cryptogamie, and order of filices. See Botany Index.

TRICOCCEF (resic " three," and zoyxog " a grain"), the name of the 38 th order in Linraus Fragments of a Natural Method, confifting of plants with a fingle three-conered caplule, having three cells, or internal divifions, each containing a fingle feed. See Botany.

I'RICOSANTHES, a genus of plants belonging to the clals of monacia, and in the natural fyitem ianging under the 3 th order, Cucurliacer. See Rotany Index.

1 RIDENT, an attribute of Neptune, being a kind of fceptre which the painters and poets put into the hands of that god, in form of a fpear or fork with three teeth; whence the word.

TRIENNIAL, an epithet applied chiefly to offices or employments which laft for thee years.

TRIENS, in antiquity, a copper moncy of the walue of one-third of an as, which on one fide bore a Janus's head, and on the other a water rat.
TRientalis, Chichweed winter-green, a genus of plants belonging to the clafs of heptandria, and in the natural fyftem ranging under the 20 th ordcr, Rotacece. See Botany Index.

Triers, or Treves. See Treves.
'IRIFOLiUM, Trefoll, or Clover, a genus of plants belonging to the clafs of diadetphia, and in the natural fyftem ranging under the 32 d order Papilionacece. See Botany Index.

TRIGA, in antiquity, denotes a kind of car or chariot drawn by three horles; whence the name.

TRIGLA, a genus of fifhes belonging to the order of thoracici. See Ichthyology Index.

TRIGLOCH1N, a genus of plauts belonging to the clafs of hexandria, and in the natural fyftem ranging under the fifth order, Tripetaloidca. See Botasy Inder.

TRIGLYPHS, in Architeçure, a fort of ornament repeated at equal intervals, in the Doric freeze.

Dialing Trigon. See Dialing.
Trigonalis. \({ }^{\text {- See Pila. }}\)
Trigonella, Ferugreek, a genus of plants belonging to the clafs of diadc/phia, and in the natural fylfem arranged under the 32 d order, Papilionaceca. See Botany Index:
ure and TRIGONOMETRY is the application of arithme-nfruce- 1 tic to geometry. It confirts of two principal pats, of Tri- viz. Plane Trigonometry and Sherical Trigo-Tmetri- NOMETRY.

Plane trigonometry treats of the application of numbers to determine the relations of the fides and angles of a plane triangle to one anothcr.
Spherical trigonometry treats of the application of numbers in like manner to fpherical triangles; the nature of thefe will be explained in the courle of this article.

Both branches of the fuhject depend effentially upon certain numerical tables, the nature and conftruction of which we flall now proceed to explain.

\section*{SECTION I.}

\section*{NATURE AND CONSTRUCTION OF TRIGONOMETRICAL TABLES.}

It has been demonfrated in Geometry (Theor. 3 r . Seet. IV.) that any angles at the centre of a curcle have to one another the fame proportion as the arches ineercepted between the lines which contain the angles. Hence it is cafy to infer, that an angle at the centre of a circle has the fame ratio to four right angles, that the arch intcrcepted betwcen the lines which contain the angle has to the whole circumferencc. It alfo foilows that we may employ arches of a circle as meafures of angles, and thus the comparifon of angles is reduced to the comparifon of arches of a circle. From this principle we infer the confiftency of the firt of the following feries of definitions.

\section*{Definitions.}
1. If two fuaight lines interfect one another in the centre of a circle, the arch of the circumference intercepted between them is called the Meafure of the angle which they contain. Thus, (Plate DXXXVII. fig. 1.)
Plate the arch \(A B\) is the meafure of the angle contanined by \(\therefore \mathrm{XXVII}\), the lines CA and and CH .
II. If the circumference of a circle be divided into 360 equal parts, each of thefe is called a Degree; and if a degree be divided into 60 equal parts, each of thefe is called a Ninute; and if a minute be divided into 60 equal parts, each of thefe is called a Second, and fo on ; and as many degrees, minutes, feconds, \&cc. as are in any arch, fo many degrees, minutes, feconds, \&c. are faid to be in the angle meafured by that arch.

Cor. 1. Any arch is to the whole circumference of which it is a part, as the number of degrees and parts of a degree in it is to the number 360 . And any angle is to four right angles as the number of degrees, \&cc. in the arch which is the muafure of the angle to \({ }_{3} 60\).

Cor. 2. Hence alfo it appears that the arches which saeafure the fame angle, whatcrer be the radii with
which they are defcribed, contain the fame number of :iature an: \(i\) degrees and parts of a degree.

Conftruc-
The degrees, minutes, leconds, \&c. contained in antiva of Triarch or angle are commo:ly written thus, \(23^{\circ} 29^{\prime} 32^{\prime \prime \prime}\) gononetri\(20^{\prime \prime \prime}\), which expreffion means 23 degrees 29 manutes \(\underbrace{\text { cal Tables. }}\) 32 feconds and 20 thirds.
III. Two angles which make together two right angles, alfo two arches which make together a femicircle, are called the Supplements of one another.
IV. A flraight line BG drawn through B , one of the extremities of the arch AB , perpendicular to the diameter palling througla the other extrenity \(\Lambda\), is called the Sine of the arch \(A C\), or of the angle \(A C B\), having arch \(A B\) for its meafure.

Cos. 1. The fine of a quadrant or of a right angle is equal to the radius.
Cor. 2. The fine of an arch is half the chord of twice the arch.
V. The fegment \(A G\) of the dianmeter intercepted. between its extremity and the fine BG is called the Verfed Sine of the arch AB , or of the angle ACB .

V1. A Itraight line \(\Lambda \mathrm{H}\) touching the circle at \(\Lambda\) one extremity of the arch AB , and meeting the diameter CB which paffes through B the other extremity, is called the Tangent of the arch AB , or of the angle ACB.
Cor. The tangent of half a right angle is equal to. the radius.
VII. The ftraight line CH between the centre and: the extremity of the tangent AH is called the Secant of the arch AB or of the angle ACB .

Cor. to Def. 4, 6, 7. The fine, tangent, and fecant of any angle ACB , are alfo the fine, tangent, and fecant of its fupplement BCE. For by the definition, \(B G\) is the fine of the angle BCE; and if BC be produced to meet the circle in I , then AH is: the tangent and CH the fecant of the angle ACI or BCE.
Cor. to Def. 4, 5, 6, 7. The fine, verfed fine, tangent, and lecant of an arch which is the meafure of the angle ACB is to the fine, veried fine, and fecant of any other arch which is the meafure of the fame angle as the radius of the firt arch is to the radius of the fecond.

Let BG, fig. 2. be the fine, AG the verled fine, AH the tangent, and \(C H\) the fecant of the arch \(A B\) to the radius CA ; and \(b g, a g, a h, c h\) the fame things to the radius \(\mathrm{C} a\). From fimilar triangles \(\mathrm{BG}: b g:=\mathrm{BC}\) : \(b \mathrm{C}\); and becaufe \(\mathrm{CG}: \mathrm{C} g(:: \mathrm{CB}: \mathrm{C} b):: \mathrm{CA}: \mathrm{C} a ;{ }_{3}\) therefore, by divifion \(\mathrm{AG}:\) ag :: \(\mathrm{CA}: \mathrm{Ca}\). Alfo \(\mathrm{AH}: a h:: \mathrm{CH}: \mathrm{C} / \mathrm{A}: \mathrm{CA}: \mathrm{C} a\).

Hence it appears that if tables be confruaced exlio biting in mumbers the fines, tar.gents, and verfed fi: es of certain angles io a given radius, they will exhibit the ratios of the fines, tangents, and verfed fines of the lame angles to any radius whatever. In fuch tables, which are called trigonometrical tables, the radius is either fuppofed 1 , or fome number: in the ferits \(12,102,1000\),

Nature and \& c. The conftruction and ufe of thefe tables we flall Conftruc- prefently explain. tion of Tri-gonometrical Tables \(\xrightarrow{\sim}\) Fig. r.
VIII. The difference between any angle and a right angle, or between any arch and a quadrant, is called the Complement of that angle, or of that arch. Thus, if the angle \(A C D\), fig. 1. be a right angle, and confe-
quently the arch \(A D\), which is its meafure, a quadrant, the angle BCD is the complement of the angle BCA , and the arch BD is the complement of the arch AB . Alfo the complement of the obture angle BCE is BCD , its excefs above a richit angle; and the complement of the arch BDE is the arch BD .
IX. The fine, tangent, or fecant of the complement of any angle is called the cofine, cotangent, or cofecant of that angle. Thus, fuppofing the angle ACD to be a right angle, then \(\mathrm{BF}=\mathrm{CG}\), the fine of the angle BCD , is the cofine of the angle BCA; DK, the tangent of the angle BCD , is the cotangent of the angle BCA, and CK, the fecant of the angle BCD, is the cofecant of the angle BCA.

The following properties of the lines which have been defined flow immediately from their pofition.
I. The fum of the fquares of the fine and cofine of any angle is equal to the fquare of the radius. For, in the right-angled triangle \(\mathrm{BGC}, \mathrm{BC}^{2}=\mathrm{BG}^{2}+\mathrm{GC}^{2}\), (Geometry, Sect. IV. theor. 13.) Now BG is the fine, and \(C G=B F\) is the cofine of the angle \(B C A\).
2. The radius is a mean proportional between the tangent of any angle and its cotangent, or tan. \(\mathrm{ACB} \times\) cot. \(\mathrm{ACB}=\) rad. \(^{2}\). For fince DK, CA are parallel, the angles DKC, HCA are equal; now \(\mathrm{CDK}, \mathrm{CAH}\) are right angles, therefore the triangles \(\mathrm{CDK}, \mathrm{HCA}\) are fimilar, and therefore \(\mathrm{AH}: \mathrm{AC}:: \mathrm{CD}\) or \(\mathrm{AC}: \mathrm{DK}\), and \(A C^{2}=A H \times D K\).
3. The radius is a mean proportional between the cofine and fecant of any angle. Or cof. \(\mathrm{ACB} \times\) fec. ACB \(=\mathrm{rad}^{2}\). For the triangles CGB, CAH are fimilar; therefore CG: CB or CA : : CA: CH.
4. The tangent of an arch is a fourth proportional to its cofine, its fine and the radius, or tan. \(\mathrm{ACB}=\) fin. \(A C B\) \(\overline{c o f . A C B} \times r a d\). For, from fimilar triangles \(C G: G B\) : CA: AH.

Trigonometrical tables ufually exhibit the fines, tangents, and fecants of all angles which can be expreffed by an exact number of degrees and minutes from 1 minute to 90 degrees, or a right angle. Thefe may be computed in various ways, the moft clementary is to calculate them by the help of principles deducible immediately from the elements of geometry.

It has been demonflrated in Geometry, (Seet. V. prob. 22.) that the chord of one.fixth of the circumference, or an arch of \(60^{\circ}\), is equal to the radius; therefore, if BD be an arch of \(30^{\circ}\), its fine BF will be half the radius (cor. 2. def. 4.). Let us fuppofe the radius to be expreffed by unity, or 1 , then fin. \(30^{\circ}=\frac{1}{2}\); now fince \(a\) being put for any arch, cof. \({ }^{2} a+\mathrm{fin}^{2}{ }^{2} a=\mathrm{rad} .{ }^{3}\) (where by \(\operatorname{cof}^{3} a\) is meant the fquare of the number expreffing the cofine of the arch \(a, \& c\).) and as fin. \(30^{\circ}\) \(=\frac{1}{5}\), therefore cof. \(30^{\circ}=1-\frac{1}{4}=\frac{3}{4}, \quad \& \mathrm{c}\). Cof. \(30^{\circ}=\) \(\frac{3}{2} \sqrt{3}=.8660254038\).

It has been demonflrated in the arithmetic of fines (Algerra, \(\oint 356\).) that 2 cof. \({ }^{3} a=1+\) cof. \(2 a\); hence we have the following formula for findling the cofine of an arch, having given the cofine of its double; cof. \(a=\)
\(\sqrt{\frac{1+\operatorname{cof} .2 a}{2}}\). By this formula from the cofine of \(30^{\circ}\) we may find that of \(15^{\circ}\), and again from cof. \(15^{\circ}\) we may find cof. \(7^{\circ} 30^{\prime}\), and proceeding in this way we may find the cofines of \(3^{\circ} 45^{\prime}, 1^{\circ} 52^{\prime} 30^{\prime \prime}\), and fo on, till after In bilections the coline of \(52^{2^{\prime \prime}} 44^{\prime \prime \prime} 3^{\text {iv }} 45^{\circ}\) is found ; we may then find the line of this arch by the formula fin. \(a=\sqrt{ }\left(1-\operatorname{cof}^{2} a\right)\). Now, as fiom the nature of a circle the ratio of an arch to its fine approaches continually to that of equality, when the arch is continually diminifhed, it follows that the fines of very fmall arches will be very nearly to one another as the arches themfelves: Therefore, as \(52^{\prime \prime} 44^{\prime \prime \prime} 3^{\text {iv }} 45^{v}\) to \(1^{\prime}\) fo is the fine of the former arch to the fine of the latter. By performing all the calculations which we have here indicated, it will be found that the fine of \(\mathbf{1}^{\prime}\) is .0002908882 .

It has been flhewn in the arithmetic of fines (AlgeBRA, § 355.) that \(a\) and \(b\) being put for any two arches, fin. \((a+b)=2\) cof. \(b\) fin. \(a\)-fin \((a-b)\), hence putting \(1^{\prime}\) for \(b\), and \(I^{\prime}, 2^{\prime}, 3^{\prime}, \& c\). fucceflively for \(a\), we have,

> fin. \(2^{\prime}=2\) cof. \(1^{\prime} \times\) fin. \(1^{\prime}\),
> fin. \(3^{\prime}=2\) cof. \(1^{\prime} \times\) fin. \(2^{\prime}-\) fin. \(1^{\prime}\), fin. \(4^{\prime}=2\) cof. \(1^{\prime} \times\) fin. \(3^{\prime}-\) fin. \(2^{\prime}\), \(\&\) c.

In this way the fines for every minute of the quadrant may be computed, and as the multiplier col, I' remains always the fame, the calculation is eafy. It intlead of \(I^{\prime}\), the common difference of the feries of arches were any other angle, the very fame formula would apply.

The fines, and confequently the cofines of any num. ber of arches being fuppofed found, their tangents may be found by confidering that \(\tan . a=\frac{\text { fin. } a}{\operatorname{col} . a}\); and their fecants from the formula fec. \(a=\frac{1}{\operatorname{cof.} a}\).

We have here very briefly indicated the manner of conltracting the trigonometrical canon, as it is fometimes called. There are, however, various properties of fines, tangents, \&c. which greatly facilitate the actual calculation of the numbers, thefe the reader will find detailed in Algerra, Sect. XXV. which treats exprefsly of the Arikmetic of Sines.

The moft expeditious mode of computing the fine or cofine of a fingle angle is by means of infinite feries: The inveftigation of thefe is given in Fiuxions, \(\oint 70 . ;\) and it is there fhewn that if a denote any arch, then, the radius being expreffed by I ,
\[
\begin{aligned}
& \text { fin. } a=a-\frac{a^{3}}{1 \cdot 2 \cdot 3}+\frac{a^{5}}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5}-\text { \&c. } \\
& \operatorname{cof} . a=1-\frac{a^{2}}{1 \cdot 2}+\frac{a^{4}}{1 \cdot 2 \cdot 3 \cdot 4}-\text { \&c. }
\end{aligned}
\]

To apply thefe we muft have the arch expreffed in parts of the radius, which requires that we know the proportion of the diameter of the circle to its circumference. We have inveftigated this profortion in Geomftry, Prop. 6. Sect. vi.; alfo in Ficuxioss, § \(1 \mathbf{3 7}\); and fubfequently in the article entitled Souaring The Cincif.

From thefe feries others may be found which fiall exprefs the tangent and fecant. Thus becaufe tan.
ture and
nifruce:' \(a=\frac{\text { fin. } a}{\text { cof. } a}\), we get, after dividing the feries for the fine oo 1mi- by that for the cofine,
\[
\tan a=a+\frac{a^{3}}{3}+\frac{2 a^{5}}{15}+\frac{17 a^{7}}{3^{5} 5}+\& c
\]

And in like manner, dividing unity by the ferics for cof. \(a\), becaufe fec. \(a=\frac{1}{\operatorname{cof} . a}\), we get
\[
\text { fec. } a=1+\frac{a^{2}}{2}+\frac{5 a^{4}}{24}+\frac{61 n^{6}}{720}+\& c
\]

We thall conclude what we propofed to fay on the conftruction of the tables, by referring fuch of our readers as wifh for more extenfive information on this fubject to Dr Hutton's Introduction to his excellent Mathematical tables; alfo to the treatifes which treat exprefsly of trigonometry, among which are thofe of Emerfon, Simpfon, Bonnycafle, Caguoli, Mauduit, Lacroix, Legendre. In particular, we refer to an excellent treatife on the fubject by Mr R. Woodhoufe of Caius college, Cambidge.

\section*{Defcription of the Table of Logarithmic Sines, woc.}

That trigonometrical tables may be extenively ufeful, they ought to contain not only the fine, tangent, and fecant to every minute of the quadrant, but alfo the logarithms of thefe numbers; and thefe are given in Dr Hutton's Mathematical Tables, a work which we have already mentioned; as, however, the fines, \&c. or the natural fines, \&c. as they are called, are much lefs frequently wanted than their logarithms, we have only given a table of the latter. See Logarithms.

This table contains the logarithms of the fines and tangents, or the logarithmic fines and tangents, to every minute of the quadrant, the degrees at top and minutes defending down the left-hand fide, as far as \(45^{\circ}\), and from thence returning with the degrees at the bottom and the minutes afcending by the right hand fide to \(90^{\circ}\), in fuch a manner that any arch on the one fide is in the fame line with its complement on the other, the refpective fines, cofines, tangents, and cotangents, being in the farne line with the minutes, and on the columns figured with their refpective names at top when the degrees arc at top, but at the bottom when the degrees are at the bottom. The diferences of the fines and cofines are placed in columns to the right-hand, marked D ; and the differences of the tangents and cotangents are placed in a column between them, each difference belonging equally to the columns on both fides of it. Alfo each differential number is fet oppofite the fpace between the numbers whofe difference it is. All this will be evident by infpecting the table itfelf.

There are no logarithmic fecants in the table, but thefe are eafily had from the cofines; for fince fec. \(a=\) \(\frac{\mathrm{rad.} .}{\mathrm{cof} .} \mathrm{a}^{2}\), therefore, log. fec. \(a=2\) log. rad.-log. cof. \(a\); now log. rad. \(=10\), therefore the log. fecant of any arch? is had by fubtracting its log. cofine from 20.

The \(\log\). fine, log. tangent, or log. fecant of any angle is exprefled by the fame numbers as the log. fine, log. tangent, or log. fecant of its fupplement ; thercfore, when an angle exceeds \(99^{\circ}\), fubtract it from \(180^{\circ}\)
and take the log. fine, \&*c. of the remainder for that of Nature and the angle.

To find the log. fine of any angle expreffed by dearces and minutes. If the angle be lefs than \(45^{\circ}\) look gonometrifor the number of dearees angle be lefs han 45 , look ual Tables, for the number of degrees at the top, and oppofite to the minutes on the left hand will be found the fine required; thas the log. fine of \(8^{\circ} 10^{\prime}\) is \(9.15^{2} 45\). But if the angle be \(45^{\circ}\) or more than \(45^{\circ}\), look tor the degrecs at the bottom and the mi:utes on the right hand, and oypofite will be found the log. fine required. Thus the log. fine of \(58^{\circ} 12^{\prime}\) is 9.92936 . The very fame directions apply for the cofine, tangent, and cotangent ; and from what has been faid, the manner of finding the angle to degrees and minutes, having given its fine, \&c. mutt be obvious.

If the angle confifts of degrecs, minutes, and feconds, find the fine or tangent to the degrees and minutes, and add to this a proportional part of the difference given in the column of differences for the feconds, obferving that the whole difference correfponds to \(\mathrm{I}^{\prime}\) or \(60^{\prime \prime}\). 'Thus to find the log. fine of \(30^{\circ} 23^{\prime} 28^{\prime \prime}\); firt the fine of \(30^{\circ} 23^{\prime}\) is \(9.7 \circ 396\). The difference is 21 . \(1 \mathrm{~s} 6 \%^{\prime \prime}\) : \(28^{\prime \prime}:: 21: \frac{28 \times 21}{60}=10\) nearly, the part of the difference to be added, therefore the fine of \(30^{\circ} 23^{\prime} 28^{\prime \prime}\) is 9.70406.

On the contrary, let it be required to find the angle correfponding to the tangent 10.14152 .

The next lefs tangent in the table is 10.14140 , which correfponds to \(54^{\circ} 10^{\prime}\); the difference between the propofed tangent and next lefs is 12 ; and the difference between the next lefs and next greater, as given in the table, is 26 ; therefore, \(26: 12:: 60^{\prime \prime}: \frac{12 \times 60}{26}: 28^{\prime \prime}\) nearly, hence the angle correfponding to the propofed log. tangent is \(54^{\circ} 10^{\prime} 28^{\prime \prime}\).

\section*{SECTION II.}

\section*{PLANE TRIGONOMETRY.}

The following propofitions exprefs as many of the properties of plane triangles as are effentially neceffary in. plane trigonometry.

\section*{Theor. I.}

In a right-angled plane triangle, as the hypothenufe is to either of the fides, fo is the radius to the fine of the angle oppofite to that fide; and as either of the fides to the other fide, fo is the radius to the tangent of the angle oppofite to that fide.

Let ABC be a right-angled plane triangle (fig. 3.), of which AC is the hypothenufe. On A as a centre with any radius, defribe the arch DE; draw EG at right angles to AB , and draw DF touching the circle at \(D\), and meeting \(A C\) in \(F\). Then EG is the fine of the angle \(A\) to the radius AD or AE , and DF is its tangent.

The triangles AGE, ADF are manifefly fimilar to the triangle ABC . Therefore \(\mathrm{AC}: \mathrm{CB}:: \mathrm{AE}: \mathrm{EG}\); that is, \(A C ; C B::\) rad : fin. \(A\).

\section*{Fig. 3.}

Plane Tri- Again, \(A B: B C:: A D: D F\); that is \(A B: B C::\) gonometry. rad.: tan. \(A\).

Cor. In a right-angled triangle, as the hypothenufe to either of the fides, fo is the fecant of the acute angle adjacent to that fide to the radius. For AF is the fecant of the angle \(A\) to the radius \(A D ;\) and \(A C: A B:: A F\) : AD, that is, AC : AB :: fec. A : rad.

Note. This propofition is mont eafly remembered when flated thus. If in a right-angled triangle the hypothenufe be made the radiur, the fites become the fines if the oppofite angles; rind if one of the fides be made the radius, the other fide becomes the tangent of the oppofite angle, and the hypothenufe its fecant.

Theor. II.
The fides of a plane triangle are to one another as the fines of the oppofite angles.
From B any angle of the tiangle ABC (fig. 4.), draw BD perpendicular to \(A C\). Then, by laft theorem,
\[
\begin{array}{r}
A B: B D:: \text { rad. : fin. } A \text {, } \\
\text { alfo } B D: B C:: \text { fin. } C: r a d .
\end{array}
\]
therefore ex equo inverfely (Geometry, Sect. III. Theor. 7.), \(\mathrm{AB}: \mathrm{BC}::\) fin. \(C:\) fin. \(A\).

\section*{Theor. III.}

The fum of any two fides of a triangle is to their difference as the tangent of half the fum of the angles oppofite to thefe fides to the tangent of half their difference.

Let \(A B C\), fig. 5 . be a triangle; \(A B+B C: A B\) \(-\mathrm{BC}:: \tan \cdot \frac{.}{2}(\angle \mathrm{BCA}+\angle \mathrm{BAC}): \tan \cdot \frac{1}{2}(\angle \mathrm{BCA}\) \(-\angle B A C)\).

In AB produced take \(\mathrm{BE}=\mathrm{BC}\), and on B as a centre with BC or BE as a radius, defcribe the femicircle ECF meeting AC in D ; join \(\mathrm{BD}, \mathrm{CF}\), and CE , and from F draw FG parallel to AC , meeting CE in G .

Becaufe the angles CFE, CBE, ftand on the fame arch CE, and the former is at the circumference of the circle, and the lyter at the centre; therefore, the angle CFE is half the angle CBE (Geonetry, Sect. II. Theor. XIV.) ; but the angle Clle is the fum of the angles BAC, BCA (Geolietry, Sec. I. Theor. XXIII.) ; therefore the angle CFE is half the fum of the angles \(\mathrm{BC} A, \mathrm{BAC}\).

Becaufe the angle BDC is the fum of the angles \(B A C, A B D\), therefore the angle \(A B D\) is the difference between the angles \(\mathrm{BDC}, \mathrm{BAD}\); but fince \(\mathrm{BD}=\mathrm{BC}\), the angle \(B D C\) is equal to \(B C D\) or \(B C A\), therefore \(A B D\) is the difference of the angles \(B C A, B A C\); but ABD , or FBD, being an angle at the centre of the circle, is double the angle FCD at the circumference, which laft is equal to the alternate angle CFG; therefore the angle CFG is balf the difference of the angles BCA, BAC.
Becaufe CE is maniferty the tangent of the angle CFE to the radius CF and CG the tangent of the angle CFG to the fame radius; therefore \(\mathrm{CE}: \mathrm{CG}::\) tan. CFE. : tan. CFG, that is, CE: CG :: tan. \(+(\mathrm{BCA}+\) \(B A C)\) : tan. \(\frac{1}{2}(B C A-B A C)\); but becaufe FG is pasallel to \(\mathrm{AC}, \mathrm{CE}: \mathrm{CG}:: \mathrm{AE}: \mathrm{AF}\), that is, \(\mathrm{CE}: \mathrm{CG}\) \(:: A B+B C: A B-B C\), the refore \(A B+B C: A B\) \(-B C: \tan \cdot \frac{1}{2}(B C A+B A C) \tan \cdot \frac{1}{2}(B C A-B A C)\).

If a perpendicular be drawn from any angle of a triangle to the oppofite fide or bafe; the fum of the fegments of the bafe is to the fum of the other two fides as the difference of thefe fides to the difference of the fegments of the bafe.
Ler ABC be a triangle (fig. 6.), and BD a perpendicular drawn to the bafe from the opponte angle; \(A D+D C: A B+B C:: A B-B C: A D-D C\).

On, \(B\) as a centre with the radius \(B C\), defcribe a circle meeting \(A C\) in \(E\), and \(A B\) in \(G\), and the fame line produced in F . Then \(\mathrm{AC}: \mathrm{AE}:: \mathrm{AG}: \mathrm{AE}\); now \(A F=A B+B C\), and \(A G=A B-B C\), and becaufe \(E D=D C, A E(\) or \(A D-D E)=A D-D C\), therefore \(A C: A B+B C:: A B-B C: A D-D C\).

\section*{Prosle:i.}

Having given the fum of any two quantities and alfo their difference, to find each of the quantities.

Solution. To half the fum add lalf the difference of the quantities, and it will give the greater; and from half the fum fubtract half the difference, and it will give the lefs.

For let the greater of the tiro quantities be exprefied by the line \(A B\), and the lefs by \(B C\); bifeet \(A C\) in \(D\), and take DE equal to DB , then \(\mathrm{AE}=\mathrm{BC}\), and AF , \(-\mathrm{BC}=\mathrm{AB}-\mathrm{AE}=\mathrm{EB}\), and \(\frac{7}{8}(\mathrm{AB}-\mathrm{BC})=\mathrm{DB}\); alfo \(\frac{1}{2}(A B+B C)=A D\); now \(A B=A D+D B\) and \(B C=A D-D B\), therefore the truth of the folution is evident.

In a plane triangle there are five diftind parts, which are fo comected with onc another, that any three of them being given, the remaining two may be found; thefe are, the three fides and any two of the three angles; as to the remaining angle, that depends entirely upon the other two, and may be found from them independent of the fides.
If one of the angles be a right angle, then the number of parts is reduced to four, and of thefe, any two being given, the remaining two may be found.

\section*{Solution of the Cafes of Right-angled Plane Triangles.}

In right-angled triangles there are four cafes which may be refolved by the firf theorem.

Case I. The hypotherufe AC (fig. 7.) and an angle A being given, to find the fides \(A B, B C\) about the right angle.
\[
\text { Solution. }\left\{\begin{array}{l}
\text { Rad. : fin. A :: AC : PC, } \\
\text { had. cof. A :: AC : AB. }
\end{array}\right.
\]

Examplc. In the triangle ABC . let the hypothenufe AC be 144, and the angle \(\mathrm{A} 99^{\circ} 22^{\prime}\). Required the fides \(A B\) and \(B C\).
ngle

inne Tri- Here the logarithms of the fecond and thitd terms nomerry; are added, and the logarithm of the firf term fubtract. ed or rejected from the fum.

Case 2. A fide \(A B\), and an acute angle \(\Lambda\) (and confequently the other angle \(C\) ) being given, to find the hypothenufe \(A C\), and remaining fide \(B C\).

Solution. \(\left\{\begin{array}{l}\mathrm{Cof.} \mathrm{~A}: \text { rad. }:: \mathrm{AB}: \Lambda \mathrm{C}, \\ \text { had. }: \text { tan. } \mathrm{A}: \mathrm{AB}: \mathrm{BC} .\end{array}\right.\)
Example. In the triangle ABC are given AB 208, and the angle \(A 35^{\circ} 1 \sigma^{\prime}\), to find \(A C\) and \(B C\).

Case 3. The hypothenufe AC and a fide AB being given, to find the angle \(A\) (and conlequently \(C\) ) and the fide BC.
\[
\text { Solution. }\left\{\begin{array}{l}
\mathrm{AC}: \mathrm{AB}:: \text { rad. }: \text { col. } \mathrm{A} \\
\text { Rad. }: \text { fin. } \mathrm{A}:: \mathrm{AC}: \mathrm{BC} .
\end{array}\right.
\]

Example. Let the hypothenufe \(A C\) be 272 , and the fide \(A B\) 232. Required the angle \(A\) and the fide BC.
\begin{tabular}{|c|c|c|c|c|c|}
\hline \multicolumn{3}{|c|}{To find \(A\)} & \multicolumn{3}{|c|}{To find BC.} \\
\hline AC 272 & - & 2.43457 & Rad. & & 10.00000 \\
\hline AB 232 & - & 2.36549 & \multicolumn{2}{|l|}{\multirow[t]{2}{*}{\(\operatorname{Sin}\). A \(3 \mathrm{I}^{\circ} 28^{\prime}\)}} & \multirow[t]{2}{*}{9.71767} \\
\hline liad. - & - & 10.00000 & & & \\
\hline \multicolumn{3}{|r|}{\multirow[t]{2}{*}{12.36549}} & AC 272 & & 2.43457 \\
\hline & & & BC 142 & & 2.15224 \\
\hline
\end{tabular}

Case 4. The fides \(A B\) and \(B C\) about the right angle being given, to find the angle \(A\) (and thence \(C\) ) and the hypothenufe \(A C\).
\[
\text { Solution. }\left\{\begin{array}{l}
A B: B C: r a d .: \tan . A \\
C o f . A: r a d .: A B: A C
\end{array}\right.
\]

Example. Let the fide AB be 186, the fide BC 152. Required the angle \(A\), and the hypothenufe \(A C\).
\[
\text { To find } A .
\]

\section*{Solution of the Cafes of Oblique-angled Triangles.}

In oblique-angled triangles there are alfo four cafes, which, with their folutions, are as follows.

Case 1. Two angles \(A\) and \(B\), and a fide \(\Lambda B\) being given, to find the other fides \(A C, B C\).

Vol. XX. Part II.

Solution. Firf fubtract the fum of the angices \(A\) and Prane Trin \(B\) from \(180^{\circ}\), and the remainder is the angle C ; then gonometry AC and BC are to be found from thefe proportions.
\[
\begin{aligned}
& \operatorname{Sin} . C: \operatorname{Sin} . I B: A B: A C \\
& \text { Sin. } C: \operatorname{Sin} . A: A B: B C .
\end{aligned}
\]

The truth of this folution is obvious from Theor. Ir.
Example. In the triangle \(A B C\) are given the fide \(\mathrm{AB}=266\), the angle \(\mathrm{A} 38^{\circ} 40^{\prime}\), the angle \(\mathrm{B} 72^{\circ} 16^{\prime} ;\) to find the fides \(A C\) and BC.
lirn, \(A+B=110^{\circ} 56^{\prime}\), and \(182^{\circ}-110^{\circ} ; 6^{\prime}=69^{\circ}\) \(4^{\prime}=C\).

Case 2. Two fides AC, CB (fig. 9.), and the angle Fig. 9. A oppofite to one of them, being given; to find the other angles \(\mathrm{B}, \mathrm{C}\), and alfo the other fide AB .

Solution. The angle B is found by this proportion.
\[
C B: A C:: \text { fin. } A: \text { fin. } B
\]

When \(C B\) is lefs than \(C A\), the angle \(B\) admits of two values, one of which is the fupplement of the other; becaufe, correfponding to the fame value of the fide \(A C\), and the angle \(A\), the fide \(B C\) may evidently have two diftinct pofitions, viz. \(\mathrm{CB}, \mathrm{C} b\). The angle CBA and its fupplement \(C b\) A being found, the angle \(A C B\), allo the angle AC \(b\) may be found, by fub. tracting the fum of the two known angles from \(180^{\circ}\). and then \(A B\) and \(A b\) may be found by thefe proportions.
\[
\begin{aligned}
& \operatorname{Sin} . A: \operatorname{Sin} . A C B:: C B: A B \\
& \operatorname{Sin} . A: \operatorname{Sin} . A C b:: C B \text { or } C b: A b .
\end{aligned}
\]

This is called the ambiguous cafe, on account of the angle \(B\) and the fide \(A B\) having fometimes tivo values.

This folution, like the laft, is deduced from Theorem II.

Example. Suppofe \(\mathrm{AC} 225, \mathrm{BC}\) I80, and the angle A \(42^{\circ} 20^{\prime}\); to find the remaining parts.

In the triangle \(A C B\) we have now the fide \(A C\) and the angles \(\mathrm{CAB}, \mathrm{CBA}\), therefore the semaining angle ACB and fide AB may be found by \(\mathrm{Cafe} 1 . ;\) and the farme is true of the triangle \(A C b\).

Plane Tri- CASE 3. Two fides CA, CB and the included angle \(\underbrace{\text { gonometry }} \mathrm{C}\) being given, to find the remaining angles \(\mathrm{B}, \mathrm{A}\), and fide AB.

Solution. Find \(A C+C B\), the fum of the fides, and \(A C-C B\) their difference; allo find the fum of the angles \(A\) and \(B\) (that fum is the fupplement of \(C\) ), and half that fum; then half the difference of the angles will be got from this proportion. (See Theor. III.).
\(A C+C B: A C-C B:: \tan \cdot \frac{\pi}{2}(B-1-A): \tan \cdot \frac{1}{2}(B-A)\). Having now the fum and difference of the angles \(B\) and A, the angles will be found by the rule given in the problem followitg Theor. IV.

The remaining fide may be found by either of thele proportions.
Sin. \(B\) : fin. \(C:: A C: A B\); or fin. \(A:\) fin. \(C:: B C: A B\).
Example. Let AC be \(128, \mathrm{CB} 90\), and the angle C \(48^{\circ} 12^{\prime}\). Required the remaining parts of the thiangle.
\begin{tabular}{|c|c|}
\hline \(A C+C B 218\) & \(2 \cdot 338.6\) \\
\hline & \\
\hline \(\tan . \frac{x}{2}(\mathrm{~B}+\mathrm{A}) 65^{\circ} 54^{\prime}\) & 10.34938 \\
\hline & 18.92916 \\
\hline tan. \(\frac{7}{2}(\mathrm{~B}-\mathrm{A}) 21^{\circ} \mathrm{I} 7^{\prime}\) & 9.59272 \\
\hline
\end{tabular}

Hence by the given rule in the above-mentioned problem, \(B=87^{\circ} 11^{\prime}, A=43^{\circ} 37^{\prime}\). As we now know all the angles and two fides, the remaining fide may be found by Cale 1.
Fig. 10. Case 4. The three fidec AB, EC and AC (fig. 10.) being given, to find the three angles \(A, B, C\).

Solution. Let fall a perpendicular CD upon the greateft of the three fides from the oppofite angle. Then find the difference between AD and DB by this proportion.
\[
A B: A C+C B:: A C-C B: A D-D B
\]

The fegments \(\mathrm{AD}, \mathrm{DB}\) may now be found feverally by the rule given for finding each of the quantities whofe fum and difference is given, and then the angles \(A\) and \(B\) may be found by the following proportions.
\[
\begin{aligned}
& \mathrm{CA}: \mathrm{AD}:: \text { rad. : cof. } \mathrm{A}, \\
& \mathrm{CB}: \mathrm{BD}:: \mathrm{rad.} \text { : cof. } \mathrm{B} .
\end{aligned}
\]

The angles \(A, B\) being found, \(C\) of courfe is known. The firl part of this folution follows from Theor. IV. The latter part from Theor. I.

Example. Let AB be \(125, \mathrm{AC} 105\), and BC 95. Required the angles.

In this cafe \(A C+B C=200, A C-B C=10\), therefore we have
\[
125: 200:: 10: A D-D B=\frac{200 \times 10}{125}=16
\]

Now \(A D+D B=125\), therefore \(\mathrm{AD}=70.5 \mathrm{DB}=\) 54.5.

For the application of plane trigonometry, fee Mensurition, Seef. I.

\section*{SECTION III.}

\section*{SPHERICAL TRIGONOMETRY.}

Theor. I.
If a fphere be cut by a plane through the centre, the fection is a circle.

Tue truth of this propofition is evident from the definition of a fphere. See Geometry, Sect. IX. Def. 3 .

\section*{Definitions.}
I. Any circle which is a fection of a fphere by a plane palling through its centre, is called a great circle of the fphere.

Cor. All great circles of a fphere are eq̧ual, and the centre of the fphere is their common centre, and any two of them bifect one another.
II. The pole of a great circle of the fphere is a point in the fuperficies of the fphere from which all traight lines drawn to the circumference of the circle ate equal.
111. A fpherical angle is that which on the fuperficies of a fphere is contained by two arches of great circles, and is the fame with the inclination of the planes of thefe great circles.
IV. A foherical triangle is a figure upon the fuperficies of a fphere comprehended by three arches of three great circles, each of which is lefs than a femiciscle.

Theor. II.
The arch of a great circle between the pole and and the circumference of another circle is 2 quadrant.

Let ARC be a great circle, (fig. 1I.) and D its pole; let the great circle \(A D C\) pals through \(D\), and le: AEC be the common fection of the planes of the two circles, which will pais through E the centre of the circle; join DA, DC. Becanfe the chord DA is equal to the chord \(D C\), (Def. 2.) the arch DA is equal to the arch DC; now ADC is a femicircle, thercfore the arches AD and DC are quadrants.

COr. I. If DE be drawn, the angle AED is a right angle, and DE being therefore at right angles to every line it meets with in the plane of the circle \(A B C\), is at right angles to that plane. Therefore the ftraight line drawn from the pole of any great circle to the centre of the fphere is at right angles to the plane of that circle.

Cor. 2. The circle has two poles \(\mathrm{D}, \mathrm{D}\) ', one on each
herteal each Give of its plane, which are the extremitics of donome- a dianteter of the fphere perpendicular to the plane Mry. \(A B C\).

Thieor. III.
A fpherical angie is meafured by the arch of a great circle intercepted between the great eircles containing the angle, and loving the angular point for its pole.

Let \(A B, A C\) be two arclies of great circles containing the fpherical angle BAC ; let BC be an anch of a great circle intercepted between then, and having A for its pole, and let BI, CD, \(\mathrm{A} D\) he drawn to D the centre of the fplere. The arches \(\mathrm{AB}, \mathrm{AC}\) are quadrants, (Theor. 1I.), and therefore the angles ADB, ADC right angles; therefore (Gfonetry, Seet. Vil. Def. 4.), the angle BDC (which is meafured by the arch BC ) is the inclination of the planes of the circles BDA, CDA, and is equal to the fpherical angle BAC (Def. 3.).

COR. If \(\mathrm{AB}, \mathrm{AC}\) two archer of great circles meet in A, then A thall be the pole of a great circle palfing through B and C .

Theor. IV.
Two great circles whofe planes are perpendicular pafs through each others poles.

Let ACBD, AEBF be two great circles, the planes of which are at right angles to one another; from G the centre of the fphere, draw GC in the plane ABCD perpendicular to AB , then GC is alfo perpendicular to the plane AEBF, (Geometry, Sect. Vil. Theor. 12 .) ; therefore C is the pole of the circle AEBF, and if CG be produced to \(\mathrm{D}, \mathrm{D}\) is the other pole of the circle AEBF.

In the fame manner, by drawing GE in the plane AEBF perpendicular to \(A B\), and producing it to \(F\), it is fhewn that E and F are the poles of the circle \(A B C D\).

COR. 1. If two great circles pafs through each cthers poles, their planes are perpendicular to one another.

COR. 2. If of two great circles the firft paffes through the poles of the fecond, the fecond alfo paffes through the poles of the firft.

\section*{Thror. V.}

If the angular points of any fpherical triangle be made the poles of three great circles, another triangle will be formed by their interfections, fuch, that the filles of the one triangle will be refpectively the fupplements of the meafures of the angles oppofite to them in the other.

Let the angular points of the triangle ABC be the pole's of three great circles; which by their interfections form the three lunary furfaces \(\mathrm{DO}, \mathrm{FR}\), and EO ; A being the pole of EF, B the pole of DF, and C the pole of ED. Than the triangle DEF which is common to three lunary furfaces will be in every refpect fupplemental to the triangle \(A B C\).

For let eacli fide of \(A B C\) be produced to meet the fides that contain the angle oppofte to it, in the triangle DEF; then, becaule BC palles through the pules of \(\mathrm{ED}, \mathrm{DF}, \mathrm{ED}, \mathrm{DK}\) muit allo pafs through the poles of BC. (Thoor. II. Cur, 2.). Therefore the prints D, \(Q\) are the poles of \(B C\). In like mannner \(k\), \(1:\) ars the puies of AB , and \(\mathrm{E}, \mathrm{O}\) the pules of AC . Herice LLL, FK are quadrants, (I'heor. I1.); and therefore 1:k is the fupplement of K L , but fince A is the pole of \(\mathrm{E}!\), \(K L\) is the inealure of the angle at \(A\); thus LF is tle lupplement of the meafure of the angle at \(A\). In like maner FD is the fupplement of the meafure of the angle at B , and DE the fupplement of the meafure of the angle at C .

Further, it will appear in the fame manner that BC is the fupplement of HM , the meafure of the angle at D; that AB is the fupplement of NK the meafure of the argle at \(F\); and that \(A C\) is the fupplement of GL, the meafire of the angle at E .

\section*{Theor. VI.}

If from any point \(E\), which is not the pole of the Fig. 16 . great circle ABC , there be drawn arches of great circles EA, EK, \(\mathrm{EB}, \& \mathrm{c}\). the greateft of thefe is EGA, which paffes through G the pole of ABC , and EC the remainder of the femictele is the leaft, and of the other, EK, EB, \& E ER which is nearer to EA is greater than EB, which is more remote.
Let AC be the common fection of the planes of the great circles \(\mathrm{AEC}, \mathrm{ABC}\); draw EH perpendicular to \(A C\), which will be perpendicular to the plane of the circle ABC (Geometry, Sect. VII. Theor, XII.) and j in \(\mathrm{AE}, \mathrm{KE}, \mathrm{BE}, \mathrm{KH}, \mathrm{BH}\). Then of all the ftraight lines drawn fion H to the circumference, HA is the greatelt, HC the leali, and HK greater than HB : Therefore in the right-angled triandes EHA, EHK, E4B, EHC, which have the fide EH common, EA is the greatell hypothenufe, EC the leaft, and EK greater than EB, confequently the arch EGA is the greatef, EC the leaft and EK greater than EB.

\section*{Theor. VII.}

Any two fides of a fpherical triangle are together greater than the third, and all the three fides are together lefs than a circle.
Let ABC be a fpherical triangle, let D be the cen \({ }^{\circ}\) Fig. 16. tre of the fohere, join \(\mathrm{DA}, \mathrm{DB}, \mathrm{DC}\). The folid angle at D is contained by three plane angles \(\mathrm{ADB}, \mathrm{BDC}\), ADC , ary two of which are greater than the third, (Geometry, Seet. ViI. Theor. XV.) ; and therefore any lwo of the arches \(A B, B C, A C\) which meafure thefe angles muft be greater than the third arch.

To prove the fecond part of the propofition, produce the fides \(A B, A C\) until they meet again in \(E\); then ECA and EBA are femicircles; now CB is lefs than \(C E+E B\), therefore \(\mathrm{CB}+\mathrm{CA}+\mathrm{BA}\) is lefs than \(\mathrm{CE}+\mathrm{EB}+\mathrm{CA}+\mathrm{BA}\), but thefe four arches make up two femicircles; therefore \(\mathrm{CB}+\mathrm{CA}+\mathrm{BA}\) - is lefs than a circle.
spincrical \(\xrightarrow[\sim]{2}\)

\(\qquad\)
\(\qquad\)

\(\qquad\)

greateft, EC the leaft and EK greaier than EB.

Spherisaly
Trigonosiaz angles oppofite to them are equal, and converiely.
In the triangle \(A B C\), if the fides \(A B, A C\) be equal, the angles \(A B C, A C B\) are alfo equal. If \(A B, A C\) be quadrauts, \(A B C, A C B\) are right angles. If not, let the tangent to the fide \(A B\) at \(B\) meet \(E A\) the line of cominon fection of the planes \(A B, A C\) in \(F\), and let the tangents to the bafe BC at its extremities meet each other in G; allo, let-FC, FG, EC, and EB be joined. Then the triangles FEB, FEC have FE common, \(\mathrm{EB}=\mathrm{EC}\), and the angle \(\mathrm{AEB}=\mathrm{AEC}\), therefore FB \(=\mathrm{FC}\), and the angle \(\mathrm{FCE}=\mathrm{FBE}\) a right angle : hence \(F C\) is a tangent, and the triangles \(F G B, G C F\) are mutually equilateral, therefore the angle \(\mathrm{FBG}=\mathrm{FCG}\) and confequently the fpherical angle \(\mathrm{ABC}=\mathrm{ACB}\).

Again, if the angles \(A B C, A C B\) be equal, the fide \(A B=A C\). For if in fig. 14, the angle \(A B C\) be cqual to \(A C B\), the fide \(D F\) of the fupplemental triangle DEF will be equal to the fide DE (Theor. V.) ; therefore the angle \(\mathrm{DEF}=\mathrm{DFE}\), and confequently in the triangle \(A B C\), the fide \(A C=A B\) by Theorem \(V\).

Cor. In any triangle the greater angle is fubtended by the greater fide; and converfely. For if the angle \(A C B\) be greater than ABC (fig. 18.) let \(\mathrm{BCD}=\mathrm{ABC}\), then \(\mathrm{BD}=\mathrm{DC}\), and \(\mathrm{AB}=\mathrm{AD}+\mathrm{DC}\), which is greater than AC (Theor. V1I.). The converfe is demonftrated in the fame manner as the like property of plane triangles, (Geometry, Sect. I. Theor. XIII.).

\section*{Theor. 1X.}

All the angles of a fpherical triangle are together greater than two, and lefs than fix right angles.

Fig. 14
In the triangle \(A B C\) (fig. I4.) the three angles are together lefs than fix right angles, becaufe when added to the three exterior angles they only make fix ; and they are greater than two right angles, becaule their meafures \(\mathrm{GH}, \mathrm{KL}, \mathrm{MN}\), added to DE, EF, FD, are equal to three femicircles; and DE, EF, FD being lefs than two femicircles (Theor. VII.) GH, KL, MN muft be greater than one.

\section*{Theor. X.}

Any two angles of a fpherical triangle are together greater, equal, or lefs than two right angles, according as the fum of the oppofite fides is greater, equal, or lefs than a femicircle; and converfely.
Fig. r9. Let the fides \(A B, A C\) (fig. 19.) of the fpherical triangle \(A B C\) be preduced to meet in \(D\); then it is e.vident that according as the fum of \(A B, B C\) is greater, cqual, or lefs than the femicircle ABD , the fide BC will be greater, equal, or lefs than BD ; the angle D or A will be greater, equal, or lefs than BCD, and the fum of the angles \(\mathrm{BAC}, \mathrm{BCA}\) greater, equal, or lefs than the fum of \(\mathrm{BCA}, \mathrm{BCD}\), which is two right anples.

Cur. According as half the fum of any two fides of
a folherical triangle is greater, equal, or lefs than a que- Spheri drant, half the fum of the oppofite angles will te gireat- Trigonc er, equal, or lefs than a right angle.

\section*{Theor. XI.}

In a right-angled triangle, according as either of the fides about the right angle is greater, equal, or lefs than a quadrant, its oppofite angle is greater, equal, or lefs than a right angle ; and converfely.

Let ABC (fig. 20.) be a triangle right-angled at B, Fig. 22 . and let the fides \(A B, B C\) be produced to meet in \(D\); then, becaufe they pafs througli each others poles, E the middle point of BAD will be the pole of BCD ; let a great circle pafs through the puints CE.' The arch EC is a quadrant, and the angle ECB a right angle. Now it is plain, that accotding as \(A B\) is greater, equal, or lefs than the quadrant EB, the oppofite angle ACB will be greater, equal, or lefs than the right angle ECB, and converfely.

Cor. I. If the two fides be both greater, or both lefs than quadrants, the hypothenufe will be lefs than a quadrant; but if the one be greater and the other lefs, the hypotherufe will be greater than a quadrant, and converfely.

For in the triangles \(\mathrm{ABC}, \mathrm{ADC}\), right-angled at B , D , in which the fides \(\mathrm{AB}, \mathrm{BC}\) are lefs, and confequently \(\mathrm{AD}, \mathrm{DC}\) greater than quadrants, the hypothenufe AC is lefs than a quadrant, becaufe it is nearer to CB than the quadrant CE . But in the triangle \(a \mathrm{BC}\), of which the fide \(a \mathrm{~B}\) is greater, and BC lefs than a quadrant, the hypothenufe \(a \mathrm{C}\) is greater than a quadrant, becaufe it is further from CB than CE is.

Cor. 2. In every fpherical triangle, of which the two fides are not both quadrants, if the perpendicular from the vertex fall within, the angles at the bafe will be both acute or both obtufe; but if it fall without, the one will be obtufe, and the other acute; and converfely.

\section*{Theor. XII.}

In any right-angled fpherical triangle, as radius is to the fine of the hypothenufe, fo is the fine of one of the oblique angles to the fine of its oppolite fide.

Let ABC (fig. 21.) be a fpherical triangle, having Fig. 25. a right angle at B ; and let \(\mathrm{AD}, \mathrm{BD}, \mathrm{CD}\) be drawn to the centre of the fophere. From C, in the plane DCA, let CE be drawn perpendicular to DA, and from E, in the plane DBA, draw EF perpendicular to the fame line, and let CF be joined. Then becaufe DA is perpendicular to the two lines CE, EF, it is perpendicular to the plane CEF, and confequently the plane CEF is perpendicular to the plane DBA; but the plane DCB is alfo perpendicular to DBA ; therefore their line of common fection CF is perpendicular to the fame: Hence CFD, CFE are right angles. Now in the right-angled triangle CFE, rad. : CE :: fin. E: CF; but the angle CEF, being the inclination of the planes DCA, DBA, is the fame with the fipherical angle \(\mathrm{CAB}, \mathrm{CE}\) is the fine of AC , and CF the fine of BC ; thercfore rad. : fin. \(\mathrm{AC}::\) fin. \(A: f i n . \mathrm{BC}\).

Cor.
herital- Cor. i. As radisis to the cofine of either of the fides, zonounc- \(f_{0}\) is the cofine of the other to the cofine of the hypo"1y: thenufe.

For let the great circle of which A is the pole, meet the three fides in \(\mathrm{D}, \mathrm{E}, \mathrm{F}\); then F is the pole of AD ; and applying this propofition to the complemental triarigle FCE, rad. : fin. FC :: fin. F: fin. CE; that is, \({ }^{7}\) rad. : cof. \(\mathrm{BC}::\) cof. AB : cof. AC.

Cor. 2. As radius to the cofine of one of the fides, fo is the fine of its adjacent angle to the cofine of the other anglc.

\section*{Theor. XIII.}

In any right-angled triangle, as radius to the fine of one of the fides, fo is the tangent of the adjacent angle to the tangent of the other fide.

From B let BE be cirawn perpendicular to DA , and from E, EF alfo perpendicular to DA, in the plane DCA, to meet DC in F, and let BF be joined. It may be thown as in the preceding propofition, that FB is perpendicular to the plane DBA ; hence FB is the tangent of BC , and FBE is a right-angled triangle; therefore rad. : EB :: tan. \(\mathrm{E}: \mathrm{FB}\); that is rad. : fin. AB :: \(\tan \mathrm{A}: \tan . \mathrm{BC}\).

Cor. 1. As radius to the cofine of the hypothenufe, fo is the tangent of one of the angles to the cotangent of the other. For, in the complemental triangle FCE, (fig. 22.) rad. : fin. CE :: \(\tan . \mathrm{C}: \tan . \mathrm{FE}\), that is, rad. : cof. AC :: tan. C : cot. A, or, rad. : cof. AC :: tan. A : cot. C.

Cor. 2. As radius is to the cofine of one of the angles, fo is the tangent: of the hypothenufe to the tangent of the fide adjacent to that angle.

For rad. : fin. \(\mathrm{FE}:: \tan \mathrm{F}: \tan . \mathrm{CE}\); that is, rad. : cof. A :: cot. AB : cot. AC, or rad. : cof. A :: tan. \(\mathrm{AC}: \tan . \mathrm{AB}\).

\section*{Napier's Rule for Circular Parts.}

Let the hypothenufe, the two angles, and the complements of the two fides of any right-angled fpherical triangle be called the fivecircular parts of the triangle. Any one of theie being confidered as the middle part, let the two which are ne.st to it be called the adjacent parts, and the remaining two the oppofite parts. Then the two preceding theorems, with their corollaries, may be all expreffed in one propofition adapted to practice, as follows.

In any right-angled Spherical trinngle, the rectangle under radius, and the cofine of the middle part, is equal to the reftangle under the cotangents of the adjacent parts, or to the rectangle under the fines of the oppofite parts.

CASE 1. Let the hypothenufe \(A C\) be the middle part.
Then, rad. : cof. AC :: tan. C : cot. A (Theor. 13 : Cor. 1.).
Therefore (rad. : tan. C :i) cot. C : rad. :: cof. AC: cot. A.
And rad. : cof. \(A B \prime:=\) cof, \({ }^{\prime} B C\) : cof. \(A C\) (Theor, 12 : Cor. 1.).
Casf. 2. Let the angle A be the middle part. .

Then ('Theor. 13. Cor. 2.) rad. : cof. \(\mathrm{A}::\) tan. \(\mathrm{AC}:\) Spherical
trigmon!-
Therefore, (rad. : tan. \(\mathrm{AC}::\) ) cot. \(\mathrm{AC}: \mathrm{rad},:\) cof. \(\underbrace{\text { try. }}\). A : tan. AB,
And (Theor. 12. Cor. 2.) rad. : cof, BC :: fin. C : cof. A.
CAsf: 3. Let the complement of the fide \(A B\) be the micidle part.
Then (Theor. 13.) rad. : fin. \(\mathrm{AB}:: \tan , \mathrm{A}: \tan , \mathrm{BC}\). Thetefore (rad. : tan. A ::) cot. A : rad. :: fin. AB: tan. BC.
And ('Heor. 12.) rad. : fin. AC :: fin. C : fin, AB.
We are indebted for the foregoing rule to Napier, the celebrated inventor of logarithms. It comprebends all the propofitions which are neceflary for the refolution of right-ingled triangles, and being eafily remembered, is perhaps onc of the happieft inftances of artificial memory that is known.

\section*{Theor. XIV.}

In any fpherical triangle, the fines of the fides are proportional to the fines of the oppofite angle.
This propofition has been demonftrated in the cafc of right-angled triangles. Let ABC be any oblique- Fig. \(5^{\circ}{ }^{\circ}\) angled triangle, divided into two right-angled triangles, \(\mathrm{ABD}, \mathrm{CBD}\), by the perpendicular BD , falling from the vertex upon the bafe \(A C\). In the former, the complement of BD being the middle part, rad. \(\times\) fin. \(\mathrm{BD}=\mathrm{fin}, \mathrm{AB} \times\) fin. A, (Napier's Rule). In the latter, the complement of BD being the middle part, rad. \(\times\) fin. \(B D=\operatorname{fin} . \mathrm{BC} \times\) fin. \(C\). Hence fin. \(A P\) \(x\) fin. \(A=\) fin. \(B C \times\) fin. \(C\), and fin. \(A B:\) fin. \(B C::\) fin. C : fin. A.

Cor. 1. The cofines of the two fides are to one another directly as the cofines of the fegments of the bafe. This is proved by making \(\mathrm{AB}, \mathrm{BC}\) the middle part.

Cor. 2. The tangents of the two fides are to one another inverfely as the cofines of the vertical angles. This will follow from making the angles \(A B D, C B D\) the middle parts.

Lemma 1 . The fum of the tangents of two arches is to their difference, as the rectangle under the fine and cofine of half their fum to the rectangle under the fine. and cofine of half their difference.

For, putting \(a\) and \(b\) for any two arches, by the arithmetic of fines (Algefra, § 353.),
\[
\operatorname{Sin} . a \operatorname{cof} . b+\operatorname{cof} . a \operatorname{fin}, b=\operatorname{fin} .(a+b) .
\]

Let each fide of this equation be divided by cof. \(a\) cof. \(b_{\text {, }}\), and we gct
\[
\frac{\sin . a}{\operatorname{col} . a}+\frac{\operatorname{fin} . b}{\operatorname{col} . b}=\frac{\operatorname{fin}:(a+b)}{\sin . a} \frac{(\operatorname{cof} . b}{b}
\]
that is, \(\tan \cdot a+\tan : b=\frac{\operatorname{fin} .(a+b)}{\operatorname{fin} . a \frac{\operatorname{cof} \cdot b}{}}\).
In like manner, from the formula fin. \((a-b)=\) fin. \(a \operatorname{cof} . b-\operatorname{cof}\). \(a\) fin. \(b\); we.get
\(\tan . a-\tan . b=\frac{\operatorname{fin} .(a-b)}{\operatorname{fin} . a \operatorname{cof} \cdot b:}\)
therefore \(\tan . a+\tan . b: \tan a-\tan , b: \operatorname{fin} .(a+b)\) \(:\) fin. \((a-b)\), and remarking that fin \((a+b)=2\) fitr.

\section*{TRIGONOMETRY.}

Splarerical \(\frac{1}{2}(a+b) \operatorname{cof}\). \(\frac{1}{2}(a+b)\), and Gn. \((a-b)=2 \mathrm{fm}\). Trigunome- \(\frac{1}{y}(a-b)=\left\{\frac{1}{2}(a-b),(\right.\) Aigebra \(\}\). 358\()\) it folluws \(\underbrace{\text { try: that tan. } a+\tan . b: \tan , a-\tan . b:: \text { fin } \cdot(a+b)}\) col. \(\frac{3}{2}(a+b): \operatorname{fin} . \frac{1}{2}(a-b) \cos \frac{1}{\frac{1}{2}(a-b)}\).
leamma 2. The furn of the fines of two arches is to their difference, as the refiangle under the fine of half the foum arid cofine of half the difference of thefe arches is 10 the rectangle undicr the fine of half the differcnce and cofine of half the funn.

Fur it has been thown in the arithmetic of fines (AlCEBRA, § 355 ), that
\[
\begin{aligned}
& \text { Sin. }(p+q)+\text { fin. }(p-q)=2 \text { fin. } p \text { cof. } q, \\
& \operatorname{Sin} .(p+q)-\text { fin. }(p-q)=2 \text { cof. } p \text { fin. } q .
\end{aligned}
\]

Let \(p=\frac{r}{8} a+\frac{1}{2} b\), and \(q=\frac{1}{2} a-\frac{1}{2} b\), fo that \(p+q\), \(=a\) and \(p-q=b\), then thefe formulas become
\[
\begin{aligned}
& \operatorname{Sin} . a+\operatorname{fin} . b=2 \text { fin. } \frac{1}{2}(a+b) \operatorname{cof} \frac{1}{2}(a-b) \\
& \operatorname{Sin}, a-\operatorname{fin} . b=2 \operatorname{cof} \frac{1}{2}(a+b) \sin . \frac{1}{2}(a-b) .
\end{aligned}
\]

Therefore, fin. \(a+\) fin. \(b:\) fin. \(a-f i n . b::\) fin. \(\frac{1}{3}(a+b) \operatorname{cof} \frac{1}{2}(a-b):\) cof. \(\frac{1}{2}(a+b)\) fin. \(\frac{1}{2}(a-b)\).

Lemvas 3. The fuem of the fincs of two arches is to their difference, as the tangent of half the fum of thefe arches is to the tangent of half their difference.

For, dividing the latter antecedent and confequent of the proportion in the foregoing Iemma by cof. \(\frac{x}{x}(a+b)\) \(\times\) cof. \(\frac{1}{2}(a-b)\), we have fin. \(a+\) fili, \(b:\) fin. \(a-\) fin. \(b:: \frac{\operatorname{in} . \frac{1}{2}(a+b)}{\cot \cdot \frac{1}{2}(a+b)}: \frac{\operatorname{fin} . \frac{1}{2}(a-b)}{\operatorname{cof} \cdot \frac{1}{2}(a-b)}\), that is, becaufe \(\frac{\operatorname{fin} .}{\operatorname{cof} .}=\) tan. fin. \(a+\operatorname{fin} . b:\) fin. \(a-\) fin. \(b:: \tan , \frac{7}{2}(a+b):\) tan. \(\frac{1}{2}(a-b)\).

Lemma 4. The fum of the cofines of tuo arches is 10 their difference, as the cotangent of half the fum of thefe arches is to the targent of half their difference.

By Arithmetic of fines (Algerra, § 355 .),
col. \((p-q)+\operatorname{cof} .(p+q)=2\) cof. \(p\) cof. \(q\), \(\operatorname{cof} .(p-q)-\operatorname{cor} .(p+q)=2\) fin. \(p\) fin. \(q\).
Let \(p=\frac{1}{4}(b+a)\) and \(q=\frac{r}{2}(b-a)\), then \(p-q=a\) and \(p+q=b\), and the two formulas bccome
\[
\begin{aligned}
& \operatorname{cof} . a+\cos . b=2 \operatorname{cof} \cdot \frac{1}{\frac{1}{2}}(b+a) \operatorname{cof} . \frac{1}{\frac{1}{2}}(b-a), \\
& \operatorname{cof}, a-\operatorname{cof} . b=2 \operatorname{fin} . \frac{1}{2}(b+a) \sin \cdot \frac{1}{8}(b-a) ;
\end{aligned}
\]

Hence, cof. \(a+\operatorname{cof.} b: \operatorname{cof}, a-\operatorname{cof} . b:: \operatorname{cof} . \frac{1}{2}(b+a)\) cof. \(\frac{t}{y}(b-a): \operatorname{fin} \frac{1}{\square}(b+a) \ln . \frac{1}{3}(b-a)\);
and dividing the latter antecedent and confequent by fin. \(\frac{1}{3}(b+a)\) cof. \(\frac{1}{2}(b-a)\),
\(\operatorname{cof} . a+\operatorname{cof} . b: \operatorname{cof} . a-\operatorname{cof} . b:: \frac{\operatorname{cof} . \frac{1}{\frac{1}{2}}(b+a)}{\operatorname{fint} \frac{1}{2}(b+a)}\)
\(: \frac{\text { finc. } \frac{1}{+}(h-n)}{\operatorname{col} \cdot \frac{1}{y}(b-a)}\), that is, becaufe \(\frac{\operatorname{cof} f_{0}}{\text { fin. }}=\cot\).
and \(\frac{\text { fin. }}{\text { cof. }}=\tan\). we have cof. \(a+\operatorname{cof} . b: \operatorname{cof} a-\) cof. \(b:: \cot . \frac{7}{8}(b+a):\) tan. \(\frac{1}{2}(b-a)\).

Fig. \({ }^{26}\).
In the demonfration of the remaining theorems, we Sall put \(A, B\) for the angles \(A\) and \(B\) at the bafe of the fptcrical triangle ACB (fig. 26), \(a\) and \(b\) for the fides oppofite to thefe angles, \(p\) and \(q\) for the fegments of the bafe BD, AD made by the perpendicular arch \(C D, P\) and \(Q\) tor the vertical angles \(B C D, A C D\); we

Thall alfo put \(s\) fur \(\div(a+b), d\) for : \((a-b), s^{\prime}\) for Spheri \(\frac{1}{4}(p+q), d^{\prime \prime}\) for \(\frac{1}{\pi}(p-q), S\) for \(\frac{1}{2}(A+13), D\) for Trigoni \(\frac{3}{2}(\mathrm{~A}-\mathrm{B}), \mathrm{S}^{\prime}\) foi \(\frac{1}{2}(\mathrm{P}+\Omega)\), and \(\mathrm{D}^{\prime}\) for \(\frac{1}{2}(\mathrm{P}-\Omega)\).

\section*{Thisor, XV.}

In any fpherical triangle, the tangent of half the fum of the fegments of the bafe is to the tangent of half the fum of the two fides, as the tangent of half their difference to the tangent of half the difference of the fegments of the balfe.

For by Theor. XIV. Cor. 1. cof. \(a: \operatorname{cof.} b:: \operatorname{cof}\). \(p\) : cof. \(q\); therefore, cof. \(a+\operatorname{cof.} b: \operatorname{cof} . a-\operatorname{cof} . b\) :: cof. \(p+\operatorname{cof} . q:\) cof. \(p-\operatorname{cof}\). \(q\), hence (Lemma 4.) cot. \(s:\) tan. \(d::\) cot. \(s^{\prime}: \tan . d^{\prime \prime}\), ur col. \(s:\) cot. \(s^{\prime}:: \tan , d\) : tan. \(d^{\prime \prime}\); but cot. \(s: \cot . s^{\prime}::\) tan. \(s^{\prime}:\) tarl. \(s\), therefore, \(\tan . s^{\prime}: \tan , s:: \tan . d: \tan . d^{\prime}\). This propofition expreffed in words at length is the theorm to be demonitrated.

\section*{Theor. XVI.}

The cotangent of half the fum of the vertical angles and the tangent of half their difference, or the cotangent of half their difference and the tangent of half their fum, according as the perpendiculars fall within or without, are reciprocally proportional to the tangents of half the fun and half the difference of the angles at the bafe.

For, taking the cale in which the perpendicular CD Fig. 27. (fig. 27.) falls within, let EI.: be the fupplemental triangle, let the arches GE, GF mect again in L , and produce \(\mathrm{CA}, \mathrm{CB}\) to met EF in H and K . Becaufe G and L are the poles of AB , the perpendicular CD, if produced, will pafs through \(G\) and \(L\); let it meet EF in I; then, becaufe C is the pole of EF, the atch GCI is perpendicular to EF , and fince E is the pole of BC , \(\mathrm{KE}=\mathrm{a}\) quadrant \(=\mathrm{FH}\), and \(\mathrm{EH}=\mathrm{KrF}\), and \(\mathrm{F}-1 \mathrm{E}=\) IK-1H. In the triangle LEF, by the preceding propofition, tan. \(\frac{1}{2}(\mathrm{FI}+\mathrm{IE}): \tan \cdot \frac{x}{2}(\mathrm{FL}+\mathrm{LE}):: \tan\). \(\frac{1}{2}(\) FL-LE \(): \tan \cdot \frac{1}{2}(\) FI-IF. \()\) or \(\tan \cdot \frac{1}{2}(\mathrm{Kl}-\mathrm{IH})\). Now \(\mathrm{Fl}+1 \mathrm{E}\), or FE , being the fupplement of C , (Theor. 5.), tan. \(\frac{1}{2} \mathrm{FE}=\cot . \frac{1}{2} \mathrm{C}\); and FL, LE being the fupplements of FG and GE, FL and LE are the meafures of the angles \(A, B\); moreover, \(I K, I H\) are the meafures of the angles \(\mathrm{BCD}, \mathrm{ACD}\), therefore, cot. \(\frac{\pi}{2} C\), or cot. \(\frac{1}{2}(P+Q): \tan . \frac{1}{2}(A+B): \tan\). \(\frac{1}{2}(A-B)\) : and. \(\frac{1}{2}(P-Q)\). In the very fame way it may be proved, when the perpendicular falls without the triangle, that cot. \(\frac{1}{2}(P-Q): \tan\). \(\frac{1}{2}(A+B)\) \(:=\tan \cdot \frac{1}{2}(A-B): \tan \frac{1}{2}\left(P^{2}+O\right)\).

\section*{Thfor. XVII.}

In any fpherical triangle, the fine of half the fum of the fides is to the fine of half their difference, as the cotangent of half the vertical angle to the tangent of half the diference of the augles at the bafe.

For fince ta:1, \(a: \tan . b:: \operatorname{col.} \mathrm{Q}:\) cof. P , therefore,
fin. \(s^{\prime}\) cof. \(s:\) fin. \(d\) cof. \(d:: \cot , S^{\prime}: \tan , D^{\prime} \ldots(1)\)
Again, becaufe (by Theor. XIV.) fin. \(a:\) fin. \(b:\) : fin. A: fin. B , therefore, fin. \(a+\operatorname{fin} . b:\) fin. \(a-\) fin. \(b\) :: fin. A + fin. B : Gin. A-fin. B; hence, (by Lemana 2. and 3.).
fin. \(s\) cof. \(d:\) fin. \(d\) col, \(s::\) tan. S : tan. D . . . (2).
Taking now the product of the correfponding terms of the propurtions (1) and (2), and rejecting the factor cof. \(s\) cor. \(d\), which is common to the firft antecedent and confequent of the refulting proportion, we have,
\[
\operatorname{fin}^{2} s: \operatorname{fin}^{2} d:: \cot . \mathrm{S}^{\prime} \tan . \mathrm{S}: \tan \mathrm{D}^{\prime} \tan . \mathrm{D} .
\]

But fince by Theor. XVI. tan. \(\mathrm{S}: \tan . \mathrm{D}^{\prime}::\) cot. \(\mathrm{S}^{\prime}\) : tan. D , therefore cot. \(\mathrm{S}^{\prime}\) tan. \(\mathrm{S}^{\prime}: \tan ^{\text {an }} \mathrm{D}^{\prime}\) tan. \(\mathrm{D}::\) cot. \(^{2} \mathrm{~S}^{\prime}\) \(: \tan ^{2}{ }^{2} \mathrm{D}\); therefore, fin. \({ }^{2} \mathrm{~s}: \mathrm{fin}^{3} d:: \cot ^{2}{ }^{2} \mathrm{~S}^{\prime}: \tan ^{2} \mathrm{D}\), and fin. \(s:\) fin. \(d::\) cot. \(\mathrm{S}^{\prime}:\) tan. D , this proportion when exprefied in words is the proportion to be demoriftrated.

\section*{Theor. XVIII.}

In any fuherical triangle, the cofine of half the fum of the two files is to the cofine of half their difference, as the cotangent of half the vertical angle to the tangent of half the fum of the angles at the bafe.

For it has been proved in laft theorem that
\[
\text { fin. } s \text { cof. } s: \operatorname{fin} . d \operatorname{cof} . d:: \cot . \mathrm{S}^{\prime}: \tan . \mathrm{D}^{\prime}
\]
fin. \(s\) col, \(d:\) fin. \(d\) col, \(s:: \tan\). \(\mathrm{S}: \tan . \mathrm{D}\);
therefore, dividing the terms of the firt of thefe two proportions by the correfponding terms of the fecond, we get,
\[
\frac{\operatorname{cof} . s}{\operatorname{col} . d}: \frac{\operatorname{cof} . d}{\operatorname{col} . s}: \frac{\cot . \mathrm{S}^{\prime}}{\tan . \mathrm{S}}: \frac{\tan . \mathrm{D}^{\prime}}{\tan . \mathrm{D}}
\]

Hence, multiplying the firft and fecond terms by cof. s \(x\) cof. \(d\), and the third and fourth by tan. \(\mathrm{S} \tan . \mathrm{D}\), we have,
\[
\text { cof. }{ }^{3} s: \operatorname{cof}^{2}{ }^{2} d:: \cot . \mathrm{S}^{\prime} \tan , \mathrm{D}: \tan . \mathrm{S} \tan . \mathrm{D}^{\prime} .
\]

But fince by Theor. XVI. tan. D:tan. \(\mathrm{D}^{\prime}::\) cot. \(\mathrm{S}^{\prime}\) : \(\tan\). S , therefore, cot. \(\mathrm{S}^{\prime} \tan . \mathrm{D}: \tan . \mathrm{S} \tan . \mathrm{D}^{\prime}:: \cot ^{2} \mathrm{~S}^{\prime}\) : \(\tan .^{2} S\); therefore, cof. \({ }^{2} s: \operatorname{cof} .^{2} d:: \cot ^{2} \mathrm{~S}^{\prime}: \tan ^{2} \mathrm{~S}\), and \(\operatorname{cof}\). \(5: \operatorname{cof} . d:: \cot . \mathrm{S}^{\prime}: \tan . \mathrm{S}\).

\section*{Theor. XIX.}

In any fpherical triangle, the fine of half the fum of the angles at the bafe is to the fine of half their difference, as the tangent of half the bafe to the tangent of half the difference of the two fides.

For the fame confruction being made as in Theor. XVI. in the trianule ELF (fig. 27.) fin. \(\frac{1}{2}\) (FL+LE) : fin. \(\frac{\frac{x}{2}}{2}\) (FL-LE) :: cot. \(\frac{7}{\frac{7}{y}} \mathrm{~L}: \tan \frac{\frac{1}{2}}{2}(\mathrm{E}-\mathrm{F})\) (Theor. XVII.) ; but EFG being the fupplemental triangle of \(\mathrm{ABC}, \mathrm{LF}\) and LE are the meafures of A and \(\mathrm{B}, \mathrm{L}\) is the fupplement of AB, ard LFE, LEF are the meafures of the fides AC, BC (Theor. V.) ; therefore fin.
\(-\Lambda \mathrm{C})\).

Theor. XX.
In any fipherical triangle, the cofine of half the funs of the angles at the bafe is to the cofme of half their difference, as the tangent of half the bafe to the tangent of half the fum of the two fides.

For in the triangle EIF, cof. \(\frac{x}{2}\) (LF +LE) : cof. Fig. 27 \(\frac{1}{2}(\) LF-LE \():: \cot \frac{1}{2} \mathrm{~L}: \tan . \frac{1}{2}(E+F)(11\). XVIII.) that is, becaufe of the relation of the irrangle FLE to ABC , as exprefied in lall theorem, cof. \(\frac{1}{2}(A+B)\) : cof. \(\frac{1}{2}(A-B):: \tan \cdot \frac{1}{2} A B: \tan \cdot \frac{1}{2}(B C+A C)\).

\section*{Scholium.}

Let one nf the fix parts of any fpherical triangle be neglected; let the one oppofite to it, or its fupplement, if an anyle, be called the middle part, the two next to it the adjacent parts, and the remaining two the oppofite parts. Then the four preceding propofitions, which are called Napier's Annlogies, becaufe firf invented by him, may be included in one, as follows.

In any fpherical triangle, the fine or cofine of hatf the fum of the adjacent parts, is to the fine or cofine of half their difference, as the tangent of half the middle part 10 the tangent of half the difference or half the fum of the oppofite parts, that is,
Sin. \(\frac{x}{2}(\mathrm{~A}+a):\) fin. \(\frac{x}{2}(\mathrm{~A}-a):: \tan . \frac{x}{2} \mathrm{M}: \tan\). \(\frac{1}{2}(\mathrm{O}-\mathrm{c})\).
\(\operatorname{Cof}^{2} \frac{x}{2}(\mathrm{~A}+a): \operatorname{cof} . \frac{x}{2}(\mathrm{~A}-a):: \tan , \frac{\pi}{2} \mathrm{M}: \tan\). \(\frac{1}{3}(\mathrm{O}+\mathrm{o})\).
When \(\mathrm{A}, a\) and M are given, by the firt proportion, \(\frac{x}{2}(\mathrm{O}-0)\) is found, and by the fecond \(\frac{1}{2}(\mathrm{O}+0)\); thence O and o may be had immediately by the problem following Theor. IV. Plane Trigonometry.

\section*{The Cafes of Right-angled Spherical Triangles.}

In a right-angled triangle, let \(c\) denote the fide op-Fig. 28: pofite the right angle, \(a, b\) the fides containing it, and A, B the oppofite angles, A being oppofite to \(a\), and B to \(b\). Then, combining thefe quantities two by two, there will be found to be fix diftinct combinations, or cales.

Case 1. When \(c\); A, the hypothenule and cne of the angles are given; to find \(a, b, \mathrm{~B}\).
\(a\) is found by Thenr. XII. ; \(b\) by Theor. XIII. Co . 2. and B by Theor. XIII. Cor. I.

CASE 2. Given \(a, B\), a fide and its adjacent angle. Sought. A, \(b, c\).

A is found by Theor. XII.Cor. 2.; b by Theor. XIII.; \(c\) by Theor. XIII. Cor. 2.

Case 3. Given \(a, A\), a fide and its oppofite angle; to bind \(b, \mathrm{~B}, c\).
\(b\) is found bv Theor. XIII.; B by Theor. XII.; Cor, 2. c by Theor. XI!.

CasF. 4. Given \(c, a\), the hypothenufe, and one of the fides; to find \(A, b, B\).

A is found bv Theor. X11.; \(b\) by Theor. XII. Cor: I.; B by Theor. XIII. Cor. 2.

Case

Spherica!Trigoname15.

Case 5. Given \(a, b\), the two fides. Sought \(\mathrm{A}, \mathrm{B}, \mathrm{c}\) A is found by Theor, XIII.; B by the lame; \(c\) by Theor. XII. Cor, 1.

Case 6. Given \(\mathrm{A}, \mathrm{B}\), the two angles. Sought \(a, b, c\).
\(a\) and \(b\) are found by Theor. XII. Cor. ; \(2 c\) by Theor. XIII. Cor. I.

Tue cafes may be all refolved alfo by Napier's Rufes, obferving to make each of the things given the middie part : then two of the required parts will be found, and the remaining part is found by making it the middle part.

Sy Theor. II. and Cor. I. each of the unknown parts is, in every cafe except the third, limited to one value.

\section*{The Cafes of Oblique-angled Spherical Triangles.}

In any fpherical triangle let the fides be denoted by \(R, b, c\), and the oppofite angles by \(\mathrm{A}, \mathrm{B}, \mathrm{C}\) refpectively.

Let \(p, q\) denote the fegments into which a fide is divided by a perpendicular from the oppofite angle, and \(P, Q\) the parts into which it divides the angle. Com. bining the fix quantities \(a, b, c, \mathrm{~A}, \mathrm{~B}, \mathrm{C}\), three by three, there are found fix diltinct combinations or cafes.

Case i. Given \(a, A, b\), two fides and an angle oppofite to one of them. Sought \(c, B, C\).

B is found by Theor. XIV.; \(c\) by either Theor. XIX.; or Theor. XX.; C by Theor. XVII. or Theor. XVIII.

CASE 2. Given \(\mathrm{A}, a, \mathrm{~B}\), two angles and a fide oppofite to one of them. Sought \(l, c, \mathrm{C}\).
\(b\) is found by Theor. XIV.; \(c\) and C as in Cafe I.
Case 3. Given \(a, C, b\), two fides and the included angle. Sought \(A, B, c\).

Find \((A-B)\) by Theor, XVII, and \(:(A+B)\) by Sphe Theor. XVIII, and thence A and B by the rule Trigor Sect. Il. for finding each of two quantities whofe fum and difference are given. All the angles being known, alfo two fides, \(c\) is found by Theor. XIV.

Cass: 4. Given \(\mathrm{A}, c, \mathrm{~B}\), two angles and a fide between them. Sought \(a, \mathrm{C}, b\).

Find \(\frac{1}{2}(a-b)\) by Theor. XIX. and \(\frac{7}{5}(a+b)\) by Theor. XX. and thense \(a, b\). All the fides and two angles being now known, C is found by Theor. XIV.

Case 5. Given \(a, b, c\), the three fides. Sought A, \(B, C\).
Draw a perpendicular from any one of the angles, dividing the oppofite fide into the fegments \(p, q\). Find \(\frac{1}{2}(p-q)\) by Theor. XV. and then, from \(\frac{1}{8}(p+q)\) and \(\frac{2}{2}(p-q)\), find \(p, q\). The triangle being now refolved into two right-angled triangles, the angles may be found by Cafe 4. of right-angled triangles.

Case 6. Given A, B, C, the three angles. Sought \(a, b, c\).

Draw a perpendicular, dividing any one of the angles into the parts \(P, Q\). Find \(\frac{1}{3}(P-Q)\) by Theor. XVI. and then \(\mathrm{P}, \mathrm{Q}\). The triangle being now refolved into two right-angled triangles, the fides may be found by Cafe 6. of right-angled triangles.

By Theor. X. XI. and Cor. each of the unknown parts is limited to one value in all the cafes, except in fome of the fubcafes of the firft and fecond.

As every oblique-angled triangle may be refolved into two right-angles, all thefe cafes may be refolved by means of Napier's Rulc, and the 5 th propofition only. And the cafes may be reduced to three, by ufing the fupplemental triangle.

\section*{T R I}

TRIHILAT 牛, from tres, " three," and hilum, " an external mark on the feed;" the name of the 23 d clafs in Linnæus's Fragments of a Natural Method;" confifing of plants with three feeds, which are marked with an external cicatrix or fcar, where they are faftened within the fruit. See Botany.

TRIM, implies in general the fate or difpofition by which a fhip is beft calculated for the feveral purpofes of navigation.

Thus the trim of the hold denotes the moft convenient and proper arrangement of the various materials contained therein relatively to the fhip's motion or flability at fea. The trim of the mafts and fails is alfo their molt appofite fituation with regard to the confruction of the thip and the effort of the wind upon her fails. See SEAgqanship.

TRINGA, Saxdpiper; a' genus of birds belong-

\section*{T, R I}
ing to the order of gralla. See Ormithology Index.

Trinidad, an inand in the gulf of Mexico, feparated from New Andalufia, in Terra Firma, by a Arait about three miles over. The foil is fruitful, producing fugar, cotton, Indian corn, fine tubacco, and fruits. It was taken by Sir Walter Raleigh in 1595 , and by the French in 1676, who plundered the inand and then left it. It is about 62 miles in length, and 45 in breadth; and was difcovered by Cluritopher Columbus in 1498. It is now in the poffeffion of Britain. What was called a bituminous lake in this ifland, appears, from the experiments of Mr Hatchet, to be a poo ous fitone from which the mineral pitch exudes.

TRINITARIANS, thofe who believe in the Trinity; thofe who do not believe therein bcing called Antis trinitarians.

anty TRINITY, in Theology, the ineffable nyyfery of three perfons in one God; Father, Son, and Holy Spirit. See Theology.

Thinitr-Houfe. See London, No 49.
Thinits-Sunday, a fentival obferved on the Sunday nexi after Whitfunday, in honour of the holy Trinity. The obfervation of this feltival was fult enjoined in the council of Arles, anno 1260.
TRINOBANTES, in Ancimt Geography, a people of Britain, luppofed to have occupied Middlefex and Effex.

TRIO, in Mufic, a part of a concert wherein three perfons fing ; or, more properly, a mufical compofition confiting of thee parts.

TRIPHTHONG, in Grammar, an affemblage or concourfe of three vorvels in one fyilable; as quae.

TIRILLE, in Mufic, is one of the fpecies of meafure or time. See Music.

TRIPOD, in antiquity, a famed facred feat or fool, fupported by three feet, whicreon the piells and fibyls were placed to render oracles. It was on the tripod that the gods were faid to infpire the Pythias with that divine fury and enthufiafn wherewith they were feized at the delivery of their predictions.

TMIPOLI, a country of Africa, in Larbary; bounded on the north by the Mediterranean fea; on the fouth, by the country of the Beriberies; on the weft, Ly the kingdom of Tunis, Biledulgerid, and territory of the Gadamis; and on the ealt, by Egypt. It is about 925 miles along the fea conft; but the breadth is various. Some parts of it are pretty fruitful; but that towards Egypt is a fandy defert. It had the title of a kingdon; but is now a republic, governed by a dey. He is not abfolute; for a Turkifh bafhaw refides here, who receives his authonity from the grand feignior, and has a power of controulling the dey, and levying taxes on the people. The dey is clected by the foldiers, who make no fcruple of depofing him when they pleafe.

Tripoli, a confiderable town of Africa, and capital of a republic of the fame name in Barbary, and under protection of the grand feignior, with a caftle and a fort. It is pretty large, and the inhabitants are noted pirates. It was taken by Charles \(V\). who fettled the Enights of Malta there; but they were driven away by the Turks in 1551 . It was formerly very flourihing; and has now forme trade in fuffs, faffron, corn, oil, wool, dates, offrich feathers, and fkins: but they make more of the Chriltian flaves which they take at fea; for they either fet high ranfoms upon them, or make them perform all forts of work. It is feated on the coaft of the Medicerranean, in a fandy foil, and furrounded by a wall, Arengthened by o:her fortifications. E. Long. 13. 12. N. Lat. 32.34.

Tripols, called Tripolis of Syria, to difinguilh it from 'Tripoli in Barbary, received its name from its being anciently formed of three cities at a fmall diftance from each other, one of which belonged to the Aradians, or ancient kingdom of Arad, the fecond to the Sidonians, and the third to the Tyrians, periaps as a common mart to thofe maritime powers. The prefent town of Tripoli is built at the diftance of a mile and a half from she other, upon the declivity of a hill facing the fea, in \(34^{\circ} 20^{\prime}\) north latitude, and in \(35^{\circ} 50^{\prime}\) ealt longitude from Greenwich. It is furrounded with walls, fortifed with feven ligh Arong towers, and cafle, all of Go-

Vor.. XX. Part II.
thic architedu:e; but the frects are narrow, and the houfes low. The city contains about 8000 houles, and near 60,000 inhabitants, confiting of 'luks, Chrif. tians, and Jews. The balha, or paclad, who refides in the caftle, where there is a garrifon of 200 janizaries, governs the adjacent territory, in which there is plenty of fruit, and a great number of mulberry trecs, which enable the inhabitants to carry on a fiti manufacture. from which they draw confiderable profit.

All the enviruns of l'ripoli are lend out in orchards, where the nopal grows fpontancoully, and the white mulbery is cultivated for the lish-woru; the potnegranate, orange, and lemon hees for their liuit, which is here very tine. 'The country, though delightul to the eye, is unhealthy; from July to September, epidemic fevers, like thole of Scanderoon and Cyprus, picvaii, and ate principally caufed by the artificial mundations made for the purpofe of watering the mulberry trees, to enable them to throw out their lecond leaves, and fism a want of frce circulation of sir, the city being open only to the wellward.

1kıpolt, a lpecits of argillaceous earth, much ufed in the polahing of metals. See Mineralogy Index.

TRIPiolimus, Lafos of. See Mystlries, \(\mathrm{N}^{0}{ }_{74}\) 。

1 KIQUETIOUSS, among botanifs, denotes a fruit or leaf that has three flat fides or faces.

TRIKEMIS, in antiquity, a galley with three ranks of oars on a fide.

TRISMEGIS'IUS, an epithet or furname given to one of the two Hermefes. See Thotit.

TRismuS, the Locked Jaw. See Medicine, No 280.

TRISSYLLABLE, in Grammar, a word confiling of three fyllables.

TRITICUM, Wheat ; a genus of plants belonging to the clafs of triandria; and in the natural fyftem ranging under the \(4^{\text {th }}\) order, Gramina. See. Botasiy and Agriculture. Index.

TRITON, a fea demigod, held by the ancients to be an officer or trumpeter of Neptune, attending on him, and carrying his orders from fea to lea.

IRIIURATION, the act of reducing a folid body into a fubtile powder; called allo pulverifation and lewigaion.

TllIUMPH, in Foman antiquity, a public and folenn honour conferred by the liomans on a victonious general by allowing him a magnificent entry into the city:

The greater triumph, called alfo curulis, or finply the triumph, was decreed by the fenate to a general, upon the conquering of a province or gaining a fignal victory. The day appointed for the ceremony being arrived, feaffulds were erected in the form and circus, and all the other parts of the city where they could belt behold the pomp: the fenate went to meet the conqueror without the gate called Capena or Triumplalis, and marched back in order to the Capitol; the ways being cleared and cleanfed by a number of officers and tipftaff, who drove away fuch as thronged the panage or Atraggled up and down. The general was clad in a rich purple rabe, interworen with 太gures of gold, fetting forth lis great exploits; his bulkins were befet with pearl; and he wore a crown, which at firf was only laurel, but afterwards gold; in one hand be bore \(3 Q\)

\section*{T R O [490] T R O}

Triumph
was carried in a magnificent chariot, adorned with ivory and plates of gold, drawn ufually by two white horfes; though fometimes by other animals, as that of Pompey, when he triumphed over Africa, by elephants; that of Mark Antony by lions; that of Heliogabalus by \(1 y\) gers; that of Aurelian by deer, \&c. His children were at his feet, and fometimes on the chariot-horfes. The procefion was led by the muficians, who played triumphal pieces in praife of the general : thefe were followed by young men, who led the vitims to the facrifice, with their homs gilded, and their lieads adomed with ribbands and garlands; next came the carts and waggons, loaded with all the fpoils taken from the cnemy, with their horfes, chariots, \&c.; thefe were followed by the kings, princes, and generals, who had been taken captives, loaded with chains: after thefe appeared the triumphal chariot, before which, as it paffed, they all along firened Howers, and the people with loud acclamations called out, Io triumphe! The chariot was followed by the fenate, clad in white robes; and the fenate by fuch citizens as had been fet at liberty or ranfomed ; and the proceflion was clofed by the priefts and their officers and utenfils, with a white ox led along for the chicf victim. In this order they proceeded through the triumphal gate, along the Via Sacra, to the Capitol, where the victims were flain. In the mean time all the temples were open, and all the altars loaded with offerings and incenfe; games and combats were celebrated in the public places, and rejoicings appeared everywhere.

TRIUMVIR, one of three perfons who govern abfolutely, and with equal authority, in a ftate. It is chiefly applied to the Ruman government: Cæfar, Pompey, and Craflus, were the firlt triumvirs who divided the government among them. There were alfo other officers fo called; as the triumviri or trefviri capitales, who were the keepers of the public gaol : they had the office of punifhing malefactors; for which purpole they kept eight lictors under them.

TROAS, a country of Phrygia in Afia Minor, of which Troy was the capital. When Troas is taken for the whole king dom of Priam, it may be faid to contain Myfia and Phrygia Minor; but if only applied to that part of the country where Troy was fituated, its extent is confined within very narrow limits. Troas was ancientlv called Dardaniz. See Troja.

IROCHÆUS, in profody, a foot confiling of a Iong and fhort fylable.

TROCHANIFF, in Anotomy. See there, N \({ }^{5} 5\).
TROCHE, in Pharmacy, a fort of medicine made of glutinous fubikances into little cakes, and afterwards exficeated. See Materia Medici Index.

TROCHII,US, HUmmivg Bird, a genus of birds belonging to the urder of picx. See Ornithology Index.

MROGLOIXYTES, in the Ancient Geography, a people of Ethopia, faid to have lived in caves under grou:d. Pomponius Mela gives a ftrange account of the Troglolvies: he fays, they did not fo properly fpeak as flriek ; and that they lived on ferpents.
©ROGUS Pomprius, a Latin univerfal hillorian to The time of Auguilus Cefar, of whom we have only an atridgement by Juftin, flourified about is B. C.
'IROJA, the capital city of Troas, or, according to
others, a country of which Ilium was the capital. It was built on a fmall eminence near Mount Ida, and the promontory of Sigrum, at the dillance of about four miles from the fea-thore. Dardanus the firt king of the country built it, and called it Durdania, and from Tros one of his fucceffors it was called Troja, and from Ilus Ifion. This city has been celebrated by the poems of Homer and Virgil; and of all the wars which have been carried on among the ancients, that of Troy is the molt famuns.

A delcription of the plain of Troy has been pub. lifhed in French in the \(3^{d}\) volume of the Philofophical Tranfactions of the Koyal Society of Edinburgh, written by M. Clievalier. The city of 'Troy, according to him, flood on the prefent fite of the modern vil. lage of Bounarbachi, diftant four leagues from the fea, and which is the relidence of an aga, ruling with ablolute fway the inhabitauts of the 'Trojan plain and the in. felior agas, to whom they are immediatcly fubject. Bounabachi is fituated on the fide of an eminence, expoled to every wind, at the termination of a fpacious plain, the foil of which is rich and of a blackifl colour. Clofe to the village is to be feen a marfh covered with tall reeds; and the fituation is impregnable on all fides except at Erin (Homer's sctsos), the hill of wild fig trees, which extended between the Scæan gate and the fources of the Scamander. Thefe circumitances, agreeing with Homer's defcriptions, frongly fupport M. Chevalicr's opinion concerning the fituation of Troy. A very interefting part of this work is the account of conical mounds or barrows, feveral of them 100 feet in diameter at the bale; and which the author maintains to be the identical tombs raifed over the athes of the heroes of the Trojan war; fome of them he deems more ancient. He defcribes particularly the tombs of Efy. etcs, Ilus, Ajax, Hector, Achilles, Patroclus, and Antilochus.

This differtation, which runs to the length of \(9^{2}\) quarto pages, is replete with erudition and ingenicus reafoning, and is illuftrated and embellifhed by maps of the plain of Proy and feveral tables of infcriptions. It has been tranflated with much accuracy and care by Mr Dalzel profeffor of Greek in the Univerfity of Edinburgh, and accompanied with large notes and illuftrations.

TROLLIUS, Globe-flower, or Iucken Gouan, a genus of plants belonging to the clafs of polyandria; and in the natural fyftem ranging under the 26 th order, Mulifliquie. See Botany Index.

TROMp, Martin Happertz Van, a celebrated Dutch admiral, was born at the Baille, in Holland. He raifed himfelf by his merit, after having diftinguifted himfelf on many occafions, efpecially at the famous ergagement near Gibraltar in \(560 \%\). He pafled for one of the greatell feamen that had till that time appeared in the world; and was declared admiral of Holland, even by the advice of the prince of Orange. He in that character defeated a large Spanifh fleet in 1630 , and gained 32 other victorics at fea; but was killed when under deck, in an engagement with the Englinh in 1653 . The ftates-general caufed medals to be ftruck to his honour, and lamented him as one of the greatefl heroes of their sepublic. Van Iromp, in the midft of the greateit glory, conflantly difcovered a remarkable modelly; for he never aftumed a higher cha-

\section*{}

Tronage racter than that of a burgher, and that of being the father of the failors.

TRONAGE, an ancient cuftomary duty or toll, for weighing of wool, According to Fleta, trona is a beam to weigh with, mentioned in the ftat. Weflm. 2. cap. 25. And tronage was ufed for the weighing wool in a flaple or public mart, by a common trona or beam; which, for the tronage of wool in London, was fixed at Leaden-Hall. The mayor and commonalty of London are ordained keepers of the beams and weights for weighing merchants commodities, with power to affign clerks and porters, \&c. of the great beam and balance; which weighing of goods and wares is called tronage; and no Atranger fhall buy any goods in London before they are weighed at the King's beam, on pain of forfeiture.

TRONE-veIGht, the moft ancient of the different weights ufed in Scotland; and, though now forbidden by feveral ftatutes, is fill ufed by many for home commodities, and that in a very irregular manner; for the pound varies in different places, and for different purpofes, from 20 to 24 Dutch ounces. The common allowance is \(21 \frac{7}{2}\) ounces for wool, \(20 \frac{\gamma}{2}\) for butter and cheefe, 20 for tallow, lint, hemp, and hay. It is divided into 16 of its own ounces, and 16 pounds make a frone.

TROOP, a fmali body of horfe or dragoons, about 50 or 60 , fometimes more, fometimes lefs, commanded by a captain, licutenant, comet, quarter-mater, and three corporals, who are the lowefl officers of a troop.

TROPE. See Oratory, No 52-66.
TROPHONIUS's cave, or Oracle, in Ancient Grography, a cave near Lebadia in Bceotia, between Helicon and Chæronea (Strabo): fo called from Trophonius, an enthufialtic diviner; who, defcending into this cave, pretended to give anfuers and pronounce oracles; and was hence called Jupiter Trophonius. Such as went down to this cave never after fmiled ; hence the proverbial faying of a man who has loft his mirth, That he is come out of Trophonius's cave. Though Paufanias, who writes from experience, contradicts this; affirming that perfons came out of the cave affected indeed with a ftupor, but that they foon after recovered themfelves. See Oracle.

TROPHY (Tropocum), among the ancients, a monument of viEtory.

Thopic-Bird. See Phaeton, Orvithology Index.

TROPICS. Sec GCography.
TROUBADOURS, poets that flourificd in Provence durirg the 12 th century.

They wrote poems on love and gallantry; on the iljuftrious characters and remarkable events of the times; fatires which were chiefly directed againf the clergy and monks; and a few didactic pieces. The troubadours were great favourites in different courts, diffuled a talte for their language and for poetry over Europe, which was about that time funk in ignorance and rudcnets; they difappeared in the \(14^{\text {th }}\) century. A hitory of the troubadours in 3 vols 12 mo , was begun by MI. de Sainte. Palaie, and finimed by the abbé Millot. Sce Mustc.

Troy. See Troja.
Trox-Weight, one of the moft ancient of the different kinds ufed in. Britain. The ounce of this weight was brouglat from Grand Cairo in Egypt, about the time of the crufades, into Europe, and fillt adopted in Troyes, a city of Champagne; whence the name.

The pound Englifb 'Jroy contains i 2 ounces, or 5760 grains. It was formerly ufed for every purpole; and is dill retained for weighing gold, filver, and jewels; for compounding medicines; for experiments in natural philofophy; and for comparing different weights with Lach other.

Scots Thor-IWeight was eftablihned by James VT: in the year 16I8, who ena\&ted, that only one weight Arould be ufed in Scotland, viz, the French 'Jroy thone of 16 pounds, and 16 ounces in the pound. The pound contains 7600 grains, and is equal to 17 oz .6 dr . avoirdupois. The cwt. or 112 lb . avoirdupois, contains only \(103 \mathrm{lb} .2 \frac{1}{2} \mathrm{oz}\). of this weight, thuugh generally reckoned equal to 104 lb . This weight is nearly, if not exactly, the fame as that of Paris and Amfterdam; and is generally known by the name of Duich weight. Mhough. prohibited by the articles of union, it is ltill ufed in weighing iron, Lemp, flax, mof Dutch and Baltic goods, meal, butcher-meat, unwrcught pewter and lead, and forne other articles.
'TRUE-love. See Paris, Botani Index.
TRUFFLES. See Licoperdon, Botany Index.
TRUMPET, a mufical inflrument, the moll noble of all portable ones of the wind kind; ufed chicfly in war, among the cavalry to direct them in the fervice. Each troop of cavalry has one. The cords of the trumpets are of crimfon, mixed with the colours of the facings of the regiments.

As to the invention of the trumpet, fome Greck hif torians afcribe it to the Tyrihenians; but others, with greater probability, to the Egyptians; from whom it might have been tranfmitted to the Ifraelites, The trumpet was not in ufe among the Greeks at the time of the Trojan trar; though it was in common ufe in the time of Homer. According to Potter (Arch. Grac. vol. ii. cap. 9.), before the invention of trumpets, the firt fignals of battle in primitive wars were lighted torches; to thefe fucceeded thells of filles, which were founded like trumpets. And when the trumpet became common in military ufe, it may well be imagined to have ferved at firt only as a rough and noify fignal of battle, like that at prefent in Abyfinia and New Zealand, and perhaps with only one found. But, even when more notes were produced from it, fo noify an inftrument mull have been an unfit accompamiment for the voice and poctry; fo that it is probable the trumpet was the firf folo inftroment in ufe among the ancients.

TrUAMPET, Articulate, comprehends both the fpenkins and the learing tumpet, is by much the moft valuable inftrument, and has, in one of its forms, been ufed by people among whom we fhould hardly have expectcd to find fuch improsements.

That the Jpeaking trumpet, of which the object is to increafe the force of articulate, founds, fhould have been known to the ancient Greeks, can excite no, worder;

\section*{T R U [492] Ti R U}

Trumpet. and therefore we eafly admit the accounts which we read of the horn or trumpet, with which Alexander addreffed his army, as well as of the whifpering caveros of the Syracufan tyrant. But that the natives of Peru were acquainted with this inftrument, will probably, furprife many of our readers. The fakt, however, feems incontrovertible.
- In the Hiflory of the Order of Jefuits, publifhed at Naples in 1601 by Beritaria, it is faid, that in the year 1595 a fmall convent of that order in Peru, fituated in a remote corner, was in danger of immediate deflruction by famine. One evening the fuperior Father Samaniac implored the help of the cacique; next morning, on opening the gate of the monaftery, he found it furrounded by a number of women, each of whom carried a fmall bafket of provitions. He returned thanks to heaven for having miraculuunly interpofed, by infpiring the good people with pity for the diftrefs of his friars. Hut when he expreffed to them his wonder how they came all to be moved as if by mutual agreement with thefe benevolent fentiments, they told him it was nofuch thing; that they looked upon him and his countrymen as a pack of infernal magicians, who by their forceries had enflaved the country, and had bcivithed their good cacique, who hitherto had treated them with kindnefs and attention, as became a true worfhipper of the fun; but that the preceding evening at funfet he had ordered the inhabitants of fuch and fuch villages, about fix miles off, to come that morning with provifions to this neft of wizzards.

The fuperior afked them in what manner the governor had warned fo many of them in fo Chort a time, at fuch a diltance from his own refidence ? They told him that it was by the tiumpet ; and that every perfon heard at their own door the diftinet terms of the order. The father had heard nothing; but they told him that none heard the trumpet but the inhabitants of the villages to which it was directed. This is a piece of very curious information; but, after allowing a good deal to the exaggeration of the reverend Jefuits, it cannot, we think, be doubted but that the Peruvians actually poffeffed this ftentorophonic art. For we may obferve that the effect defcribed in this narration refembles what wo now know to be the effect of fpeaking trumpets, while it is unlike what the inventor of fucha tale would naturally and ignorantly fay. Till fpeaking trumpets were really known, we ftoould expect the found to be equally diffufed on all fides, which is not the cale; for it is much Aronger in the line of the trumpet than in any direction very oblique to it.

About the middle of the \(17^{\text {th }}\) century, Athanafius Kircher turned his attention to the philofophy of found, and in different works threw out many ufeful and fcientific bints on the conflruction of feaking trumpets (fee Acoustics and Kircher) ; but his mathematical illuftrations were fo varue, and his own character of inattention and credulity fo notorious, that for fome time thefe works did not attract the notice to which they were well entitled.

About the year 16yo, Sir Samucl Morland, a gen-
tleman of great ingenuity, fcience, and order, took up Trump the fubject, and propofed as a queition to the Royal Society of London, What is the beft form for a fpeaking trumpet? which he called a ftentorophonic horn. He accompanied his demand with an account of his own notions on the fubject (which he acknowledged to be very vague and conjectural), and an exhibition of fome inftruments conftructed according to his views. They were in general very large conical tubes, fuddenly fpreading at the very mouth to a greater width. Their effect was really wonderful. They were tried in St James's park; and his Majelty K. Charles II. fpeaking in his ordinary colloquial pitch of voice through a trumpet only \(5^{\frac{1}{2}}\) feet long, was clearly and mof diftinctly beard at the diftance of a thoufand yards. Another perfon, felected we fuppofe for the loudnefs and diftinetnefs of his voice, was perfectly underftood at the diftance of four miles and a half. The fame of this foon fpread; Sir Samuel Morland's principles were refined, confidering the novelty of the thing, and dif. fer confiderably from Father Kircher's. The aêrial undu. lations, (for he fpeaks very accurately concerning the nature of found) endeavour to diffufe themfelves in fpheres, but are ftopped by the tube, and the refore reundulate towards the axis like waves from a bank, and, meeting in the axis, they form a trong undulation a little farther advanced along the tube, which again fpreads, is again reflected, and fo on, till it arrives at the mouth of the tube greatly magnified, and then it is diffufed through the open air in the fame manner, as if all proceeded from a very fonorous point in the centre of the wide end of the trumpet. The author diltinguithes with great judgement between the prodigious reinforcement of found in a fpeaking trumpet and that in the mufical trumpes, bugle-horn, conch-fhell, \&c.; and hows that the difference confifts only in the violence of the firt fonorous agitation, which can be produced by us only on a very fmall extent of furface. 'The mouth-piece diameter, therefore, of the mufical trumpet muit be very fmalr, and the force of blafl very confiderable. Thus one ftrong but fimple undulation will be excited, which muft be fubjected to the modifications of harmony, and will be augmented by ufing a conical tube (A). But a fpeaking trumpet muft make no change on the nature of the firit undulations ; and each point of the mouth-piece muft be equally confidered as the centre of fonorous undulations, all of which muft be reinforced in the fame degree, otherwife all diftinctnefs of articulation will be lolt. The mouth-piece mult therefore take in the whole of the mouth of the feaker.

When Sir Samuel Morland's trumpet came to be generally known on the continent, it was foon difcovered that the fpeaker could be heard at a great diftance only in the line of the trumpet; and this circumftance was by a a MrCaffegrain (Journ. des Şavans, 1672, p.1.31.) attributed to a defect in the principle of its conftruction, which he faid was not according to the laws of fonorous undulations. He propofed a conoid formed by the revo. lution of a hyperbola round its affymptote as the beft form. A Mr Hafe of Wirtemberg, on the other hand, propofed a parabolic conoid, having the mouth of the

Speaker
(A) Accordingly the found of the bugle horn, of the mufical trumpet, or the French horn, is prodigiouly loud, when we confider the fmall paffage through which a moderate blaft is fent by the trumpeter.
queaker placed in the focus. In this conftruction he plairily went on the principle of a reflection fimilar to that of the rays of light; but this is by no means the cafe. The efled of the parabola will be to give one reflection,' and in this all the circular undulations will be converted into plane waves, which are at right angles to the axis of the trumpet. But nothing linders their fubfequent diffufion; for it does not appear that the found will be enforced, becaufe the agitation of the particles on each wave is not augmented.

The fubject is exceedingly difficult. We do not fully comprchend on what circumftance the affcetion or agitation of our organ, or fimply of the membrana tym-pani,-depends, A more violent agitation of the fame air, that is, a wider ofcillation of its particles, cannot fail to increafe the impulfe on this membrane. The point therefore is to find what concourle of feeble unditlations will produce or be equivalent to a great one. The reafonings of all thefe reftorers of the fpeaking trumpet are almoft equally fpecious, and each point out fome phenomenon which thould characterife the principle of confruction, and thus enable us to fay which is molt agreeable to the procedure of nature. Yet there is bardly any-difference in the performance of trumpets of equal dimenfions made after thefe different methods.

The propagation of light and of elaftic undulations feem to require very different methods of management. Yet the ordinary phenomena of echoes are perfectly explicable by the acknowledged laws either of optics or acott ftics; fill however there are fome phenomena of found which are very unlike the genuine refults of elaftic undulations. If founds are propagated fpherically, then what comes into a room by a fmall hole thould diffufe itfelf from that hole as round a centre, and it fhould be heard equally well at twelve feet difance from the hole in every direction. Yet it is very fenfibly louder when the hearer is in the fraight line drawn from the fonorous body through the hole. A perfon can judge of the direction of the founding body with tolerable exactnefs. Cannon difcharged from the different fides of a mip are very eafily diflinguifhed, which hould not be the cafe by the Newtonian theory; for in this the two pulfes on the ear fhould have no fenfible difference.

The moit important fact for our purpofe is this: An echo from a finall plane furface in the midt of an open field is not heard, unlefs we fland in fuch a fituation that the angle of reflected found may be equal to that of incidence. But by the ufual theory of undulations, this frall furface ftould become the centre of a new undulation, which thould fpread in all directions. If we make an analogous experiment on watery undulations, by placing a frall flat furface fo as to project a little above the water, and then drop in a fmall pebble at a diftance, fo as to raife one circular wave, we thall obferve, that when this wave arrives at the projecting plane, it is difturbed by it, and this difturbance fureads from it on all fides. It is indeed renfibly ftronger in that line which is drawn from it at equal angles with the line drawn to the place where the pebble was dropped. But in the cafe of found, it is a fact, that if we go to a very fmall diltance on either fide of the line of retlection, we flall hear nothing.

Here then is a fact, that whatever may be the nature of the elaftic undulations, founds are reflected from a fmall plane in the fame meaner as light. We miny avail
ourfelves of this fact as a mean fot enforcing found, thouglı we cannot explain it in a fatisfactory manner. We thould expect from it an effect fimilar to the hearing of the original found alorg with another original found coming from the place from which this refleeted found diverges. If therefore the reflected found or echo arrives at the ear in the fame inftant with the original found, the effect will be doubled; or at leaft it will be the fame with two fimultaneous original founds. Now we know that this is in fome fenle, equivalent to a flonger found. For it is a fact, that a number of voices uttering the fame or equal founds are heard at a much greater diftance than a fingle voice. We cannot perhaps explain how this happens by mechanical laws, nor affign the exact proportion in which 10 voices exceed the effect of one vaice; nor the proportion of the diftances at which they feem equally loud. We may therefore, for the prefent, fuppofe that two equal voices at the fame dillance are twice as loud, three voices three times as loud, \&c. 'Therefore if, by means of a fpeaking trumpet, we can make 10 equal echoes arrive at the ear at the fame moment, we may fuppole its effect to be to increafe the audibility 10 times; and we may exprefs this fhortly, by calling the found 10 times louder or more intenfe.

But we cannot do this precifely. We cannot by any contrivance make the found of a momentary fnap, and thofe of its echoes, arrive at the earin the fame moment, becaufe they come from different dillances. But if the original noife be a continued found, a man's voice, 'for example, utering a continued uniform tone, the firf echo may reach the ear at the fame moment with the fecond vibration of the larynx; the fecond echo along with the third vibration, and fo on. It is evident, that this will produce the fame effect: The only difference will be, that the articulations of the voice will be made indifinet, if the echoes come from very different difances. Thus if a man pronounce the fyllable taw, and the \(10^{\text {- fucceflive echoes are made from "places }}\) which are so feet farther off, the 10 th part of a fecond (nearly) will intervene between hearing the firt and the latt. This will give it the found of the fyllable thaw, or perhaps raw, becaufe \(r\) is the repetition of \(\ell\). Something like this occurs when, ftanding at one end of a long line of foldiers, we hear the mulkets of the whole line difcharged in one inftant. It feems to us the found of a running fire.

The aim therefore in the conftruction of a feaking? trumpet may be, to caufe as many echoes as porfible to reach a diftant ear without any perceptible interval of of lime. This will give diftinctnefs, and fomething e= quivalent to loudnels. Pure loudnefs arifes from the violence of the fingle aerial undulation. To increafe this may be the aim in the conftruction of a trumpet; but we are not fufficiently acquainted with the mechanifm of thefe undulations to bring this about with certainty and precifion; whereas we can procure this accumulation of echoes without much trouble, fince we know that echoes are, in fact, rellected like light. We can form a trumpet fo that many of thefe lines of reflected found hall pafs through the place of the hearer. We are indebted to Mr Lambert of Berlin for-this fimple and popular view of the fubject; and hiall here giye an abflraet of his moft ingenious Difiertation on Acouftic Infruments, publifued in the Berlin Memoirs for" \(763 *\)

\section*{TRU [ 494] T R U}

Tnmpet. Sound naturally fpreads in all directions; but we know that echoes or reficeted founds proceed almolt frictly in certain limited directions. If therefore we contrive a trumpet in fuch a way that the lines of echo thall be confined within a certain fpace, it is reafonable to fuppofe that the found will become morc audible in proportion as this diffufion is prevented. Therefore if we can oblige a found which, in the open air, would have diffufed itfelf over a hemifphere, to keep within a cone of 120 degrees, we fhould expect it to be twice as audible within this cone. This will be accomplithed, by making the reflections fuch that the lines of reflected found ftall be confined within this cone. N.B. We here fuppofe that nothing is loft in the reflection. Let
Piate us examine the effect of a cylindrical trumpet.
Dxxxix. . Let the trumpet be a cylinder ABED, (fig. I.), and Fig. Is. let C be a founding point in the axis. It is evident that all the found in the cone BCE will go forward without any reflection. Let CM be any other line of found, which we may, for brevity's fake, call a fonorous or phonic line. Being reflected in the points M, N, O, P, it is evident that it will at laft efcape from the trumpet in a direction \(P Q\), equally diverging from the axis with the line CM. The fame mult be true of every other fonorous line. Therefore the echoes will all diverge from the mouth of the trumpet in the fame manner as they would have proceeded from C without any trumpet. Even fuppofing, therefore, that the eclooes are as ftrong as the original found, no advantage is gained by fuch a trumpet, but that of bringing the found forward from C to \(c\). This is quite trifing when the hearer is at a diftance. Yet we fee that founds may be heard at a very great diftance, at the end of long, narrow, cylindrical, or prifmatical galleries. It is known that a voice may be diftinctly heard at the difance of feveral hundred feet in the Roman aqueducts, whofe fides are perfectly ftraight and fmooth, being plaftered with fucco. The frooth furface of the fill water greatly contributes to this effect. Cylindrical or prifmatical trumpets muft therefore be reje ted .
Fig. 2. CN is the axis, DK a line perpendicular to the axis, and DFHI the path of a reflected found in the plane of the axis. The laft angle of reflection IHA is equal to the laft angle of incidence FHC. The angle BFH, or its equal CFD, is equal to the angles FHD and FCH ; that is, the angle of incidence CFD exceeds the next angle of incidence FHC by the angle FCD ; that is, by the angle of the conc. In like manner, FDH exceeds CFD by the fame angle FCD. Thus cvery fucceeding angle, either of incidence or reflection, exceeds the next by the angle of the cone. Call the angle of the cone \(a\), and let \(b\) be the firt angle of incidence PDC. The fecond, or DFC, is \(b-a\). The third, or FHC, is \(b-2 a ; \& \% c\). : and the \(n\)th angle of incidence or reflection is \(b-n a\), after \(n\) reflections. Since the angle diminifhes' by equal quantities at each fubfequent reflection, it is plain, that whatever be the firn angle of incidence, it may be exhaufted by this diminution; namely, when \(n\) times \(a\) exceeds or is cqual to \(b\). Therefore to know haw many reclections of a found, whofe firf incidence has the inclination \(b\), can be made in an infinitely extended conc, whofe angle is \(a\), divide \(l\) by \(a ;\), the quotient will give the number \(n\) of reflestions,
and the remainder, if any, will be the laft angle of in. Trum cidence or reflection lefs than \(a\). It is very plain, that when an angle of reflection IHA is equal to or lefs than the angle BCA of the cone, the reflected line HI will no more meet with the other fide CB of the cone.

We may here obferve, that the greateft angle of incidence is a right angle, or \(90^{\circ}\). This found would be reflected back in the fame line, and would be incident on the oppofite fide in an angle \(=90^{\circ}-a\), \& c.

Thus we fee that a conical trumpet is well fuited for confining the found : for by prolonging it fufficiently, we can keep the lines of reflected lound wholly within the cone. And when it is not carried to fuch a length as to do this, when it allows the founding line GH, for example, to efcape without farther reflection, the divergency from the axis is lefs than the laft angle of reflection BGH by half the angle BCA of the cone. Let us fee what is the connection between the length and the angle of ultimate reflection.

We have fin. \(\overline{b-a}: \mathrm{fm} . b=\mathrm{CD}: \mathrm{CF}\), and \(\mathrm{CF}=\) \(\mathrm{CD} \times \frac{\mathrm{fin} \cdot b}{\operatorname{lin} . \overline{b-a}}\), and fin. \(\overline{b-2 a}:\) fin. \(\overline{b-a}=\mathrm{CF}:\) CH , and \(\mathrm{CH}=\mathrm{CF} \times \frac{\sin \cdot b-a}{\operatorname{lin} . \overline{b-2 a}}=\mathrm{CD} \times \frac{\operatorname{fin} . b}{\operatorname{fin} b-a} \times\) \(\frac{\operatorname{fin} \cdot \overline{b-a}}{\sin \cdot \overline{b-2 a}}=\mathrm{CD} \times \frac{\mathrm{fin} . b}{\operatorname{fin} . b-2 a}\), \&cc.

Therefore if we fuppofe \(X\) to be the length which will give us \(n\) reflcetions, we Mall have \(X=C D X\) fin. \(b\) fin. \(\overline{b-n}\).
the angle \(\overline{b-n a}\) diminifhes; but is not infinite, unlefs \(u a\) is equal to \(b\). In this cafe, the immediately preceding angle of reflection muft be \(n\), becaufe thefe angles have the common difference \(a\). Therefore the laft reflected found was moving parallel to the oppofite fide of the cone, and cannot again meet it. But though we cannot aflign the length which will give the onth reflection, we can give the length which will give the one immediatcly preceding, whofe angle with the fide of the cone is \(a\). Let Y be this Iongth. We have Y \(=\mathrm{CD} \times \frac{\operatorname{fin} . b}{\text { fin. } a}\). This length will allow every line of
found to be reflected as often, faving once, as if the tube were infinitely long. For fuppofe a fonorous line to be traced backwards, as if a found entered the tube in the direction \(i h\), and were reflected in the points \(h, f, d, \delta, \mathrm{D}\), the angles will be continually augmented by the conftant angle \(a\). Rut this augmentation can never go farther than \(90^{\circ}+\frac{3}{2} a\). For if it reaches that value at D , for inftance, the rellected line DK will be perpendicular to the axis CN ; and the angle ADK will be equal to the angle DKB, and the found will come out again. This rematk is of importance on another account.

Now fuppofe the cone to he cut off at D by a plane perpendicular to the axis, KD will be the diameter of its mouth-piece; and if we fupprofe a mouth completely occupying this circle, and every paint of the circle to be fonorous, the refleched foumds will proceed from it in the fame, manner as light.would from a flame which
completcly

\section*{\(T R \quad U\)} fide of the cone. The angle FDA will have the greateft poffible fine when it is a right angle, and it never can be greater than ADK, which is \(=90+\frac{1}{2} a\). And fince between \(90^{\circ}+\frac{1}{2} a\), and \(90-\frac{1}{1} 1\), there muft fall fome multiple of \(a\); call this multiple \(b\). Then, in order that every found may be reflected as often as poffible, faving once, we muft make the length of it \(\mathrm{X}=\) \(\mathrm{CD} \times \frac{\mathrm{S}, b}{\mathrm{~S}, a}\).

Now fince the angle of the cone is never made very great, never exceeding 10 or \(\mathbf{1 2}\) degrees, \(b\) can never differ from \(9 \supset\) above a degree or two, and its fine cannot differ much from unity. Therefore X will be very nearly equal to \(\frac{\mathrm{CD}}{\mathrm{S}, a}\) which is alfo very nearly equal to \(\frac{\mathrm{CD}}{2 \mathrm{~S}, \frac{1}{2} a}\); becaufe \(a\) is fmall, and the fines of fmall arches are nearly equal and propertional to the arches themfelves. There is even a fmall compenfation of errors in this formula. For as the fine of \(90^{\circ}\) is fomewhat too large, which would give X too great, \(2 \mathrm{~S}, \frac{\pi}{2}\) a is alfo larger than the fine of \(a\). Thus let \(a\) be \(12^{\circ}\) : then the nearell multiple of \(a\) is 84 or \(96^{\circ}\), both of which are as far removed as poliiblc from \(90^{\circ}\), and the error is as great as poffible, and is nearly rioth of the whole.

This approximation gives us a very fimple conftruction. Let CM be the required length of the trumpet, and draw ML perpendicular to the axis in O . It is evident that S, MCO : rad. \(=\mathrm{MO}: \mathrm{CM}\), and CM ; or \(\mathrm{X}=\frac{\mathrm{MO}}{\mathrm{S}, \frac{1}{2} a}=\frac{\mathrm{LM}}{2 \mathrm{~S}, \frac{1}{2} a}\), but \(\mathrm{X}=\frac{\mathrm{CD}}{2 \mathrm{~S}, \frac{1}{2} a}\), and therefore LVI is equal to CD.

If therefure the cone be of fuch a length, that its diameter at the mouth is equal to the length of the part cut off, every line of found will have at leaft as many reflections, fave one, as if the cone were infinitely long; and the laft reflected line will either be parallel to the oppofite fide of the cone, or lie nearer the axis than this parallel; confequently fuch a cone will confine all the reflected founds within a cone whofe angle is \(2 a\), and will augment the found in the proportion of the fpherical bafe of this cone to a complete hemifpherical furface. Defcribe the circle DKT round C, and making DT an arch of 90 , draw the chord DT. Then fince the circles defcribed with the radii DK, DT, are equal to the fpherical furfaces generated by the revolution of the arches DK and DKT round the axis CD, the found will be condenfed in the proportion of \(\mathrm{DK}^{3}\) to \(\mathrm{DT}^{2}\).
This appears to be the beft general rule for conftructing the inftrument; for, to procure another reflection, the tube miuft be prodigioufly lengthened, and we cannot fuppofe that one reflection more will add greatly to its power.

It appears, too, that the length depends chiefly on the angle of the cone; for the mouth-piece may be confidered aś nearly a fixed quantity. It mult be of a fize to admit the mouth whien feaking with force and without conftraint. About an inch and a half may. be fixed on for its diametcr. When therefore we propofe to confine the found to a cone of twice the angle of the trumpet, the whole is determined by that angle. For
fince in this cafe LM is equal to CD, we have DK: Trumpet. \(\mathrm{CD}=\mathrm{LM}\) (or CD ) : CM and \(\mathrm{CM}=\frac{\mathrm{CD}^{2}}{\mathrm{DK}^{2}}\).

But \(\quad 2 \mathrm{~S}, \frac{5}{2}: 1=\mathrm{DK}: \mathrm{CD}\),
and \(\quad 2 S_{2}^{s} \frac{1}{s} a: 1=\mathrm{CD}: \mathrm{CM}\);
therefore \(4 \mathrm{~S}^{2} \frac{1}{2} a: 1=\mathrm{DK}: \mathrm{CM}\),
And \(\quad \mathrm{CM}=\frac{\mathrm{DK}}{4 \mathrm{~S}, \frac{1}{2} a},=\frac{\mathrm{DK}}{S_{1}^{2} a}\) very nearly. And fince DK is an inch and a half, we get the length in inches, counted from the apex of the cone \(=\frac{\frac{1}{2}}{S_{2}{ }^{2} a}\), or \(\frac{3}{2 S^{2}{ }^{2} a}\). From this we mult cut off the part \(C D\), which is \(=\frac{\mathrm{DK}}{\mathrm{S}, \frac{1}{2} a}\), or very nearly \(\frac{\mathrm{DK}}{\mathrm{D}_{1} a}\), or \(\frac{3}{2 \mathrm{~S}, a}\), meafured in inches, and we mult make the mouth of the farme width \(\frac{3}{2 S, a}\).

On the other hand, if the length of the trumpet is fixed on, we can determine the angle of the cone. For let the length (reckoned from C) be L. we have \(2 \mathrm{~S},{ }^{2} a=\frac{3}{L^{2}}\),
or \(S,{ }^{2} a=\frac{3}{2 L}\), and \(S, a=\sqrt{\frac{3}{2 L}}\).
Thus let 6 feet or 72 inches be chofen for the length of the cone, we have \(S, a=\sqrt{\frac{3}{144}}=\sqrt{\frac{1}{48}},=0,14434\). \(=\operatorname{lin} 8^{\circ} 17^{\prime}\) for the angle of the cone; and the width at the mouth is \(\frac{3}{2, S, a}=10,4\) inches. This being taken from 72 , leaves 61,6 inches for the length of the trumpet.

And fince this trumpet confines the refiected founds to a cone of \(16^{\circ} 34^{\prime}\), we have its magnifying power \(=\frac{\mathrm{DT}^{3}}{\mathrm{DK}^{2}}\) \(=\frac{\frac{1}{2} \mathrm{DT}^{2}}{\frac{\pi}{2} \mathrm{DK}^{2}}=\frac{\mathrm{S}^{2}{ }^{2} 45^{\circ}}{\mathrm{S}_{9}^{2} 4^{\circ} 8^{\frac{1}{2} \frac{1}{2}}}=96\) nearly. It therefore condenfes the found about 96 times; and if the diffribution were uniform, it would be heard \(\sqrt{96}\), or nearly 10 times farther off. For the loudnefs of lounds is fuppofed to be inverfely as the fquare of the diftance from the centre of undulation.

But before we can pronounce with preciñon on the performance of a feaking trumpet, we muft examine into the manner in which the reflected founds are diftibuted aver the fpace in which they are all confined.

Let BKDA (fig. 3.) be the fection of a conical fig. \$ trumpet by a plane through the axis; let \(C\) be the vertex of the cone, and CW its axis; let TKV be the fection of a fphere, having its centre in the vertes of the cone; and let \(P\) be a fonorous point on the furface of the fphere, and \(\mathrm{P} a f_{e} /\) the path of a line of found lying in the plane of the fection.
In the great circle of the fphere take \(K Q=K P, D R\) \(=\mathrm{DQ}\), and \(\mathrm{KS}=\mathrm{KR}\). Draw \(Q B h\); allo draw \(Q d n\) patallel to DA ; and draw PB, P. d, PA.
1. Then it is evident that all the lines, drawn from P , within the cone APB , proceeg without. reflection, and are diffuled as if no trumpet bad been ufed.
2. All

Trumpet. 2. All the fonorous lines which fall from P on KB are retlected frem it as if they had conie from \(Q\).
3. All the fonorous lines between BP and \(d \mathrm{P}\) have fupfered but one reflection; for \(d n\) will no more meet DAA fo as to be reflected again.
4. All the lines which have been reflected from KB, and afterwards from DA, proceed as if they had come from R. For the lines reflected from KB proceed as if they tad come from \(Q\); and lines coming from \(Q\) and reflected by DA, proceed as if they had come from R. Therefore draw \(\mathrm{RA} \circ\), and alfo draw Rg m parallel to KB , and draw \(\mathrm{Q}_{\mathrm{c}} \mathrm{A} q, \mathrm{Q}^{b} g, \mathrm{P} c\), and \(\mathrm{P} b\). Then,
5. All the lines between \(b \mathrm{P}\) and \(c \mathrm{P}\) have been twice teflected.

Again, draw \(\mathrm{SB} p, \mathrm{Br}, r^{u} \mathrm{Q}, \mathrm{S} x \mathrm{~A}, \mathrm{R} y x, \mathrm{Q} x y\).
6. All the lines between \(u \mathrm{P}\) and \(\approx \mathrm{P}\) have fuffered three reflections.

Draw the tangents TAt, VB \(v\), "croffing the axis in W.
7. The whole founds will be propagated within the cone \(v \mathrm{~W} t\). For to every fonorous point in the line \(K D\) there correfponds a point fimilar to \(Q\), regulating the firft reflection from KB ; and a point dimilar to h , regulating the fecond reflection from DA; and a point \(S\) regulating the third reflection from KB, \&c. And fimilar points will be found regulating the firft reflection from DA, the fecond from KB , and the third from \(D A\), \&cc.; and lines drawn from all thefe through \(A\) and \(B\) muft lie within the tangents \(T A\) and VB.
8. Thus the centres of reflection of all the fonorous lines which lie in planes paffing through the axis, will be found in the furface of this fphere; and it may be confidered as a fonorous fphere, whofe founds firtt concentrate in W, and are then diffufed in the cone \(\approx \mathrm{W} t\).

It may be demonftrated nearly in the fame manner, that the fonorous lines which proceed from \(P\), but not in the plane paffing through the axis, alfo proceed, after various reflections, as if they had come from points in the furface of the fame fphere. The only difference in the demonfration is, that the centres \(O, R, S\) of the - fucceffive reflections are not in one plane, but in a fipiral line winding round the furface of the fophese according to fixed laws. The foregoing conclufions are therefore general for all the founds which come in all directions frons cvery point in the area of the mouth-piece.

Thus it appears, that a conical trumpet is well fitted for increafing the force of founds by diminithing their final divergence. For had the fpeaker's mouth been in the open air, the founds which are now confined within the cone \(v \mathrm{~W}\) \& would have been diffufed over a hemifphere: and we fee that prolonging the trumpet mult confine the founds fill more, becaufe this will make the angle BWYA fill frmaller ; a longer tube muft alfo occafion more reflections, and confequently fend more fonorous undulations to the ear at a diftance placed within the cone \(v \mathrm{~W} t\).

We have now obtained a very connected view of the whole effect of a conical trumpet. It is the fame as if the whole fogment TKDV were fourding, every part of it with an intenfity proportional to the denfity of the points (), R, S, \& c. correffording to the diffcrent points \(P\) of the moutl-piece. It is enfy to fee that this cannet lec uniform, but muft be much rarer towards the margin of the fegment. It rould require a good deal of dif.
cuffion to flow the denfity of thefe fifitious founding Trum points; and we thall content ourfelves with giving a very palpable view of the diftribution of the fonorous rays, or the denfity (fo to fpeak) of the echoes, in the different fituations in which a hearer may be placed.

We may obferve, in the mean time, that this fubfitution of a founding fphere for the founding mouthpiece has an exact paraliel in Ortics, by which it will be greatly illultrated. Suppofe the corr EKDA (fig. 3.) Fig. 3. to be a tube polifhed in the infide, fixed in a wall \(13 \times\), perforated in 13 A , and that the muath-piece DK is occupied completely by a flat flame. The effeet of this on a fpectator will be the fame, it he is properly placed in the axis, as if he were looking at a flame as big as the whole fphere. This is very evident.

It is eafy to fee that the line \(l e \mathrm{~S}\) is equal to the line lef a P ; therefore the reflected founds a: fo come to the ear in the fame moments as if they had come from their refpective points on the furface of the fubrtituted !phere. Unlefs, therefore, this lpheie be enormounly large, the diftinctnefs of articulation will not be fenfibly affected, becaufe the interval between the arrival of the difierent echoes of the fame frap will be infenfible.

Our limits oblige us to content ourfelves with exhibiting this evident fimilarity of the progrefs of echo from the furface of this phonic fphere, to the progref \({ }_{3}\) of light from the fame luminous fpliere fluning through a hole of which the diameter is AB. The dired inveltigation of the intenfity of the found in different directions and diftances would take up much rocm, and give no clearer conception of the thing. The intenfity of the found in any point is precifely finilar to the intenfity of the illunination of the fame point; and this is proportional to the portion of the luminous furface feen from this point through the hole directly, and to the fquare of the diftance inverfely. The intelligent reader will acquire a diftinct conception of this matter from fig. 4. which reprefents the diftribution of the fonorous lines, and by confeguence the degree of loudnefs which may be expected in the different filuations of the hearer.

As we have already obferved, the effect of the cone of the trumpet is perfectly analogous to the reflection of light from a polified concave, conical mirior. Such an infrument would be equally fitted for illuminating a diftant of jec. We imagine that thefe would be mucli more powerful than the filherical or even parabolic mirrors commonly ufed for this purpofe. Thefe laft, having the candle in the focus, alfo fend forward a cylinder of lighte of equal width with the mirror. But it is well known, that oblique reflections ate prodigioully more yivid than thofe made at greater angles. Where the inclination of the reflected light to the plane of the mirror does not exceed eight or ten degrees, it refects about three-fourths of the light which falls on it. But when the inclination is 80 , it does not reflect one-fourth part.
We may allo obferve, that the denfity of the reflected founds by the conical trumpet ABC (fig. 4.) is pre-Fig. 4. cifely finilar to that of the illumination produced bya luminous fphere TDV, fhaining through a hole AB. There will be a fpace circumfcribed by the cone formed by the lines TB: and VAv, which is uniformly illuminated by the whole fphese (or rather by the fegment \((T D V)_{2}\) and on eacla fide there is a pace illuminaled by
CYig.

\section*{T R U [ 497}
npect. a part of it only, and the illumination gradually de\(\square\) creafes towards the borders. A fpectator placed much out of the axis, and looking through the hole AB, may not fee the whole fphere. In like manner, he will not hear the whole founding fphere: He may be fo far from the axis as neither to fee nor, hear any part of it.

Affiting our imagination by this comparifon, we perceive that beyond the point \(z v^{\prime}\) there is no place where all the reflected founds are heard. Therefore, in order to preferve the magnifying power of the trumpet at any diftance, it is neceffary to make the mouth as wide as the fonorous fphere. Nay, even this would be an imperfect inftrument, becaufe its power would be confined to a very narrow fpace; and if it be not accurately pointed to the perfon liftening, its power will be greatly diminithed. And we may oblerve, by the way, that we derive from this circumftance a flrong confirmation of the juftnefs of Mr Lambert's principles; for the effects of fpeaking trumpets are really obferved to be limited in the way here defcribech.-Parabolic trumpets have been made, and they fortify the found not only in the cylindrical fpace in the direction of the axis, but alfo on each fide of it, which Mrould not have been the cafe had their cffeet depended only on the undulations formed by the parabola in planes perpendicular to the axis. But to proceed.

Let BCA (fig. 5.) be the cone, ED the mouth. piece, TEDV the equivalent fonorous fyhere, and TBAV the circumfcribed cylinder. Then CA or CB is the length of cone that is necefliary for maintaining the magnitying power at all difances. We have two conditions to be fulfilled. The diameter ED of the mouthpiece mult be of a certain fixed magnitude, and the diameter \(A B\) of the outer end mult be equal to that of the equivalent fonorous fphere. Thefe conditions determine all the dimenfiuns of the trumpet and its magnifying power. And, firt, with refpect to the dimenfions of the trumpet.

The fimilarity of the triangles ECG and BCF gives \(\mathrm{CG}: \mathrm{ED}=\mathrm{CF}: \mathrm{AB}\); but \(\mathrm{CG}=\mathrm{BF},=\frac{1}{2} \mathrm{AB}\), and \(\mathrm{CF}=\mathrm{CG}+\mathrm{GF},=\mathrm{GF}+\frac{1}{2} \mathrm{AB}\); therefore \(\frac{2}{2} \mathrm{AB}: \mathrm{ED}\) \(=\mathrm{GF}+\frac{\pi}{2} \mathrm{AB}: \mathrm{AB}\), and \(\mathrm{AB}: \mathrm{ED}=2 \mathrm{GF}+\mathrm{AB}:\) AB ; therefore \(2 \mathrm{GF} \times \mathrm{ED}+\mathrm{AB} \times E D=A \mathrm{~B}^{2}\), and \({ }_{2} \mathrm{GF} \times \mathrm{ED}=\mathrm{AB}^{2},-\mathrm{AB} \times \mathrm{ED},=\mathrm{AB} \times \overline{\mathrm{AB}-E D}\), and \(\mathrm{GF}=\frac{\mathrm{AB} \times \overline{\mathrm{AB}}-\overline{\mathrm{ED}}}{2 \mathrm{ED}}\). And, on the other hand, becaufe \(\mathrm{AB}^{2}-\times \mathrm{EBAD}=2 \mathrm{GF} \times \mathrm{ED}\), we have \(\mathrm{AB}^{3}-\mathrm{AB} \times \mathrm{ED}+\frac{1}{4} \mathrm{ED}^{2}=2 \mathrm{GF} \times \mathrm{ED}+\frac{1}{4} \mathrm{ED}^{2}\), or \(\overline{\mathrm{AB}-\frac{\mathrm{T}}{2} \mathrm{ED}^{2}}=2 \mathrm{GF} \times \mathrm{ED}+\frac{1}{4} \mathrm{ED}^{2}\), and \(\mathrm{AB}=\) \(\sqrt{2 \mathrm{GF} \times \mathrm{ED}+\frac{7}{4} \mathrm{ED}^{2}}+\frac{1}{2} \mathrm{ED}\).

Let \(x\) reprefent the length of the trumpet, \(y\) the diameter at the great end, and \(m\) the diameter of the mouth-
piece. Then \(x=\frac{y \times y-m}{2 m}\), and \(y=\sqrt{2 \times m+\frac{1}{4} m^{2}+\frac{1}{2} m}\). Thus the length and the great diameter may be had reciprocally. The ufeful cafe in practice is to find the diameter for a propofed length, which is gotten by the laft equation.
Now if we take all the dimenfions in inches, and fix \(m\) at an inch and a half, we have \(2 x m=3 x\), and \(\frac{5}{4} m^{2}\) \(=0,5625\), and \(\frac{1}{2} m=0,75\); fo that our equation becomes \(y=\sqrt{3 x+0,5625}+0,75\). The following table YoL. XX. Part II.
gives the dimenfions of a fuficient varirity of trempets. Trumpees The firft column is the length of the trumpet in feet; the fecond columa is the diameter of the mouth in inches; the third column is the number of times that it maguifies the found; and the fourth column is the num. ber of times that it increafes the difance at which a man may be dittinctly heard by its means; the fiffls contairio the angle of the conc.

\end{tabular}

The two laft columns are confructed on the following confiderations: We conceive the hearer placed within the cylindrical fpace whofe diamcter is BA. In this fituation he receives an echo coming apparently from the whole furface TGV ; and we account the effeet of the trumpet as equivalent to the united voices of as many mouths as would cover this furface. Therefore the quotient obtained by dividing the furface of the hemifphere by that of the mouth-piece will exprefs the magnifying power of the trumpet. If the chords \(g \mathrm{E}, \mathrm{gT}\), be drawn, we know that the fpherical furfaces \(T g \mathrm{~V}\), \(\mathrm{E}_{\mathrm{g}} \mathrm{D}\), are refpectively equal to the circles defribed with the radii \(\mathrm{T} g, \mathrm{E} g\), and are therefore as \(\mathrm{T} g^{2}\) and \(\mathrm{E} g^{2}\). Therefore the audibility of the trumpet, when compared with a fingle voice, may be exprefied by \(\frac{\mathrm{T} g^{2}}{\mathrm{E} g^{2}}\). Now the ratio of \(\mathrm{T} g^{2}\) to \(\mathrm{E} g^{3}\) is eafily obtained. For if \(\mathrm{E} f\) be drawn parallel to the axis, it is plain that \(\mathrm{B} f=\frac{\mathrm{BA}-\mathrm{ED}}{2}\), and that \(\mathrm{E} f\) is to \(f \mathrm{~B}\) as radius to the tangent of BCF; which angle we may call \(a\). Therefore tan. \(a=\frac{y-m}{2 x}\), and thus we obtain the angle a. But if the radius \(C E\) be accounted \(\mathrm{I}, \mathrm{T} g\) is \(=\downarrow^{\prime} 2\), and \(\mathrm{E}_{\mathrm{g}}\) is \(=2\) fin. \(\frac{a}{2}\). Therefore \(\frac{\mathrm{Tg}}{\mathrm{Eg}}=\frac{\sqrt{2}}{2 \operatorname{fin} \cdot \frac{a}{2}}\), and the magnifying power of the trumpet is \(=\frac{2}{4^{\operatorname{tin} \cdot \frac{a}{2}} \frac{a^{2}}{2}}\)
\(\underbrace{\text { rnampet. }}=\frac{1}{2 \operatorname{lin}^{2} \frac{a}{2}}\). The numbers, therefore, in the third co-
\[
\text { lumn of the table are each }=\frac{1}{2 \text { fin. }^{2} \frac{a}{2}} \text {. }
\]

But the more ufual way of conceiving the power of the trumpet is, by confidering how much farther it will enable us to hear a voice equally well. Now we fuppofe that the audibility of founds varies in the inverfe duplicate ratio of the difance. Therefore if the diftance \(d\), at which a man may be difinetly heard, be increafed to \(z\), in the proportion of EG to \(T g\), the found will be Iels audible, in the proportion of \(\mathrm{T} g^{2}\) to \(E G^{2}\). Therefore the trumpet will be as well heard at the difance \(\approx\) as the fimple voice is heard at the diffance \(d\).
Therefore \(\frac{\mathscr{Z}}{d}\) will exprefs the extending power of the trumpet, which is therefore \(=\frac{\sqrt{2}}{2 \text { fin. } \frac{a}{2}}\). In this manner were the numbers computed for the fourth column of the table.

When the angle BCA is fmall, which is always the cafe in fpeaking trumpets, we may, without any fenfible errot, confider EG as \(=\frac{\mathrm{ED}}{2},=\frac{m}{2}\). And \(\mathrm{TG}=\mathrm{TC}\) \(\times \sqrt{ } 2,=\frac{A B}{2} \sqrt{2}=\frac{A B}{\sqrt{2}}=\frac{y}{\sqrt{2}}\). This gives a very eafy computation of the extending and magnifying powers of the trumpet.

> The extending power is \(=\sqrt{ } 2 \frac{y}{m}\)
> The magnifying power is \(=2 \frac{y^{2}}{m^{2}}\)

We may allo eafily deduce from the premifes, that if the mouth-piece be an inch and a half in diameter, and the length \(x\) be meafured in inches, the extending power is very nearly \(=\sqrt{\frac{8}{3} x}\) and the magnifying power \(=\frac{8}{3} r\).

An inconvenience ftill attends the trumpet of this conftruction. Its compiete audibility is confined to the cylindrical fpace in the direstion of the axis, and it is more faintly heard on each fide of it. This obliges us to dired the trumpet very exadtly to the fot where we wilh it to be heard. This is confirmed by all the accounts we have of the performance of great fpeaking trumpets. It is evident, that by lengthening the trumpet, and therefore eularging its mouth, we make the
will not be fo difficult to direet the trumpet.

But even tlis is confined within the limits of a few degrces. Even if the trumpet were continued without end, the founds cannot be reinforced in a wider fpace than the cone of the trumpet. But it is always advantagrous to increafe its length; for this makes the extreme tangents embrace a greater portion of the fonorous fubere, and thus increafes the found in the fpace where it is all reflected. And the limiting tangents ITB, VA, expand ftill more, and thus the fpace of full cffect is inrreafed. But either of thefe aurmentations is very fmall in compation of the augmentation of dize. If the trum-
pet of fig. 5. Were made an hundred times longer, its power would net be increafed one half:

We need not therefore aim at much more than to produce a cylindrical fpace of full effect ; and this will always be done by the preceding rules, or table of conftructions. We may give the trumpet a third of a fourth part mote length, in order to fpread a little the fpace of its full effect, and thereby make it more eafily directed to the intended abject. But in doing this we muft be careful to increafe the diameter of the mouth as much as we increafe the length; otherwife we produce the very oppofite effect, and make the trumpet greatly inferior to a fhorter one, at all difances beyond a certain point. For by increafing the length while the part CG remains the fame, we caufe the tangents TB and VA to meet on fome diftant point, beyond which the found diffufes prodigioully. The confruction of a fpeaking trumpet is therefore a problem of fome nicety; and as the triais are always made at fome confiderable diffance, it may frequently happen that a trumpet which is not heard at a mile's diftance, may be made very audible two miles off by cutting off a piece at its wide end.

After this minute confideration of the conical trumpet, we might proceed to confider thofe of other forms. In particular, the hyperbolic, propofed by Caffegrain, and the parabolic, propofed by Haafe, feem to merit confideration. But if we examine them merely as reflectors of echoes, we hall find them inferior to the conical.

With refpect to the hyperbolic trumpet, its inaptitude is evident at firt fight. For it muft diffipate the echoes more than a conical trumpet. Indeed Mr Caffegrain proceeds on quite different principles, depending on the mechanifm of the aerial undulations: his aim was to increafe the agitation in each pulfe, fo that it may make a more forcible impulfe on the eat. But we are too imperfeetly acquainted with this fubject to decide a priori; and experience hows that the hyperbola is not a good form.

With refpect to the parabolic trumpet, it is certain that if the mouth-piece were but a point, it would produce the noft favourable reffection of all the founds; for they would all proceed parallel to the axis. But every point of an open mouth mull be confidered as a centre of found, and none of it mult be kept out of the trumpet. If this be all admitted, it will be found that a conical trumpet, made by the preceding rules, will diffipate the retlected founds much lefs than the parabolic.

Thus far have we proceeded on the fair confequences of the well known fact, that echocs are reficeted in the fame manner as light, without engaging in the intricate invenigation of aerial undulations. Whoever confiders the Newtonian theory of the propagation of found with intelligence and attention, will fee that it is demonftrated folely in the cafe of a fingle row of particles; and that all the general corollaries refpecting the lateral diff fion of the elaftic undulations are little more than fagacious guefles, evely way worthy of the illuftrious suthor, and beautifully confirmed by what we can mon difinetly and accurately ohferve in the citcular waves on the furface of fill water. But they are by no means fit for becoming the foundation of any doctrine which lays the fmalleft claim to the title of accurate fcince. We really

know exccedingly little of the theory of aerial undulations; and the conformity of the phenomena of found to thefe guefles of Sir Ifac Newton has always been a matter of wonder to every eminent and candid mathematician : and no other frould pretend to judge of the matter. This wonder has always been acknowledged by Daniel Bernoulli; and he is the only perfon who has made any addition to the fcience of founds that is worth mentioning. For fuch we muft always efleem his doczrise of the fecondary undulations of mufical cords, and the fecondary pulfes of air in pipes. Nothing therefore is more unwarrantable, or more plainly ftows the precipitant prefumption of modern fciolifts, than the familiar ule of the general theory of aesial undulations in their attempts to explain the abftrule phenomena of nature (luch as the communication of fenfation from the organ to the fenforium by the vibrations of a nervous fluid, the reciprocal communication of the volitions from the fenforium to the mufcle, nay, the whole phenomena of mind), by vibrations and vibratiuncule.

Such attempts equally betray ignorance, prefumption, and meannefs of foul. lgnorance of the extent to which the Newtonian theory may be logically carried, is the neceffary confequence of ignorance of the theory itfelf. It is prefumption to apply it to the phenomena of the intellectual vorld ; and furcly he has an abject foul who hugs and cherifies the humble thought, that his mind is an undulating fluid, and that its all-grafping comprehenfion, and all its delightful emotions, are nothing more than an etherial tune.-_" Pol me occiditis amentes." This whim is older than Hartley: It may be found in Robinet's Systeme de la Nature. This by the bye made its firft appearance as a difcourfe delivered by Brother Orateur in the lodge of the grand Orient at Lyons; from which fource have proceeded all the colmopolitical focielics in Europe, and that illumination by which reafon is to triumph over revelation, and liberty and equality over civil government. We crave pardon of our readers for this cbullition of fpleen; and we hope for it from all thofe who can read Newton, and who efteem his modefty.

Thofe who have endeavoured to improve the fpeaking trumpet on mechanical principles, have generally aimed at increafing the violence of the elaftic undulations, that they may make a more forcible impulfe on the ear. This is the object in riew in the parabolic trumpet. All the undulations are converted into others which are in planes perpendicular to the axis of the inftrument; fo that the fame little mals of air is agitated again and rgain in the fame direction. From this it is obvious to conclude, that the total agitation will be more violent. But, in the firt place, thefe violent agitations mult diffufe themfelves laterally as foon as they get out of the trumpet, and thus be weakened, in a proportion that is perhaps impolible for the moft expert analyft to deterinine. But, moreover, we are not fufficiently acquainted with the mechanifm of the very firft agitations, to be able to perceive what conformation of the trumpet will caufe the reflected undulations to increafe the firf undulations, or to check them. For it mult happen, during the production of a continued found in a trimpet, that a parcel of air, which is in a fate of progreffive agitstion, as it makes a pulfe of me found, may be in a Itate of retrograde agitation, as it is part of a pulfe of air pro-. ducing another found: We cannot (at leaft no mathe-
matician has yet done it) difcriminate, and then com- Trumpet: bine thefe agitations, with the intelliyence and precifion that are necelfary for enabling us to day what is the ultimate accumulated effect. Mr Lambert thercfure did wifely in abflaining from this intricate inveftigation; and we are highly obliged to him for deducing fuch: body of demonifrable ductrine from the acknowled aed, but ill underfood, fact of the retlection of echoes.

We know that two founds ackupily crofs each other without any mutual diflurbance; for we can hear either of them dillingly, provided the other is not fo loud as to flun our ears, in the famo manner as the glare of the fun dazzles our cyes. We may therefore depend on all the confequences which are legitimately deduced froma this fact, in the fame manner as we depend on the fcierice of catoptrics, which is all deduced from a fact perfectly fimilar and as little undertood.

But the preceding propofitions by no means explain or comprehend all the reinforcement of found which is really obtained by merns of a fpeaking trumpet. In the firft place, although we cannot teli in what degree the aerial undulations are increafed, we cannot doubt that the reflections which are made in directions which do not greatly deviate from the axis, do really increafe the agitation of the particles of air. We fee a thing perfectly fimilar to this in the waves on water. Take a long Ilip of lead, about two inches broad, and having bent it into the form of a parabola, fet it into a large flat trough, in which the water is about an inch deep. Let a quick fucceffion of fmall drops of water fall precifely on the focus of the parabola. We thall fee the circular waves proceeding from the focus all converted into waves perpendicular to the axis, and we flatl frequently fee thefe ftraight waves co:fiderably augme: ted in their height and force. We fay generally, for we have fometimes obferved that thefe reflected waves were not fenfibly flronger than the circular or original waves. We do not exactly know to what this difference mult be afcribed: we are difpofed to attribute it to the frequency of the drops. This may be fuch, that the interval of time between each drop is precifely equal, or at leaft commenfurable, to the time in which the waves run over their own breadth. This is a pretty experiment; and the ingenious mechanician may make others of the fame kind which will greatly illuftrate feveral difficult points in the fcience of founds. We may conclude, in general, that the reflection of founds, in a trumpet of the ufual fhapes, is accompanied by a real increafe of the aerial agitations; and in fome particular cafes we find the founds prodigioully increafed. Thus, when we blow through a mufical trumpet, and allow the air to take that uniform undulation which can be beft maintained in it, namely, that which produces its mufical tone, where the whole tube contains but one or two undulations, the agitation of a particle muft then be very great; and it mufl defcibe a very confiderable line in its ofcillations. When we fuit our blatt in fuch a manner as to continue this note, that is, this undulation, we are certain that the fubfequent agitations confpire with the preceding agitation, and augment it. And accordingly we find that the found is increafed to a prodigious degree. A cor de chafte, or a bugle horn, when properly winded, will almolt dcaten the ear; and yet the evertion is a mere nothing in comparifon with what we make when bellówing with all

Trumpet. our force, but with not the tenth part of the noife. We alfu know, that if swe fpeak through a fpeaking trumpet in the key which correfponds with its dimenfions, it is much more audible than when we fpeak in a different pitch. Thefe obfervations fhow, that the loudnefs of a fpeiking trumpet arifes from fomething more than the fole reflection of echoes confidered by Mr Lamberithe very echoes are rendered louder.

In the next place, the founds are increafed by the vibrations of the trumpet iffelf. The elaftic matter of the trumpet is thrown into tremors by the undulations which proceed from the mouth-piece. Thefe tremors produce pulfes in the contiguous air, both in the infide of the trumpet and on that which furrounds it. Thefe undulations wi.h in the trumpet produce original founds, which are added to the reflected founds: for the tremor con'inues for fome little time, perhaps the time of three or four or more pulfes. This muft incteafe the loudnefs of the fubfequent pulfes. We cannot fay to what degree, becaufe we do not know the farce of the tremor which the part of the trumpet acquires: but we know that thefe founds will not be magnified by the trumpet to the fame degree as if they had come from the mouth-prece; for they are reflecied as if they bad come from the furface of a fphere which pafies through the agitated point of the trumpet. In flart, they arc magnified only by that part of the trumpet which lies without them. The whole founds of this kind, therefore, proceed as if they came from a number of concentric fpherical furfaces, or from a folid tphere, whofe diameter is twice the length of the trumpet cone.

All thefe agitations arifing from the tremors of the trumpet tend greatly to hurt the diftinctnefs of articulation; becaufe, coming from different points of a large fphere, they arrive at the ear in a fenfible fucceffion; and thus change a momeniary articulation to a lengthened found, and give the appearance of a number of voices uttering the fame words in fucceffion. It is in this way, that, when we clap our hands together near a long rail, we get an echo from each poft, which produces a chirping found of fome continuance. For thefe reafons it is found advantageous to check all tremors of the trumpet by wrapping it up in woollen lifts. This is alfo necefiary in the mufical trumpet.

With relpect to the undulations produced by the tremors of the trumpet in the air contiguous to its outfide, they alfo hurt the articulation. At any rate, this is fo much of the fonorous momentum ufelefly employed; becaufe they are diffufed like common founds, and receive no augmentation from the trumpet.

IT is evident, that this inftrument may be ufed (and accordingly was fo) for aiding the hearing; for the fonorous lines are reflected in either direction. We know that all tapering cavities greatly increafe external noifes; and we obferve the brutes prick up their cars when they want to hear uncertain or faint founds. They turn thens in fuch directions as are beft fuited for the reflection of the found from the quarter whonce the animal imagines that it comes.

Let us apply Mr Lambert's principle to this very interefling cafe, and examine whether it be poffible to affift dull hearing in like manner as the optician has affifted imperfect fight.

The fubjeat is greatly fimplified by the circuminances Trinn of the cafe; for the founds to which wetbilten generally come in nearly one direction, and all that we have to do is to produce a conftipation of them. And vie may conclude, that the audibility will be proportional to this conflipation.

Therefore let ACB, fig. 6 . be the cone, and CD its Fig. \(\sigma\) axis. The found may be conceived as coming in the direction RA, parallel to the axis, and to be reflected in the points \(\mathrm{A}, b, c, d, c\), till the angle of incidence increafes to \(90^{\circ}\); after which the fubfequent reflections fend the found out again. We muft therefore cut off a part of the cone; and, becaufe the lines increafe their angle of incidence at each reflection, it will be proper 10 make the angle of the cone an aliquot part of \(90^{\circ}\), that the leaft incidence may amount precifely to that quantity. What part of the cone flould be cut off may be determined by the former principles. Call the angle \(\mathrm{ACD}, a\). We have \(\mathrm{C} c=\frac{\mathrm{CA} \cdot \mathrm{fin} . a}{\operatorname{lin} \cdot(2 n+1) a}\), when the found gets the laft uffful refection. Then we have the diameter of the mouth \(\mathrm{AB}=2 \mathrm{CA} \cdot\) fin. \(a\), and that of the other end ef \(f=\mathrm{C}_{e} \cdot 2\) fin. \(a\). Thicrefore the founds will be compipated in the ratio of \(\mathrm{CA}^{2}\) to \(\mathrm{C} \epsilon^{2}\), and the trumpet will bring the \(\int_{p e a k e r ~ n e a r e r ~ i n ~ t h e ~ r a t i o ~ o f ~ C A ~}^{\text {a }}\) to \(\mathrm{C} e\).

When the lines of reflected found are thus brought logether, they may be received into a finall pipe perfeetly cylindrical, which may be inferted into the external ear. This will not change their angles of inclination to the axis nor their denfity. It may be convenient to make the interimal diameter of this pipe \(\frac{7}{3}\) of an inch. Therefore \(\mathrm{C}_{c} \cdot\) fin. \(a\) is \(=\frac{x}{8}\) of an inch. This circumfarce, in conjunction with the magnifying power propofed, determines the oulher dimenfions of the hearing trumpet. For \(\mathrm{C} c=\frac{1}{6 \operatorname{fin} \cdot a}=\frac{\mathrm{CA} \cdot \operatorname{fin} \cdot a}{\operatorname{fin} \cdot(2 n+1) a}\), and CA \(=\frac{\text { fin. }(2 n+1 a)}{6 \operatorname{inn}^{2} a}\).

Thus the relation of the angle of the cone and the length of the infirument is afcertained, and the fornd is brought nearer in the ratio of CA to Ce , or of fin. \((2 n+1) a\) to fiv. \(a\). And feeing that we found it proper to make \((2 n+1) n=90^{\circ}\), we obtain this very fimple analogy, \(1: \mathrm{fin}, a=\mathrm{CA}: \mathrm{C} e\). And the fine of \(\frac{r}{2}\) the angle of the cone is to radius as 1 to the approximating power of the inftument.

Thus let it be required that the found may be as audible as if the voice were 12 times nearer. This gives \(\frac{\mathrm{CA}}{\mathrm{C} e}=12\). This gives fin. \(a=\frac{1}{12}\), and \(a=4^{\circ} 4 \%^{\prime}\), and the angle of the cone \(=9.34\). Then \(\mathrm{CA}=\frac{1}{6 \text { fin. }{ }^{2} a}=\) \(\frac{1}{6,1}=\frac{144}{6},=24\). Therefore the length of the cone is 24 inches. From this take \(C e=\frac{C A}{12}=2\), and the length of the trumpet is 22 inches. The diameter at the nouth is \(2 \mathrm{Ce},=4\) inches. With this inftrument one voice ftoould be as loud as 144 .

If it were sequired to approximate the found only four times, making it. 16 limes ffronger than the natural

\section*{T R U [ 501 ] T R U}
smumpet. voice at the fame diftance, the, angle \(\Lambda C B\) murt be \(.29^{\circ}\); Ae mult be 2 inches, AB mult be \(1 \frac{1}{3}\) d inches, and of mult be \(\frac{5}{5} \mathrm{~d}\) of an inch.

It is eafy to fec, that when the fize of the ear-end is the fame in all, the diameters at the outer end are proportional to the approximating powers, and the lengths of the cones are proportional to the magnifying powers.

We thall find the parabolic conoid the preferable Alape for an acoultic trumpet; becaufe the founds come into the inffrument in a direction parallel to the axis, they are reflected fo as to pafs through the focus. The parabolic conoid mult therefore be cut off through the focus, that the founds may not go out again by the fublequent reflections; and they muft be receired into a cylindrical pipe of one-third of an inch in diameter. Therefore the parameter of this parabola is one-fixth of an inch, and the focus is ore-twelfth of an inch from the vertex. This determines the whole inflrument; for they are all portions of one parabolic conoid. Suppofe that the inftrument is required to approximate the found 12 times, as in the example of the conical inftrument. The ordinate at the mouth muf be 12 times the 6 th of an inch, or 2 inches; and the mouth diameter is four inches, as in the conical iuftrument. Then, for the length, obferve, that DC in fig. 7 . is \(\frac{\gamma}{6}\) th of an inch, and MP is 2 inclese, and \(A C\) is \(\frac{x}{2}\) th of an inch, and \(\mathrm{DC}^{2}: \mathrm{MP}^{2}=\mathrm{AC}: \mathrm{AP}\). This will give \(\mathrm{AP}=12\) inches, and \(C P=11 \frac{1}{2} \frac{1}{2}\) ths; whereas in the conical tube it was 22. In like manner an inftrument which approximates the founds four times, is only \(1 \frac{7}{3} \mathrm{~d}\) inches long, and \(1 \frac{1}{7} \mathrm{~d}\) inches, diameter at the big end. Such fmall inftruments may be very exactly made in the parabolic form, and are certainly preferable to the conical. But fince even thefe are of a very moderate fize when intended to approximate the found only a few times, and as they can be accurately made by any tinman, they may be of more general ufe. One of 12 inches long, and 3 inches wide at the big end, fhould approximate the found at leaft 9 times.

A general rule for making them.-Let \(n\) exprefs the approsimating power intended for the inflrument. The length of the inftrument in inches is \(\frac{m \times \overline{m-1}}{6}\), and the
diameter at the mouth is \(\frac{\mathrm{m}}{3}\). The diameter at the fmall end is always one-third of an inch.
In trumpets for affining the hearing, all reverberation of the trumpet muft be avoided. It muft be made thick, of the leaft elaflic materials, and covered with cloth exterially. For all reverberation lafts for a fhort time, and produces new founds which mix with thofe that are coming in.

We muft allo obferve, that no acouftic trumpet can feparate thofe founds to trhich' we liften from others that are made in the fame direction. All are received by it, and "maguified in the fame' proportion. This is frequen \(\cdot l y\) a very great inconvenience.

There is aifo another imperfction, which we imagine cannot be removed, namely, an odd confufion, which cannot be called indiftinctnefs, but a feeling as if we were in the midfl of an cchoing room. The caufe feems to be this: Hearing gives us fome' perception of the direction of the foumding object, not indeed very. precife,
but fufficiently fo for moft purpofes. In all inftruments Trumpet. which we have defcribed for conflipating founds, the lafl reflections are made in directions very much inclined to the axis, and inclined in many different degrees. Therefore they have the appearance of coming from different quarters; and inftead of the perception of a fingle rpeaker, we have that of a founding furlace of great extent. We do not know any method of preventing this, and at the fame time increafing the found.

There is an obfervation which it is of importance to make on this theary of acouftic inftruments. Their performance does not feem to correfpond to the computations founded on the theory. When they are tried, we cannot think that they magnify fo much: Indeed it is not eafy to find a meafure by which we can eflimate the degrees of audibility. When a man fpeaks to us at the dillance of a yard, and then at the diftance of two yards, we can lardly think that there is any difference in the loudnefs; thoagh theory fays, that it is four times lefs in the laft of the two experiments; and we cannot but adhere to the theory in this very fimple cafe, and mult attribute the difference to the impoffibility of meafuring the loudnefs of founds with precifion. And becaufe we are familiarly acquainted with the found, we can no more think it four times lefs at twice the diflance, than we can think the vifible appearance of a man four times lefs when he is at quadruple diftance. Yet we can completely convince ourfelves of this, by obferving that he covers the appearance of four men at that diffance. We cannot eafily make the fame experiment with voices.

But, befides this, we have compared two lieating trumpets, one of which fhould liave made a found as audible at the difance of 40 feet as the other did at 10 feet diffance; but we thought them equal at the diftance of 40 and 18: The refult was the fame in many trials made hy different perfons, and in different circumflances. This leads us to fufpect fome miftake in Mr Lambert's principle of calculation; and we think him miftaken in the manner of eflimating the intenfity of the reflected founds. He conceives the proportion of intenfity of the fimple voice and of the trumpet to be the fame with that of the furface of the mouth-piece to the furface of the fonorous hemifphere, which the has fo ingenioufly fubflituted for the trumper. But this feems to fuppofe, that the whole furface, generated' by the tevolution of the quadrantal arch. TEG round the axis CG (fig. 4.), is equally fonosous, \(n\) We are affured that it is not: For even if we fhould fuppofe that each' of the points \(Q, R\), and \(S\) (fig. 3:), are equally - fonorous with the point \(P\), thefe points of reflection do not fland fo denfe on the furface of the fphere as on the furface of the mouth-piece. Suppofe them arranged at equal diflances all over the mouth-piece, they will be at equal diffances alfo on the fphere, only in the direction of the arches of great circles which pafs through the cenire of the mouth-piece. But in the direction perpendicular to this, in the circumference of [mall circles, having the centre of the mouth-piece for their pole, they mult be rarer in the proportion of the fine of their dillance from this pole. This is certainly the cafe with refpect to all fuch founds as have been reflected in the planes which. pals through the axis of the trumpet ; and we do not fee (for we have not examined this point) that any compenfation is made by the reflection which is not in:

\section*{T IR Y [ 502 ] T U M}

Tremper planes paffing through the axis. We therefore imagine, I! Tryphicalorus.
\(\qquad\) that the trumpet does not increafe the found in the proportion of \(g E^{3}\) to \(g^{2}(6 g .5 \cdot)\), but in that of \(\frac{g E^{3}}{G E}\) to \(\frac{\mathrm{S}^{3}}{\mathrm{CT}}\).

Mr Lambert feems aware of fome error in his calculation, and propofes another, which leads nearly to this conclufion, but founded on a principle which we do not think in the leaft applicable to the cafe of founds.

Trumpet, Marine, is a mufical inftrument confifting of three tables, which form its triangular body. It has a very long neck with one fingle ftring, very thick, mounted on a bridge, which is firm on one fide, but iremulous on the other. It is ftruck by a bow with one hand, and with the other the ftring is preffed or ftopped on the reck by the thumb.
- It is the trembling of the bridge, when fruck, that makes it imitate the found of a trumpet, which it does to that perfection, that it is fcarcely poffible to difinguifh the one from the other. And this is what has given it the denomination of trumpet-marine, though, in propriety, it be a kind of monochord. Of the fix divifions marked on the neck of the inftrument, the firf makes a fifit, with the open chord, the fecond an octave, and fo on for the reft, correfponding with the intervals of the military trumpet.

Trumpet-Flower. See Bignonia, Botany Index.
TRUMPETER. See Psophia, Ornithology Inder:

TRUNCATED, in general, is an appellation given to fuch things as have, or feem to have, their points cut off: thus, we fay, a iruncated cone, pyramid, leaf, \&c.

TRUNCHEON, a fhort ftaff or baton ufed by kings, generals, and great officers, as a mark of their command.

TRUNDLE, a fort of carriage with low wheels, whereon heavy and cumberfome burdens are drawn.

TliUNK, among botanifts, that part of the herb which arifes immediately from the root, and is terminated by fructification; the leaves, buds, and auxiliary parts of the herb not entering in its defcription.

TRUNNLONS, or Trunions, of a piece of ordnance, are thofe knobs or bunches of metal which bear ber up on the cheeks of the carriage.
'TRUSS, a bundle, or cestain quantity of hay, fraw, Suc. A trufs of hay contains 56 pounds, or half an hundred weigla: 36 truffes make a load.

Truss is alfo ufed for a fort of bandage or ligature made of fteel, or the like matter, wherewith to keep up the parts in thofe who have hernias or ruptures.

Truss, in a thip, a machine employed to pull a yard home to its refpective maft, and retain it firmly in that pofition.

TRUSTEE, one who has an eftate, or money, put or trulted in bis hands for the ule of another.
'TRUTH, a term ufed in oppofition to falfehood, and applied to propofitions which anfwer or accord to the nature and reality of the thing whereof fomething is affirmed or denied.

IRYPHIODORUS, an ancient Greek poet. who lived fume time between the reign of Severus and Anaflafius. His writings were very numerous; yet none of
them ha*e come down to us, except an epic poem, on Tryphiu which Mr Addifon has made fome entertaining remark's in the Spectator, \(N^{\circ} 63\).

The firit edition of this extraordinary worl was publihed by Aldus at Venice, with Quintus Calaber's Pa. ralipomena, and Coluthus's poem on the rape of Heien. It has been fince reprinted at feveral places, particularly a: Francfort in 1580 by Frifchlinus; who not only corrected many corrupt peffages, but added two Latin ver fions, one in verfe and the other in prole. That in verfe was reprinted in 1742 , with the Greek, at Oxford, in 8vo, with an Englith thanliation in verfe, and Notes, by Mr Merrick.

TUAM, a town of Ireland, in the province of Connaught, and county of Galway, with an archbilhop's fec. It was once a famous city, though now it is reduced to a village ; but it fill retains the title of a city, as being an archicpifcopal fee. W. Long. 8. 46. N. Lat. 53. 33.

TUB, in commerce, denotes an indetermined quantity or meafure : thus, a tub of tea contains about 60 pounds; and a tub of camphor from 56 to 86 pounds.

TUBE, in general, a pipe, conduit, or canal; a cylinder, hollow within-fide, either of lead, iron, glats, wood, or other matter, for the air or fome other matter to have a free conveyance through it.

Auricular TUBE, or inftrument to facilitate hearing. Sec Articulate Trumpet.

TUBERCLES, among phyficians, denote little tio mors which fuppurate and difcharge pus; and are often found in the lungs, efpecially of confumptive perfons.

TUCUMAN, a province of Paraguay, in South A. merica, bounded on the north by the provinces of LosChicas ard Choco; on the eaft by Choco and Rio-de-la-Plata, on the fouth by the country of Chicuitos and Pampes, and on the weft by the bifhopric of St Jago. The air is hot, and the foil fandy: however, fome plsces are fruitful enough. The Spaniards poffels a great part of this country.

TUFA, a flone confifting of volcanic athes concreted together with various other fpecies of flone. It is of various colours, blackifh gray, bluifh gray, and yellow ; every colour having a different mixture and folidity: but all of them have the bad quality of mouldering down on long expofure to the weather; notwithflanding which, they have been ufed in buildings both ancient and modern. The yellow kind refifts the air lefs than any other.

TULIPA, TULIP; a genus of plants belonging to the clafs of hexandria; and in the natural fyttem ranging under the 1oth order, Coromaric. See Botany Iudex; and for the culture of the tulip, fee Gardering.

Tulip-Tree. See Liriodendron, Botany 'Index.
TULL, Jethro, an Oxfordthire gentloman who farmed his own land, and introduced a new method of culture, to raife repeated crops of wheat from the fame land withont the neceffity of manure: the principles of which lie publifhed about 30 years fince, in a Treatife on Horf-hoeing Hufbandry.
'IUMBRELL, Tumerellum, or Thrbichefum, is an engine of punifiment, formenly employed for the correction of fcolds and unquict women.
'lUMEFACTION, the act of fwelling or rifing into a tumor.

\section*{\(T \mathrm{U}\) N \(\left[\begin{array}{ll}503\end{array}\right] \quad \mathrm{C}\) U R}

TUMOR, in Medicine and Surgery, a preternatural rifmg or eminence in any part of tlie body.
Tumors, in Farriery. See Farriary Indec.
TUN, a large veffel or caf:, of an oblong form, biggett in the middle, and diminifling towards its two ends, girt about with hoops, and ufed for flowing feveral kinds of merchandife for convenience of carriage; as biandy, oil, fugar, 1 kins, haty, \&c.

I'un is alfo the name of a meafure. A tun of wine is four hoghteads; of timber, a fquare of 40 folid feet; and of coals, 20 cwt .

TuN is alfo a cortain weight whereby the burden of fhips, \&zc. is eflimated.

TUNBRIDGE, a town of Kent in England, fituated on a branch of the river Medway, over which there is a bridge. It is a large well built place, noted for the mineral waters four or five miles louth of the town. E. Long. O. 20. N. Lat. 5 1. \({ }^{1} 4\).

TUNE. See Music and Tome.
TUNGSTEN, one of the metals. See Chemistry and Mineralogy Index.

TUNICA, a kind of waifcoat or under garment, in ufe among the Romans. They wore it within doors by itfelf, and abroad under the gown. The common people could not afford the toga, and fo went in their tunics; whence Horace calls them populus tunicatus.

Tusica, in Anatomy, is applied to the membranes which inveft the veffels, and divers others of the lefs folid parts of the body; thus the inteftines are formed of five tunics or coats.

TUNIS, a large and celebrated town of Barbary, in Africa, and capital of a kingdom of the fame name. It is feated on the point of the gulf of Goletta, about cight miles from the place where the city of Carthage flood. It is in the furm of a long fquare, and is about four miles in circumference, with ten large freets, five gates, and 35 mofques. The houfes are all built with flone, though but one flory high; but the walls are very lofty, and flanked with feveral ftrong towers. It has neither ditches nor ballions, but a good citadel, built on an eminence on the weft fide of the city. It is
for want of water. 'lowards the middle the mountains and valleys abound in fruits; but the weftern part is the mot fertile, becaufe it is watered with rivers. The cuvirons of 'Tunis are very dry, upon which ac. count corn is generally dear. The inroads of the \(A\). rabs oblige the inhabitants to fow their barley and rye in the fuburbs, and to inclofe their gardens with walls. However, there are plenty of citrons, Jemons, oranges, dates, grapes, and other fruits. There are alfo olive tress, rafes, and odorifcrous plants. In the woods and mountains there are lions, wild beeves, offriches, monkeys, cameleons, rorbucks, hares, pheafants, partridges, and other forts of birds ind bealls. The molt remarkable rivers are the Guadilcarbar, Magrida, Magerada, and Caps. The form of government is aritocratic; that is, by a council, whofe profident is the dey, not unlike the doge of Venice. The members of the divan or conncil are cliofen by the dey, and he in his turn is elected by the divan; which is compofed of foldiers, who have more than once taken off the dey's head. The bafluw is a 'lurk, refiding at Tunis; whofe bufinefs is to receive the tribute, and protect the republic: the common revenues are only 400,000 crowns a-year, becaufe the people are very poor; nor can they fend above 40,050 men into the field; nur more than 12 men of war of the line to fea, even upon the mof extraordinary occafions. There are generally about 12,000 Chriflian flaves in this country; and the inhabitants carry on a grest trade in linen and woollen cloth. In the city of Tunis alone there are above 3000 clothiers and weavers. They alfo have a trade in horfes, olives, oil, foap, oftriches eggs and feathers. The Mahometans of this city have nine colleges for fludents, and 86 petty fchools. The principal religion is Mahometanifm; but the inhabitants confint of Moors, Turks, Arabs, Jews, and Cleriftian flaves. However the Turks, though feweft, in number, domineer over the Moors, and treat them little better than flaves.
TUNKERS, a religious fect of Baptift in Pennfyivania, fo called from the word tunker, to put a morlel in fauce. They are alfo called tumblers, becaufe in performing baptifm they plunge the perfon into the water with the head firf. As the Germans found the letters \(t\) and \(b\) like \(d\) and \(p\), the words tunkers and rumblers, have been fometimes written dunkers and dumplers. Their church government and difcipline are the fame with thofe of the Englim Baptifs, except that every brother is allowed to fpeak in the congregation, and the beft fpeaker is ufually ordained to be their minifter. They are a harmlefs, well-mearing people.

TUNNAGE. See Tonnage.
TUNNY. See Scomeer, Ichthyolugy Indca.
TUNNY-Fishisc. See Fishery.
TURBAN, the head-drefs of moft of the eaftern nations. It confilts of two parts, a cap and fall of firc. linen or taffety, artfully wound in divers plates about the cap. The cap has no brim, is pretty flat, though roundith at top, and quilted with cotton; but dues not coter the ears. There is a good deal of art in giving the turban a fire air; and the making of them is a particular trade. The faft of the Turk's turban is white linen; that of the Perfians red woollen. Thefe are the diltinguifeing marks of their defferent religions. Sophiking of Perfin, being of the feet of Ali, was the fint who affumed

Turbinated the red colour, to ditirguith himfeif from the Turks, who are of the fect of Omar, and whom the Perlians elleem heretics.

IURBINATED, is a term applied by naturalifts to fhells which are fiviral, or wreathed conically from a larger bafis to a kind of anex.
'TURBI'TH or Turpeti mineral. Sec Mercury, \(\mathrm{N}^{\circ} 1720\) and 1728 Cilemiscry.

TURBO, the WRE.Iti, a genus of thell-filh. See Conchology Index.
"IURBOI'. Sec Pleuronectes, Ichtuyology Index:

TURC Æ or Turci, (Mela); fuppofed to be the Tufci of Ptolemy; whom he places between Caucalus and the Montes Ceraunii. The name is faid to denote, "to defulate, or lay wafte." Herodotus places thein among the wild or barbarous nations of the north. There is a very rapid river called Turk, running into the Cafpian fea, from which fome fuppofe the Turks to take their name. They made no figure in the world till towards the 7 th century; about the beginning of which they fullied forth from the Portæ Cafpiz, laid wafte Perfia, and joined the Romans againft Chofroes king of Perfia. In 1042 they fubdued the Perfians, in whofe pay they ferved, and from whom they derived the Mahometan religion; and afterwards pouring forth, overran Syria, Cappadocia, and the other countries of the Hither Afia, under diftinct heads or princes, whom Oitoman fubduing, united the whole power in himfelf, which to this day continues in his family, and who fixed his feat of empire at Prula in Bithynia. His fuc. ceffors fubdued all Greece, and at length took Conftan. tinople in 1453 ; which put a period to the Roman empire in the Eatt, under Conttantine the laft emperor. It is a.llanding tradition or prophecy amcang the Turks, that their empire will at length be overturned by the Franks or Chriftians; which feems now to be drawing on apace towards accomplifhment.

\section*{TURCOISE. See lurquoise.}

\section*{TURENNE, VISCOUNT. See Tour.}

TURE, peat, a blackin earth uled in feveral parts of the world as fuel. Turf, as diftinguilhed from peat, confills of mould interwoven with the roots of vegetables.

TURGESCENCE, among phyficans, denotes a fivelling or growing bloated.
'I UlRGOT, ANe Robert Janes, a celebrated French financicr, was born at Paris in 1527 , of a very aucient Norman family. His father was a long time prus of of the curporation of merchants; during which he was the nliject of gencral admiration, on account of his urudent adminiltation. M. Turgot was the youngcft cf ilree lirothers, and was deftined for the church. Hehad farcely attained the age at which reflection commeices, when he refolsed to facrifice all temporal advantages to liberty and confcience, and to purfue his ecclcliaftical fludies mithout declaring his repugnance 'o their propoled ol.ject. At the age of 23 years lee tool: bis degree, and was elected prior of the Sorbonrie.

The time when it was neceflary for him to declare that he would not be an ecclefiatic was now arrived. He announced this refolution to his father by letter, fhowing the motives which induced him to decline the clerical order. His father conlented, and he was appointed matler of requells. MI. Turgot prepared himficif for this office by particular application to thofe parts of fcience which are moft connceted with its functions and duties, viz. natural philofophy, agriculture, manufactures, commerce, \&c. About this period he wrote fome articles for the Encyclopidie, of which the principal are Etymology, Exittence, Expanfibility, Fair, and Foundation. He had prepared feveral others, but the perfecution agninft the Encyclopidie induced him to de. cline father contrioutions.

In ip6I M. Turgot was appointed intendant of Linoges, whea he gave activity to the fociety of agricilture; opened a mode of public inftuction for female profeffors of midwifery; procured for the people the attendance of able phyficians during the raging of epide. mic difeafes; eflabliihed houles of induftry, lipported by charity (the only fpecies of alms-giving which does not encourage idlenefs): introduced. the cultivation of potatoes into his province, \&c. \&c. While M. Turgot proceeded with unremitting activity and zeal, in promoting the good of the people over whom he was placed, he meditated projects of a more extenfive nature, fuch as an equal diftribution of the taxes, the conftruction of the roads, the regulation of the militia, the prevention of a fascity of provifion, and the protection of commerce.

At the death of Louis XV. the public voice called M. Turgot to the firt offices of government, as a man who united the experience refulting from habits of burfinefs to all the improvement which ftudy can procure. After being at the head of the marine department only a hoort time, he was, Auguf 24. 1774, appointed comptroller general of the finances. During his difcharge of this important office, the operations he carried on are afoniming. He fuppreffed 23 kinds of duties on neceflary occupations, ufeful contracts, or merited compen. fations. He abolifhed the corvée, or the labour required from the public for the hirhways, faving the nation thirty millions of livres annually:-He fet afide another kind of corvée, which refpected the carriage of military ftores and baggage. - He abated the riguur in the adminiftration of indirect impofitions, to the great profit of the contributors, the king, and the financiers; befide many other effential improvements in political economy.

At length, however, by the artifices of the courtiers, he was deprived of his offices; and in retirement he de. voted himfelf to the fciences and the belles lettres, which he had cultivated in his youth. Natural philofophy and chemiftry were his favourite purfuits; fometimes he indulged in poetry. He compoled, it is faid, only one Latin verle, intended for a picture of Dr Franklin.

He died in 1781.
ITURIN, an ancient and populous city of Italy, and capital of Piedmont, where the fovereign refides, with an archbithop's fee, a flrong citadel, and an univerfity. It is feated on a vaft plain, at the confluence of the rirers Doria and Po. But the air is unbealthy in the au-

\section*{T U R [ 505\(]\) T U R}

Turia, m
turin and winter on account of the thick fogs. One half of this place is lately built; and the flreets are Itraight and clean, being wafhed by an aqueduct. It contains many elegant buildings. When the plagne reigned at Marfeilles in 1720, a great number of artificers withdrew to Turin; infomuch that there are now above 87,000 inhabitants, and 48 churches and convents. Turin is very well fortified, and extremely Arong; as the French found by experience in 1706, who then befieged it a long while to no purpofe. The citadel, which is flanked with five bafions, is without doubt a mafterpiece of architecture. There are fine walks on the ramparts, and fine gardens on the fide of the river Po; and the houfe commonly called La Chavité is remarkable, as there is room for 3000 poor people. The college of the academy is very large and well built, and has a great number of ancient infcriptions. In the royal library are 19,000 manufcripts, befides 30,000 printed books. In December 1798 , it was taken poffeffion of by the French, who in June following were driven out of it by the Auflians. But with the reft of Italy it is now under the dominion of the French. It is charmingly featcd at the foot of a mountain, 62 miles northeaft of Ge noa, 72 fouth-weft of Milan, and 280 north-weft of Rome. E. Long. 7. 45. N. Lat. 44-50.

TURKEY, an extenfive empire, fituated partly in Europe, and partly in Afia. It is bounded on the north by the empire of Ruffia, Hungary, and the Black fea; on the weft by the gulf of Venice and the Mediterranean; on the fonth by the Mediterranean and Arabia; and on the eaft by Perfia. In its prefent fate, we may compute it as extending from the river Unna, in eaft longitude about \(17^{\circ}\), to the mountains which leparate it from Perlia, in about \(50^{\circ}\) of ean longitude from Greenwich, or about \(33^{\circ}\) from wefl to eaft ; while from the moft foutherly point, a little above Baffora, in north latitude \(31^{\circ}\), to the confines of European Ruflia, in north latitude \(47^{\circ}\), it occupies a range of \(16^{\circ}\) of latitude. In Britih miles itsextent i seftimated at 750 in length, by a medial breadth of about 1000 , and its area at 652,960 fquare miles.
Turkey is naturally divided into European and Afiatic, feparated from each other by the Black fea, the Archipelago, and the ftraits by which thefe are connected. European Turkey is fubdivided into if provinces, viz. Moldavia, Bessarabia, Wallachia, Bosnia, Servia (partially), Bulgaria, Romeria (including Maredonia and Thrace), Dafmatia, Albanta (including Epirus), Croatra (partially), and the Morea, or ancient Greece; while Afratic Turkey is fubdivided into feven provinces, viz. Natolia (A/fa Minor), Diarbec (Mefopotamia), Syria (including Judaza), Georgia (IUcria), Turcomanta (Armenia), Irac-Arabla, and Kurdistan (ADyria). See each of thefe articles in the general alphabet.

The iflands belonging to Turkey are extremely numerous; comprifing thofe of the Archipelago, or the Grecian iflands, and feveral in the Levant. The moft important are Lfanos, Lesbos or Mytelene, Scro, Samos, Cos, Rhodes, Cyprus, Candia, Paros, Delins, Naxia, Sanctorini, Patmos, Negropont, Andro *, Colttri or Salamis *, Egina, Zante *, Cepharonia, Lfucadia, Corfu, and Cerigo or Cytherea, which fee under their proper heads.
Both European and Afiatic Turkey abound in mountainous tracts, intelfperfed with numerous plains and Voz. XX. Part II.
valleys, and here and there a defert of confiderable ex. Turfecytent. The plains ate watered by numetous large rivers, and, in the Afiatic part, confift chiclly of pallure grounds.

Among the mountains of European Turkey may be Mountaias; noticed the Carpathian clain, which divides it frum the Auftrian territuries; the celebrated mountains of Hz mus; the Acroceraulian mountains; and the claflical hills of Pindus, Offa, Pelios, and Athos. The moft important mountains of Afatic Tulkey are, Muunt Caucalus, dividing it from Riuffia; Mount Thurus, now called Thuron; Olympus; Ida; the mountains of Elivend, and perhaps Mount Ararat, the relling-place of the Ark, dividing it from Perfia; and Mount Lebanon, celchated in fcripture for its cedars.

The principal river of European Turkey is the Da-Rivers. nube, with its tributary ftreams, the Save, the Morava, the Bofna, and the Pruth; but we may alfo notice the Marifa or Hebrus, and the Vardan or Axius. In A. fiatic Turkey are feen the Kifil-Irmal: or Halys, the Saccatia, the Sarabat or Hermus, the Minder or Meander, the Araxes, the Orontes, the Jordan, and the Euphrates. Lakce.
The lakes of European Turkey are of little importance, and in the \(\Lambda\) fiatic part there are only three that merit notice. Thefe are the Dead fea and the fea of Galifee in Paleftine, and the Van in Armenia.

The climate in the geater part of the Turkifh em-climate pire is delightful, and the feafons mild and genial. The and feafonis heats of the fummer, except in the deferts of Syria, and on the fhores of the Black fea, are tempered by the keen winds that blow from the higher regions, and the winter is in general extremely mild. The unhealthinefs of the large towns on the coalt of Afiatic Turkey, is owing much more to the indolent and dirty habits of the people, than to any infalubrity of the climate.

Turkey affords a moft ample field to the naturalift, Naturab whether his tafte lead him to explore the animal, the hiftory. vegetable, or the minetal kingdom. In the firt of thefe he will find the lion, a variety of the tiger, the hyena, the jackal, the ibex, the goat and cat of Angora, and many other quadrupeds common in. Europe. Among the birds, one of the moft numerous and moft ufeful is the flork; partridges of a large fize, quails, woodcocks, cranes, and feveral birds of prey, are allo very common. The Black fea and the Archipelago abound with excellent fift, and contain great variety of curious mollufca, and other marine animals. Among the infects, that defruclive animal the locuft is a frequent vifitant; and Sonnini particularifes the tarantula, and a monflous fpecies of fpider, which he calls galcode arancoide, or the fcorpion fider. Of the domeftic animals, the Turks abound in excellent horfes, affes of a large fize, and that mof ufeful heaft of burden, the carael.
To enumerate the vegetable productions of Turkey, would far exceed our fcanty limits. The forefts of European Turkey, though far lefs extenfive than in ancient. times, furnifh abundance of the fineft timber, efpecially oak, cedar, larcl, walnut, chefnut, and beech, whitc the olive, the date, the almond, the peach, the mulberry, the cherry, the lemon, and the orange, are the ratural productions of Afiatic Turkev. Many of the moft valuable drugs employed in medicine, are alfo the produce of this empire, efpecially opium, rhubarb, myrrh, afafcetida and other fetid gums, fcanmony, fenna, galls, and coloquintida.

\section*{Fourdation} of the Ot toman empire.
A. D. 1300

\section*{Eftablith-} ment of the Janizaries, 1352.

Outine of Pa:os, is proverbially excellent.
the 1.antulh The people whom we now call Turks, and who form hifory. the great nuafs of population of the Turkin empire, are
generally believed to be the defcendants of the ancient generally believed to be the defcendants of the ancient generally believed to be the defcendants of the ancient
Scythians. Thefe are fuppofed to have migrated from the Altai mountains in Tartary, about the middle of the Altai mountains in Tartary, about the middle of
the fisth century, and to have gradually diffufed themfelves towards the weif, till they reached the lake Mieotis, the modern fea of Azof, near which they fettled in
Armenia Minor or Turcomania. At this time the liotis, the modern fea of Azof, near which they fettled in
Armenia Minor or Turcomania. At this time the lioman empire in the eaft was fufficiently ftrong to prevent
the invaders from extending heyond the river Oxus, on the man empire in the eaft was fufficiently ftrong to prevent
the invaders from extending hey ond the river Oxus, on the banks of which they eftablifhed themelves, and foon be-

Both gold and filver mines are found in Turkey, but from the indolence of the natives they are fearcely ever worked. Many of the iflands abound in mineral treafures, efpecially Cyprus, where are found mines of gold, copper, vitriol, and iron; and where rock cryital, jalper, and feveral precions fones are occafomally procured. The chief mineral production of Turkey, however, is its marble, of which it furnifhes feveral of the molf rare and beauliful varieties. That from the Grecian ifland came a formidable foe to the emperors of Conttantinople.
There is little certain or interefling in the hiftory of thefe barbarians till the reign of the caliph Othman, or Ofman, who in the end of the \(13^{\text {th }}\) century eftablifhed what from him has been called the Ottoman empire. He firt took the title of fultan, and fixed the feat of his government at Prufa. the capital of Bithynia. His fucceffor Orkan was a reflefs, ambitious, and cruel prince, who greatly extended the limits of the empire, took pofieffion of Gallipoli, and penetrated into Thrace. A murath the grandion of Ofman, in 1362 , ellablithed the famous military bands called jamizaries, which till form the chief engines and chief moderators of Turkifh defpotifm. Thefe were firt compofed of young Chriflian flaves that had been taken in war, and educated in the Mohammed?n religion. They were inured to obedience by fevere difcipline, and trained to warlike exercife; and as every fentiment which enthufiafm can infpire, and every matk of honour which the favour of the prince could confer, were employed to animate them with martial ardour, and excite in them a fenfe of their own importance, thefe janizariss, (or new foldiers) foon became the chief ftrength and pride of the Ottoman arms. On the affaffination of Amurath in 1389, he was fucceeded by his fon Bajazet, furnamed Ilderim, or the Thunderbolt, whofe reign forms one of the moll fplendid epochs in the Turkifh hiftory.

Early in this reign, viz. in 1396, the Hungarians were defcated at Nicopoli in Bulgaria, and in 1402, was fought the famous battle between Bajazet and Timur or Tamerlane, the chief of the Moguls, between Cefarea and Aneyra, which ended in the captivity of Bajazet, and the temporary humiliation of the Turks. See Moguls, \(N^{\circ} 19\) and 20.

On the death of Bajazet, his fon Moufa became fultan, and in 1412 defeated the emperor Sigifmund with great flughter. Moufa was fuccecded by his brother Mohammed 1. by whom he had been affifinated. The reign of Amurath 1I. fucceffor of Mohammed, conttibuted greatly to increafe the fplendour of the Turkif esopire. In this reign Conitantinople was attacked, but for the prefent efcaped pillage. Amurath was fuccefsfully oppofed in his hofilities againg the Chriftian
princes, by the Albanian chief George Caftriota, whom the Turks call Scanderbeg *.

Amurath was fucceeded by Mohammed II. and foon after his acceffion, viz. in I4S3, the city of Comilantinople was taken by the Turks, and has ever fi:ce re-Takin? mained the capital of their empire. The events of which we have thus drawn the faint outline, are related at fome length in the article Constantinopolitan \(\mathrm{H}_{1}\). STORY, No 111.-168.

Three years after the taking of Conftantinople, Mohammed laid fiege to Belgrade, from which, after an ebflinate refiftance, he was at length repulled with confiderable lofs. Abandoning his attempt on Hungary, the fultan made preparations for an expedition into Greece, whate the priuces Thomas and Demetrius, bothers of the emperor, filll continued to maintain their authoity. Alarmed at the progrefs of the Tuskifh arms, thefe princes refolved on retiring into laly, on which the peninfula was feized by the Albunians. This tribe fent a deputation to Mohammed, offering to give up to him the Grecian cities and fortrefles, provided they flould be allowed to keep the open country; but this offer was rejected by the fultan, who under the afpearance of affilling the Greeks, entered the country with a formidable army, defeated the Albanians, took feveral cities, and carried off great numbers of the inhabitants.

Mohammed was fucceeded by his fecond fon Baja- Bajazc zet 11. in 1481 , preferred by the janizaries to his An. 1 elder brothes Zizan, who lled for protcction to Pope Alexander VI. by whom he is faid to have been poifoned, at the inftigation of Bajazet, and for the reward of 300,000 ducats. Selim, his youngelf fon and fucceffor, was a fucceisful prince. He conquered Egypt, Aleppo, Antioch, Tripoli, Damalcus, and Gaza, and defeated the Perfians. Solyman, furnamed the Magnificent, one of the mof accomplithed, enterprifing, and warlike, of the Turkifh princes, afcended the Ottoman throne in confequence of the death of Selim.

Having qualled fome infurrections in Aba, be com-Sctrma menced hoftilities againf the European princes, and en- An. s: tering Hungary, made himfelf mafter of Belgrade, then reckoncd the chief barier of that kingdom againt the Turkifl power. He next tunned his vietorious arms againft the ifland of Rhodes, then the feat of the knights of St John of Jerufalem. After incredible efforts of courage and military conduct, the knights obtained an honnurable capitulation, and retired to the fmall ifland of Malta, where they fixed their refidence. See Malta. He afterwards annexed Hungary to the Ottoman empire. His dominions extended from Algiers to the river Euphrates, and from the farther end of the Black fea to the extremity of Greece and Epirus. During the fiege of Sigeth, a city of Hungary, before which the Turks loft above 30,000 men, Solyman expired in the 74 th year of his age, and 41 ft of his reign.

His fon and fucceffor, Selim II. befieged and took Cyprus; but in the famous fea fight at Lepanto, in 157 r , the Turkifh fleet was utterly deftroyed by Don John of Auftria. He afterwards invefted and took Tunis by form, putting the garrifon to the fword.

On his death, Amurath 111. afcended the Ottoman throne, and extended his dominions on both fides by the addition of Raab in Hungary, and Tigris i: PerLia. His fon, Mohammed III. has no claim to notice

\section*{T U R}
have been enumerated in the article RUSSIA, \(N^{0} 13\) and 144 .

In this reign an extraordinary alarm was excited in Turkey by the fudden appearance of a new prophet in Upper Afia. This man, whofe name was Shice Monfour, an pretended that he was predoomed by the eternal ins- Alia. mutable decrees of heaven to fill up the mealure of divine revelation to mankind; and that, as he was to be the latt, fo he was the greatef of the proplets. "1he feene of his minilly was in the wide and delolate regions on the borders of the Calpian fea; and thougl the firt rumour of his proccedings reprefented him as at the head of a multitude of armed enthulialts, ready to overturn the ellablithed government, and the religion of Muhammed, it was foon difcovered that all the military fury of his zeal was directed againlt the Chriftians.

About the lame time a formidable rebellion broke \(\Lambda\) reth hion out in Egypt, which, though it has never properly form- in Eyyt. ed a part of the Turkith empire, may be confidered as tributary to the Turks, and as conftituting the granary of that empire. This rebellion, which has been fufticiently noticed under the article EG广pT, \(\mathbb{N}^{\circ} 125\), was fupprefted chictly by the wile conduct and intrepid bravery of Hollan Bey, the captain paclia, who at the age of 70 , fought with all the ardour of youth, and all the fkill of the molt confummate general. That veteran, however, was recalled before he was able to carry all his patriotic deligns into excution, that he might aid the divan with his council, in the critical fituation ints which the empire was brought by the arrogant claims of the court of Ruffid. The refult of the deliberations was a precipitate declaration of war againit that court, contrary to the better judgement of the old pacha. The war commericed in autumn \(178 \%\), and the hordes of 'lartars which were firlt brought into the field, headed by the new prophet, were everywhere defented by the fiperior difcipline of the Ruffian troops commanded by Prince Potemkin. Sone enterprifes which were ur:dertaken by the Turks againit the ifland of 'l'anan and the Krimea were attended with as little fuccefs as the attempts of the Tartars; while the emperor Jofeph declared to the Porte, that he would affit his ally the emprefs of Ruffia with an army of \(80,000 \mathrm{men}\). Four Auftrian armies were accordingly affembled; one at Carlfadt in Croatid. under the command of General de Vins; another at Peterwaradin in Hungary, commanded by General Langlois; a third on the borders of Lithuania, under General Febris; and the fourth in the Buccowine, under the orders of the prince of Saxe-Cobourg. Iwo other generals, 10 lieutenant-gencials, and 30 major-generals, were all ordered to prepare for active fervice in the frontier armies.

The war between the Turks and Aufrians was carried on with various ficcefs. At firt the advantage was evidently on the fide of the O:tomans, and the im. perial Jofeph acquired no warlike renown. His declared purpofe was to get poffeffion of B Igrade; from which, howeyer, he was repulfed with difgiace. The prince of Saxe-Cobourg in his department of the war difplayed indeed prodigies of valour ; but being oppefed to a fuperior force, he was long obliged to act oniy on the defenfive. At length being joined by a body of Ruffian forces under General Soltikof, preparations were made for commencing in form the fiege of Chorzim, which was furrendered to the allied armies on Michael.

\section*{TU R \(\quad[508] \quad \mathrm{T} \quad \mathrm{K}\)}

Tiviky. 4-rentures mas'day 3788 , after a defence which would have done honour to the ableft general in Europe, Still, howevcr, fuccefs feemed to lean to the Turks. The grand vizier made a fudden incurfion into the Bannat, and fpread confermation and difmay to the very gates of Vienna. The Auftrian affairs feemed approaching to a very alarming crifis'; not only the fplendid views of conquelt shich were beheid in the imagined partition of a tottering empire had totally difappeared, but had left in their place the fad and gloomy reverfe of a difcontented and impoverifhed people, an exhaufted treafury, and an army thinned by pefilence and defertion. The firf campaign of an invafive war had already produced an impreftion on the territory of the invader.
In this fituation of affairs Marftal Laudohn was with fome difficulty drawn from his retirement to take the command of the army in Croatia; and under his aulpices fortune began to fmile on the Aullian arms. He quickly reduced Dubicza and Nevi, though they were both defended by the molt obllinate bravery. He then fat down before Turkih Gradifca; but the autumnal rains coming on with fuch violence, that the Save overflowed its banks, he was compelled to raife the fiege. During this period the war in the Bannat raged with the utmof viclence; torrents of blood were thed on both fides; mucl defperate valour difplayed on the one fide, and many brave actions performed on the other; while a very great part of that fine but unfortunate country fuffered all the defolation and ruin that fire and fword, under the dominion of vengeance and animofity, could inflict. The inhabitants were objects of commiferation; but the injuftice with which the emperor had commenced the war, made his perIonal loffes be confidered as nothing more than the due reward of his conduct.

In the midft of thefe military operations Achmet IV. was depofed, and fucceeded by Selim III. the late fultan. The new emperor did not want either courage or prudence, and he continued the war with Ruffia and Aufria, with great fpirit and refolution. Thofe events of this war in which the Ruffians were more immediately concerned, have been already noticed under the article RUssia, \(N^{0} 156,158,160\) and 161 ; fo that we have merely to relate the remaining operations of the Auffrians.

Marhial Laudohn renewed his attempts upon Gradifca as foon as the feafon would permit, and after a brave defence it fell into his hands. This, with fome other fucceffes roufed the emperor from his inactivity, and made him ferioufly determine on the attack which he had long meditated on Belgrade. The enterprife was intrufted to Landohn, who, with that good fortune which feemed conflantly to attend him, made himfelf mafter of the place in lefs than a month. The ref of the campaign was little elfe than'a feries of the moft important fucceffes. While one detachment of General Laudohn's forces tonk pofiefion of Czernitz in Walachia, another made iffelf maller of Cladova in Servia. Buchareft, the capital of the former of thefe provinces, fell without oppofition into the hands of Prince Cobourg; while Akerman on the Black fea was reduced by the Ruffinns; and Bender lurreudered to Prince Potemkin, not withnut fufpicion of finifter practices, on the 1 g th of November.
Soon after this, the emperor Jofeph died, and his fucceflior Leopold liewed a defire for peace. After the te-
duction of Oriova, therefore, which happened on the Tur 16th of April 1790, the war was carricd on with languor on the part of Auftria; and in the month of Jurie a conference was agreed on at Reichenbach, at which the minifters of Prufia, Aultria, Britain, and the United Provinces, alfitted, and at which allo an envoy from Poland was occafionally prefent. After a negociation, which continued till the 17th of Auguft, it was agreed that a peace floould be concluded between the king of Hungary and the Ottoman Porte; that the bafis of this treaty fhould be a general furrender of all the conquelts made by the former, retaining only Choczim as a fecurity till the Porte ihould accede to the terms of the agreement, when it alfo was to be reftored.

In the following year the Porte was compelled to con- and \(\hat{\mathrm{s}}^{2} \mathrm{wi}\) clude a peace with the emprefs of Ruffia, and from that Rufia. period till the depofition of Selim in 1807, no event of confequence has occurred. The Porte has alternately been at war with Britain and with France, but in neither conteft has fhe acquired either honour or territory. As the very confined limits to which we are now reduced forbid us to dwell on thefe minor tranfactions, we flall haiten to conclude this hifforical outline with an account of the revolution which placed Muftapha IV. on the Ottoman empire.

In the fpring 1807 , the fpirit of infurrection had flown itfeif among the janizaries belonging to the garriions of the Dardanelles, and in the camp of the grand vizier. In the afternoon of the 25 th of May, the garrifons of the caftles of the Dardanelles were in a ftate of Depofit tumult, on account of the European uniform, the new of Seling tactics, \&c. Hali Aga, the commandant of Madfchia. fon acc burna, on the Afiatic fhore, was murdered. Indiche flapha 1 Bey, commandant of the entrance of the Black fea, only efcaped the fame fate by flight. The reis effendi happening to come to infpect that pof juit at the fame time, the military immediately rofe upon him as one of the introducers of the nizam geded. He endeavoured to fave himfelf in a bark, by paffingtover to Buyukdere, but 100 piftol fhots laid him and his attendants dead. It feems that the rage of the janizarics had been embittered againft him by the recollection of a promife he made to raife their pay, on condition they would adopt the new difcipline, and which promife he never performed.

Another circumitance increafed the fpirit of oppofition; the fultan had given notice that the janizaries were no longer to attend him as uftal to the mofque, but that this duty was to devolve upon the troops difciplined after the European manner. Thoulands of janizarics were now marching to Conflantinople, and arrived in the futurb of Pera on the evening of the 28th. They fwore to each other to conduct the revolution with the beft order. Any perfon who flould in the leaft injure any Frank was to fuffer death. One individual janizary only met with his fate, for taking bread from a Greek (a baker), wilhout paying for it. Behind the janizaries barracks, in the wellknown place called Eimeldan, the janizaries planted their colours, and took with them their camp kettles; an infallible fignal of infurrection. For a time, the fultan thought of defending himfelf; and troops, powder, and cannon, were brought to the feraglio. Soon after the mufti, the feimen bafche, the kaimakan, and the two kazcakars of Romelia and Natolia, joined the jani-

\section*{\(T \cup[509] \quad T \quad U R\)}
zaties, A couricil was held in form, and it was pro. pofed as a preliminary, to requet the grand fcignior to abolifi the new difcipline by a fettiva from the mufti. The grand feignior, however, thought he thould be able to put a flop to the infurrection before the ftep could be taken, in confequence of his fending the heads of Mahmud, Terfana Emin, Hagai Ibrahin, and the kiaga Mehmefch Effendi, to the Limeldan. This emeafure completely failed; the janizaries were more enraged than ever; they did not require the heads of the univerfally eftemed Mahmud Effendi, but that of the Reis Effendi, then in the camp of the grand vizier.

The jamizaries continued to fearch every place for thofe minifters, who had promoted the adoption of the European difcipline, and publicly avowed themelelves as it's patrons, namely, Franfillo, Ibrahim, Juffuf Aga, Hadichi Ibrahim, and Achmet Bey, captains of the grand feignior's guard; Haffian Aga, Achmet Efiendi, and others, 12 in number, who were all taken, dragged to the Eimeldan, and there cut to pieces. At this juncture the grand feignior fent a hatti fcheriff, a letter written in his own hand, in which he for ever abolifled the nizam geded, and pronounced an execration on it. But the hatti fcheriff was not now accepted; the depolition of the grand feignior was refolved on. The whole force of the janizaries now proceeded to the feraglio. The mufti and the ullemas alone entered the haram, while the reft of the minifters, the agas, the janizaries, and the people, furrounded the palace.

Muflapha 1V. born on the 7 th of September 1799 , the eldeft fon of the fultan Achmet IV. fet afide in 1789 , was raifed to the Turkilh throne. And according to ancient cuftom, Selim, the former fultan, threw himfelf at the feet of Muftapha, kiffied the border of his garment, and immediately repaired to that department of the Ceraglio occupied by the princes of the Ottoman blood who no longer reign. The folemn invitation to Muftapha, to afcend the throne, was made on the 29th of May, and on the 3 d of June the ceremony of invelting him with the fabre of the prophet, took place.
The population of the whole Turkifh empire is ufually effimated at \(18,000,000\). Of thefe, \(10,000,000\) have been allotted to Afiatic Turkey, and the remaining \(8,000,000\) to Turkey in Europe. A confiderable part of this population confifts of Jews and mercartile Chriftians, from different parts of Europe, who are diflinguifhed by tie name of Frazks.

The gavernment of Turkey is defpotic, but the power of the fultan is by no means fo abfolute as we are generally led to fuppofe. Befides, being frrietly fubjeet to the laws of the Koran, and thus to the national religion, fuch obftructions to his ablolute will are raifed by the power of the mufti, or chief prieft and judge, by the frequent infurrections of the janizarics, and the ambition of the pachas, or governors of provinces, that many Chriftian fovereigns are much more defpotic. The principal title of the fultans is, as. we have feen, grand feignior, and the court of Conflantinople is ufually flyled the Porte, or Ottoman Porte, either from the large gate at the entrance of the feraglio, or, what is more probable, from the palace of the vizier, where all the affairs of fate are tranfacted. The principal minifters of the Porte are the grand vizier or prime minifter, the mifti, the reis effendi or chief fecretary of ftate,
the killar-aga or chief of the black cunuchs, and the Tarkey. aga of the jonizaries.

The revenues of the whole Turkift empire are com-Reverucs. puted at about \(7,000,0001\), Sterling, while the ufual expence dnes not exceed \(5,000,0001\). This revenue is partly derived from the capitation tax on unbelievers and from the cuftoms, but principally from the tax on land, amounting to about 6* per acre. The fultan is alfo fuppoled to poffefs a confiderable private treafure, but of this nothing certain is known.

The military trength of 'Turkey is but inconfidera-Mililitary ble for fo large an empire. The whole of the landfrength. forces are fuppofed never to exceed 150,000 mer, and thefe are ill difciplined, and now difpirited by fucceffive difaftrous wars. The navy is eftimated at 30 fail of the line ; but the fhips are ill-built, badly mannced, and wretchedly navigated. In fhort, the military frength of the Ottoman empire is not improperly faid to be more defructive to its own provinces than to any flate with which they are at war, and more terrible to its friends than its encmies.

The eftablillied religion of Turkey is Mahometanifm, Reli \({ }^{38}\) the tenets of which have been already explained under and laws. the articles Mahometanism and Alcoran. The laws of the empire are entirely founded on the Koran ; but in particular cafes the judges are guided by certain commentaries on that work, which have acquired the force of laws. The chief of thefe are the commentaries of Abou-Hanife.

The mufti, or Mohammedan pontiff, prefides at Conflantinople, but his power has feldom interfered with the civil government. Next to him in rank are the monlahs, who, though efteemed dignitaries of the church, are in fact rather doctors of the law, while the Koran is alfo a code of civil obfervance. From the moulahs are felected the inferior muftis or judges throughout the empire, and the cadelefquiers, or chief juffices. The next clafs of divines includes the imaums, or parilh priefts, who perform the fervice of the mofques, while the cadis are judges annually appointed to adminifer juftice in the towns and villages, and being regarded as churchmen, like the moulahs, have directed their chief attention to the judicial part of the Koran. Ftom this bricf view it will be. obferved, that the ecclefiaftical orders of muftis and imaums fomewhat refemble the Chriftian bifhops and parochial clergy; while the other diftinctions arife from the fingularity of both religion and laws being united in the Koran, fo that a lawyer or judge mult be at the fame time a Riilful divine. The Turks have alfo their monks, fyled dervifhes, of four various orders and inffitutions, dedicated by folemn vows to religious offices, public prayer, and preaching. The Greeks, along with their faith, retain their priefts, bihops, archbihops, and patriarchs; but their church is in the laft ftate of degradation, and its dignities openly fold by the Turks ; this abomination, however, it muft be confefied, partly arifes from the miferable ambition and avarice of the Greck ecclefiaftics, who think they can atone by idle ceremonies for the neglect of all the-invaluable morality of the goipel.

39
The Turkifh language is of far inferior reputation Languaga to the Perfian or Arabic, being a mixture of feveral dia- and literat lects, and poffefing neither the force, elegance, nor pu- ture:,

\section*{T U R [ 510 ] T U R}

Zurksy. rity of thefe two celebrated oriental tongues. Litera. ture, however, is not wholly neglected, and it has been repeatedly attempted to eftablith a printing prefs at Conftantinople; but the defign failed from the interett of the copyiths, who inferred that this art would deprive them of their bread. A late traveller informs us that there are in this capital feveral kuttub-chans, or public libraries, among which are thofe of St Suphin, and the Solimanie Jamafy; but none are fo elegant as that founded by the grand vizier Raghid, which is wholly built of marble in the midit of a fquare court, and is filled with books chitlly theological. A librarian conftantly attends, and there are convenient feats with carpets and culhions. In the neighbourhood is a fchool founded by the fame vizier, in which about 100 bays are taught to read and write. The market for buoks is extenfive, containing many hops well lupplied with oriental manulcripts. The Turks have their ancient pocts, hiftorians, and divines; but of little "reputation when compared with thole of Perfia or Arabia. Ihe ftate of education among the Tusks may be conceived to be very low, and ignorance is indeed a chief part of the national character. The only profeffion which requires a thadow of leàrning is that of the law, which is intimately connected with their theology. The celebrated doftors have difciples, who are trained up to that department; but there feems nothing that can deferve the name of college or univerfity.

The Turks cannot be regarded as a commercial people, though they admit of an extenfive commercial in-
tercourfe with the ftates of Europe, through the medium of Frank and Greek merchants. The chief parts are Smyrna and Conftantinople, the former of which is the great centre of the Levant trade, while the latter is concerned chietly in the trade with Ruflia, by the Black fea. At both thefe ports, and indeed throughout the Iurkith empire, the trade is nominally carried on by factors from the diffrent European Itates; but it is managed more immediately by Jew or Armenian brokers, who take numerous advantages of the ignorance of the factors, and feldom fail to enrich themfelves at the expence of their emplovers. The commodities expoited from Turkey, chiefly to Britain, Germany, Italy, Holland, and France, confift for the moft part of bees wax, boxwood, fik, cotton yarn, walnut planks, fponges, opium and other drugs enumerated in \(\mathrm{N}^{0} 9\), madder root, and other dye fluffs, and various dried fruits, fuch as figs, raifins, and cu rants. The imports are chictly tin and tin plates, fugar, flalloons, cotton yatn and cotton goads, mullins, clocks and watches, cutlery and glafs ware, indigo, gunpowder, piltols and military ftores, \(\log\) wood, rum, coffee, and various fpices, efpecially pepper, ginger, and cinnamon. The expurts are principally from Sinyrna, where the trade is carried on almoft entirely by way of exchange, while at Contantinople the imports are generally paid for by calh or bills. The exchange is commonly againft the Tuks.

The Turkith money ufually employed in commerce is the piaftre, which, according to the exchange or agio, is rated at from 13 to 17 in the Enslifn pound nenling, fo that the average value of the piaftre is about 15. 6d. Elch piefle is divided into 40 paras, and each para into three afpers. The principal weight employed is lie kintal. equal to ahout one cwt. Englifh, divided into \(4 t\) oke, and each oke into 400 drahen.

From their jealoufy with refpeet to firangers, it is ce: tremely difficult to form a truc etlimate of the national characler of the Turks. An intelligent wrier, who feems well qualified to direct our judgement in this re. fpeel, has thus deliseated the Tukih character. "Ihe 1 'lurks are in general a fagacious, thinking people; in the putuit of their own interett, or fortune, their attention is fixed on one object, and they perfevere with great fteadinefs until they attain their purpofe. They are in common life leemingly obliging and humane, not without appearances of gratitude: perhaps all or either' of thefe, when extended towards Chitians, are practif. ed with a view of fome advantage. Interelt is their fupreme good; where that becomes an object of competition, all attachment of fiendmip, all ties of confanguinity, are diffolved; they become defperate, no barrier can flop their purfuit, or abate their rancour towards their competitors. In their demeanour they are rather hypochondriac, grave, fedate, and pafive; but when agitated by paffion, furious, raging, ungovernable; big with diflimelation ; jealous, lulpicious, and vindictive beyond conception; perpetuating revenge from generation to generation. In matters of religion, tenacious, fupercilious, and morole". *

The manners and cufoms of the Turks are diftin-Obfervaguifted by the peculiarity of their religion from thofe \({ }^{t}\). ons on of othet European nations. On the birth of a clitd the gion, N/6 fither hinfelf gives the name, putting at the fame time ners, \&cc. a grain of falt into its mouth. The circuncifiun is not of the performed till the age of 12 or 14. Marriage is only a Turks, ve civil contrae, which cither party may break, and is managed by female mediation, the youth feldom feeing his bride till after the ceremony. The dead are perfumed with incenfe, and buried in a cloth, open at top and tomm bottom, that the deceafed may be able to lit up and anfwer the queflions of the angels of death. The burialgrounds are near the highways, and flones are often placed at the heads of the graves, with carved turbans denoting the fex. As they never intrench upon a former grave, the cemeteries are very extenfive. In diet the Turks are extremely moderate, and their meals are difpatched with great hafte. Rice is the favourite food, and is dreffed in three ways. In boiling, the meat is cut into fmall pieces, and in roafting fill fmaller, a bit of meat and an onion being placed alternately on a very long fpit. The fift of the Archipelago are excellent, and the beef tolerable, except that of the buffalo, which is very hard. The hares, partridges, and other game, are of fuperior tlavour. The meal is ufually fpread on a low wooden table, and the mafter of the houfe pronounces a hort prayer. The frugal repalt is followed by fiuits and cold water, which are fucceeded by hot coffce and pipes with tobacco. The houfes of the Turks are feldom expenfive; the chief furniture is the carpet which covers the floor, with a low fofa on one fide of the room. In regard to drefs, Tournefort obferves that the ule of the tushan is unhealthy. The flirt is of callico, and the loofe robe is faftened by a girdle, in which is fluck a dagger, while the tobacco box, pocketbook, \&c. are worn in the hofion. The robe is gencrally of European brond cloth, trimmed with various furs. The floes or llippers are flight, and unfit for much exercile. The drefs of the women differs little from that of the men, the chief diftinction being the licad-drefs; that of the fair fex confiting of a bonnet like an inverted bafket, formed of pafteboard covered with cluth of gold, with a veil extending to the eycbrows, wbile a fine handkerchief conceals the under part of the face. The perfonal cleanlinefs of both fexes is highly laudable; but the European eyc is not pleafed with the fanale cuttom of thaining the nails with a red tincture. 'The amufements of the 'luks partake of their indolent apathy, if we except hunting, and thofe of a military defcription. 'l'o recline on an elegant carpet, or in a hat feafon by the fide of a fiream, and fmole the delicate tobacco of Sysia, may be regarded as their chief amufement. Chefs and draughts are favourite games; but thofe of chance are confidered as incumpatible with Itrict morals. 'The coffee-houfes and baths furnilh other lources of amufement; and the hairam, or fellival which follows their long lent, is a feafon of univerfal diflipation. *

It appears to be a miftaken notion, that the practice of eating opium, to procure intoxication, is generd a. mong the Turks. We are affured by a late traveller, that this practice is confined to a few individuals, who are regarded by the majority of their countrymen with as much contempt as drunkards are in the more polihed focieties of Lurope.

Tunnep-Bread. See Bread.
Turnep-Fly. See Chrysonela, Entomology Index.

TURNING, the art of forming hard bodies, as wood, ivory, iron, into a round cr oval fhape, by means of a machine called a lathe.

This art was well known to the ancients, and feems to have been carried by them to a very great degree of perfection; at leafl, if we believe the teftimony of Pliny and feveral other authors, who tell us, that thofe precious vafes enriched with figures in half-relief, which fill adorn our cabinets, were tumed on the lathe.

The art of turning is of confiderable importance, as it contributes effentially to the perfection of many other arts. The architect ufes it for many ornaments, both within and without highly finifhed houfes. The mathematician, the aftronomer, and the natural philofopher, have recourfe to it, not only to embellifh their influments, but alfo to give them the neceffary dimenfion and precifion. In Mort, it is an art abfolutely neceflary to the goldmith, the watchmaker, the joiner, the fmith.

Turning is performed by the lathe, of which there are various kinds, and feveral inftruments, as gouges, chifels, drills, formers, ferew tales, ufed for cutting what is to be turned into its proper form as the lathe turns round. The following is a fimple kind of lathe (fig. 1.), in which \(a\) is the footfool, \(b\) the cord, \(c\) the frame of the lathe, \(d d\) the puppets, \(e \in\) the points, \(f\) the fpangingtree.

The lathe fhould be fixed in a place very well lighted; it mould be immoveable, and neither too high nor too low. The puppets hould neither be fo low as to oblige the workman to foop in order to fee his work properly, nor fo high that the little chips, which he is continually driving off, fhould come into his eyes.

The picce to be turned fhould be rounded (if it be
wood) before it be put on the lathe, either with a fmall latchet made for the purpole, or with a plane, or with a file, fixing it in a vice, and flaving it down till it is cverywhere almolt of an equal thicknefs, and leaving it a little bigger than it is intended to be when fisinued off. Before putiong it on the lathe, it is alfo necuflary to find the centres of its two end lurlaces, and that they flould be exactly oppolite to each other, that when the points of the puppets arc applied to them, and the piece is turned round, no fide may belly out more than another. 'To find thefe two centres, lay the piece of woud to be turned upon a plank; open a pair ot compaftes to almolt half the thicknefs of the piece; fix one of the legs in the plank, and let the point of the other touch one of the ends of the piece, brought into the fame plane with the plank on which the compaffes is fixed and very near the lixed leg. Defcribe four arches on that end at equal dillances from cach other at the circumference of the end, but interfecting one another within; the point of interfection is the centic of the end. In the fatne matıner mult the centre of the other end be found. After finding the two centres, make a fmall tole at each of them, into which infert the points of the puppets, and fix the piece fo firmly as not to be maken out, and yet loofe enough to turn round without difficulty.

The piece being thus fixed, it is neceffary in the next place to adjuft the cord, by making it pafs twice round the piece, and in fuch a manner that the two ends of the cord, both that which is fixed to the fpang and to the foot-board, come off on the fide on which the turner ftands, that the piece may move againt the edge of the cutting-tool and be turned. If the lathe be moved by a wheel, the manner of adjutting the cord needs no directions.

If the workman does not choofe to be at the trouble to find the two centres of the piece in the manner defcribed above, let him lay, as nearly as he can, the centre of one end upon the point of the left hand puppet, and then let lim puh forward the right hand puppet, Ariking it with a mallet till its point is as near as he can in the centre of the other end of the piece; and then fixing the right hand puppet by a gentle blow of the mallet on the key, let him turn round the piece to fee by the eye if the centres have been properly found. If any part of it bellies out, let him Atrike that part gently with the mallet till it goes properly; then let him itrike one of the puppets pretty fmartly to drive the points into the piece, and afterwards fix the puppet by ftiking the key. If the workman cannot judge by the eye whether the piece be turning properly round its centres. or not, he fhould apply gently the paint of an inftrument called a triangular graver, leaning it on the reff, and it will mark by a line the place where the piece is out of its centre ; and by friking upon this line with a mallet, the piece can eafly be placed properly. The reft, of which we have juft fpoken, ought to be placed upon the two arms of the lathe, and fixed with fcrews as near the piece as the workman pleafes.

The piece being fixed between the two points of the puppets (or, as they are called in Scotland, the heads), the cord adjufted, and the reft fixed as near the work as poflible without touching it; the workman is now to take a gouge (fig. 2. in which \(a\) is the mouth and \(b\) the Fig. a handle) of a proper fize in his left hand, and hold it by the handle a little inclined, keeping the back of the

Tirning. hand lowermof. Witls his right hand, the back of which is to be turned upwards, he is to grafp it as near the end as pofithle on this fide of the reff; then leaniar the gouge on the refl, he is to prefent the edge of it a lilue higher than the horizontal diameter of the piece, fo as to form a hind of tangent to its circumference; then puting the right foot on the foot-board, and turning round the wheet, and holding the gouge firmly on the ref, the piece will be cut neatly. In the fame manner are the chifels, formers, and other infruments to be ufed, taking care that the wood be cut equaliy, and that the inflrument be not pufled improperly, fometimes ftronger than at others; and taking care alfo that the inflrument ufed do not follow the work, but that it be kept firmly in the hand without yielding.

The young turner ought to endeavour to acquire the management of the gouge and the chifel, which are the iniltuments by far the molt frequently ufed, and the mon neceflary in this att: by them, almof entirely, are the foft woods turned; for as for hard woods and other things, as box, ebony, horn, ivory, and the metals, they are hardly ever turned except by fhaving off. In that cafe gravers are to be ufed with fquare, round,

Fig. 3, 4, and 5 or triangular mouth (fig. \(3,4,5\).). They fhould be held horizontally while applied to the wood, and not obliquely as directed for the gouge and the chifel.
After the work is completely turned, it is next to be polifhed; and this camot be done with the infruments hitherto mentioned. Soft woods, as pear-tree, hazel, maple, ought to be polifhed with fhark-ikin or Dutch rufhes. There are different fpecies of fharks; fome of which have a grayifh, others a reddif fkin . Shark- Elin is always the better to be a good deal ufed; at frift it is too rough for polifing. The Dutch-rufb (equiftum hy emale), which grows in moil places among moun. tains, and is a native of Scotland. The oldeit plants are the bell. Before ufing them they hould be moiftened a little, otherwife they break in pieces almof immediately, and render it exceedingly difficult to polifh with them. They are particularly proper for fimoothing the hard woods, as box, lignum vite, ebony, \&c. After having cleaned up the pieee well, it mould be rubbed gently either with wax or olive-oil, then wiped clean and rubbed with its own rafpings or with a cloth 2 little worn. Ivory, horn, filver, and brafs, are polifhed with pumice.flone finely pounded and put upon leather or a linen cloth a little moiltened : with this the piece is rubbed as it turns round in the lathe; and to prevent any dirt from adhering to any part of it, every now and then it is rubbed gently with a fmall brufh dipt in water. To polifh very finely, the workmen make ufe of tripoli, a particular kind of earth, and afterwards of putty or calx of tin. Iron and fteel are poliihed with very fine powder of emery; this is mixed with oil, and put between two pieces of very tender wood, and then the iron is rubbed with it. Tin and filver are polifited with a burnifher and that kind of red fone called in France fanguine dunc. They may be polifited alfo with putly, putting it dry into fhamoy-kin, or with the palm of the hand.

To fucceed in turning iron, it is neceflary to have a bathe exccedingly Atrong in all its parts, and exceedingly well fixed. The puppets fhould be fhort, and the ref well fixed very near the work: the back of the reff
fhould be two or three lines lower than the iron to be Tun turned.

The lathe and other inftruments being preparcd, it is neceliary to determine the langth and thichinefs of the iron to be tusned according to the defign which is to be executed, and to make a model of it in wood a little thicker than it ought to be: Then one exactly like this is to be forged of the beil iron that can be procured; that is to fay, it muft not be new, but well prepared and well beaten with hammers; it mult have no ilaws, nor cracks, nor pimples. New iron, which has not been well beaten, often contains round drops of caft iron, called by the workmen grains, which blunt the edges of the gouges, chifels, and other infruments ufed for cutting, break them, or make them slide. The iron being forged according to the model, it thould be annealed, that is, heated red hot and allowed to cool flowly on the coals till the fire go out of itfelf. Some people, to foften the iron, cover it over with clay and allow it to cool. The iron cylinder being thus made, it is next to be put upon the lathe, finding the centres as formerly directed, and boring a fmall hole in them that the iron may not efcape from the points.

The points fhould be oiled from time to time to prevent their being exceffively heated and fpoiled while the iron is turning. A crotchet is then to be applied to the iron to be turned, a little above its centre, pretty gently, and by this means the inequalities of the cylinder will be taken off. Other inftruments are then to be applied to mold the iron according to the model; and whenever any of them grow hot, they are to be plunged into a bafon of water lying befide the workman. If the iron, after being properly turned, is to be bored like a gunbarrel, one of the puppets is to be removed and another fubflituted in its place, having a fquare hole through it, into which the collar of the iron is to be fixed firmly, fo as not to thake; then borers are to be applied, like thofe which lockfiniths ufe to bore keys; and beginning with a fmall one, and afterwards taking larger ones, the hole is to be made as wide and deep as neceflary; great care muft be taken to hold the borers firm on the ref, otherwife there is danger of not boring the hole firaight. The borer mult be withdrawn from time to time to oil it and to clean the hole. Since it is difficult to make a hole quite round with bosers alone, it is necefilary to have alfo an inftrument a good deal fmaller than the hole, one of the fides of which is fiarp, very well tempered, and a little hollow in the middle. This inflrument being fised in a pretty long handle, is to be applied with fteadinefs to the inner furface of the hole, and it will entirely remove every inequality that may have been there before its application.

To cut a fcrew upon the eylinder, fome perfons ufe an inffrument confifing principally of a female forew; but this is rather an improper infrument; for if one prefies too violently, or inclines it ever fo litile to the right or left, he runs the greatef rikk of fpoiling the fcrew. To avoid this danger, fome ufe it only to trace out the lines of the fcrew, and afterwards finifl it with a file. But the following is a much better way. Take a tap for making a female fcrew, the threads of which have been cut very accurately, and exaclly of the fize of the focw which you want; and having put it in the opening which you have traced in the collar of the
＇I．I＇IININC「．

\section*{T U R [ 513] T U R}
rurning., axis on which the fcrew is to be cut, folder it with tin, fal-ammoniac, and rofin, as exactly correfponding to the axis as poffrble. Take then a puppet with a hole cut into a correfponding female fcrew, into which the male ferew is to be put. The axis on which the fcrew is to be cut mull be placed exactiy horizontally between the two puppets. The refl is then to be brought as near as poffible to the place where the forew is to be cut, and a fmall hollow fhould be cut in that part of it which is exactly oppofite to the place where the forew is to be cut, to hold your in?frument firmly and prevent it from flaking. The intrument witl: which the ferew is to be cut thould be very tharp, and its point thould make an angle of \(60^{\circ}\) with the forew to be cut; and if you winh the forew to be cut very deep, it thould make an angle a little larger. The lathe being now put in motion, the tap fixed at the end of the axis will move gradually through the female fcrew in the puppet; and your inftrument in the mean time will trace a fimilar male forew on the axis fixed in the lathe. Many perfons, after having in this manner drawn the outlines of the fcrew, finifh it with a fcrew-tale of three teeth correfponding exactly to the fize of the forew, or with a triangular file; but this lat method is rather improper.

For turning ovals, a lathe of fomewhat a different confruction is ufed. The axis or fpindle, having on it the pulley over which the band-cord paffes for turning the lathe, is fixed between the two puppets fo as to turn round eafily: one end of it paffes through one of the puppets, and to it is firmly fixed a circular plate of brafs, fo that it turns round along with the fpindle. Upon this plate two brazen fegments of circles are faftened, the circumferences of which correfpond to the circumference of the plate: their chords are parallel, and cqually diflani from the centre of the plate, fo that they leave a diftance between them. They have a graove in each of them: in thefe grooves another plate is placed which exactly fills up the face between the two grooves, but is fhorter than the diameter of the larger circular plate on which it is laid. This plate is made to flide in the grooves. To its centre is fixed a fhort fpiadle, on which the piece of wood to be turned is fixed. When the lathe is fet a going, the circular plate moves round, and carries the piece along with it ; the plate of brafs on which the piece is fixed being fixed loofely in the grooves already defcribed, flides down a little every time that the grooves become perpendicular to the floor (and there are particular contrivances to prevent it from fliding down too far); and by thefe two motions combined, the circular one of the large plate, and the ftraight one of the fmall, the circumference of the piece of wood to be turned neceffarily defcribes an oval; and gouges or other tools heing applied in the ufual manner fupported on the ref, it is cut into an oval accordingly. The fmall plate may be made to flide either more or lefs in the grooves; and by this contrivance the tranfverfe diameter of the oval, or rather ellipfe, may be male longer or fiorter at pleafure.
I. The method of monding bowes of frell and lioms. In the firt place, form a proper mould, which mult confift of two picces, viz. of a circle about half an inch thick, which flould flope a little in order to draw out the moulded fhell the more eafily; and a ring fitted to the outfide of the circle, fo that both together make the fiape of a box. Thefe two pieces being adjufted, it is Vul. XX. Part II.
neceffary to round the flell to be moulded of fuch a fize Tumize. that, when moulded, it will be a little higher than the ring of the mould, that there may be no deficiency. The mould is then to be put into a prefs on a plate of iron, exadly under the fcrew of the prefs; put then the flyell upon the circle of the mould, fo that its centre alfo is exactly oppofite to the ferew of the prefs: then take a piece of wood formed into a truncated cone, and not fo thick as the diameter of the circle of the mould, nor fo deep as the ring : then put a plate of iron above the ccise, and ferew down the prefs gently and cautioufly till the whole is well fixed : then plunge the whole into a cauldron of boiling water placed above a firc. \(\ln 8\) or 10 minutes the fhell or horn will begin to foften; fcrew the prefs a little firmer that the wooden cone may fink into the foftened thell: repeat this from time to time till the cone is quite funk in the mould; then take out the prefs and plunge it into cold water. When it is cold, take the box now formed out of the mould, and put into the infide of it a new mould of tin exactly of the form you wifh the infide of the box to be; do the fame with the outfide, put it again into the prefs and plunge it into boiling water; ferew the prefs gradually till the bo: receive the defired form.
2. Method of preparing green wood fo that it will not split in the turning.-Cut the wood into pieces of a proper fize, put them into a vellel full of potath ley. Poil them about an hour; take the cauldron from the tire, allow the ley to cool; and take out the wood and dry it in the flade.
3. Method of giving an cbony-black to hard and fine woods.-After forning the wood into the deftined figure, rub it with aquafortis a little diluted. S:nall threads of wood will rife in the drying, which you will rub off with pumice-ftone. Repeat this procefs again, and then rub the wood with the following compofition: Put into a glazed earthen veffel a pint of thong vinegar, two ounces of fine iron-filings, and half a pound of pounded galls, and allow them to infufe for three or four hours on hot cinders. At the end of this time augment the fire, and pour into the veffel four ounces of copperas, and a chopin of water having half an ounce of borax and as much indigo diffolved in it; and make the whole boil till a froth rifes. Rub feveral layers of this upon the wood; and when it is dry, polifh it with leather, on which you have put a little tripoli
4. Nethod of giving to plum-tree the colour of brazil uood.-Slake lime with urine, and bedaub the wood over with it while it is hot : allow it to dry; then take off the coat of lime and rub it with fhamoy fkin well oiled. Or, fteep the wood in water, having a quantity of alum diffolved in it : then, having allowed brazil wood to diffolve in water five or fix hours, fteep the wood in it, kept lukervarm during a night; and when it is dry, rub it, as before directed, with fhamoy fikn well oiled.
5. Mie:Mod of giving a fine black colour to wood Steep the rrood fre two or three days in lukewarm water in which a little alum has been diffolved; then put a handful of logwood, cut fmall, into a pint of water, and boil it down to lefs than half a pint. If youthen add a little indigo, the colour will be more beautiful. Spread a laycr of this liquor quite hot on the wood with a reaci!, which will give it a violet colour.

3 T
When

\section*{\(T \quad \mathrm{~T}\)}

Turning, When it is dry, fpread on another layer; dry it again IIurntone. and give it a third : then boil verdegrife at dilcretion in
its own vinegar, and fpread a layer of it on the wood: when it is dry, rub it with a brufh, and then with oiled fhamoy ikin. This gives a fine black, and initates perfectly ilie colour of ebony.
6. Method of cleaning and whitening bones before yfing them.-Having taken off with a law the ufelefs ends of the bones, make a frong ley of ahtes and quicklime, and into a paiful of this ley put four ounces of a.um, and boil the bones in it for an hour ; thein take the veffel containing the ley off the fire, and let it cool; then talie out the bones and dry them in the fhade.
7. Metrod of foldering Bells.-Clean the two fides of the llells which you wifh to join together; then, having joined them, wrap them up in linen folded double and well mointened; then heat two plates of iron pretty hot that they may keep their heat for fome time; and putting the floells rolled up between them under a prefs, which you mull ferew very tight, leave them there tiil the whole is cold, and they will be foldercd. If you do not fucceed the firt time, repeat the procefs.
8. Method of moulding fbells.--Put fix pints of water into a kettle; add to it an ounce of olive or othex oil; make the water boil; then put in your fhell, and it will grow foft. Take it out and put it into a mould under a prefs, and it w:11 take the figure you want. This mult be done quickly; for if the thell cool ever fo little, the procefs will fail. It will not require much preffire.
9. Method of singing bones and ivory red.-Boil flavings of fcarlet in water. When it begins to boil, thirow in a quarter of a pound of athes made from the dregs of wine, which will extract the colour: then throw in a little rock alum to clear it, and pafs the water through a linencloth. Sieep the ivery or bone in aquafortis, and put it into the waier. If you wilh to leave white foots, cover the places denined for them with wax.
10. To tinge ivory black.-Steep the ivory during five or fix days in water of galls with afles made with dried dregs of wine and arfenic; then give it two or three layers of the fame black wilh which plum-tree is blackened, in order to imitate ebony. Or, diffolve filver in aquafortis, and put into it a little rofe-water. liub the ivory wilh this, and allow it to dry in the fun.

1 1. Method of hardening wood to make pulleys.-After frinfing the puilcy, boil it feven or eight minutes in olive oil. and it will become as hard as copper.
12. To make Chimefe vornijh.-Take of gum lac in grains four ounces; put it into a flrong bottle with a pound of good ficit of wine, and add about the hallk of a hazel nut of camphor. Allow them to mix in fummer in the fun, or in winter on hot conbers for 24 hours, flaking the bottle from time totimc. Pals the whole through a fine cloth, and throw away what femains upon it. Then let it fettle for 24 hours, and you will frd a clear part in the upper part of the thotle, which you nuft feparate gently, and put into another vial, ind the remains will fuse for the firlt layers.
turnstone. Sce Tringa, Ormithology In\(d c \%\).

TUSCAN order, in Architeçure. Ste Architecturf, \(\mathrm{N}^{0} 42\).

Tuscan Earth, a yellowifh kind of bole found in many parts of Italy, and particularly about Florence, where there is a flratum eight or ten feet thick, at the depth of five or fix feet from the furface. It is fuppofed to have an aftringent property.

TUSCANY, a duchy of Italy, which makes part of the ancient Hetruria, and, cxcepting fome detached part, is encompaffed by a part of the Mediterranean, called here the Tufcan Sca; the ecclefiaftical tlate; the duclyy of Modena; and the republic of Lucca; its extent from north to fouth being about 116 Englifh miles, and from ealt to weft about 80 .

Though fome parts of it are mountainous, yet both the liils and dales are covered with vines, olives, citron, lemon, and orange trees, \&c. The mountains yield alfo copper, iron, alum, \&:c. and fome of the fineft marble. Here is alfo plenty of com, rice, fafiron, honey, wax, wool, flax, hemp, with mineral waters, bicla paiture, falt-pils, fulphur, alabaficr, calcedony, lapis hazuli, borax, amethstis, carnelians, jafpers, cryfals, and black flate. In fome places the elms and afles yield manna.

The principal river in Tufcany is the Arno, which has its fource in the Apennine mountains, and falls into the fea below Pifa. There are fome other fmaller rivers.

This duchy fell under the dominion of the Romans about 455 years before Chrif. The Ofrogoths poffef. fed themfelves of it in the fifth century, and after them the Lombards, who were expelled by Charlemagne anno 800 ; in confequence of which it became fubject to the German emperors, who appoirted governors crer it. At laft the cities of Florcnce, Pifa, Sienna, and fome others, during the contentions betwcen the pore and the emperor, and their refpective adhercnts, the Guelphs and Gibbelines, withdrew themfelves from the dominion of both, and erected themfelves into feparate commonsecalihs. In that of Florence, John de Medicis, a popular nobleman, fo infinuated himfelf into the favour of his ceuntrymen, that they invefled him with furereign power. Pope Pius V. conserred the title of grand ciuke on Cofmo de Mediris anno 1570, in whofe famity the duchy continued until the death of Gallon de Medicis, who died anno 1737. The duely was then transferred to the duke of Lorrain, afternards the em-

TYMPANY, or 'lympantes, in Midicinc. See Memines, N" 3.37 , and Surceri Index.
'TYNDILE, Whhirss, a zealous E.glifin reformcr, and memorable for having made the firft Englifi verfion of the Bible, was born on the borders of 1 ales fome time before 1500 . The was of Mogdalenc-hall in Oxford, where he diftinguilhed himelf by inbiting early the doctrines of Luther, and by as zcaloully propagating tiem. Afterwards he removed to Canabidge, and from thence went to live with a gentleman in Cloucefterlhite in the capacity of tutor to his children.While he continued there, he thowed himfelf fo furious for Luther, and fo inveterate to the poje, that he was forced, nierely for the fecurity of his perfon, to leave the place. He next endeavoured to get into the fervice of Tonftall bihhop of Durbam, but did not fucceed. His zeal for Lutheranifin made him defirous to tranflate the New ''eftament into Englilh; and as this could not fafely be done in England, he went into Germaty, where, fettiag about the work, he finilhed it in \(152 \%\). He then began with the Old Teftament, and finilised the five books of Mofes, prefixing difcourfes to each book, as he had done to thofe of the New Teftament. At his firlt going over into Germany, he went into Saxony, and had much conference with Luther; and then returning to the Netherlands, made his abode chietly at Antwerp. During his peregrinations from one country to another, he fuffered flipowreck upon the coaft of Holland, and loft all his books and papers. His tranilations of the Scriptures being in the mean time fent to England, made a great noife there ; and, in the opinion of the clergy, did fo much mifchief, that a royal proclamation was iffued, prolibiting the buying or reading them. But the clergy were not fatisfied with this, they knew Tyyndale capable of doing infinite harm, and therefore thought of nothing lefs than removing him out of the way. For this purpofe one Philips was fent over to Antwerp, who inlinuated himfelf into bis company, and under the pretext of friendfrip betrayed him into cuftody. He was fent to the caftle of Fillord, about 18 miles from Antwerp; and though the Englifh merchants at Antwerp did what they could to procure his releafe, and letters were alfo fent from Lord Cromwell and others out of England, yet Philips beitirred himfelf fo heartily, that he was tried and condemned to die. He was firf ftrangled by the hands of the common hangman, and then burned near Filford cafte, in \({ }_{1} 536\). While he was tying to the fake, he cried with a fervent and loud voice, "Lord, open the King of England's cyes."

TYPE (turos), an imprefion, image, or reprefentation of fome model, which is termed the antitype. In this fenfe the word occurs often in the rvitings of divines, who employ it to denote that prefiguration of the great events of man's redemption which they have found or fancied in the principal tranfactions recorded in the Old Teflament.

Typf, among letter-founders and printers, the fame with letter. Sec Letter.

\section*{T Y R}

Type is allo ufed to denote the order obferved in the intenfion and remiffion of fevers，pulfes，\＆c．

TYPHA，Cat＇s－tail ；a genus of plants belonging to the clafs of monecia，and in the natural fyftem ranging unjet the 3 do order，Calamaric．See Botany Index． TYMHON．See－Whirlwind．
Typhos，the devil of the ancient Egyptians．See Polytheism， \(\mathrm{N}^{\circ} 29\).
1 Y＇POGRAPHY，the art of printing．See Print－ ing．

TYRANT，among the ancients，denoted fimply a king or monarch；but the ill ufe which feveral perfons invefted with that facred character made of it，has al－ tered the import of the word；and tyrant now conveys the idea of an unjuft or cruel prince，who rules in a more defpotic manner than the laws allow．

TYRE，formerly a celebrated city of Afia，on the coaft of Syria，fituated under the 54 th degree of eaft longitude，and 32 d of north latitude．It was built，ac－ cording to fome writers， 2760 years before the Cbrif－ tian era．There were two cities of that name；the one called Palctyrus，fituated on the continent；and the other the city of Tyre，built on an illand about half a mile from the flore．It was about 19 miles in circum－ fcrence，including Paletyrus；the town on the illand was about four miles round．The buildings of Tyre were very magnificent；the walls were 150 feet high， and broad in proportion．This city was at one period the mof famous commercial city in the world．Of its commercial tranfactions，the moft particular account
that is to be found in any ancient writer has been given by the prophet Ezckiel，which at the fame time con－ veys a magnificent idea of the extenfive power of that ftate．It refifted Nebuchadnezzar king of Babylon for 13 years；at the end of which，wearied with fruitlefs efforts，the irmabitants refolved to place the fea be－ tween them and their enemy，and paffed accordingly in－ to the ifland．The new city food out againft Alexan－ der the Great for feven months；and betore he could take it，he was obliged to fill up the ftrait which fepa－ rated the ifland from the continent．It was repaired af－ terwards by Adrian，and became the metropolis of the province．It afterwards fell into the hands of the \(A\) ． rabs；and after being taken by Baldwin II．king of Je－ rufalem，it was deftroyed by the fultan of Egypt in 1289，and abandoned．An excellent account of its modern fate may be found in Volney＇s Travels，vol．ii． It now confills of a fmall village，compofed of fifher－ men＇s huts，and containing about 50 or 60 poor families．

Tyhian dye．See Murex，Conchology In－ dex．

TYRONE，a county of Ireland，in the province of Ulfer， 46 miles in length and 37 in breadth；bounded on the north by Londonderry，on the eaft by Armagh and Lough－Neagh，on the fouth by Fermanagh，and on the weft by Donnegal．It is a rough and rugged country，but tolerably fruitful ；contains \(\mathbf{1 2 , 6 8 3}\) houles， 30 parithes， 4 baronies， 4 boroughs，and formerly fent 10 members to the Irifh parliament．The principal town is Dungannon．

\section*{U，V．}

U，or \(u\) ，the 20 th letter and 5 th yowel of our alpha－ ，bet，is formed in the voice by a round configu－ ration of the lips，and a greater extrufien of the under one than in forming the letter o ，and the tongue is alfo more cannulated．The found is thort in curft，muft，tur， tub；but is lengthened by a final \(e\) ，as in tune，tule，\＆ \(\mathbf{c}\) ． In fome words it is rather acute than long；as in brule， flute，lute，\＆c．It is moftly long in polyfyllables；as in union，curious，\＆c；but in fome words it is obfcure， as in nature，venture，\＆c．This letter in the form of V or v ，is properly a confonant，and as fuch is placed before all the vowels；as in vacant，venal，vibrate，\＆c． Though the letters \(v\) and \(u\) had always two founds，they had only the form \(v\) till the beginning of the fourth century，when the other form was introduced，the in－ convenience of expreffing two different founds by the fame letter having been obferved long before．In nu－ merals V tlands for five；and with a da \(\mathrm{h}_{1}\) added at top， thus \(\overline{\mathrm{v}}\) ，it fignifies 5000 ．

In abbreviations，among the Romans，V．A．nood for veterani affignati；V．B．viro brno；V．B．A．viri boni arlitratu；V．B．F．vir benae fidei；V．C．air con－ fularis；V．C．C．F．vale，conjux charifime，fcliciter； V．D．1）．voto didicatur；V．G．verli gratia；Vir．Ve． virgo vefalis；VL．viddicet；V．N．quino nonaruas．

Vaccinium，the Whortle－berry，or Billerry； a genus of plants belonging to the clafs octandria，and arranged in the natural fyitem under the 18th order， Bicornes．Sce Botany Index．

VACUUN，in Philofophy，denotes a fpace devoid of all matter or body．

It has been greatly difputed whether there be in na－ ture a perfect vacuum，or fpace void of all matter；but if bodies confit of material folid atoms，it is evident that there muft be vacuities，or motion would be im－ polfible（fee Metaphysics， \(\mathrm{N}^{\circ}\) 193．）．We can even produce fomething very near a vacuum in the receives of an air－pump and in the Torricellian tube（fee Pneu－ matics，pa（fim）．

VADIUM，a pledge in law，is either vivum or mor－ tuum．

VADIEM Vivum，or Living Pledge，is when a man borrows a fum（fuppofe 2c0l．）of another；and grants him an eftate，as of 201．per annum，to hold till the rents and profits glall repay the fum fo borrowed．This is an ellate conditioned to be void as foon as fuch fum is raifed．And in this cafe the land or pledge is fail to be living：it fubfifts，and furvives the debts；and， immediately on the difcharge of that，reverts to the borrowet．

VAGABOND, or Vacrant, one who wanders illegally, without a fettled habitation. Such perfons are cognizahle by the laws. See Iddeness.

VIGINA; properly fignifies a fleath or fcabbard; and the term vagina is ufed in architceture for the part of a terminus, becaufe refembling a fheath out of which the flatue feems to illiue.

\section*{Vagena. See Anatomy Index.}

VAlLLANI; Jonn Foy, a phyfician and great medalift, to whom, according to Voltaire, lirance was indebted for the fcience of medals, and Louis XIV. for one half of his cabinet, was born at Beauvais in 1632 . Through the means of the minifter Colbert he travelled into Italy, Greece, Egypt, and Perfia, to collect medals for the royal cabinet; and returned with fo many as made the king's cabinet fuperior to any in Europe. In one of his voyages the flip was taken by an Algerine corfair. After a captivity of near five monthis he was permitted to return to France, and received at the fame time 20 gold medals which had been taken from him. He embarked in a veffel bound for Marfeilles, and was carried on with a favourable wind for two days, when another corfair appeared, which, in fpite of all the fail they could make, bore down upon them within the reach of canmon fhot. Mr Vaillant, dreading the miferies of a freh llavery, refolved, however, to fecure the medals which he had received at Algiers, and therefore fwallowed them. But a fudden turn of the wind frecd them from this adverfary, and caft them upon the coalts of Catalonia, where, after expecting to run aground every moment, they at length fell among the fands at the mouth of the Rhone. Mr Vaillant got to thore in a fkiff, but felt himfelf extremely incommoded with the medals he had fwallowed, which might weigh altogether five or fix ounces, and thercfore did not pals like Scarborough waters. He had recourfe to a couple of phyficians; who were a litte puzzled with the fingularity of his cafe; however, nature relieved him from time to time, and he found himfelf in poffection of the greateft part of his treafure when he got to Eyons. Among his collection was an Otho, valuable for its rarity.--He was much careffed on his return ; and when Louis XIV. gave a new form to the academy of inferiptions in 1701 , Mr Vaillant was firt made aflociate, and then pentionary. He wrote feveral works relating to ancient coins, and died in 1706.
VAIR, or Vaire, a kind of fur, formerly ufed for lining the garments of great men and knights of renown. It is reprefented in engraving by the figures of little bells reverfed, ranged in a line. Sec Heraldry, Chap. II. Sect. 2.

VAIRY, in Heraldry, exprefles a coat, or the bearings of a coat, when charged or chequered with vairs.

VALAIS, a valley in Swiferland, which exiends from the fource of the river Rhone to the lake of Geneva. It is near 100 miles in length, but of unequal breadth. It is bounded on the north by the Alps, which feparate it from the cantons of Berne and Uri, on the eaft by the mountains of Forche, on the fouth by the duchy of Milan and the Val d'Aolle, and on the weft by Savoy and the republic of Geneva. The inhabitants profefs the Roman Catholic reiigion, and are fubjeit to the fwelling of the throat called bronchocele;
and idiots are faid to abound among them more than in Valantia. any other place of the globe. They are naturally hardy, enterprifing, and good-natured. Valais is furrounded on all fides by very high mountains, moft of Valentinian. which are covered with perpetual fnow. The foil is fertile in corn, wine, and fruits. The mufcat-wine, which is produced here is excellent, and well known all over Europe. This country comprehends 55 large parilles, with one bilhop. The religion is the Roman Catholic.

VALANTIA, : genus of plants belonging to the clafs polygamia, and in the natural fyttem arranged under the 4 It order, a/perifolice. See Botany Index.

VALENCIA, a province of Spain, which has the title of a kingdom; and is bounded on the eaft and fouth by the Mediterranean fea, on the north by Catalonia and Arragon, and on the weft by New Caltile and the kingdom of Murcia. It is about \(16_{5}\) miles in length, and 63 in breadth. It is one of the moft populous and agreeable parts of Spain, enjoying almoof a perpetual fpring. The great number of rivers wherewith it is watered renders it extremely fertile, particularly in fruits and wine. There are very rugged mountains in it, which contain mines of alum and other minerals.
Valencti, a city of Spain, and capital of the kingdom of the fame name. It contains about 12,000 houfes, befides thofe of the fulurl)s and the fummerhoufes round it. It has an univerfity, and an archbifhop's lee; and was taken from the Moors by the Chriftians in the \(13^{\text {th }}\) century. The town is handfome, and adorned with very fine ftructures. It is not very frong, though therc are fome baftions along the fides of the walls. They have marufactures in wool and filk, which bring in great fums to the inhabitants. It is feated on the river Guadalaviar, over which there are five handfome bridges; and it is about three miles from. the fea, where theie is a harbour, 110 miles north of Murcia, and 165 calt by fouth of Madrid. This city lurrendered to the earl of Peterborough in the ycar 1705 ; but it was lolt again in 1707 . W. Long. 0. 10. N. Lat. 39. 23.

VALENCIENNES, an ancient, frong, and confiderable city of France, in the department of the North and late province of Heinault, containing about 20,000 fouls. The Scheldt divides it into two parts. It is a very important place : the citadel and fortifications, the work of Vauban, were conflructed byorder of Louis XIV. who took this town from the Spaniards. It was confirmed to him by the treaty of Nimeguen, in 1678 . In 1793, it furrendered to the allies after a fevere fiege, but was afterwards abandoned; and is now in poffefion of the French. Befides lace, this city is noted for manufactories of woollen fuffs and very fine linens. It is 20 miles weft-fouth-weft of Mons, 17 morth-eaft of Cambray, and 120 north-eaft by noth of Paris. E. Long. 3. 37 N. Lat. 50.21 .

VALENS, Flavius, emperor of the Eaft, a great patron of the Arians.. Killed by the Goths in the year 379. See Constantinople, No -6 .

II
Valet.
VALENTINIANS, 11 church hithory, a lect of

Clinitian heretics, who Cprung up i:s the fecond century, and were to called from their leader Valentinus.
The Valentinians were only a branch of the Gnoftics, who realized or perlonified the Platonic ideas concerningr the Deity, whom they called Pleroma or Plenilute. Their fyltem was this: the firlt principle is Bythos, i. e. Depth, which remained many ages unknown, having with it Ennoe or Thought, and Sige or Silence; from thele fprung the Nous or Intelligence, which is the only fon, equal to and alone capable of comprehending the Bythos; the filter of Nous they called Aletheia or Truth; and thefe confituted the firlt quaternity of xons, which were the fource and original of all the reft: for Nous and Alecheia produced the World and Life; and from thefe two proceeded Man and the Church. But befides thefe 8 principal æons, there were 22 more; the lalt of which, called Sophia, being defrous to arrive at the knowledge of Bythos, gave her. felf a great deal of uneafinefs, which created in her Anger and Fear, of which was born Matter. But the Horos or Bounder ftopped her, preferved her in the Pleroma, and reftored her to Perfection. Sophia then produced the Clirit and the Holy Spirit, which brought the æons to their lat perfection, and made every one of them contribute their utmoft to form the Saviour. Her Enthymele, or Thought, drelling near the Pleroma, perfected by the Chritt, produced every thing that is in the woild by its divers paftions. The Chrift fent into it the Saviour, accompanied with angels, who delivered it from its paffons, without annihilating it: from thence was formed corporeal matter. And in this mamer did they romance concerning God, mature, and the myftcries of the Chrifian religion.

VAleERIAN, or Viderianus, Pablitus Licinites, emperor of Rome, remarkable for his captivity and cruel treatment by Sapor I. king of Perfia. See Rome, \(\mathrm{N}^{\circ}+9 \mathrm{I}\).

VALERIANA, a genus of phants belonging to the clafs triandita, and in the natural fyfem arranged under the 48 h order, aggregatce. See Botany and Miteria Medica.Indes.

VALERIUS MAXIMUS, a Latin hiftorian, fprung from the Camilies of the Valerii and Fabii, which made him take the name of Valerius Maximus. He fundied polite literatu:e, and afterwards followed Sextus Pompey to the wars. At his return he compofed an account of the actions and remarkable fayings of the Romans and other great men; and dedicated that work to the emperor Tiberius. Nany of the learned think that this is the fame that is now extant, and bears the name of Valerius Maximus; but others maintain, that what we have now is only an abridgment of the work written by this celcbrated hiforian, and that this abridgment was made by one Nepotian of \(\Lambda\) frica. However, this work is well witten, and contains a great number of memorable actions performed by the Greeks and Romans that ase worthy of being read.

VAIET, a French term, ufed as a common name for all domeftic men fervants employed in the more fervile cffices, as grooms, footmen, coachmen, \& c. But zwith us it is only ufed in the phrafe valct de chambre,
which is a fervant whofe office is to drefs and undreis his mafter, \&:c.

VAILl"1'A, a city of Malta, and capital of the Vanh ifland (lee M.MTA, N \(\mathrm{N}^{\circ}\) 6.). It is fituated in L. Long. I4.34. N. Lat. 35. 54.

VALETUDNNARY, among medical writers, denotes a perfon of a weak and lickly contitution, and frequently out of order.

VAIID, in Law, an appellation given to acts, deeds, tranfactions, \&:c. which are clothed with all the formalities requifite to their being put into execution, and to their being admitted in a court of jultice.

VA[.LADOIIID, an ancient, large, and handfome city of Spain, in Oid Cantile, and capital of a principaJity of the fame name, with a bithop's fee ard an univeifity. It is furtounded with ftrong walls, embellithed with handfome buildings, large public fquares, piazzas, and fountains; containing ir,000 houfes, with fine long and broad freets, and high houfec, adorned with balcouies. There is a fquare in the middle of the city, furrounded with handfome brick houfes, laving under them piazzas, where people may walk dry in all weathers. Within thefe piazzas merchants and tradefmen keep their hops. All the houfes are of the fame height, being four ftories; and there are balconies at every window, of gilt iron. In the whole there are 70 monateries and nunneries; the fineft of which is that of the Dominicans, remarkable for its church, which is one of the mof magnificent in the city. The kings re. fided a long while at this place; and the royal palace, which Aill remains, is of very large exteat, though but two llories high; within are fine paintings of various kinds, and at one of the corners a curious clock, made in the lame manner as that of Stralburg. The environs of the city are a fine plain, covered with gardens, orchards, vireyards, and meadous. It is feated on the rivers Efcurva and Pefuerga, in W. Long. 4. 25. N. Lat. 4 I. 50.

VALUE, in Commerce, denotes the price or worth of any thing.

VALVE, in Hydraulics, Pneumatics, \&ec. is a kind of lid or cover of a tube or veffel fo contrived as to oper one way, but which, the more forcibly it is prefied the other way, the clofer it fluts the aperture; fo that it either admits the entrance of a fuid into the tube or vefiel, and prevents its return; or admits its efcape, and prevents its re-entrance.

Talue, in Aluatomy, a thin membranc applied on feveral cavities and veffels of the body, to afford a paffage to certain humours going one way, and prevent their reflux towards the place from whence they came.

VAMIPTRE, a Ppecies of bat. See Vespirtitio, Manmala Inder.

V \(\Lambda\) N, a term derived from the French avant or \(a\) vaumt, fignifying before or foremoft of any thing : thus we fay, the van-guard of the army, \&c.

VANBRUGII, Sir John, a celebrated Englith dramatic witcr and architect, was defeended of a family in Chemire which cane from France, though by his name he appears to have been originally of Dutch extraction. He was born about the middle of the reign of Charles 1I. and received a liberal education. His firf comedy, called the Relapfe or Virtue in Danger, was acted in the year 1697 with great applaufe; which gave him fuch
wellia encouragement, that he wrote cleven more comedies. He was the friend of Mr Congreve, whofe genius was naturally turned for dramatic performances; and thele two gave new life to the Englith itage, and reflored its finking reputation. Sir John was alfo clleemed an able architect. Under his direction was raifed Blenheim-houfe in Oxfordhire. He died in 1726.

VANDELLIA, a genus of plants belonging to the clals didynamia. See Botany Index.

VAN-Dilinen's lind. See Diemen.
VANDYCK, Sir Anthony, a celebrated painter, ras born at Antwerp in the year 1599 . After giving carly proofs of his genius, he became the difciple of the illullious Rubens. In the church of the Augulines at Antwerp, at the high altar, is a celebrated picture of Rubens, reprefenting, in one part, the Virgin Mary fitting with the child Jefus in her lap, and in another part feveral faints, male and fenale, fanding. The breaft of one of thefe, St Sebaltian, is faid to have been painted by Vandyck when he was only a difciple of Iubens. This great mafer being engaged one day abroad, his difciples went into his paintiag-ioom, where, after laving been fome time employed in admiring his works, lidey began to play or romp in fuch a manner, that the brealt of St Sebaltian, which was not yet dry, was bruhned away by a hat thrown at random. This accident put an end to their play: they were very anxious to rellore it, fearing that if Rubens difcovered it they thould all be difcarded. At length it was agreed that Anthony fhould undertake to mend the faint's breaf. In fhort, taking his manter's pallet and brulies, he fucceeded fo well that his companions imagined Rubens would overlook it. 'They were inifaken; for Rubens at his return knew immediately that fome Bne had touched upon lis performance: calling his difciples, he anked them why any one had dared to meddle with his painting? They were fome time doubt[u] whether they hoould confefs or deny the fact. I hreats at length prevailed : they owned that Vanciyck liad thrown his hat upon it. Upon this, cloceting Vandyck, inflead of chiding him, he told him, that "it was pro. per and even neceffary for him to travel into Italy, the only fehool that produced excellent painters." By this advice, and with the affiflance of his maller, he let out for Italy, about the year 1621 , being then about 21 or 22 years of age. Having faid a fiort time at fome, he removed to Venice, where he attained the heautiful colouring of Titian, Paul Veronefe, and the V'enetian fehool.

After a few years he returned to Flanders, with fo noble, fo eafy, and natural a manner of painting, that Titian himfelf was hardly his fuperior: and no other matler could equal him in portiaits. Suon after his return, he accidentally met with D. Teniers, who acconed him with great politenefs, and afied him whether he had much bufinefs fince he came from Rome? "What bufinefs, think you, can I have had time to do (replied Vandyck)? I am only juf arrived here. Would you believe, that I offered to draw that fat brever's picture sho juf pafied by us for two piftoles, and that the loolyy laughed in my face, faying it was too dear? I affure you, that if the cards do not turn up better, I harll make no long ftay at Bruffels." Soon after this, he painted thole two damous pichures, the Nativity and a
dying Chrift ; the fift in the pariff-church, the fccond Vandych in that of the Capuchins, at "Permond.

Vandyck, finding lue could not make a fortune in his Variation. own countty, took a refolution of going over into Fingland. Accordingly he borrowed fome gruincas of 'I'eniers, and fet out, furnifhed with letters of reconmendation. His fuperior genius foon brouglat hitn into great reputation; and above all, lie excelled in portraits, which he drew with an inconceivable facility, and for which he charged a very high price, according to the inftructions which had been given him on that head. It is alfirmed, that for fome of them he received 400 guincas apiece. He foon found himfelf loaded with honours and riches; and as he had a noble and generous heart, he lived equal to his fortune. He married a daughter of the lord luthven, earl of Gowry; and, though he had but little fortune, maintained her in a ftyle luitable to her birth. He generally kept a magnificent equipage, and a numerous retinue. He died in 1641 , at the age of 42 , leaving property, it is laid, to the amount of \(40,0 c o l\). 月erling.

VANE, a thin llip of bunting hung to the mafthead, or fome other confpicuous place in the mip, to nhow the direction of the wind. It is commonly fewed upon a wooden frame called the fuck, which contains two holes whereby to flip over the spindle, upon which it turns about as the nind changes.

Vanillia, or Vanijlo. See Lpidesdaum, Bo. tany Indre.

VAPOUR, in Philofoply, the particles of bodies barefied by heat, and thus rendered fpecifically lighter than the atmofphere, in which they rife. See Evaporation, and Heat, Chemistry Index.

Varours, in Mcdicine, ctherwife called hypochone drinfis or fplech. See Medicine, \(\mathrm{N}^{0} 276\) and 321.

IAPOUR-Bath, in Chemiftry, a term applied to a chemilt's bath or heat, in which a body is placed fo as to receive the fumes of boiling water.

We alfo use the term vopour. buth, when a fick perfon is made to receive the vapours arifing from fome liquid matter placed over a fire. Many contrivances have been propoled for this purpole; and their expediency and utility are beft known to thofe who are converfant in this bulinefs. A late writer has fuggeficd a new conflrustion of vapour baths; and the whole apparatus is reduced to a tin-boiler, tin pipes wrapped in flannel, sind a deal bow with a cotton cover, for the seception of the body and circulation of the vapcur.

VARI, in Medicine, little, hard, and ruddy tumors, which frequently infelt the faces of yount perions of a hot temperament of body.

VARIATION of the Compafs, is the deviation of the magnetic or marinet's needle from the meridian or true north and South line. On the continent it is called the decilination of the magnetic reedle; and this is a better term, for reatons which will appear by and by.

We have given the general facts relating to magnetic variation under the article Magnetism, No \(19 . ;\) and under the articles COMpASS, an:d Arimuth COMPASS', we have noticed the methods of afcertaining the variation at any particular time or place. We hal! here only give a mort hittorical account of the progreflive difcoveries refpesing magnetic variation, and notice

Variation the explanations that have been offered to account for this phenomenon.

About the time that the polarity of the magnet was frit oblerved in Europe, the magnetic direction, both in Europe and in China, was nearly in the plane of the meridian. It was therefore an ineftimable prefent to the mariner, giving him a fure direction in his courfe through the pathlefs ocean. But by the time that the European navigators had engaged in their adventurous voyages to far dillant thores, the deviation of the needle from the meridian was very lenfible even in Europe. The fon of Columbus politively fays, that it was obferved by his father in his firlt voyage to America, and made his companions fo anxious left they fhould not find the way back again to their own country, that they mutinied and refufed to proceed. It is certain that Gonzales Oviecio and Sebaftian Cabot obferved it in their voyages. Indeed it could not pollibly efcape them; for in fome parts of their feveral tracks the needle deviated above \(25^{\circ}\) from the meridian; and the rudeft dead reckoning, made on the fuppofition of the needle pointing due north and fouth, mult have thrown the navigators into the utmof confufion. We know that fpherical trigonometry was at that time abundantly familiar to the mathematicians of Europe, and that no - perfon pretended to take the command of a hip bound to a dillant port that was not much more informed in - this fcience than moft mafters of hips are at prefent. The deviation of the compars, however, was not gencrally allowed by mathematicians, who had not yet become fenfible of the neceffity of quitting the Ariftotelian trammels, and inveltigating nature by experiments. They chofe ather to charge the navigators with inaccuracy in their obfervations than the fchoolmen with errors in principles. Pedro de Medina at Valladolid, in his Arte de Naviggar, publifhed in 1545, denies the variation of the compars. But the concurring reports of the commanders of hips on diflant royages, in a few years, obliged the landfmen in their clofets to give up the point; and Martin Cortez, in a treatife of navigation, printed at Seville before 1556 , treats it as a thing completely, eltablified, and gives rules and inltruments for difcovering. its quantity. About the year 1580 Norman publihed his difcovery of the dip of the needle, and lpeaks largely of the horizontal deviation from the plane of the meridian, and attributes it to the attraction of a point, not in the heavens, but in the earth, and defcribes methods by which he hoped to find its place. Io the third, and all the fuhfequent editions of Norman's book (called the New Altraciive), was fubjoined a differ tation by Mr Burroughs, comptroller of the navy, on the variation of the compals, in which are recorded the quantity of this deviation in many places; and he laments the obflacle which it caufes to ravigation by its total uncertainty previous to obfervation. The author indeed offers a rulesfor computing it à priori, founded on fome conjecture as to its caule; but, with the modefly and candour of a gentleman, acknowledges that this is but a guefs, and intreats all navigators to be affiduons in their obfervations, and ready in communicat. ing: them to the public. Accordingly obfervations were Hiberally contributed from time to time, and were publifhed in the fubfequeit treatifes on navigation.
- But in 1635 the nariners wete thrown into a new and great perplexity, by the publication of a Difcour \(/ \rho_{0}\)

Mathenatical on the Variation of the Magnetical Necdle, by Mr Henry Gillebrand, Grefham protefior o: attronomy. He had compared the variations obferved at London by Burroughis, Gunter, and himfelf, and found that the north end of the mariner's needle was gradually drawing moie to the weftward. Fur Noman and Bunoughs had oblerved it to point about 11全 degrees to the ealt of north in 1580 ; Gunter found its deviation only \(6 \frac{1}{4}\) in 1622, and he himfelf had obferved only \(4^{\circ}\) in 1634; and it has been found to deviate more and more to the weltward ever fince, as may be feen from the tables given under Magnetism.

Mr Bond, teacher of mathematics in London, and employed to edit and improve the impreffions of the popular treatifes of navigation, about 1650 , declared, in a work called the "Seaman's Kalendar," that he had difcovered the true progrefs of the deviation of the compals; and publithed in another work, called the "Longitude Found," a table of the variation for 50 -years. This was, however a gratuitous prognoftication, not founded on any well-grounded piinciples; and though it agreed very well with the obfervations made in London, which fhowed a gradual motion to the weftward at the rate of \(-.12^{\prime}\) annually, by no means agreed with the obfervations made in other places. See Phil. Tranf. 1668.

But this news foon loft its credit: for the inconfitency with obfervation appeared more and more every day, and all were anxious to difcover fome general rule, by which a near guefs at leaft night be made as to the direction of the needle in the mont frequented feas. Halley recommended the matter in the moft earneft manner to the attention of government; and, after much unwearied folicitation, obtained a flip to be fent on a voyage of difcovery for this purpofe. He got the command of this hip, in which he repeatedly traverfed the Atlantic ocean, and went as far as the goth degree of fouthern latitude. See his very curious fpeculations on this fubject in the Phil. Tranf. 1683 and 1692.

After he had collected a prodigious number of obfervations made by others, and compared them with his own, he publifhed in 1700 a fynoptical account of them in a very ingenious form of a fea chart, where the ocean was crolled by a number of lines paffing through thole planes where the compafs had the fame deviation. Thus, in every point of one line there was no variation in 1700 ; in every point of another line the compals had \(20^{\circ}\) of eatit variation; and in every point of a third line it had \(20^{\circ}\) of welt variation. Tliefe lines have fince been called Halleyan lines, or curves. This chart was received with univerfal applaufe, and was undoubtedly one of the moft valuable prefents that fcience lias made to the arts.

The polarity of the magnetic needle, and a general thougb intricate connection between its pufsions in all parts of the world, naturally makes the philofopher fpeculate ahout its caufe. We fee that Corez atcribed it to the attraction of an eccentric point, and that Bond thought that this point was placed not in the heavens, but in the earth. This notion made the batis of the famous Theory of Magnetifm of Dr Gilbert of Colchefter. See Macnetism, N* 7 .

Gilbert's theo:y may be underfood from the follore. ing general propolition.

Let NS (fig. 1.) be a magnet, of which \(N\) is the
wriation. north and \(S\) the fouth pole: Let \(n s\), be any oblong piece of iron, poifed on a point \(c\) like a compals needle. It will arrange itfelf in a pofition nos precifely the tame with that which would be affumed by a compafs needle of the fame fize and fhape, having \(n\) for its north and \(s\) its fouth pole. And while the piece of iron remains in this pofition, it will be in all refpects a magnet fimilar to the real compafs needle. The pole \(n\) will attract the fouth pole of a fmall magnetifed needle, and repel its north pole. If a paper be held over \(n s\), and fine iron-flings be firewed on it, they will arrange themfelves into curves iffuing from one of its ends and terminating at the other, in the fame manner as they will do when Arewed on a paper held over a real compals needle. But this magnetifm is quite temporary; for if the piece of iron \(n s\) be turned the other way, placing \(n\) where \(s\) now is, it will remain there, and will exhibit the fame phenomena. We may here add, that if \(n s\) be almolt infinitely fmall in comparifon of NS, the line \(n s\) will be in fuch a poiftion that if \(s a, s b\), be drawn parallel to \(\mathrm{N} c, \mathrm{~S} c\), we hall have \(s a\) to \(s b\), as the force of the pole N to the force of the pole S . And this is the true caufe of that curious difpofition of iron-filings when ftrewed round a magnet. Each fragment becomes a momemtary magnet, and arranges itfelf in the true magnetic direction, and when fo arranged, attracts the two adjoining fragments, and co-operates with the forces, which alfo arrange them. We throw this out to the ingenious mechanician as the foundation of a complete theory of the magnetical phenomena. When the filings are infinitely fine, the curves \(\mathrm{N} c \mathrm{~S}\) lave this property, that, drawing the tangent \(n c s\), we always have \(s a: s b=\) force of \(\mathrm{N}:\) force of S ; and thus ire may approximate at pleafire to the law of mag. netic attraction and repultion. The theory, of which an outline is given under Magnetism, is founded on this principle, and applies with fuccels to every phenomenon yet obferved.

Now, to apply this theory to the point in hand. Let \(n s\) (fig. 2.) be a fmall compafs needle; of which \(n\) is the north and \(s\) the fouth pole: let this needle be poifed lorizontally on the pin \(c d\); and let \(n^{\prime} s^{\prime}\) be the pofition of the dipping needle. Take any long bar of common iron, and hold it uprigbt, or nearly fo, as reprefented by AB. The lower end B will repel the pole \(n\) and will attract the pole s, thus exhibiting the properties of a north pole of the bar AB. Keeping B in its place, turn the bar round \(\mathrm{B}^{\prime}\) as a centre, till it conme into the pofition \(A^{\prime} B^{\prime}\) nearly parallel to \(n^{\prime} s^{\prime}\). You will obferve the compafs needle \(n s\) attract the end \(B^{\prime}\) with either pole \(n\) or \(s\), when \(\mathrm{B}^{\prime} \mathrm{A}^{\prime}\) is in the pofition \(Z^{\prime}{ }^{\prime}\). perpendicular to the direction \(n^{\prime} s^{\prime}\) of the dipping needle: and when the bar has come into the pofition \(B^{\prime} A^{\prime}\), the upper end \(B^{\prime}\) will fhow itfelf to be a fouth pole by attracting \(n\) and repelling s. This beautiful experiment was exhibited to the Royal Society in 1673 by Mrs Hindithaw.

From this it appears, that the great magnet in the earth induces a momentary magnetifm on foft iron precifely as a common magnet would do. Therefore (Tays Dr Gilbert) it induces permanent magnetifm or magnetifable ores of iron, fuch as loadfones, in the fame manner as a great loadfone would do; 'and it affects the magnetifin already imparted to a piece of tempered fteel precifely as any other great magnet would.

Vol. XX. Part II.

Therefore the needle of the mariner's compals in ansation. every part of the world arranges itfelf in the magnetic direction, fo that if poifed as a dipping needle flould be, it will be a tangent to one of the curves \(\mathrm{N} c \mathrm{~S}\) of fig. I . The horizontal needle being fo poiled as to be capable of playing only in a horizontal plane, will only arrange itfelf in the plane of the triangle \(N \subset S\). That end of it which has the fame magnetifm with the fouth pole \(S\) of the great magnet included in the earth will be tumed towards its north pole N. Therefore what we call the north pole of a needle or magnet really has the magnètifm of the fouth pole of the great primitive magniet. If the line NS be called the axis, and \(N\) and Sthe poles of this great magnet, the plane of any one of thefe curves \(\mathrm{N} c \mathrm{~S}\) will cut the earth's furface in the circumference of a circle, great or fnall according as the plane does or does not pals through the centre of the earth.

Dr Halley's firft thought was, that the north pole of the great magnet or loadifone which was included in the bowels of the earth was not far from Baffin's bay, and its fouth pole in the Indian ocean fouth-weff from New Zealand. But be could not find any pofitions of theie two poles which would give the needle that particular pofition which it was obferved to affume in different parts of the world; and he concluded that the great terreftrial loadfone had four irregular poles (a thing not unfrequent in natural loadffones, and cafily producible at pleafure), two of which are ftronger and two weaker. When the compals is at a great diffance from the two nortl poles, it is affected fo as to be directed nearly in a plane paffing through the flrongeft. But if we make it approach much more to the weakef, the greater vicinity will compenfate for the fmaller abfolute force of the weak pole, and occafion confiderable irregularities. The appearances are favourable to this opinion. If this be the real confitution of the great magnet, it is almon a defperate tak to afcertain by computation what will be the pofition of the needle. Halley feems to have defpaired: for he was both an clegant and a moft expert matliematician, and it would have coft him little trouble to afcertain the places of two poles only, and the direction which thefe would have given to the needle. But to fay what would be its pofition when acted on by four poles, it was neceffary to know the law by which the magnetic action varied by a variation of diffance; and even then, the computation would have been exceedingly difficult.

In order to account for the change of variation, Dr Halley fuppofes this internal magnet not to adbere to the external Thell which we inhabit, but to form a mucleus or kernel detached from it on all fides, and to be fo poifed as to revolve freely round an axis, the pofition of which he hopes to difcover by obfervation of the compafs. Dr Halley imagined that the nucleus revolved from eaft to weft round the fame axis with the earth. Thus the poles of the magnet would change their pofitions relatively to the earth's furface, and this would change the direction of the compafs needie.

The great Euler, whofe delight it was always to engage in the moft difficult mathematical refearches and computations, undertook to afcertain the pofition of the needle in every part of the earth. His differtation on this fubjeet is to be feen in the 13th volume of the Memoirs of the Royal Academy of Berlin, and is exceed-

\section*{\(\mathrm{V} / \mathrm{A}\) R [ 52 z ] \(\mathrm{V} / \mathrm{A} \mathrm{R}\)}

Wariation ingly beautiful, abounding in thofe analytical tours d'adrefle in which he furpalied all the world. t He bas reduced the computation to a wonderful fimplicity.

He found, bowever, that four poles would engage him in ao onalyfis which would be exceffively intricate, and has contented himfelf with computing for two only; obferving that this fuppofition agrees fo well with obfervation, that it is highly probable that this is the real conftitution of the terreftrial magnet, and that the coincidence would have been.perfect if he had hit on the due pofitions of the two poles. He places one of them in lat. \(76^{\circ}\) north, and long. \(96^{\circ}\) welt from Tene. riffe. The louth pole is placed in lat. \(58^{\circ}\) fouth, and long. \(158^{\circ}\) welt from. Teneriffe. Thefe are their fituations for \(1757 .-M r\) Euler has annexed to his differtation a chart of Halleyan curves fuited to thefe aflumptions, and fitted to the year 1757.

It mult be acknowledged, that the general courfe of the variations according to this theory greatly refembles the real fate of things; and we cannot but own ourfelves highly indebted to this great mathematicion for having made fo fine a firf attempt. He has improved it very confiderably in another differtation in the 22d volume of thefe memoirs. But there are flill fuch great differences, that the theory is of no ufe to the navigator, and it only ferves as an excellent model for a father profecution of the fubject. Since that time another large variation chart has been publifhed, fitted to a late period; but the public has not fufficient information of the authorities or obfervations on which it is founded.

The great object in all thefe charts is to facilitate the difcovery of a thip's longitude at fea. For thè lines of variation being drawn on the chart, and the variation and the latitude being obferved at fea, we have only to look on the chart for the interfection of the parallel of obferved latitude and the Halleyan curve of obferved variation. : This interfection mult be the place of the thip. This being the purpofe, the Halleyan lines are of great fervice; but they do not give us a ready conception of the direction of the needle. We have always to imagine a line drawn through the point, cutting the meridian in the angle correfponding to the Halleyan line. We thould learn the general magnetic affections of the globe much better if a number of magnetic meridians were drawn. Thefe are the interfections of the carth's furface with planes paffing through the magnetical axis, cutting one another in angles of \(5^{\circ}\) or \(10^{\circ}\). This would both fhow us the places of the magnetic poles much more clearly, and would, in every place, fhow us at once the direction of the needle. "In all thofe places where thefe magnetic curves touch the mcridians, there is no variation; and the variation in every other place is the angle contained between thefe magnetic meridians and the true ones.

The program of a work of this kind has been publifhed by a Mr Churchman, who appears to have engaged in the invettigation with great zeal and confiderable opportunities. It is pretty certain that the north magnetic pole (or point, as Mr Churchman calls it) is not far removed from the flations given it by Halley and Euler; and there feems no doubt but that in the countries between Hudfon's bay and the wettern coafts of North America the needle will have every pofition with refpect to the terieftrial meridian, fo that the morth
end of a compais needle will even point due fouth in fe. veral places. Almoft every thing that can be delired in this inquiry would be obtained by a few zuell-chofen obfervations made in thole regions.: It would be of intu menfe advantage to have the dips afcertained with great precifion. Thele would enable, us :lo. judge at what depth under the furface the pole is fituated; for she well-informed mechanician, who will Itudy, feriounly what we have faid about the magnetical curves; will fee that a compals needle, when compared with the great terteltrial magnet, is but as a particle of iron-filings compared to a very large artificial magnet. Therefore, from the pofition of the dipping needle, we may infer the place of the pole, if the law of magnetic action be given; and this law may be found by means of other experiments which we could point out. See-Macse. Tisa, No 80 , et feq.

Mr Churchman has adopied the opinion of only two poles. According to him, the north pole was (in 1800 ) in Lat. \(5^{8^{\circ}} \mathrm{N}\). and Long. \(534^{\circ} \mathrm{W}\). from Greenuich, very near Cape Fairweather; and the fouth pole lics in Lat. \(58^{\circ} \mathrm{S}\). and Long. \(165^{\circ} \mathrm{E}\). from Greenwich. He allo jmagines that the north pole has moved to the eaftward, on a parallel of latitude, about 65 fince the begiming of the 19 th century (from 1600 ), and concludes that it nakes a revolution in 1096 years. The fouthem pole has moved lefs, and completes its revolution in 2289 years. This motion he aferibes to fome influences which he calls mognetic tides, and which he keen.s to confider as celeftial. This he infers from the clianges of variation. He announces a phyfical theory on this fubject, which, he fays. cnables him to compute the variation with precifion for any time palt or to come; and he even gives the procefs of trigonometrical computation illuftrated by examples. But as this publication (entitled The Magnetic Atlas), publibted for the author, by Darton and Harvey, 1794) is only a program, he exprefles himfelf obfcurely, and fomenhat enigmatically, refpecting his theory. He fpeaks of the intluence of one pole being greater than that of the other ; and lays, that in this cafe the magnetic equator, where the needle will be parallel to the axis, will not be in the middle between the poles. This is true of a common magnet. He mult therefore abide by this fuppofition in its other confequences. The magnetic meridians mult be planes pafing through this axis, and therefore mult be circles on the furface of the earth. This is incompatible with the obfervations; nay, his charts are fo in many places, particularly in the Pacific ocean, where the variations by his chart are three times greater than what has been obferved.- His parallels of dip are ftill more different from obfervation, and are incompatible with any phenomena that could be produced by a magnet! having but two poles. His rules of computation are exceedingly cxceptionable. He has in fact but onc example, and that fo particular, that, the mode of computation will not apply to any other. This circumfance is not taken notice of in the enunciation of his firf |ploblem; and the reader is made to imagine that he has got a rule for computing the variation, wheteas all the rules of calculation are only running in a circle. The variation computed for. the port of St Peter and Paul in Kamt chatka, by the sule, is ten times greater than the truth.

For our own part, we have little hopes of this problem ever being fubjecicd to accurate calculation. W'e
believe,

\section*{V A R \([523] \quad \mathrm{V} A \mathrm{R}\)}
siation. boblievel inited, that there is a cofmical change going - on in the earth, which will produce a progreflive change in the variation of the needle; and we fee none mose likely than Ur Halley's motion. There is nothing repreguant to our' knowledge of the univetfe in the fuppofition of a magnetic nucleus revolving within this earth; and it trivery eafy to conceive a very fimple motion of revolution; whisli mall produce the very motion of the fentible poles: for which: Mr Churchman contends. We need only fuppofe that the magnetical axis of this nu. cleus is not its axis of revolution. It may not even bifea rhat axis; and this circumitance will caufe the two poles to have different degrees of motion in relation to the thell which furrounds it.
\({ }^{29}\) But this regular progrefs of the magnet within the earth may produce very irregular motions of the compafs needle, by the intervention of a third body fufceptible of magnetifm. The theory of which we have jult given a hint comes here to our affitance. Suppofe NS (fig. 3.) io reprefent the primitive magnet in the earth, and \(n s\) to be a tratum of iron ore fulceptible of nagnetifm. Alfo let \(n^{\prime} s^{\prime}\) be another fmall mafs of a fimilar ore; and let their fituations and magnitudes be fuch as is exhibited in the figure. The fact will be, that \(n\) will be the north pole and \(s\) the fouth pole of the great ilra-tum, and \(n^{\prime}\) and \(s^{\prime}\) will he the north and fouth poles of the fraall mals or loaditone. Any perfon may remove all doubts as to this, by making the experiment with a magnet NS, a piece of iron or foft tempered heel \(n \mathrm{~s}\), and another piece \(n^{\prime} s^{\prime}\). The well-informed and attentive reader will eafly fee, that by fuch interventions every conceivable anomaly may be produced. While the great magnet makes a revolution in any. direction, the needle will change its pofition gradually, and with a certain regularity; but it will depend entirely on the fize, fhape, and fituation, of thefe intervening mafles of magnetifable iron ore, whether the change of variation. of the compafs thall be fuch as the primitive magnet alone would have produced, or whether it thall be of a kind wholly different.

Now, that fuch intervening difturbances may exilt, is patt contradiction. We know that even on the film of earth which we inhabit, and with which only we are acquainted, there are extenfive ftrata or otherwife difpofed mafles of iron ores in a ftate fufceptible of magnetifm; and experiments made on bars of hard tempered. feel, and on bits of fuch ores, affure us that the magnetifn is not induced on fuch bodies in a moment, but propagated gradually along the mafs. - That fuch difurbances do actually exif, we have many relations. There are many inflances on record of very extenfive magnetic rochs, which affect the needle to very confiderable diftances. The inand of Elba in the Mediterranean is a very remarkable inflance of this. The iflard of Cannay alfo, on the weit of Scotland, has rocks which affeet the needle at a great diflance.
\(\therefore\) A fimilar effect is obferved near the Feroe iflands in the North fea; the compals has no determined direction when brought on 'fhore. Journ: de Sgavan, 1679 , p. 174.

In Hudfon's fraits, in latitude \(63^{\circ}\), the needle has hardly any polarity. Fllis's Voyage to Hudfon's Bay.

Bougner obferved the fame thing in Perv. Nay, we helieved that almoft all rocks, efpecially of whin or trappe fone, contain iron in a proper flate, al rury malr s. 1 ! 1

All this refers only to the thin cruft through which Vanatinai. the human eye has occafionally penetrated. Of what may be below we are ignorant; but wher we fee-ap: pearances which tally fo remarkably with what would be the effects of great maffes of magnetical bodies; mo: difying the general and regularly progreflive nction of a primitive magnet, whofe exiftence and motion is inconffitent with nothing that we know of this globe, this manner of accounting for the obferved change of varia: tion has all the probability that we can delire. Nay, we apprehend that very confiderable changes may be produced in the direction of the compals neerlle, even without the fuppofition of any internal motion. If the great magnet refembles many loadfones we are acquainted with, having more than iwo poles, we know that thefe poles will act on each other, and gradually change each other's force, and confequently the direction of the compals. 'This procefs, to be fure, tends to a flate of things which will change no more.-- But the period of human hiftory, or of the hiflory of the race of Adam, may make but a fmall part of the hiflory of this globe; and therefore this objection is of little force.

There can be no doubt of the operation of the general terreftrial magnetifm on every thing fulceptibie of. magnetic properties; and we cannot hefitate to explain in this way many changes of magnetic direction. which have been obferved. Thus, in Italy, Father de la 'lorré obferved, that during a great eruption of Vefuvius the variation was \(16^{\circ}\) in the morning, at noon it was \(14^{\circ}\), and in the evening it was \(10^{\circ}\), and that it continued in that flate till the lava grew fo dark as no longer to be vifible in the night; after which it fowly: increafed to \(13^{\frac{1}{2}}\), where it iemained. Daniel Bernoulli found the needle changed its pofition \(45^{\prime}\) by an earthquake. Profeffor Muller at Manheim obferved that the declination of the needle in that place was greatly affected by the earthquake in Calabria. Such flreams of lava as tlowed from Hecla in the laft dreadlul eruption? muft have made a transference of magnetic matter that uould confiderably affect the needle. yut no obferva* tions feem to have been made on the occafion; for we. know that common ironftone; which has no effect on the needle, will, by mere cementation with any inllam-i mable fuhtance, become magnetic. In this way Dr Knight fometimes made artificial loadfones.-But-thefe are partial things, and not connected with the generals change of variation now under confideration.

We have faid fo much on this fubjee, chiefly with the view of cautioning, our readers againit too fanguine? expectations from any pretenfions to the folution of this great problem. We may certainly gather from thefe obfervations, that even althourh the theory of the vad? riation fhould be completed; we inuf exnect (byiv what 5 we already know of magnetifm in general) that the di-n Aturbances of the needle, by Incal caufes intervening between it and the great infuence by which it is chiefly? directed, may be fo confiderable as to affect the poftion, of the compafs needle in a very fenfible manner: for we know that the metallic fubitances in the bowels of the? earth are in a ftate of continual change, and this to an :l extent altogether unknown.

There is another irregularity of the mariner's needles that. we: have noticed under Magnemsm, p. 365.4 namely, the daily variation...This was firf opferved.

\section*{\(\boldsymbol{V}^{\prime} \mathrm{A} \boldsymbol{\mathrm { R }} \quad\left[\begin{array}{ll}524\end{array}\right] \quad \mathrm{V} A \quad \mathrm{R}\)}

Whitiont by \(\mathrm{Mr}^{1}\) George Gratiam in 1722 (Pinilofophical Tranfo. aetions, \(\mathrm{N}^{\circ} 8\) ), and reported to the Royal Society of London. \({ }^{2}\) It uliually moves (at leaft in Europe) to the weftward from 8 morning till 2 P. M. and then gradually returns to its former fituation. The diurnal variations are feldom lefs than \(0^{\circ} s^{\prime}\), and often much greater. Mr Graham mentions (Philofophical Tranfaetions, \(\mathrm{N}^{\mathrm{O}}\) 428.) fome obfervations by a Captain Hume, in a voyage to America, where he found the variation greateft in the afternoon. This being a general phenomenon, has alfo attracted the attention of philofophers. The molt detailed accounts of it to be met with are thofe of Mr Canton (fee Magnetrs:i1), in Philofoplaical Tranfactions, vol. 1i. part 1. p. 399, and thofe of Van Swinden, in his Treatife on Electricity and Magnetifm.

Mr Canton attempts to account for thefe changes of pofition, by obferving that the force of a magnet is weakened by heat. A frall magnet being placed near a compais needle, ENE from it, fo as to make it deAlect \(45^{\circ}\) from the natural pofition, the magnet was covered with a brafs veffel, into which hot water was poured. The needle gradually receded from the magnet \(45^{\prime \prime}\), and returned gradually io its place as the water cooled. This is confirmed by uniform experience.

The parts of the earth to the ealtward are firft heated in the morning, and therefore the force of the earth is weakeried, and the needle is made to move to the weftprard. But as the fun warms the weftern fide of the earth in the afternoon, the motion of the needle mult take the contrary direcion.

But this way of explaining by a change in the force of the earth fuppofes that the changing caule is acting in oppofition to fome other force. We do not know of any fuch. The force, whatever it may be, feems fimply to produce its own effect, in deranging the needle from the direction of terreftial magnetifm. If Æpinus's theory of magnetic action be admitted, we may fuppofe that the fun acts on the earth as a magnet acts on a piece of foft iron, and in the morning propels the fluid in the north-weft parts. The needle directs itfelf to this conftipated fluid, and therefore it points to the eaftward of the magnetic north in the afternoon. And (to abide by the fame theory) this induced magnetifm will be fomewhat greater when the earth is warmer; and therefore the diumal variation will be greateft in fummer. This change of pofition of the conttipated fluid mult be'fuppofed to bear a very fmall ratio to the whole fluid, which is naturally, fuppofed to be conflipated in one pole of the great magnet in order to give it magnetifm. Thus we fhall have the diurnal variation a very fmall quantity. This is departing, however, from the principle of Mr Canton's explanation; and indeed we cannot fee how the weakening the general force of the terreflial magnet fiould make any change in the needle in refpect to its direction; nor does it appear probable that the change of temperature produced by the fun will penetrate deep enough to produce any fenfible effect on the magnetifm. And if this be the caufe, we think that the derangements of the ricedle fhould vary as the thermometer varies, which is not true. The other method of explaining is much better, if Æepinus's theory of magnetic attraction and repulion be juft; and we may fupporic that it is only the fecondary magnetifm
(i. e. that of the magnetifable minerals) that is ferribly Voriatin affected by the heat ; this will actount very v.ell for the greater mobility of the fluid in fummer than in winet ter.
A great objection to either of thefe explanations is the prodigious diverfity of the diumal variations in different places. This is fo very great, that we.can fcarcely afcribe the diumal variation to any change in the magnetifm of the primitive terretrial magnet, and munt rather look for its caufe in local circumplances. This. conclufion becomes more probable, when we learn that the deviation from the meridian and the deviation from the borizontal line are not affected at the fame time, Van Swinden afcribes them folely to changes produced on the needles themfelves. If their magnetifm be greatly deranged by the fun's pofition, it may throw the magnetic centre away from the centre of the needle's motion, and thus produce a very fmall change of pofition. But if this be the caufe, we fhould expect differences in different needles. Van Swinden days, that there are fuch, and that they are very great; but as he has not fpecified them, we cannot draw any conclufion.

But, befides this regular diurnal variation, there is another, which is fuhjected to no rule. The aurora borealis is obferved (in Europe) to difturb the ncedle exceedingly, fometimes drawing it feveral degrees from its pofition. It is always obferved to increafe its deviation from the meridian, that is, an aurora borealis makes the needle point more welterly. This difturbance fometimes amounts to fix or feven degrees, and is generally obferved to be greatelt when the aurora borealis is mott remarkable.

The obfervation of the connection of the polarity of the needle with the aurora borealis occurred to the late Profeffor Robifon in 1759, when a midthipman on board the Koyal William in the river St Lawrence. The point of the heavens to which all the rays of light converged was precilely that which was oppofite to the fouth end of the dipping needle.

This is a very curious phenomenor, and we have not been able to find any connection between this meteor and the pofition of a magnetic needle. It is to be obferved, that a needle of copper or wood, or any fub. ftance except iron, is not affected. We long thought it an electric phenomenon, and that the needle was affected as any other body balanced in the fame manner would be; but a copper needle would then be affected.

We fee the needle frequently difturbed both from its general annual pofition, and from the change made on it by the diurnal variation. This is probably the effect of aurore boreales which are invifible, either on acm count of thick weather or daylight. Van Swinden fays, he feldom or never failed to oblerve aurore boreales immediately after any anomalous motion of the needle; and concluded that there had been one at the time, though he could not fee it. Since no needle but a magnetic one is affected by the aurora borealis; we may conclude that there is fome natural connection between this meteor and magnetifm. This flould farther incite us to oblerve the circumflance above mentioned, viz. that the fouth end of the dipping needle points to that part of the heavens where the rays of the anrora appear.
rianion to converge. We wiflit that thiss were diligèntly obfer Trint ved in places which lave very different variation and
alcohol, the varnilh dries very fpeedily, and is fubje ? to crack ; but this fault is corrected by adding a fmall quantity of turpentine to the mixture, which renders it brighter, and lefs brittle when dry.

We flalli now give the method of preparing a numes ber of varniflhes for different purpofes.

A Varnifb for Toilet-boxes, Ciafes, Funs, \& \& co-Diifolve two ounces of gum mallich and eight ounces of gum fandarach in a quart of alcohol ; then add fourj ounces of Venice turpentine.

A Varnib for Wainfotr, Cane-chair's, Iron-chairs, Grater.-Diffolve in a quart of alcohol eight ounces of gum fandarach, two ounces of feed lac, four ounces of rofin; then add fix ounces of. Venice turpentine. If the varnilh is wifhed to produce a red colour, more of the lac and lefs of fandarach hould be-uled, and a little dragon's blood hould be added. This vainifh is fo thick that two layers of it are equal to four or five of another.

A Varnifh for Fiddies, and other Mufical Infruments. -Put four ounces of gum fandarach, two ounces of lac, two ounces of gum maftich, an ounce of gum elemi, into a quart of alcohol, and hang them over a flow fire till they are diffolved; then add two ounces of turpentine.

Varmijb in order to employ Vormilion for painting Equipages.-Diffolve in a quart of alcohol fix ounces of fandarach, three ounces of gum lac, and four ounces of rofin; afterwards add fix ounces of the cheapeft kind of turpentine ; mix with it a proper quantity of vermilion when it is to be ufed.
Gold-coloured Varnijb.-Pound feparately four ounces. of flick lac, four ounces of gamboge, four ounces of dragon's blood, four ounces of anotta, and one ounce of faffron : put each of them feparately into a quart of al. cohol, and expofe them for five days in a narrowmouthed botlle to the fun, or keep them during that: time in a very warm room, fhaking them every now and then to haften the folution. When they are all melted, mix them together. More or lefs of each of thefe ingredients will give the different tints of gold according as they are combined. In order to make filver imitate gold exaclly when covered with this varnifh, the quantity of ingredients muft be fomewhat greater. The method of gilding filver-leaf, \&c. with this varnilh is as follows: The filver-leaf being fixed on the fubject, in the fame manner as gold-leaf, by the interpofition of proper glutinous matters, the varnih is fpread upon the piece with a brufh or pencil. The firf coat being dry, the piece is again and again wahed over with the varnifh till the colour appears fufficiently deep. What is. called gild leather, and many picture frames, have no other than this counterfeit gilding. Wafting them with a little rectified fpirit of wine affords a proof of this; the' fpirit diffolving the varnifh, and leaving the filver-leaf of its own whitenefs. For plain frames, thick tinfoil may be ufed inftead of filver. The tin-leaf, fixed on the piece with glue, is to be burnihed, then polihhed with emery and a fine linen cloth, and afterwards wilh putty applied in the fame manner : being then lacquered over with the varnilh five or fix times, it looks very. nearly like burnihed gold... The fame varnifh, made with a lefs proportion of the colouring materials, is applied alfo on works of brafs; both for heightening the colour of the metal to a refemblance with that of gold,

Yanaifh. and for preferving it from being tarnified or corroded by the air.
- Oil Varnifhes.-Gum copal and amber are the fubflances principally employed in oil varnifles; they poffefs the properties neceffary for varnifhes, folidity and tranfparency.-The copal being whitell, is ufed for varnithing light, the amber for dark colours. It is beft to diffolve them before mixing them with the oil, becaufc by this means they are in lefs danger of being fcorched, and at the fame time the varnill is more beautiful. They fhould be melted in a pot on the fire; they are in a proper ftate for receiving the oil when they give no refiliance to the iron fpatula, and when they run off from it drop by drop. The oil employed fhould be a drying oil, and perfectly free from greafe. It thould be poured into the copal or amber by little and little, conflantly flirring the ingredients at the fame time with the fpatula. When the oil is well mixed with the copal or amber, take it off the fire; and when it is pretty cool, pour in a greater quantity of the effence of turpentine than the oil that was ufid. After the, varnith is made, it fhould be paffed through a linen cloth. Oil varnifhes become thick by keeping; but when they are to be ufed, it is only neceffary to pour in a little effence of turpentine, and to put them for a little on the fire. The turpentine is neceffary in oil varnifhes to make them dry properly; generally twice as much of it is ufed as of oil. Lefs is neceflary in fummer than in winter. Too much oil hinders the varnifh from drying ; but when too little is ufed, it cracks and does not โpread properly. We fhall fubjoin the moft ufeful oil varnilhes:

White Copal Varnifh.-On 16 ounces of melted copal pour four, fix, or eight ounces of linfeed oil, boiled and quite free from greafe. When they are well mixed, take thein off the fire (not furgetting to nir them properly); and when pretty cool, pour in 16 ounces of the effence of Venice turpentine. Pafs the varnifh through a cloth.-Amber varnih is made in the fame way.
Black Varnib for Cosches and Iron ITork.-This varnifh is compofed of bitumen of Palefline, rofin, and amber, melted, feparatcly, and afterwards mixed : the oil is then added, and afterwards the turpentine, as directed above. The ufual : proportions are, \(1^{2}\) ounces of amber, two ounces of rofin, two ounces of bitumen, fix of oil, and 12 of the effence of turpentine.-Golden-co. lyured varniflo may be made alfo by fubflituting linfeed oil.fnr alcohol.

Eflential-Oil Varnibes.-The only effential oil varnifhes ufed are for pictures. Picture varnifhes fhould be white, light, and quite tranfparent, which will preferve the colours without giving them any difagreeable tint; and it thould be poffible to take them off the pieture without injuring it. They are ufually made of gum maflich and turpentine diffolved together in fome effential oil. The varnifh is paffed through a cloth, and allowed to clarify. It is applied cold to the picture.

Varnifh for Glafs, in order so preferve it from the Rays of the Sun.-Pulverife a quantity of gum adragait, and let it diffolve for 24 hours in the white of cges well beat up; then rub it gently on the glafs with a hruth.

Varwifhes before they, are ufed flould be carefully kepl from daft, which would fyoil them; and they

Ahould be kept in a veffel quite clean and dry. Whicn ufed, they fhould be lifted lightly with a brufh, and fpread upon a ground altogether free from dirt and moiture. The fubftance, after being varnifhed, fhould be expofed to the heat of the fun, or placed in a warm room covered with a glafs cafe, to keep out all filth: Oil varnithes require more heat than alcohol varnithes: The varnith thould be put on very quickly, making great itrokes with the pencil or brufh, taking care that thefe frokes never crofs one another; it thould be fpread equally, and never thicker than a leaf of paper; a fecond coat flould not be put on till the firft is quite dry. If the varnilh, after being put on, beconues dull and uneven, it mult be taken off entirely, and new varnifh put on.

When wainfcot is to be varnifled, it is firt painted of a wooden colour. This colour is made by infufing in water either red or yellow ochre (according to the colour wifhed for), terra ombria (a kind of ochre) and white lead; into thi as much as neceffary is put of parchnent pafle. Two thin coats of this are to be put on, and, after they are quite dry, the varnifh.

Varnifhes are polilhed with pumice-ttone and tripoli earth. The pumice-tlone muft be reduced to an impalpable power, and put upon a pieoe of ferge moiftened with water; with this the varnifhed fubilance is to be rubbed lightly and equally. The tripoli muft alfo be reduced to a very fine powder, and put upon a clean woollen cloth moiftened with olive oil, with which the polifhing is to be performed. The varnifh is then to be wiped with foft linen, and, when quite dry, cleaned with flarch or Spanifh white, and rubbed with the palm. of the hand or with a linen cloth.

To recover colours or varnill, and to take off the dirt and fith which may adhere to them, a ley is ufed made of potafh and the afthes of lees of wine. Take 48 ounces of potah, and 16 of the above-mentioned ather, and put them into fix quarts of water, and the ley is made: inttead of the ailies an equal quantity of potafly would probably do as well. To clean dirty colours, dilute fome of this ley with four times its quantity of water, and rub the pieture with it ; then wafh it witls river water; and when dry, give it a coat or two of varnih. In order to take off a varnith, wafl it with the above-mentioned ley, then with water, and then lift it off the fubilance on which it was with any iron inflrument. - We thall finith this article with a defcription of the famous Chinefe varnifh.

The Chinefe varnifh is not a compofition. "but a refin which exudes from a tree called in China ffichit," varnifh tree." This tree grows in feveral provinces of the fouthern parts of China. The Chinefe take the following method of propagating this tree: In fpring they choofe a vigorous thoot about a foot in length, which proceeds immediately from the trunk; and coat orer the lower part, by which it adheres to the tree, with a k'nd of yellow earth, at' leaft three inches in thicknefs. This coat is carefully covered with a mat, to defend it from rain and the injuries of the air. . Fowards the au:tumnal equinox they detach a little of the eath, to obferve in what condition the fmall roots are, which begin to fpring forth from the fhoot. If they find that the filaments which compofe them are of a teddifh colour, they judge it is time to make an amputation;" but they defer it if the roots are white, becaufe this colour thows
that they are yet too tender: they then clofe up the coat again, and wait till the fpring foliowing. When the thoot is, feparated from the trunk of the trce, it is put intothe earth; but in whatever feafon it is planted, whether in fpring or nutumn, great care mult be taken to put plenty-of cinders into the hole prepared for it; without this precaution the auts would deftroy the yet tender roots, or at leaft deprive them of all their muillure, and caufe them to decay.
3 The Chinefe do not procure varnifl from the tfi-chu until its trunk is nearly five inches in diameter, which fize it feldom attains to before feven or eight years. Varnifl extracied from a trec finaller or ol lels age would not have the fame body and fplendor. This liquor diftils only in the night time, and during the fummer fealon. To caufe the gum to flow, they make feveral rows of incifinns round the trunk, the number of which is proportioned to the vigour of the thee. The fritt row is feven inches from the earth, and the reft are at the fame diftance one from the other, and continue to the top of the trunk, and even fometimes on the boughs which are of fufficient frength and fize. The Chinefe ufe a crooked iron for making thefe incifions, which mult run a little obliquely, and be equal in depth to the thicknefs of the bark; they make them with one hant, and with the other hold a thell, the edges of which they infert into the opening, where it remains without any fupport. Thefe incifions are made towards evening, and next morning they collect the varnifh which has fallen into the fhells; the following evening they are again inferted, and this operation is continued until the end of fummer. A thoufand trees yield almoft in one night 20 pounds of varnifh.

While the varnth diftils, it exhales a muligant vapour, the bad effects of which can only be prevented by prefervatives and great precaution. The merchant who employs the workmen is obliged to keep by him a large vafe filled with rape-oil, in which a certain quantity of thofe fleflyy filaments have been boiled that are found in hog's lard, and which do not melt. When the workmen are going to fix the thells to the trees, they carry fome of this oil along with them, and rub their face and hands with it, which they do with greater care when they collect in the moming the varnifh that has difilled during night. After eating, they wath their whole bodies with warm water, in which the bark of the chefnut tree, fir wood, cryftallized faltpetre, and fome other drugs, have been boiled. When they are at work near the trees, they put upon their heads a fmall cloth bag in which there are two holes, and cover the fore part of their bodies with a kind of apron made of doe fkin, which is fulpended from their necks with ftrings, and. tied round them with a girdle. They allo wear boots, and have coverings on their arms, made of the fame. kind of k in. The labourer who hould attempt to colled, yarnifh without ufing this precaution, would foon be punithed for his rathnefs, and the moft dreadful effeets would enfue. The diforder fhows itfelf by tetters, which become of a bright red colour, and fpread in a very fhort time; the body afterwards fwells, and the Kkin burfts and appears covered with an univerfal leprofy. The unhappy wretch could not long endure the excruciating pain which he feels, did he not find a feeedy: renicdy in thole prefervatives which are ufed
againt the malignant and noxious exhalatiens of the Vamik. varuifl.

The feafon of collecting varnifh being ended, the merchant putsit into fmall calks clolely flopped. A pound of it newly made colis him about one thilling and cight pence Sterling; but he gains cent. per cont. upon it, and fumetimes more, according to the diftance of the place to which he tranfpurts it.

Beides the luttre and beauty which that varnifl gives to many of the Chinefe manufactures, it has allo the property of procorving the wood upon which it is laid, efpecially if no other matter be mixed with it. It prevents it from being burt either by dampnefs or wornis.

Every workman has a particular art and method of uning the varnifh. 'This work requires not only much Ikill and dexterity, but allo great attention, to oblerve' the proper degree of fluidity which the gum ought to have, as it mult be neither too thick nor too liquid whenit is laid on. Patience above all is neceffary in thofe wha wilh to fucceed. 'Io be properly varnilied, a work mult be done at leifure; and the whole fummer is fcarcely \({ }^{\prime}\) fufficient to bring it to perfection. It is therefore tare to fee any of thoie cabinets which are imported to us from Canton fo beautiful and durable as thofe manis-: factured in Japan, Toing-king, and Nang-king, the capital of the province of Kiang-nan: not that the artifts do not employ the fame varnifh; but as they - wook for Europeans, who are more eafily pleafed, they do not take the trouble of giving the pieces which come from their hands all the polifh they are capable of receiving.

There are two methods of laying on the varnifh; the fimpleft is, when it is immediately laid on the wood. The work is firf poliched, and then daubed over with a kind of oil which the Chinefe call tong.yeou. When this oil is dry, it receives two or three coats of varnifh; which remain fo tranfparent, that all the fhades and. veins of the wood may be feen through them: If the artift is defirous of entirely concealing the fubftance on which they are laid, nothing is neceffary but to add a few more coats; thefe give the work a, flining furface, the fnoothnefs of which equals that of the moft beautiful ice. When the work is dry, various figures are painted upon it in gold and filver, fuch as flowers, birds, trees, temples, dragons, \&c. A new coat of varnilh is then fometimes laid over thefe figures, which preferves them, and adds much to theit fplendor. The fecond method. requires more preparation. The Chinefe workmen fix to the wood by means of glue a kind of palteboard, compoled of paper, hemp, lime, and other ingredients, well beaten, that the varnifh may incorporate with them. Of this they make a ground perfectly fmooth and folid, over which the varnifl is laid in thin coats; that are left to dry one after the other.

It often happens, that the luftre of varnifhed tablesand other pieces of furniture is infenfibly deftroyed by tea and warm liquors. "The fecret of reftoring to varnift its thining black colour (fays a Chinefe author) is to expofe it for one night to a white hoar-froft, or to cover it fome time with frow." For a method of imitating Chinefe varni/b, fee Turning.

Varnish alfo fignifies a fort of Aining coat, uherewith potters ware, delft-ware, china-ware, \&c. are co-

Varnik, rered, which gives them a fmoothnefs and luftre. Melt ed lead is gencrally ufed for the firt, and fmalt for the fecond. See Glizing.

Varnish, among medalits, fignifies the colours antique medals have acquired in the earth.

The beauty which nature alone is able to give to medals, and art has never yet attained to counterfeit, enhances the value of them: that is, the colour which certain foils in which they have a long time lain tinges the metals withal : fome of which are blue, almoit as beautiful as the turquoife; others with an inimitable vermilion colour; others with a certain Chining polifhed brown, vaftly finer than Brafil figures.

The moft ufual varnifl is a beautiful green, which hangs to the fineft frokes without effacing them, more accurately than the fineft enamel does on metals.

No metal but brafs is fufceptible of this; for the green ruit that gathers on filver always fpoils it, and it muft be got off with vinegar or lemon juice.

Falfifiers of medals have a falle or modern varnifh, which they ule on their counterfeits, to give them the appearance or air of being antique. But this may be difcovered by its foftnefs; it being fofter than the natural varnifh, which is as hard as the metal itfelf.

Some depofite their fpurious metals in the earth for a confiderable time, by which means they contraft a fort of varnilh, which may impofe upon the lefs knowing; others ufe fal ammoniac, and others burnt paper.

Varro, Marcus 'Terentius, the moft learned of all the Romans, was born 28 years B. C. He was a fenator of the firft diftinction, both for birth and merit; and bore many great offices. He was an intimate friend of Cicero; and this friendthip was confirmed and immortalized by a mutual dedication of their learned works to each other. Thus Cicero dedicated his Academic Quettions to Varro; and Varro dedicated his treatife on the Latin tongue to Cicero. In the civil wars he was zealoufly attached to Pompey; but after his defeat foon fubmitted to Cæfar, who was reconciled to him. Afterwards he applied his whole time to letters, and had the charge of the Greek and Latin libraries at Rome. He was above 70 when Antony profcribed him; however, he found means to efcape and fave his life, though he could not fave fome of his works and his library from being plundered by the foldiers. After this ftorm was over, he purfued his ftudies as ufual ; and Pliny relates, that he continued to ftudy and to write when he was 88 years of age. He was 80 when he wrote his three books De re Rufica, which are fill extant. Five of his books De lingua Latina, which he addrefted to Cicero, are all extant. There remain, too, divers fragments of his works, particularly of his Menip. pean Satires, which are medleys of profe and verfe; and Scaliger has collected fome of his epigrams from among the Catalecfa Virgilii. His books De lingua Latina, and De re Rufica, were printed with the notes of Jofeph Scaliger, Turnebus, and Vietorius, by Hemy Stephens at Paris, 1573 , in 8 vo , and have been publinied feparately fince among the Auclores de lingua Latina, and the Auctores de re Rufica.

There was another Varro of antiquity, called Alacinus, who was born about 10 years after the firf, at a fmall town near Narbonuc. Though infinitcly below the Roman in learning, he was at leafl as good, if not a better, poet; which perhaps has made Lillius Gyraldus
and other critics confound them. He compofed many works in verfe; fome fragments of which were collected, and publighed with thofe of other ancient poets, at Lyons in 1603 . His chief works were, A poem on the war with the Sequani, a people of Gaul; and the Altronomics, that went under the name of Planciades the grammarian. But the Argonautics, in four books, was what gained him the greatefl reputation: and though indeed nothing but a tranllation of Apollonius Rhodius, yet was fo well done as to be commended by Quintilian.

VARRONIA, a genus of plants belonging to the clafs pentandria, and arranged in the natural fyllem under the 4 Ift order, Afperifolice. See Borany Index.

VASCULAR, fomething confifting of divers veflels, as arteries, veins, \&c.

VASE, a term fiequently ufed for ancient vefels dug from under ground, or otherwife found, and preferved in the cabinets of the curious. In architecture, the appellation vafe is alio given to thofe ornaments placed on corniches, fochles, or pedeftals, reprefenting the veffels of the ancients, particularly thofe ufed in facrifice, as incenfe-pots, flower-pots, \&ic. See PORTLANDDVafe.

VASSAL, in our ancient cuftoms, fignified a tenant or feudatory; or feifon who vowed fidelity and homage to a lord, on account of fome land, \&c. held of him in fee; alfo a flave or fervant, and efpecially a domeftic of a prince.-Vafalius is faid to be quaf inferior fo. cius; as the vaffal is inferior to his mafter, and muft ferve him ; and yet he is in a manner his companion, becaufe each of them is obliged to the other. See FEODAL System.

VATICAN, a magnificent palace of the pope in Rome, which is faid to confift of feveral thouland rooms: but the parts of it moft admired are the grand ftaircafe, the pope's apartment, and efpecially tbe library, which is one of the richef in the world, both in printed books and manufcripts.

VAUBAN, Sfrastian le Prestre, Seigneur DE, marhal of France, and the greateft engineer that country ever produced, was bom in 1633 . He difplayed his knowledge of fortification in the courfe of many fieges, and his fervices were rewarded with the firft military honours. He was made govertor of Lille in 1668 , commiffary general of the fortifications of France in 1678 , governor of the maritime parts of Flanders in 1689, and a marihal of France in 1703. He died in 1707, after having brought the arts of attacking and defending fortified places to a degree of perfection unknown before. His uritings on thefe fubjects are in great efteem.

VAUDO1S, Valdenses, or Waldenfes, in ecclefiaftical hiftory, a name given to a fect of reformers, who made their firf appearance about the year 1160.

The origin of this famous lect, according to MoAhein, was as follows: Peter, an opulent merchant of Lyons, furnamed Valden/is, or Validifius from Vaux or Waldum, a town in the marquifate of Lyons, being ex. tremely zealous for the advancement of true piety and Chriftian knowledge, employed a certain pricf called Srephanus de Erifa, about the year ilfo, in trannating from Latin into French the four Gofpels, with other books of Holy Scripture, and the moll remarkable fentences of the ancient doftors, which were fo lighly
audo:s effeemed in his century. But no fooner had he perufed thefe facred books with a proper degree of attention, than he perceived that the religion which was now taught in the Roman church, differed totally from that which was, originally inculcated by Chrif and his apofles. Stuck with ihis glaring contradiction between the doetrines of the poatiff; and the truths of the Gotpel, "and animated with zal, he abaadoned lis metcantile vocation, diltributed his riches amoing the poor (whence the Waldenfes were called poor moch of Lyons), and forming an aflociation with other pious men, who had adopted his fentiments and turn of levotion, he began in the year 1180 to affurne the quality of a public teacher, and to inllruct the multitude in the ductrines and precepts of Chrifianity.
Soon after Peter had affumed the exercife of his miniftry, the archbiliop of Lyons, and the other rulers of the church in that province, vigorounly oppofed him. However, their oppofition was unfucceffful; for the purity and fimplicity of that religion which thefe good men taught, the fpotlefs innocence that flone for \(h\) in their lives and aftions, and the noble contempt of riches and hotours which was conficuous in the whole of their conduct and converfation, appeared fo engaging to all fuch as had any ferfe of true piety, that the number of their followers daily increafed. -They accordingly formed religious affemblies, firt in France, and afterwards in Lom'Jardy, from whence they propagated their feet throughout the other provinces of Europe with incredible rapidity, and with fuch invincible fortitude, that neither fire, nor fword, nor the mofl cruel inventions of mercilefs perfecution, could dantp their zeal, or entirely ruin their caure.

VAULT, in Architecture, an arched roof, fo contrived that the fones which form it fuftain each other.

Vaults are on many occafions to be preferred to foffits or fiat ceilings, as they give a greater height and elevasion, and are befides more firm and durable.

VAXER. See Mothe.
VAYVODE, or Vaivode. See Waywode.
UBES, ST, a fca-port town of Poriugal, in the proxince of Eftremadura, feated on a bay of the Atlantic ocean, 21 miles fouth of Libon. It flands on an emirence, with a very ftrong caftle built on a rock. The foil around is fertile in corn, wine, and fruits; and it is furniflyed with good find from the fea, and a fmall lake in the ueighbourhood. Here great quantities of fine falt are made, which is carried to the Amenican plantations. E. Long. 8. 54. N. Lat. \(3^{8.22}\)

UBIQUITARIANS, formed from ulique, " everywhere," in ecclefiatlical hiftory, a fect of Lutherans swhich rofe and fpread itfelf in Germany; and whofe dininguilhing doctrine was, that the body of Jefus Chrift is everywhere, or in every place.

Brentius, one of the earlift reformers, is faid to have frift broached this error, in 1560 . Luther himfelf, in his controverfy with Zuinglius, had thrown out fome unguarded expreffions, that feemed to imply a belief of the omniprefence of the body of Chrift; but he became fenfible afterwards, that this opinion was attended with great difficulties, and parlicularly that it ought not to be made ufe of as a proof of Chrith's corporal prefence in the eucharift. However, after the death of Luther, this ablurd hyncthefis was renewed, and drefled up in a fpecions and plaufible form by Brentius, Chemni-
tius, and Andreas, who maintained the commantica-"Luiquitation of the properties of Chrill's divin' y to h:5 itrian-rias nature. It is indecd obvious, that every Luhberan who vier. believes the dofrine of confubtantintion (ice SelPER of the Lord), whatever he may pictend, mult be ait (Ubiquitarian.

UBIDUITY, Omintresence; an attiliate of the Deity, whercby he is al:xays incumately freicut to all things; gives the efle to ail things; knjwe, preferves, and does all in all ilings.

UDDER, in comparative axatomy, that part in brutes wherein the mik is prepaled, antwering to the mamme or breatts in women. See Asatomy, Co:sparative.

VEDAS, the facred borks of the Hindoos, Lelisved to be revealed by God, and culled immarial. Wley are confidered as the fountain of all haon ledge buman and divine, and are four in number; of whicls we have the following account in the firft volume of the Afatic Refearches: The Rigveda confifts of five fections; the Yajurveda of eighty ix: the Samaveda of a thoufand; and the Abharvaredu of nine; with cleven bundred / \(a c^{\prime} /\) la's, or branches, in various divifions and fubdivifions. 'the Vedas in truth are isfinite; but have been long reduced to this number and urder: the principal part of them is that which explains the duties of man in a methodical arrangement; and in the fourth is a fyftem of divine ordinances.

From there are reduced the four Ufarcdas, the firte of which was delivered to mankind by Brahma, Indra, Dhanwantari, and five other deities; and comprifes the theory of diforders and niedicines, with the practical methods of curing difeafes.

The fecond confilts of mufic, invented for the purfofe of raifing the mind by devotion to the felicity of the Divine nature; the third tieats of the fabrication and ufe of arms; and the fourth of fixty-four mechanical arts. Of however little value we may effeem the mechanical arts of the Hindoos, and however defpicable their theological fyftem may really be, the Upaveda, which treats of difeafes and the method of curing them, furely deferves to be fludied by every European phyfician practifing in India. There are indecd a great number of medical books in the Shanfcrit language worthy of attention; for though the theories of their authors may be groundle fs and whimfical, they contain the names and defriptions of many Indian plants and minerals, with their ufes, difooveled by capericince, in the cure of difeafes.

VEDETTE, in War, a centinel on horleback, with his horfe's head towards the place whence any danger is to be feared, and his carabine advanced, with the buttend againft his right thigh. When the enemy has encamped, there are vedettes pofted at all the avenues, and en all the rifing grounds, to watch for its fecurity.
To VEER and HALI, to pull a rope tight, by drawing it in and tlackening it alternately, till the body to which it is applied acquires' an additional motion, like the incicafed vibrations of a pendulum, fo that the rope is fraitened to a greater tenfion with more facility and difyratch. This method is particularly ufed in hauling
the bowlines.

The wind is faid to veer and haul when it alters its direetion, and becomes more or lefs fair."Thus it is faid to vecr aft and to haul forward.

3 X Veer,

Verr, \({ }^{\text {, Ter-Verer, anciently Camp-Veer, a town of }}\) Zeal?nd in the United Provinces, flanding at the month of the Eaft Schelde, about four miles from Middle. buigh, and eioht from Fluhing. Veer, in Dutch, fig. nifics a pallige or ferry over an arm of the fea or a river; and as there was once a ferry here over the Schelde to the village of Compen, on the ifland of Nosth Beveland, the town thereby got the name of \(V_{\text {eer }}\), Camp-Vter, and Ter Veer. It is well fortified, and formerly enjoyed a good trade, efpecially to Scotland; the natives enjoying particular privileges here. The harbour is very good, and the arfenal the beft furnithed in the world. Hence the Veres, anciently earls of Oxford, are faid to have derived both their origin and name.

VEERING, or WEARING, the operation by which a fhip, in changing her courfe from one board to the other, turns her flem to windward. Hence it is ufed in oppofition to Tacking, wherein the head is turned to the wind and the fiern to leeward. See Seamaniship.

VEGA, Lopez De, a celebrated Spaniih poet. He was the fon of Felix de Vega and Franeifca Fernandez, who were both defcended from honourable families, and lived in the neighbourhoed of Madrid. Our poet was born in that city on the 25 th of November 1562 . He was, according to his own expreffion, a poet from his cradle; and beginning to make verfes before he had Iearned to write, he ufed to bribe his elder fchool-fellows with part of his breakfaft, to commit to paper the lines he had compofed. Having loft his father while he was yet fill a child, he engaged in a frolic very natural to a lively boy, and wandered with another lad to various parts of Spain, till, having fpent their money, and being conducted before a magiftrate at Segovia for offering to fell a few trinkets, they were fent home again to Madrid. Soon after this adventure, our young poet was taken under the protection of Geronimo Manrique, bilhop of Avila, and began to diflinguifh himfelf by his dramatic compofitions, which were received with great applaufe by the public, though their author had not yet completed his education : for, after this period, he became a member of the univerfity of Alcala, where he devoted himfelf for four years to the ftudy of philofophy. He was then engaged as fecretary to the duke of Alva, and wrote his Arcadia in compliment to that patron: who is frequently mentioned in his occafional poems. He guitted that employment on his marriage with Ifabel de Urbina, a lady (fays his friend and biographer Perez de Montalvan) beautiful without artifice, and virtucus without affectation. His domeftic happinefs was foon interrupted by a painful incident :Having written fome lively verfes in ridicule of a perfon who had taken fome injurious freedom with his character, he received a challenge in confequence of his wit; and happening, in the duel which enfued, to give his adverfary a dangerous wourd, he was obliged to tly from his family, and thelter himfelf in Valencia. He refided there al confiderable time; but connubial affection recalkd him to Madrid. His wife died in the year of his return. His alfiction at this event led him to relinquifh his favourite fludies, and embark on board the Armada which was then preparing for the invafion of Eugland. He had a brother who ferved in that flect as a lieutenant) and being fhot is an engagement with
fome Dutch veffels, his virtues were celebrated by our - Vegu afticted poet, whofe heart was peculiarly alive to every Vegeta generous affection. After the ill luccels of the Armada, the difconfolate Lopez de Vega returned to Madrid, and became fecretary to the marquis of Malpica, to whom he has addrefled a grateful fonnet. From the fervice of this patron he paffed into the houfehold of the count of Lemos, whom he celebrates as an inimitable poct. He was once more induced to quit his attendance on the great, for the more inviting comforts of a married life. His fecond choice was Juana de Guardio, of noble birth and fingular beauty. By this lady he had two childien, a fon who died in his infancy, and a daughter named Feliciana, who furvived her father. The death of his little boy is faid to have haftened that of his wife, whom he had the misfortune to lofe in about feven years after his marriage. Having now experienced the precarioufnefs of all human enjoyments, he devoted himfelf to a religious life, and fulfilled all the duties of it with the moft exemplary piety: ftill continuing to produce an aftonifning variety of poetical compofitions. His talents and virtues procured him many unfolicited honours. Pope Urban VIII. Fent him the crols of Malta, with the title of Doctor in Divinity, and appointed him to a place of profit in the Apottolic Chamber; favours for which he expreffed his gratitude by dedicating his Corona Tragica (a long poem on the fate of Mary queen of Scots) to that liberal pontiff. In his 73 d year he felt the approaches of death, and prepared himfelf for it with the utmolt compofure and devotion. IIis laft hours were attended by many of his intimate friends, and particularly his chief patron the duke of Seffa, whom he had made his executor; leaving him the care of his daughter Feliciana, and of his various manufcripts. The manner in which he took leave of thole he loved was molt tender and affecting. He faid to his difeiple and biographer Montalvan, That true fame confifed in being good: and that he would willingly exchange all the applaufes he had received to add a fingle deed of virtue to the actions of his life. Hav. ing given his dying benediction to his daughter, and performed the laft ceremonies of his religion, he expired on the 25 th of Auguft 1635.

VEGETABLE Physiology.-Under the article Botany, and alfo under Plant, we have already delivered fome of the commonly received doctrines on this fubject. But as fome late inveligations feem to lead to new views with regard to the ftucture and nature of vegetables, we have thought it neceffary to refume the fubject, and to give as full a detail of the experiments and obfervations to which we allude as our limits will permit: we fhall firf treat of the fructure, and fecond. ly of the phytiology of plants.
I. Structure of Plants,-In confidering the Atructure or anatomy of plants, we thall treat, ift, of the root; 2 d , of the ftem and branches; 3 d, of the leares; and \(4 t h\), of the Gowers; in the order in which they are now enumerated.
1. The Root.-The root is that organ belonging to vegetables by which they are fupplied with nourimment, and by which they are fixed to a commodious fituation.

It was formerly fuppofed to be compofed of outer and inner bark, of wood and of pith; but Mrs Ibbetfon, who No.t. has lately communicated * to the public the refults of an Your, xan

\section*{\(V\) E G [ 531 I \(\quad V\) E G}
retable elaborate feries of experiments on this fubject, thinks fiology. that it is wholly compoled of the rind much thickened, with perhaps a very little of the outer bark, but no inner bark; of a quantity of wood, hardly any pith, and no fpiral veffels. Mrs Ibbetforn fearched in vain for the larger veffels of the inner bark, till it occurred to her that the want of this bark accounted for there being no leaves on the root. Mrs Ibbetion had often been affured that roots were found bearing leaves, but on diffection of thefe fuppofed roots, lie found that they were branches which croffed the root.

The root confills of the caudex, flock or main body, and of the radiculte or fibres which arife from the caudex, and are the organs by which the moifture is immediately imbibed.

In botanical terminology, we generally confider all that part of a plant which is under ground as the root; but Linné comprehends under his definition, what we term the body or trunk of the plant; and he went fo far as to call the ftems of trees "roots above ground"; but as Dr Smith jutlly remarks, this leems paradoxical and fcarcely correct. Dr Sinith adds, that perhaps it would be more accurate to call the caudex a fibteriraneous fern; although he is rather inclined to think that it has functions diftinet from the ftem, analogous to digeltion; for there is evidently a great difference in many cafes, between the fluids of the root, at lealt the fecreted ones, and thofe of the reft of the plant.

In botanical phyfiology, by the term root, is often underltood the parts only which ferve to keep the plants firm in the ground : thus the bulbous and flefty roots as they are called, are Atrictly fpeaking, not roots; the radicula or fibres being the real roots. The duration of roots is various; they are either annual, biennial, or perennial.
2. The Srems and Brancras.-Linné long ago divided the Items of teees into four parts; the rind, the bark, the wood, and the pith; and nearly a fimilar divifion has been adopted by mof vegetable phyfiologifts till the prefent time.

Mrs Ibbetfon (aided by a powerful folar microfcope), however, thinks that nature points out a more regular divifion, a divifion marked not only by the form, but by the difference of the jutices, with which the parts are fwelled.

Mrs Ibbelfon divides the flem of trees into fix paris: 1. The rind; 2.- The bark and inncr bark; 3. The wood ; 4. The fuiral nerves; 5. The nerves or circle of life (corona of Hill); and 6. The pith.
1. Of the rind.-Mrs Ibbetfon conceives the rind to be merely an outward covering to the tree, which prevents its juices from being evaporated by the influence of the fun's heat. The rivid is continued under ground; but it may be as ufeful there to prevent the entrance of the duft and earth, the preffure of flones, or the injury of infeets.

The rind is compoled of two rows of cylinders, with a fingle line to divide them. The cylinders are filled with a pellucid liquor. There are feldom more than four or five layers of veffels in the rind; but it is in general fo covered with parafitic plants, as powdery li. chens, \&c. that its thicknefs is often more than doubled.

The rind does not appear to be neceffary to plants in general, as there are many in which the ba:k lerves
as a covering in its fead; but it fecms to form an effen tial part of trees.
2. Of the bark and inner bark.-Thefe parts, though certainly dififerent as to form, contain the lame kind of juice; and being fo nearly allied, may be treated of as one. From the bark and iuner bark the leaves take their origin, as fill be fhown when we come to treat of the formation of the leaf-bud. Mrs Ibbetfon conceives that tire juice of the baik is the blood ot the tree.

In the bark alone are produced the gums, the refins, the oil, the mill, \&ec.; in fhort all that belongs to the tree ; gives talte to it ; all that nakes one plant differ from andther, and all its vittues, if the eapreffion may the inner bark, may probahly ferve the fame purpofe, the impetus of the current being increafed by the leffening of the apertures of the veff:is.

The veffels of the inner bark are very thick in proportion to their fize, and there is placed in them a peculiar circular body, which refembles a cullender full of holes fo fmall that no liquid could pafs them. In viewing the thick juice whiclı runs through thele pipes, Mrs Ibbetfon oblerved many bubbles of air, the fize of which was increafed or diminilhed according to the temperature; and as their fize varied, fo was the flow of the liquid accelerated or retarded. To fee thefe veffels well, the feccimens may be placed in a baket which is to be faftened in a ruuning fream for fome time, or boiled thoroughly, and then thrown into green wax perfectly melted.

Mirbel fays that "fome plants have the fame juices in every part of them:" but Mrs Ibbetfon does not cuincide with his idea, for the did not find it to be.fo; though the potent fmell of the liquid belonging to the bark often extends to other parts of the piant, yet it generally vanihies if kept feparatc for a day, or becomes fo

Vegetable Hhy liolozy: \(\underbrace{-}\)

\(\qquad\) 

\(\qquad\)

\footnotetext{

}

\(\qquad\)

 8,

Vegetabie faint in comparifon with the real liquid of the bark as Phytiologs to prove that it does not form an ingredient of thefe parts. Mirbel fays that the cylinders of the inner bark are merely vacancies of the ordinary veffels; but Mrs Ibhetfon ftates that they are exactly the fame as thefe veffels, and occupy the fame place.

They have a peculiar flape, being unlike nny other veffels of the tree, and they perform a particular office.

The veffels of the bark are fmaller, and more fimple than thofe of the inner bark, and are divided by a line or two, running longitudinally between them.
3. Of the ITood. - This is a very obvious pait. Place the fem of any plant in a coloured liquid, and every velifl which conveys the fap from the earth to the top of the tree will be tinged.
- The fap is a thin watery liquor, probably medicated from the earth, in order to become fuitable for the life of vegetables.

Mrs Ibbetfon fuppofes that the fap may vary with the foil, though on trial the has never found that change which might have been fufpected.

If we make a tranfverfe fection of the flem of a tree, two different kinds of layers prefent themfelves in the wood; fome running in a circular manner, which timber merchants call thie fiver grain; and others from the circumference to the centre, which they denominate the bafard grain. Limné long ago believed that one of the circular layers was added to the tree each year. This opinion has often been controverted, and among others by Duhamel and Mirbel ; but Mrs Ibbetfon has had an opportunity of verifying the accuracy of Linnés opinion. She alfo obferved that the layer was large or fmall according to the expofure of the tree, and the favourablenefs of the feafon: thus in expofed fituations, the circles taken as a whole, were much narrower than in trees not expofed. In fome trees fhe noticed only half of a circular layer.

Mrs Ibbetion thinks the baftard fripe confilts of two Iines or ftrings, with a little fcale between them; and they appear from their extreme fufceptibility to be formed of the fame leather-like fubftance as the fpiral veffels, which we are immediately to notice.

Mr Knight merely calls them foales; but as he mentions their preffing clofe (which they certainly do) to the cylinders at night, and during cold weather, it is obvious (whichever of the opinions we adopt) that the baftard grains are capable of fupplying the place of the fun's rays, by their preffure.

The wood-veffels are far more fimple in frructure than thofe of the bark; they are very narrow cylinders, and the two rows next to the corona are covered by the fpiral veffels.

It is indeed difficult to determine the exact cxtent of the fpital veffels even with the affiftance of the folar microfonpe, for it is by unwinding them alone that they can be known; and their extreme finenefs confufes, in confequence of which they have been taken for fap veffels. Neither Mr Knight nor Mirbel was led into this millake, and Mrs Ibbetfon thinks that there can be no doubt that thefe vefiels (formerly fo called) are folid drings which hold no liquid.

The veffels of the wood may be beff feen in flices of the ftems of young trees; and if not very vifible when
recentily cut, they will foon become fo if the sices are Vegeta, kept in a dry place.

If the wood-veliels are cut. longitudinally and obferved with a high magnifier, as foon as the light is permitted to come on the glafs, the flow of fap will be accelerated, and with perfect eafe will run up vefiels fo diminutive that to meafure them is almofl impoffible.

A few of the wood-veffels are feparated and run with the fpiral vefiels to each leaf, in order to nourifh it, as will be more particularly noticed when we come to treat of the leaf-bud.

But little of the fap, however, pafies off in this way from the principal current, which flows on; its chief purpofe being to form the flamen and the pollen appertaining to it, and afterwards to lend its principal aid to the formation of the fruit and feed.
4. The Jpiral veffels are a quantity of folid ftrings coiled up into a fipiral form. Mrs Ibbetfon fuppofes them to be formed of a leather-like fubftance, and, as already mentioned, to be rolled sound the wood. In this fpiral manner they run up the ftems of trees and plants of every kind, (with a few exceptions) and from thence into every leaf and flower. Thele fpiral cords are fingly too fnall to be obferved by the naked eye. They run into every fibre of the leaf, and are fafteried to its edges, thus crofling among the veffels in every dircction like a fpider's web; by which difpofition they can draw the leaves in any way that is neceffary for them.

The larger of the interior wood-veffels are each fupplied with fets of ten or twelve fpiral cords, but the fmaller of thefe have only three or four to each.

In the cabbage leaf and in the burdock, the fpiral cords may be found in bundles almoft as thick as a packthread, but in fmaller leaves they are proper. ly proportioned. Thefe fipiral cords, Mrs Ibbetfon thinks, are the caufe of the motions of plants. See \(\mathrm{P}_{\text {Lakt, }} \mathrm{p}\). 601, where thefe cords are called air-veffels.
5. Of the corona or circle of life.-The next part to be noticed is the imall circle of veffels fituated between the wood and the pith, the importance of which, in the formation of the feed, will be noticed under Impregnation of the Seed; where are alfo related ftrong proofs to fhow that a plant cannot exif a day without the corona, and that if a young plant be deprived of this part, it will not grow again, though it will certainly do fo if the plant be fumewhat old. It is very curious that almont every botanical anatomift fhould have figured this part, without giving it a name, or noticing it patticularly; and that thefe anatomifts fhould have attributed all its powers to the pith, which, from the fhort term of its exiftence, and its being perpetually impeded in its progrefs to make'way for the flower-bud, can evidently have but little influence. The circle of life, however, has not efcaped the notice of Hill, who termed it the corona.

The circle of life confifts of rows of little cylinders which have their own peculiar juice, generally, of an auftere quality. From the corona all branches take their rife, and fiom it all wood threads grow. The cylinders of which it is compofed run up into all Howerbuds, but never approach the leaf-bud as is reprefented by fig. 1 and 2. ; when thefe cylinders enter the flowerbut, they make their way difinelly to each feparate

\section*{V E G [ 5.33 ] V E G}
retable flower, foriming the piftil, and after depofiting in each itoligy fide the line, which is the firit origin of life, they are affervards impregnated, or acquire the power of giving life by the juice of the tlamen, which runs through the fame tlring into the feed.

That the principal vitality of the plant refides in the corona, we think is proved by the experiments and obfervations of Mrs ibhetfon under Impregnation of Seced, and feems to be farther confirmed by the following rcmarks.

When a branch is cut from a tree, or a tree is torn up, the corona or circle of life is the firft part that dies; and if, after a fudden frolt, we examine the flowers of a fruit tree, we thall find that neither the calys, the corolla, the flamina, nor the feeds are hurt, but that the piftilla are deftroyed. And if we now obferve the piftils with care, we fhall fee that it is the line of life which is decayed, and that this is the frift part in which mortification commences. The peculiar liquor of the piltil acquires a blood-red colour, and the vefiels which run up to the fligma become black, inflead of their natural yellow colour.

If in wood, this line is injured (either by the decay of the bark or other means) the circle will undulate into a thouland forms, for the purpofe of regaining a healthy fituation in which it may purfue its courfe.

Mrs ibbetfon, to prove the power of the circle of jife, relates the following oblervations refpecting the pon reptans.

She had often meafured in winter, feven or eight yards of this grafs, which appeared perfectly dead ; and yet in May or June, the perceived life in it at the moft diftant end from the talalk. Next fpring the took up two of thefe creeping branches which were much alike; and on diffecting one of them through its whole length, flie found in it a collection of little veffels not thicker than a very fine thread.

This collection of veffels had run about half way the length of the branch, which was about three yards.
Mrs Ibbetfon having merely opened the cover of the grafs, laid it down again, and the little vefiels continued increaing till they reached the end of the branch, when they made a ftop, and it was perceived that the grais began to thicken; and at the end neareft the roots, the dead part became inflated with juice, loft by degrees its dead appearance, thickened about the joints within, and at laft hot forth frefh leaves and frelh roots from every joint.
Mrs lbbetfon has fince watched with the greateft care, and found that the fine thread which runs through the grafs protected by the dead fcale, was the circle of life. When this thread is ftopped by the covers decaying, it waits till the feafon permits the refl of the plant to grow. From what has been faid, it is evident that the dead matter may be inflated with a living juice, and live itfelf again; provided the life near the fem of the plant be not extinguifhed. Mrs Ibbetfon has obferved this to happen in many plants, as in hydrangea, in which the ftalks apparently lie down and are inflated again, or at leall a part of them.
6. Pith.-Linné confidered the pill of plants as of equal importance with the fpinal marrow of animals; but Mrs: Ibbetfon thinks this part of bat litue confequence, and transfers this impostance to the circle of
life, which fie compa:cs to the brain and fpinal mar. Vegetable row. She conceives that the pith forms merely a Phyliology. fource of moifture for the plant when required. The pith ilops wihh cvery flower-bud, and begins again to grow as foon as the bud is paft; it decreafes as the flrength and fize of the tree increafe; it is the only part of the tree which is devoid of veffels; it is merely a net, not a bundle of cylinders, and is commonly of a remarkably f \(\mathrm{p}_{\mathrm{p}}\) lendid or filver white colour.

It has been faid that the pith affumes a variety of figurcs, but Mrs lubetfon thinks this is a mittake, though fle admits a few different lorts.

All young trees and flhrubs are provided with pith; but in the progrefs of their growth they need it no longer, the wood being a good fubflitute. On the fame argcount, in general, we find no pith in water plants, which have a hollow flem, and rarely fuffer from drought.

Linne thought that the pith was the feat of life and the fource of vegctation; or in a word, the primary part of the plant. Duhamel confidered it as of but little importance at all. Wildenow and Knight concur with Mrs Ibbetfon in regarding it as a refervoir of moifture for the young plants; and Dr Smith holds a medium opinion between that of Limé and the other authors juft samed.

He fays " there is in certain refpeets an analogy between the medulla of plants, and the nervous fylte:n of animals; it is no lefs affiduouny protected than the fipinal marrow; it is branched off and diffufed through the plant, as nerves though the animal. Hence it is not abfurd to prefume that it may in like manner give life and vigour to the whole, though by no means, any more than nerves, the organ or fource of nouriftment *." *See Fig.
We were fomewhat furpuifed to find that Mrs ibbet-3.4. and sfon had not particularly noticed the cellular tiflue as a diftinct part to be feen in the ftems of trees, as it has been long known; we thall therefore fubjoin a defcription of it. It is a fucculent celluiar fubilance, general. ly of a green colour, at leaft in the leaves and branches. Duhamel long ago called it envellope cellulaire, and Mirbel more lately, ciflue herbacé.

Dahamel fuppofed that the cellular tifiue formed the cuticle, or epidermis; but this is not very probable, as his own experiments fhow that when the cuticle is re. moved, the cellular integument exfoliates, at leaft in trees, or is thrown off in confequence of the injury, and a new cuticle, covering a new layer of the cellular tiffue, is formed under the old one. This fublance is very univerfal, even in mofles and ferns. Leaves corifift alinoft entirely of a plate of this fubflance, coveted on each fide by the cuticle. The flems and branches both of annual and perennial plants are invefted with it ; but in woody plants it is dried up; and reproduced almoft continually, fuch parts only having that reproductive power. The old layers remain, are pulhed outward by the new ones, and form at length the rugged dry dead covering of the old trunks of trees. "The cellular integument is a part of plants of the greateft importance; for in it the juices of plants are operated on by light, air, \&c.

With regard to the branches of trees, it has beeri already noticed, that they derive their origin from the corona; and they are compofed exactly' of the faine parts as the trunks from which they arife.
3. T\% Leares.-Mis Ibletfori has, with the amita

\section*{V E G}

Tegetable ance of the folar mifcrofcope, and by great attention to Phyinolosy, this natural procefs, been enabled to give fome new and interelting views on this fubject. Her opinion refpectinse the formation of the leaf-bud is, "That leaves are formed or woven by the veffels or cotton that is generally fuppofed by botanifts (to be) placed there to defend the bud from the feverities of winter; that thefe veflels (or cotton) are a continuation of thofe of the bark and inner bark in the flem of the plant; that thefe veffels compofe the various interlacing branches of the leaf, which are fon filled \(u_{i}\) by the concentrated and thickened juices of the iuner bark, which form the pabulum of the leaf."

Mrs Ibbetfoa fays the truth of her affertion may be eafily feen by diffecting early buds, in which, except two or three, nothing but the cotton-like veffcls will be found. Sise afks then what could be the ufe of thefe veifels? and anfwers, that to put them within the bud to keep the outfide warm is againlt nature, for it is contrary to nature. The leaf-bud in its firfl liate confits of two or three fcales, inclofing a parcel of veffels, which appear like very moift coarfe cotton, but when drawr. out and placed in the folar microfcope, they thew themfelves to be merely the veffels of the bark and inner bark elongated and curled up in various forms.

Thefe reflicls are of three kirds like the bark, \&c. Firt, Three or four fhort thick ones which appear to grow from the larger vell?ls of the inner bark, and through which the thickened juice flows, but with this difference, that the holes are not there.

Then there are two fmaller fized veffels, which exactly refemble the fraller veftels of the bark.
- Mrs Ibbeton has always found the fhort thick kind of veffels to form the mid-rib of the leaves, and the frnaller-fized veffels to compofe the interlacing fibres (or veffels) of the other parts of the leaves; and from often comparing the full grown leaf with the leaf of the bud, fhe feels the moft thorough conviction that the latter takes its origin as above noticed. The pabulum of the leaf which lies between the veffels, is compofed of that thick juice which runs in the bark or inner bark of the tree, and which does not exift in any other part of it. The pabulum differs effentially from the fap, and may be called the blood of the tree, as it pofleffes peculiar properties in different trees; thus it is of a gummy nature in one, of a refinous in a lecond, and of an oily nature in a third, \&c.

Mrs Ibbetfon is not certain whether the pabulum both fisws forwards and in a retrograde direction; but fhe is convinced that the greateft part of it is taken up in forming the leaves. The pabulum of the leaf, after the vefiels are arranged and crofied, grows over in bladders, making alternate layers with the fmaller pipes (v-ffels), and with the bianches of the lcaf.

Mis Ibbetfon flates, that fhe does not know any tree which gives a more convincing proof of the formation of the leaves in the bud, than may be feen in the hort= chefnut (ofculus hippocaftanum) about the month of November or December.

Several diffcrent mid-ribs may be taken out at once from the fame leaf-hud, which have an innumerable number of extremely fine filken voffls faftened to or growing up from each fide of them. When thefe veffels have beconse fufficiently interlaced with each other, the
pabulum will begin to grow over them, in form of Vegetz fmall bladders full of a watery-juice; and then larger Phyfiolo veffels will crofs over them, which will foon be followed by another row of bladders, and a fimilar \({ }^{\text {p }}\) procefs will go on until the leaf has attained its proper thichnefs. 'The leaves thus'formed are very fmall, but when once their lhape is completed evely part of them continues to increafe in fize. Fig. 6. reprefents the leaf. Fig. 6. bud of the horle-chefnut, as it was examined by Mrs Ibbetfon about the month of January.

Mrs Ibbedon next notices the arrangement of the leaves in the buds of different trees; but we fball conilder them by and bye.

The rolling, folding, or olaiting, \&ic of the leaf. bud, it is oblerved, does not merely take place at once ; but to complete the procefs of budding, it appears that this arrangement of the leaves is repeated feveral times. During this arrangement the bud* leaves ate immerfed in the glutinous liquor which runs in the bark (and forms the pabulum); and the preflure of the leaves is very great. By this preffure and the rolling, \&c. the leaves are completed; for if a leaf be taken from the bud before this procefs commences, it may be compared to a piece of cloth before it is dreffed; for its back will be obfcured by the ends of veffels, which, had it remained in fitu, would have been all rubbed off, except the hairs which remain on many plants.

We come now to the formation of the edge of the leaf, a curious and beautiful procefs.

The bul if opened will appear full of the glutinous liquor which forms the pabulum, and the leaves arranged in the manner proper to the particular tree from which the bud is taken. If one of the leaves be taken out, the edges (in whatever manner folded) will exhibit a perfect double row of bubbles, following the fcollop of the edge of the leaf; and it will appear as if it were fet with brilliants.

Things being in this flate, all that is wanting for the completion of the leaf is the formation of the pores, now to be mentioned. Mrs Ibbetfon flates that in many hundred forming leaves which the expofed to the folar microfcope, fhe had never once been able to fee the pores; which the has often obferved after the leaves have cumpletely quitted the bud; and fhe is uncertain whether this is owing to the greater thicknefs of the young leaf, and its being covered with more hairs than it is afterwards, which obfcure or conceal the pores; or whether it be caufed by the upper net-work of the leaf growing laft. While the upper and under cuticles of the leaf are growing, the edge of it is completing; for the bubbles generally divide, and partly dry up, leaving horny points in their ftead. When the edges? of the leaves are completely formed, they burlt from the bud and affurne a different afiect.

The veffels of the leaves (thofe confined within the mid ribs and fide ribs of the leaves) are of two forts, the fpiral, and the nourifling. The firal veffels are thofe corkfcrew-like wires which furround the two laft rows of the fip veffels. The nourinhing veifcls, are the ouly parts formed of the wood. They convey the fap neceffiry for the fupport of the leaves, and run on eacha fide of the firiral velfels.

To prove that the has given a fair and accurate accound of the formation of the leaf, Mrs Ibbet-
etable fon adds the following remarks. The colour of leaves, finlogy the obferves, is not to be found in their fubftance, but in the liquid with which it is filled. The darkeft green leáf that can be procured, has both its upper and under cuticles of a perfe f white colour. In the cuticle the pores are to be found.

A leaf has rather a thicker net below than it has above; but this does not fufficiently account for the varieties of tints in different lenves.

The under net (or cuticle) does not lie fo clofe to the pabulum of the leaf as the upper one; which may account for the colour not piercing fo much through. When the two nets (or cuticles) are taken off, then the pabulum of the leaf appears.

The pabulum is formed of little bladders, filled with a dark-green liquid, and interlaced with veffels. When the pabulum is removed, a bed of large veffels prefents itfelf; then a colleetion of bladders; which is followed by the larger lines (or veins) of the leaf. We next meet with another bed of bladders, which is covered by the under cuticle. Though the bladde:s differ in fize and colour as well as in thicknefs in different leaves, yet the general arrangement is the fame in moft plants; but there are exceptions, as the firs, graffes, or thofe grafly leaves of early fpring, which we have in the iris, crocus, fnow-drop, \&c. for their leaves are of a different nature.

But we fhall now refer to the figures, which will ferve to illuftrate the mode of formation, \&c. of the leaf-bud.
7. S. 9. Fig. 7. 8. 9. exhibit the commencement of the formation and growth of leaves; \(a, a, a, a\), the mid rib; \(b, b, b\), the young veffels appearing like cotton; \(c, c\), the fipiral nerves; \(d\), the fmaller veffels crofing each other.
10. Fig. 10. Therrs the formation of the pabulum ; \(e, e\), the fine veffels growing up each fide of the mid rib; \(f\), the pabulum. Fig. 11. bud of the lime-tree (tilia Europea).
4. Of the Flomrars, including the caly.x, corolla, Ramina, and pifillum.-Linné long ago exprefied his opinion that each of thefe parts was formed from a particular part of the ftem; thus the calyx was formed by the bark, the corolla by the inner bark, the flamina by the wood, and the piftilla by the pith. Linné alfo reckoned the pith of a plant (which he confidered to be of equal importance with the fpinal marrow of animals), as the fole formative organ of the whole vegetable kingdom.

Linnés idea refpecting the formation of the calyx, corolla, \&c. has been often refuted; but Mrs Ibbetfon comes forward to defend the opinion of the illuftrious author with a little modification. She does not, as already noticed, confider the pith as of great importance; the therefore fays, that the corona or circle of life forms the piftil, not the pith; and thinks that each part of the flem has, when it arrives near the flower flalk, its peculiar juice.
Mrs. Ibbetfon, as a Atrong proof that the circle of life forms the piftil, fays that it is to be found in all thefe leaves that bear the flower either on the middle or on their fide ; but in no other leaves.
She firt oblerved this in the butchen's broom, where this circle leads directly up to the flower; then in foolopendrums, and aftervards in xylophyllos.

The leaves of fucl plants are more woody than any Vegetzble others, as every one may inow on breaking them. In Phytiology. fuch plants alfo, the circle of life may be traced as leading from one flower to another.

Mrs Ibbetion alfo thinks that all thofe parts which concur in forming the flower alfo join in forming the fruit and fced.

Mis Ibbetfon then adverts to the opinion of Wildenow, when he fays, "we find in the fpringing fower, elongations of air-veffels, but we never fee the elongations from each particular part, one forming the future calyx, another the corolla, and fo forth." "For inflance, in the common fun-flower (helianthus annuus), where in an immenfe large receptacle, numerous fmall flowers are placed, how thould thefe elongations be able to unford themfelves into florets from the bark, innex bark, \&c. through fuch a receptacle? There nould arife a confufion amongt thefe fmall parts which is never met with."
"How fhould, befides, the flamina be formed in herbs, which are not ligneous, or the pifili in plants which bave no pith? Every one may thus eafily conceive that all thefe opinions are mere hypothefes, which may be refuted, even without the aid of anatomical dif. fection."

Mrs Ibbetion attacks Wildenow's opinion, and fays that he adduces the fyngenefian clafs to prove the accuracy of it, the clafs which contains the very plants that would have proved the miftake of his argument, had he diffected them.

Mrs Ibbetfon then propofes the following queftions to Wildenow. Why, if the nourifhment of each part of the ftem be not confined to each different part of the flower, does the whole arrangement of the parts ather, the moment it gets to the fower-ftalk.

Why are there particular veffels to confine and carry the juice to each peculiar part, if it were not of confequence that this juice flould touch 10 other places? For what purpofe is the curious and artificial management in the bottom and top of a feed-voffel, which enables the diffector to fay, that "there are five divifions of little veffels proceeding from the wood; I know, therefore (though I do not fee it), that this mult be a pentandrian flower; here is but one middle veffel proceeding from the circle of life (for the pith ftops), it is therefore of the order motogynia; here are five divifions of little veffels proceeding from the inner bark, it nuft therefore have five petals ?" Mrs Ibbetfon withes others to be convinced of thefe facts as well as herfelf. If a cut be made above or below the feed-vefiel of a lily, a violet, or a tulif, the thinks conviction of her accuracy will follow. Why in cutting above or below the feed-vefel of a fyngenefian flower can you dire Clly tell, whether it belong to the order fuperflua, æqualis, or fegregata ? Look at the bottom of the feed-veffel of the fonchus; every pin-kole of the veffel of the male is carried up by correfponding veffels in the outward cuticle of the feed till it meets and joins the ligature of the males; and the female liquor is protruded through the infide of the feed, and is perhaps one of the Atrongeft proofs of the impreynation of the female. In the fyngenefian clafs (fee fig. I2.), the delicacy of the vefiels, which may be fuppofed too frall for a liquid to, flow through thicm, muft not impede the belief that it does, when we con-
fider

\section*{V E G \(\quad\left[\begin{array}{lllllll}536\end{array}\right] \quad\) V E G}
everetable fieler the circulation of blood in the diminutite animal - Mhyliologe that torments the body of the dlea or loufe. Mrs I'bbetion fays the has feen the liquor run up with the utmoft celerity through the upper cuticle of a very fmall feed of a plast belenging to the fyngenefian clafs, till it met the male and contimed its comile. It is to be underfood that the juice from the corolla flows in the reit of the cuticle, and that the largeft veffels are thofe for
Fig. 12. 13 rithe male liquor. See fig. 12. 13.
II. Phystology of Plants - In treating this part -af the fubiect, we propofe to confider, firt, the impregnation of leeds, and, fecond, the irritability of vegetables.
1. The impregnation of the feed.-The inventigation of what is included under this title, forms one of the molt beautiful and interelting purfuits of the vegetable phyfiologit. Mrs Ibbetfon has communicated fome cuitous obfervations on this fubject. Provided with a powerful folar niciofcope for opaque objects, ftre proceeds to an examination of the feed, and the fint thooting of the infant plant, or rather of the germ or veffel which precedes it; and the remarks that it is almof impofible to afcertain the exact time when the feed is fint formed in the pericarp; but that the has always found it in the winter buds when they were large enough for dillection.

It is curious to obferve the veffels, which, the faya, may properly be called the life, tracing their way to each flower-bud; for a feed may be faid to depend for perfection on two feparate moments: the one in which the life forfe enters the feed, when the whole outward form appears to be perfected; and the fecond, when the impregnation of the feed takes place, by the ripening sof the pollen.

But when the life enters, it leaves a lit!le ftring, and remains for a long time afterwards in a torpid ftate. This ftring crofles the corculum, or heart of the feed, fo called becaufe it is the cradle of the infant plant. She then ftates that the feed is attached to the feed-veffel by two diftinct organs, termed by the firl botanifls the umbilical cord, but as the thinks improperly, fince they do not convey nouribment to the infant plant, which is wholly the office of the fecond fet of veffels. We cannot agree with Mrs Ibbetloni in her opinion; for although the umbilical cord of an infant contains nour"ihing veffls, it alfo contains nerves, and yet we would never think of reflricting this term alone to the arterics. "The frit of the connecting organs Mrs Ibbetion conceives to be the circle of life, firl, becaule without it the plant dies, and, fecond, becaufe although every other part be eradicated by degrees and the circle of life be unirjured, the plant will grow again.

She has made thefe experiments many thoufand times and with the above refults. The circle of life confilts of delicate fimple veffels, which carry a juice of a particular nature, and may be traced in every part lying between the wood and the pith. Thefe veflels are not to he found in the leaf-bud; for they pafs by it to the female fower, where they eflablifh a new life in the
feed: a life which will enable it to grow, but not to Pregeta give life without impregnation. Thete reficls are the liay fols life, thesefore, from which all tlower buanches grow and all root-threads, procecd. In calling thefe veffels the circle of life, Mrs Ibbetlon lays the only expreffes what its office feems to denote.

Mrs Ibbetion goes on to deleribe the next (or fecond) organ by which the feed is attached to the leed-viefel. It confitts of the nourithing veffels, which the is inclined to thiak proceed from the innei bark; at leaft they may certainly be traced thence after the infant plant las left the leed. When introduced, they eniter not the feed at the fame place as the life does; they come not into the corculum, but pals it, and fipread themfelves over a fmall fpot below it, whirh is vilibly of a dufferent nature from the relk of the feed. In farmaceous plants this fpot is yellow and yieids a milk-white juice; but in other feeds it is white, and gives a gluinous water of a furetifh talle. Iirs Ibletfon thanks it probable that the nouriling veflels come from the fruit filled with this juice, which medicated with that part of the feed (which vety apparcntly diffolves), they together forth a mourihment fuited to the intant plant. When the feed is to far perfected, it remains in an alnoft torpid ltate, or growing very little; white the ficwer expands daily, and the thamens are latily advancing to their perfect ftate.

It is now that hy an almof impercepible contraction of the lower part of the piftit, the juice is raifd to the ftigina ( 1 ) on which it may be foen hanging in a lage giutinons drop, which nerer falls ont. As loon, however, as the mid-day heat abates, this juice, which is peculiar to the piitil, retiues again within the tube, the contraction ceafing with the heat that caured it. The fame procefs goes on daily, till the flamina are ripe and ready to give out their interior pouder to the piltil, which is alwys fo placed as to receive the greater part of it; and as the anther (B) requines only moiture to burf it, it foon yields that fine ard inoperceptible dull, which quickly melting and mivug with the beforemontioned liquid, forms a combination of fo powergul and fimulating a quality, that it no fomer runs down the interior of the flyle, and touches the nerve of life in the heart of the feed, than this vellel thoots forth in the moft furprifing degree, forming directly a lpecies of circuiar hook within the soid; which in lefs than two days is of ten completely filld, though it had perhaps for many weeks before lain in an abfolute tornor. This circular nerve is foon covered by an excrefeence that hides it; but if the corculum be divided with a fine lancet, the circular thook is difcorerable, until the young plant is near leaving its cradle or feed. At the turn of the hook the cotyledons grow, and the root ftoots from the covered end. The plant may be now faid to lie in the feed in a contrary direction from that in which it will at a future time grow, fince the root is above, and the ftem below: but nature has provided for their change of place, fince it is effected as they leave the feed. It has been alrealy noticed that the nourifhment of the infant
plant
(A) In the journal it is faid "to the pointal;" but certainly figma is meant, for pintil and pointal are fysonymous.
(3) In the journal it is called pollen, but anther muf be meant.

\section*{V E G}
sretable plant is medicated between the juice brought in the nourilhing veffels, and the peculiar fpot in the feed, forming a liquid which continues to abound; indeed the infant plant may be faid to rep?fe in it, till the root has opened the whole or part of the feed. The root then changes its direction, and runs into the earth, foon forming a number of fringy hairs, which \({ }^{\text {ferve }}\) as fo many fuckers to draw the liquid nourifhment from the earth, while the plant quiekly thews, by the rapid progrefs it makes, the advantage it receives from its change of diet ; for it foon railes itfelf from its profrate pofture, emerges from the feed, and is now feen in its proper direction. The above aceount, we think Mrs Ibbelfon jufly remarks, affords a complete confirmation of the fexual fyitem.

In the fyngenefian orders, the piftil being mortly fingle, runs up from the feed; and the juice of the piftii has no other way of reaching the pointal (ftigma muft be here meant), but by paffing through the feed, which it does without producing any effect, or filling up the vacancy at the top of the corculum. But as foon as the iuice of the pifil becomes mixed with the pollen, which diffolves in it, the void of the eorculum is filled, the hook is foon afterwards formed, and the plant is roufed to life. Mrs Ibbetfon relates fome experiments which the made to afeertain whether the urmbilical cord was, or was not, the life of the plant. She placed a bean in the earth, and when the infant plant was ready to leave the feed fhe opened it with a fine lancet, and cut off the cotyledons, juft where they join the heart and the circular hook which have been before defcribed. She then tied a piece of very fine thread round the bean, and replaced it in the earth. The cotyledons grew again, though higher up, but they appeared very weak and fickly for fome time. She cut off the root of another bean which had been placed in the earth, and which was of the fame age as the above, and found that the root grew again in a few days and appeared quite healthy.

In a third experiment the feparated and cut off the nourihing veffels from each fide of the bean; but a great number of hairs grew from the wounded part, which, by attaining moifture from the earth for nourihment, fupplied the place of the vefiels cut off; fo that it was not afcertained whether or not the bean would live independent of thefe veffels, which was the object of the experiment. We obferve here, however, a grand provifion of nature for the embryo plant: hairs being formed to fupply it with moifure when the nourihing veffels are deftroyed. Mrs Ibbetfon next took a bean which had been about four days in the earth, and opening it with great care took out with a fine lancet the part which fhe efteems the cord of life, that is the part which croffes the corculum and fhot forth on the firit ig. 14.15 . impregnation of the plant. on, fig. I4. and I 5 . reprefent the nourihing veffels of a bean; L to \(n\) two feminal leaves or cotyledons; // the cord of life, which is more eafily feen in the feed of the lily, fig. I \(5 . / /\) crofing the empty part of the corculum. Mrs Íbbetfon took a flower of the lilium genus, as having, a large veffel eafily attained; and being careful not to feparate it from the nouribing veffele, the Bivided the line of life fig. 16. //, cutting each thread betrieen the feeds, and

Vol.. XX. Patt II.
fo cutting off their communication ; but did not touch verezabie 00 , which the thinks is the nourifhing veffel.

The confequence was, that the fecds of this flower were never impregnated. Mrs Ibbetion next tried the effect of taking the nerve of life from the chefnut, the walnut, acorn, \&c. ; firt opening a feed without touching the nerve, that the might be certain that the opening was not the caufe of its death. Fig. I7. rerrefents the Fig. 17 heart taken out of a feed of the chefinut; \(/\) is the circular hook already deferibed; oo the nourifhing veffels, and / / the line of life, which was taken out from fome feeds where it eroffes the heart at m. Fig. 18. is the Fig. 18. feed of the goofeberry; o the nourifing veffels, \(e\) the line of life, and \(m\) the corculum or heart.

She found that all thofe feeds from which the took the nerve of life died; and that the others, which had been merely laid open, lived. She remarks that it is only at the beginning of life, that the plant can be killed by this procefs; for when older, if the nerves of life decay, they floot out above the declining part, and run into any part of the ftem that is pure, to preferve themfelves. Mrs Ibbetfon then flates that this nerve is the fource of life in very decayed trees; and is alfo the caufe of a double pith, or at leaf the appearance of it, in many trees.

To oblerve this line of life, feeds mult be examined in their firft formation; for when it has done its office, it detaches itfelf. When the feed is boiled, the line of life and nourining veffels mark themfelves by becoming of a dark colour.
2. Irritability of acgetalles.-In entering upon this fubject, we ought to warn our readers, that very oppofite opinions have been entertained refpecting it; fome phyfiologitts of the greatef eminence allowing that we have fatisfactory proofs of the irritability of vegetables in a variety of plants, but more particularly in the motions of the mimore, dionea, \&c. ; while others of no lefs refpectability afcribe thefe motions to the influence of light, heat, or fome other mechanical agent.

As neither mufcles nor nerves have ever been demonflrated in the vegetable ftructure, of courfe the proofs of the irritability of vegetables are drawn from the intimate analogy which feems to exilt between the motions of fome plants and thofe of animals. Some phyfiologits, from obferving the fimilarity of motions in the two kingdoms, were naturally led to afribe them to the fame caufe; others, from not being able to obferve the fame motive organs, namely, mufcles, in both kingdoms, denied that plants could poffes irritability; a third fet, waving the idea of irritability in the vegetable kingdom, have laboured to fhew that the motions of plants depend on mechanieal caufes alone.

We faall firft notice the obfervations of Mrs Ibbetfon, who afcribes the motions of plants to the firal wires which we have defcribed. Her opinion is founded upon a number of new oblervations made with the folar microfeope, which we thall proceed to relate.

Ift, The firial veffels are not to be found in any plants to which motion is unnece? Tary.

She could not obferve thefe veffels in any of the firs, in any of the plants which-fpread their leaves upon the furface of the water, in any of the fea weeds (c), of the lichens, or of the graffes; and the does not think

3 Y
that
(c) She afterwards excepts the conforva, which have motion.

\section*{\(V\) E G [ \(\left.5 \hat{j}^{8}\right] \quad\) V E G}

Vegetable that they exif in the fcolopendrums or lemnns. We Pisyfiology. would here obferve that if thele obfervations were completely true, they would certainly afford a thong proof in confrmation of her opinion ; but we fufpect that hiey are not altogether jult, elpecially as we obferve a diferepancy in the papers of Mrs Ibbetfon. 'Thus at one part the thas given us a very minute defcription of the fipiral veffels in the runness of the poa reptans, and now the fays they are not to be found in the grafies (0).

Mrs Ibbetfon's fecond argument is, that if a plant whofe leaves prefent their faces to the light, be tumed fo that the backs arc to the fun, the leaves in a few hours will regain their former pofition; but if this be often repeated, although the plant will not fuffer, yet the leaves will be longer at every repetition in returning to their former fituation, or will ceafe to move at all. She accounts for this by laying, that the fpiral-like elatic veffels are relaxed by the operation, and lofe their power of coiling into their ufual form.

Others would account for the above fact by faying that the initability of the plant was exhaulted by thele repeated and unnatural actions; in the fame manner as the mimola becomes gradually lefo deufible to impreflions when too often renewed.

Mirs Ibbetfon's third argument is, that thofe leaves which have molt motion, are provided with molt fpiral veffels, and bave theie veffels mott iwilled; as in the populus tremula.

Fourth proof. Mrs Ibbetfon divided the firal verfels of a vine leaf while growing, without louching the nourilhing veffels; and from that moment it never contracted, and when placed with its back to the light, it did not alter its pofition, though it was long before it decayed. Hoih electricity and galvanifm caufe thele leaves to contract, by affectins, the firal wires (not the cuticle), for when the leat is deprived of thefe velfels it does not contract at all.

We would here remark that we fuppect much, in the above experiment, that more than the fpiral veffels was divided : at any rate there is very great difcordance between Mrs Ibbetfon's experiments and that of M. Calandrini, who found that vine leaves turned to the light when they were feparated from the fem and fufpended by a thread.
Fifih argument. Mrs Ibbetfon obferved, when the placed fome of the fpiral veffels taken from a cabbage leaf upon one end of a long netting needle, and cauled a candle to approach, that they were much agitated, and at laff flung themfelves off the needle. We think no conclufion can be drawn from what is here fated.
The frelh water conferva and the dodder tribe, are the only plants, without leaves, that Mrs Ibbetfon is acquainted with, which have fpiral weffels.
Mrs lubetfon fays that the firial veffels are fo very tough, and fo very tightly coiled, in the leaf ferm (petiole) of the geranium cordifolium, that the has by means of them been cnabled to draw up the leaf; but it is difficult to be done.

The fixth proof is drawn from the effeet produced by mointure on Captain Kater's hygrometer, which will be noticed foon.

General Obforeations.-Mrs Ibbetion fays the fuiral Vereitat wires naay be confidered as a fecondary caufe of motion, Phy fiolog as they are primarily aceed upon by light and moillure? By means of the firal wire, all the movements of plants are made ; by it, flowers open in the merning and fhut in the evening ; the leaves turn, and the creeping plants wind in their regular order. Mrs Ibbetfon fays the opening of the flower at a different time of the day, or its turning in a different manner, does not mijitate a. gaintt the above ftatement; as ftrong light and dry weather produce a contraction of the wire, while darknefs and moillure efiect a dilatation of it. It depends wholly upon the pofition in which the fpiral-wire is placed, whether by its dilatation the fluwers thall be opened or fhut, as in mechanics the fame fpring may be made to turn to the right or to the left, to open or to fhut a box. Moft of the flowers which Mas Ibbetfon has oblerved to clole at noon, have in extremely limber coroila, formed only of a double cuticle without pabulum ; and hence they are foon overcome by heal, and relaxation directly takes place; as in the convorvulus nil, the evening or tree primrofe, \&c.

We mula add, however, that we regard this account of the fipiral veficls with fome degree of doubt. We fufpeet that the firiral vellels, if they have the power of opening or fluting a flower, will always act in one uniturm manner ; i. e. if they are able to open it, they will always do \(\mathrm{f}_{\mathrm{r}}\), al.d vice verfa.
The mymphea alba ralles itfelf out of the watcr, and expands, about feven o'clock in the morwing; and clotes again, repofing upon the furface, abotit four in the evering. Nuw its petals are much thicker than thofe of the leontodon taraxacum, which fluts up its flowers between eight and nine in the evening.
We could multiply inflances; bnt we conceive we have faid enough to fhew, that the flowers with the moft flender corolla are not uniformily thole which foonent clofe.

Mirs Ibbetfon fays, contrary to the opinion of Mirbel, that the cafe in which the fairal veffels are inclofed is capable of being flretched; indeed it is furmed of fo thin (or rather fo loofe) a fubftance, as plainly to be intended to dilate and contract. The cale is compofed of a very few thin veffels, interlaced with an extremely finie fpiral wive; while the larger fpial vefiels fill up thie cafe in an irregular manner, the nourifhing veffeis form a regular circle of tubes around it. See fig. 29. and 30 .
Of the Indian grafs (andropogon contertam of Linné), of which Captain Kater's hygrometer is form-ed.- The clief part of it is made with the firal awn of an Indian grals, which readily untwifts in a moift atmofphete, and vice verfa. Now Mis Ibbetfon alks, if the moft tifing change of moiflure can untwill one fort of vegetable fibre, and by this means manage an inftrument, why thould not a quantity of fimilar formed fibres or โpiral veffels produce the fame effect on leaves and flowers? She fays, Captain Kater's hygrometer moves very fenfihly if a finger be placed within half an inch of the fibre (awn). Now, the moff fenfitive plant we have will not move but with the touch."
We are quite aware of the effects of moiffure on fome vegctabics:
(D) She found the fpiral veficts alfo in the andropogon contortums.

\section*{V E G}
rgenite vecretabies. We have ffrong proofs of it in fome of the yhiofigu, mofies," as in the bryum hysrometricum, which, if the \(=-\) Yruitfalk be moitened at the bottom, makes three or four revolutions; if the upper part be moiltened it turns the coitrary way.

We cani fcarcely compare thefe motions with thofe of the mimofe; for it is quite evident that they are produced by moilture : but as we are to fipeak of the motions of the mimole in a little, we would only oblerve, that when Mrs lbbetion lays " the fenfitive plant will not move but with the touch," the argues ayainft herfelf; for this thews that it is acted upon by the fame caufes as animal mufcles, and that it is not governed by moifture alone.

The only fenfitive part of the Indian grafs is the awn, which is formed of a leather-like fubilance, infinitely thicker and flronger than the ufual fipiral veffels in plants. The awn is formed of two apparently flat pieces, with a cylindric hollow ruming through the middle, which is filled with a thick fpiral wire. Fig. 21.22.23. and 24. Fach fide of the awn is brifted; but the brifles do not add to its fenfbility.

Of the Nettle. - The avn or fing of the nettle is a long pipe with a bag at the end, divided into two parts; the fmaller contains the poifon, and the larger is fituated below it. This bag feems alfo to be compofed of a leather-like fubfance, and is likemife affected by light and moillure.

The moment the upper part of the pipe is touched, the under part of the bag whirls up, breaks the poifon bladder, and throws its contents violently up the pipe, burning the perfon who touches it.

Light thrown upon the bag by means of the folar microfcope, produces the fame effed as touching it. The poifonous liquor is protruded up the pipe with great force, till it iflues out at the minute aperture at the point ; but before it does fo, the pipe is bent down with a jerk, by means of the firal wire.

The firal wire winds round the bag at the bottom of the pipe; and it is by the action of this wire that the bag is made to contract. The nettle lays down its ftings every evening, juft as the fenfitive plant does its branches. See fig. 19, and 20.

Mimofa Serffitiva.- The motions of this plant are regulated not only by the firal wire, but alfo by a bag of a leather-like fubftance, which is capable of contraction and dilatation.

We thall next give Mrs lbbetfon's plate refpeAting the flructure of this plant, with her defcription.

Fig. 25 . is a reprefentation of the fprings which govern eath leaf; \(d, d\) is the falk. Each leaf has a bafe \(c, c\), which ferves to concentrate the fipiral wires. Thefe paffing over in every direction, being drawn through the narroweft parts of the ftem \(b b \hat{b} b\), prefs the ftem together; and, when touched, lay the leaves, one on the other, the whole way down the leaf-italk. But, before the fimulus is applied, the fem is flattened in a contrary direction. The ball of the leaf is hollow, and filled with oil. The parts ee and pp (fig. 26.) are made of that leathery fubflance, which forms the cuticle, and is contracted by the light in the folar microfope. The parts ee contain the oil which ferves to lubricate the knots (we fuppofe), and enable them to flip over each other; befide, probably,
acting fume important part in the formation of the va- veretartie rions galles and juices in the compofition of the plant. Hisysuones,

When tonched, the whole fring relaxes at \(a 0\), and lets the branch fall. This it would al.o do at \(m\), if it were not fupported by the wood-veffels turning into the Jeaf. Fig. 27. is the part eepp uncut, and in its nstural fate. Mrs lbbetion thinks that not only the motions of this plant, but of all others, depend upon the firal wires which contract and dilate by the action of light and moifture. She adds, that there are no fpiral wires in the feminal leaves of the mimofa fenfuiva, and that the fominal leaves have no motion whatever.

In farther illuftration of this fubject, we fhall next prefent our readers with fome obfervations by Mr L.yall, lately publifted irt Nicholfon's Journal *, refpeéling * Vol. arr. the irritability of the mimofa pudica, and fome other 92. plants.
"It is well known (he oblerves), if we take a leaf of this plant, fimilar to what is reprefented (fig. 31.), and then, by means of a pair of iciflars (completely dry), cut off haif the pinnula \(A\), this pinnula will contract at its joint, eithcr immediately, or in a few feconds; its neighbour, or oppofite pinnula, 13 , clofing at the fame time, or foon after.
"The pinnule \(A\) and \(B\) having come into contaĉt, there is a paufe, or a mort ceflation, of motion; but in the courfe of a few more feconds, the next pair of pinnula, CC, will alfo thut up, and the fame will happen with every pair of pinnule of that pinna fucceffively; only with this difference, that the intervals between the flutting up of each pair of pinnula will to Mhorter, the farther it is from the pinnula that was cut. \(\Delta\) fter the whole of the pinnulx of this pinna have completely clofed, and a little interval, then the joint \(D\) will bend fo as to allow the pinna to drop confiderably.
"Neverthelefs, the motion is often not fo obvious in this joint, as in that to be mentioned.
"A longer paufe will now intervene, in fome cafes fo long as to make us fuppofe that all motion is^at an end; but at length the joint E fuddenly bends, and altonithes the beholder.
"The petiole F now, inftead of forming an acute angle with the ftem above the jount, forms a very obtufe angle with it.
"We fhall now have another ceffation of motion, and then the joint, H , will llightly bend; then another paufe, then a frutting up of the pair of pinnulx, It, and fo on with the other pinnule, till the whole pinna is clofed. The motions, however, will not be fo regular in this pinna as they were in the other; for as the pinnule II approach, they prefs fot ward the next pair, and fo on with all the reft."

Thefe motions, the author fuppofes, are not occafioned by impulfe; for a bit of the pinnula may be cut off almof without producing any motion.:

But, allowing that a little motion were produced, it comes naturally as a queftion, Why does the motion become fo extenfive? how is the impulfe communicated to the origin of the petiole? The author does not think that thefe queftions will ever be fatisfactorily anfwered upon mechanical principles.

He admits indeed, that a ftructure exifts in the mi mofa fenfitiva, correfponding to what Mrs Cobetion has

\section*{\(V\) E G [ 5}

Vegcable defcribed; alchough he feems to have fome doubts reFhyfiology. fpecting it. He then proceeds to inquire, whether by \(\xrightarrow{-2}\) fuch a ftructure, acted upon by heat, light, or moif. ture, we could polibly explain the motions of the mimo/a pudica. "On the experiments above related, (he obferves), I prefume no one would fay, that moifture was the caufe of motion, as the fciflars were quite dry."

It is to be remembered alfo, that this plant will perform its motions u:lder water.

As there was no change of light, confequently this had no thare in the effect. Befides, when moifture is produced (Mr Lyall certainly means darknefs) in confequence of the abfraction of light, all the pinnulæ fhut up at the fame time; not, however, in the regular order mentioned in the experiment. Neither does the motion take place from change of temperature, for the temperature was not altered.

A great many queftions will here fuggef themSelves, as, How does it happen that the ruotion is produced? how does it become fo extenfive? how comes it that there are regular motions and paufes, \&e. ?

The author concludes, by faying, that it is vain to attempt any mechanical folution of the phenomenon mentioned above, " which would feem to depend on an exquifite irritability in the plant itfelf."

Dionzen Mufcipula.-Mr Lyall does not think that the motions of this plant are to be explained in the manner fooken of by Brouffonet, who alcribed them to an evacuation of a fluid from the leaf, which will be noticed when we fpeak of the droferce. For the leaf may be touched without caufing any efflux of fluid whatever, and yet it will contraet completely.
Comparetti's explanation relpecting the motion of this plant is lot admitted; becaufe it feems improbable, is contrary to analogy, and inadequate to explain the phenomenon.

Of the Drofera Longifolia and Rotunaifolia.-As many of the mufcles of the animal fyftem, as the heart, diaphragm, \&c. a quite independent of the will, and as thefe parts are lighly irritable, Mr Lyall wihhes to fhow, that a voluntary command of a mulcular force fhould not be taken into the definition of the word iritability, as has been done by fome. Mr Lyall fays, "By irritability, I underfand, that properly inherent in fome bodies (or rather parts of bodies), by which, when a flimulus is applied, they are enabled to contract.

The leaves of the drofera rotundifolia, when properly unfolded, lie round the fiem in a Aellated manner. The footfalks of the leaves vary in length from half an inch to an inclı and a half. The leaves are covered on their upper fusface by a number of hairs, varying alfo in length from one line to three-eighths of an inch, and are each'terminated by a little gland, which gland is covered by a tranfparent vifcid fluid, prefenting a fine appearance.

The chief difference between the drofera longifolia and rotundifolia is in the flape of the learcs; thofe of the former being obovate, while thofe of the latter are of an orbicular thape.

Mr Lyall mentions the obfervations of Mr Whately, who, it would appear, was the firft in this kingdom who deferibed the contractions of the droferice when irritated.

Mr Whately and Mr Gardom had obferved fome in- Vegerab feets imprifoned in the leaves of this plant, and hence Phytiolog' were led to prefs with a pin the centre of other leaves in their natural and expanded form, when they very fuddenly contracted, and, as it were, encircled the pin.

Roth had noticed, in 1779, that the leaves of the droferze moved, when irritated. He placed an ant upon the middle of a leaf of the drofera rotundifolia, but fo as not to difturb the plant. The ant endeavoured to efcape, but was held faft by the clammy juice at the points of the hairs, which was drawn out by its feet into fine threads; in fome minutes the fhort hairs on the difk of the leaf began to bend, then the long hairs, and laid themeclves upon the infect. After a while the leaf itfelf began to bend, and in fome hours the end of the leaf was fo bent inwards as to touch the bafe. The fame happened when the experiments wete made on the drofera longifolia, but more rapidly.

Roih alfo found that the hairs bent themfelves when he touched them with the point of a needle, with a hog's brifte, or when he placed a very fmall piece of wood the weight of an ant upon the leaves.

Mr Lyall next gives us an account of his own experiments. He fays, "that for five months, he almoft, cvery day, had the fecies of droferæ under his eye, either at home or in the country; and he confeffes, that he never faw fuch a rapid contraction of the leaves of the drofera rotundifolia, as had been noticed by Meffrs Whately and Gardom : but in all his experiments the contraction was gradual, though it feldom failed to happen, if the plant was in good condition. In moft of his experiments an hour was neceflary for the complete bending of all the hairs; and it required fome hours for the perfect hatting up of the leaves. Hence it is evident, that whoever has a wifh to notice the motions of the droferæ, mulf not fet out with the expectation of feeing a rapid motion, fimilar to what happens in the mimofr, follow the application of a timulus; but, to obferve the ultimate effects, muft watch with an attentive eye, for at leaft 20 minutes.

In accounting for the manner in which thefe motions are performed, various opinions have been held. Brouffonet fufpects that the difengagement of fome fluids influences them. He fays, that the infect, by abforbing the fluid which is on the points of the hairs, empties the veffels of the leaf, which folds upon itfelf; and the quicknefs of the action is proportional to the number of hairs touched by the infect.

Our author obfervcs, that "this theory, at firft fight, does not appear even to be plaufible; for, how is it poffible that an inf ot can abforb a thick tenacious fluid? Nò doubt, however, part of this fluid will be attached to the part of the infect which touches it ; but this feems quite uncomected with the contraction of the leaf. Oa the 3oth of July, Mr Lyall brought from the country a number of plants of the drofera rotundifolia, and, on infpecting them, he found many of the hairs of the leaves deprived of their vifcid fluid; but yet both they and the leaf remained quite expanded and in good condition. Next day, about four o'clock, he placed a fmall bit of fulplate of copper, in the difk of one of thefe expanded leaves, and by fix o'clock moft of the hairs on one fide of the leaf, even the outermolt, had bent themfelves over the bit of copper; this feems

\section*{V E G [ 54 I\(] \quad\) V E G}
atuille to prove the inaccuracy of Brouffonet's theory. In ulugy. other experiments, he placed fmall bits of bread or wood, on three or four of the central hairs, without touching the other hairs, or the vifeid fluid on their ends; and in a few hours he found that all the hairs had contracted around the foreign body. In fome plants, the fulphate of copper was placed upon fome of the fimall hairs in the difk of the leaf, without touch. ing the leaf itfelf; yet the bending of the hairs and leaf was complete.
"We have here proof (he adds), Ift, That the leaves do not contract when deprived of their vifcid fluid, which ought to have been the cafe if Brouffonet's theory had been true. 2dly, That the contraction takes place even when the vifcid fluid does not cover the little glands. \(3^{\text {dly }}\), That the contraclion follows, although the foreign body is not brought into contact with all the hairs.

The opinion of Sennebier, who appears to have alcribed the motions of the drofere to the effect of preffure is next examined. "Sennebier feems (it is obferved) fenfible, that the contractions of the leavcs take place even when light bodies are placed on them, which circumftance of itfelf would lead us to fufpect, that preffure is not alone the caufe.
"I know (it is added), that, if we prefs on the centre of a leaf with a pin, \&e. we may caufe its margin to approximate the pin; and this certainly would be owing to a mechanical caufe. But, fuppofe we fee the contraction take place, as I have done, when a body fecifically lighter than the leaf itfelf is placed in the centre, as a bit of rotten wood; fhould we be ftill inclined to afcribe it to a mechanical caufe? Admit that it is the cafe. Suppofe, then, we place the fame bit of wood on the margin of the leaf, what effect ought to follow ? If it were owing to a mechanical caufe, or the weight of the foreign body, as in the laft-mentioned cafe, then we fhould expect, that the part of the margin of the leaf, on which the bit of wood refled, would be depreffed; which undoubtedly is not the cafe : but, on the contrary, the margin rifes, and then contracts towards the foreign body, or towards the footfalk of the leaf.
"That this motion does not depend on preffure", may be fill better illuftrated, by placing a fly, or fome other body, on the apex of a leat of the drofera longifolia. The hairs near the foreign body will contract around it, and then the apex of the leaf will rife upwards, and turn inwards, until it touches the bafe. Or, if the offending body is fmall, the leaf will become convoluted around it.",

From the refult of his experiments, the author thinks, that the motions of the leaves of the drofere cannot be explained on mechanical principles. He conceives, that thefe motions are performed, if not by mufcles, at leaft by fomething which is equivalent to mufces in the animal body.

It appears that the leaves of the drofera rotundifolia and longifolia remain completely expanded during the hottef funfline and drieft weather ; during the coldeft and wetteft weather; during the greatef darknefs, and, finally, during the brightef light of day. This, however, is to be taken in a limited fenfe; i. e.only during the expanfion of the leaves, not during the cold of winter. "Here, then, neither heat," cold,' drynefs, dampnefs, darkucfs, nor light in general, at tall effect the leaves;
but, if a foreign body be applied to the leaf fo as to ni- Vegeezable mulate, then it will thut up" in the manner we have phyfiology. already defcribed.

\section*{EXPLANATION of PLATES DXLI. DXLII. ano DXLIII.}
[Note, that fome errors in the references to figures in the text may be corrected by this explanation, which is accurate.]

VEGETATIVE soul, among philofophers, denotes that principle in plants, by virtue of which they vegetate, or receive nouritsment and grow.

VEHICLE, in general, denotes any thing that carries or bears another along; but is more particularly ufed in pharmacy for any liquid ferving to dilute fome medicine, in order that it may be adminiflered more comrnodioufly to the patient.

VELI, in Antient Geography, a city of Etruria, the long and powertul rival of Rome; diltant about 100 ftadia, or 12 miles, to the nortin-well; fituated on a high and fleep rock. Taken after a fiege of 10 years by Camillus, fix years before the taking of Rome by the Gauls: and thither the Romans, afler the burning of their city, had thoughts of removing; but were difiuaded from it by Camillos (Livy). It remained flanding after the Punic war; and a colony was there fettled, and its territory affigned to the foldiers. But after that it declined fo gradually, as not to leave a fingle trace ftanding. Famous for the flaughter of the 300 Fabii on the Cremera (Ovid). The fot on which it itood lies near Ifola, in St Peter's patrimony (Holftenius).

VEIL, a piece of ftuff, ferving to cover or hide any thing.

In the Romifa churches, in time of Lent, they have veils or curtains over the altar, crucifx, images of faints, \& \(c\).

A veil of crape is woon on the head by nuns, as a badge of their profeffion: the novices wear white veils, but thofe whe have made the vows black ones. See the article Nun.

VEIN, in Anatomy, is a vef.el which carries the blood from the feveral parts of the body to the heart. See Anatomy, No \(12 \hat{3}\).

Vfin, among minets, is a fifure in the horizontal Arata which contains ore, fpar, cauk, clay, chert, croil, brownhen, pitcher-chert, cur, which the philofophers call the motber of metals, and fometimes foil of all tolours. When it bears ore, it is called a quick vein; when no ore, a dead ewin.
VEJA, a remarkatle cape on the coalt of Terra Firma, in South America. W. Long. 7t.25. N. Lat. 12. 30.

Vri.ARIUS, in antiquity, an officer in the court of the Roman emperors, being a kind of ufher, whofe port was behind the curtain in the prince's apartment, as that of the chancellor's was at the entry of the ballufirade; and that of the oftiani at the dacr. The velarii had a fuperior of the fame denomisation, who coumanded them.

VEI.FZ-di-Gomara, a tomn of Africa, in the kingdom of \(\mathrm{F}=\mathrm{z}\). and in the province of Eriff. It is the ancient Acarth. With a harbour and a handfome caftle, where the governor refides. It is feated betwecn two high mountains, on the coaft of the Mediterranean fea. W. Long. 4. O. N. Lat. 35. 10.

VELITES, in the lioman army, a kind of ancient foldiery, who were amed lightly with a javelis, a cafk, cuirass, and thield.
velleius Paterculus. Sec.Paterculus.
VELLLIM, is a kiad of parchmen!, that is finer, evener, and more white than the common parchment. The word is fomed from the Fiench valin, of the Latin vitulinus, " belonging to a calf.",

VELOCI'I Y, in Mcchanics, fwiftnefs; that affection of motion whereby a movcable is difpofed to rum over a certain fipace in a certain time. It is alfo called celerily, and is always proportional to the fpace moved. See Quantiry, \(\mathrm{N}^{0} 11\) and \(14, \& \mathrm{Ec}\).

VLI,VLE1', a rich kind of twaf, all filk, covered on the outfide with a clofe, hort, fine, foft fhay, the otherfide being a very ttrong clofe iffice.

Tlie nap or thag, called alfo the vetucting, of this fluff, is formed of part of the threads of the walp, which the wookman puts on a long narrow-channelled ruler or ncedle, which he afterwards cuts, by drawing a tharp fleel tool along the channci of the needle to the ends of the warp. The principal and beft manufactories of velvet are in France and Italy, particularly in Venice, Milan, Florence, Genoa, and Lucca : there are others in Holland, fet up by the Franch refugees; whereof that at Haerlem is the moft confiderable : but they all come flort of the beauty of thofe in France, and accordingly are fold for 10 or 15 per cent. lefs. There are even fone brought from China; but they are the wort of all.

VENAL, or Venous, in Anatomy, fomething that bears a relation to the veins. This word is alio ufed for fomething bought with money, or procured by bribes.

Veneering, Vaneering, or Fineering, a kind of marquetry, or inlaying, whereby feveral thin flices or leaves of fine wood, of different kinds, are applied and faftened on a ground of fome common wood.

There are two kinds of inlaying: the one, which is the more ordinary, goes no farther than the making of compartiments of different woods; the other requires much more art, and reprefents flowers, birds, and the like figures. The firf kind is what we properly call veneering; the latter we have already defcribed under Marouetri.

The wood intended for veneering is firf fawed out into fices or leaves, about a line thick: in order to faw them, the blocks or planks are placed upright in a kind of vice or fawing prefs: the defcription of which may be fecn under the article juft referred to. Thefe flices are afterwards cut into flips, and fathioned divers ways, according to the defign propofed; then the joints being carefully adjulted, and the pieces brought down to their proper thicknefs, with feveral planes for the purpofe, they are glued down on a ground or block of dry wrod, with good Itrong Englifh glue. The pieces thus joined and glued, the work, if finall, is put in a prefs ; if large; it is laid on the bench, covered with a board, and preffed down with poles, or pieces of wood, one end, whereof reaches to the ceiling of the room, and the other bears on the hoards. When the glue is quite dry they take it out of the prefs and finifia it; firf with little planes, then with divers fcrapers, fome whereof refemble ralps; which take off dents, \&sc. left by the planes. When fufficiently fcraped, the work is polifhed with the Rein of which

VE:NERY, is commonly uled for the att of copulation, or coition, between the two fexes; it has alto been employed by old writers as applicable to hunting or the chace, as beafls of vencry.

VENLSEC IIUN, of Pilebotoay, in Surgery. See Surgitry Index.

VENE IIAN Bore, a fine red earth ufed in painting, and called in the colour thops Fenction red.-It is dug up in Carintizia, and fent from Venice to all parts of the world; but the ufe of it is much tuperfeded by a bright colcothar of vitriol.

VENICE, STATE OF, a celeorated republic, which for nearly ten centuries formed one of the mof powerful of the maritime Itates of Lurope. Its dominions lay chietiy along the coatls at the head of the Adriatic fea, comprehending not only a coafiderable tract ruand the city of Venice, but feveral diltrict both to the eatl and welt of that fea, together with the illands of Corfu, Zante, Ceplalonia, Cerigo, and fome others of le!s note in the Archipelago. It was bounded to the north by the Alps, to the welt by the duchy of Milan, and to the eaft by Croatia, a province of lurkey in Errope.

The republic of Venice is faid to have taken its rife from a fmall Italian colony, who in the middle of the sth century were driven by Attila king of the Huns from the cities of Aquileia, Verona, Mantua, \&zc. and took refuge in the group of fmall inlands where now flands the city of Venice. Here they eftablifhed themfelves, and formed a fmall independent ftate, adopting the confular form of government which had folong prevailed at Rome. By the end of the 5 th century they had become of confequence, and were able to raife and maintain a fleet and a fmall army. They engaged in a war with the Lombards, and ditinguifhed themfelves againt the Ifrian pirates, and the inhabitants of the neighbouring port of Triefte. They alfo aflifted Juftinian in his conteft with the Goths, and received from him and his general Narfes, many marks of favour and diftinstion.

About the year 697 , the tribunitian power, which had prevailed in Venice from the end of the 5 th century, was abolifhed, and the flates eleeted a fupreme magiftrate, whom they called doge, or duke. He was to reprefent the honour and majefty of the flate; to affemble and prefide at the great council, where he had a cafting vote in all difputed points; to nominate to all offices, places, and preferments, and to enjoy the fame authority in the church as in the fate. Excepting a thort intermifion of about five years, the power of the doges continued till the fall of the republic.

Under the doges, the power and wealth of the republic continued to increafe. In 765 , the Heraclians and Geculans, fubjects of the republic, revolted, and threw themflves on the protection of the emperor Charlemagne. That emperor fettled them for the prefent at Malamoe, in the neighbourhood of the Venetian capital; but from this afylum they were quickly driven by the forces of the republic. Incenfed at this affiont committed againh his authority, Charlemagne ardered his fon Pepin to declase ivar againt the Veuetians; but as

Aftolphus king of the Lombards was then laying wafte Versice. the territories of the church, the troops of Depin were, by the increaties of the pope, difpatched againt that powerfut monarch; and though, on the defe.t of Attolphus they marched againlt the Venetians, it does not appear that the cuterpuife was productive of cilleer honour or fuccels. The war with J'epin was renewed in S34, on occation of Ubelerio, the doge of Venice, thewng an inclination to favour the Greek emperor Nicephorus againf Pepin. Oueleno was related to the Fremeh monarch, having married his fifter; and as on this account the Venctians were jealous of the attachment of their doge, he was luperfeded, and Valentin nominated commander in his place. Pepin had collected a numerous and well appoinied army, and had fitted out a fleet to act againtt the Venetians by fea. With this iormidable force he advanced directly to Venice, but here he was oppofed with all the valour of independent citizens fighting for their liberties.

The Venetians, however, notwithilanding the moft obbinate defence, the moll vigorous fallies, and therr intreprdity felling every inch of ground at an incredible expence of of the \(V\) veblood, were at length reduced to that part of the city netians. fruth of the hialto (fee the nest article); this ftream and An. 80.4. their own bravery, veing now their only defence. While Pepin was prepating to throw a bridge over the canal, they refolved, as a lat effurt, to attack Pepin's feet, and to vanquifh or die in defence of their liberty. Embarking all the truops they could fpare, they bore down with the advantage of the wind atid tide, upon the enemy, and began the attack with fuch fury, as obliged the French admiral to give way. The lightnefs of their Mips, and the knowledge of the foundings, gave the Venetians every advantage they could with: the enemy's fleet was run aground, and the greater patt of their troops perifhed iu attempting to efcape; the Ships were all to a few either taken or deftroyed. During this action at fea, Pepin refolved to affault the city by land, not doubting but the garrifon was fo ircakened by the number of forces they had fent on board the Heet, as to be able to make but a flight refiftance. Having for this purpofe thrown a bridge over the Rialto, he was marching his troops acrofs it, when he found himfelf attacked on every fide by the Venetians from their boats, and others who had pofted themelves on the bridge. The battle was long, bloody, and doubiful, until the Venetians employed all their power to break down the bridge; which at lat yielding to their obitinate endeavours, a prodigious flanghter of the French enfued; they fought, however, like men in defpair, feeing no hopes of fafety but in victory; but all communication being cut off with the troops on thore, they were to a man either killed or drowned. The number of dain was fo great, that the fpace between the Rialto and Malamoe was covered with dead bodies, and has ever fince gone by a name expreflive of the prodigious flaughter. Pepin was fo ftruck with the intrepidity of the Venetians, that he raifed the fiege, abandoned the enterprife, and concluded a peace with the republic.

In 839, the Venetians engaged in an offenfive and 6 defenfive alliance againd the Saracens, with the Greek Ventian emperor Michael, to whofe affiftance they fent a fleet of tiect de65 galleys. In an engagement which took place be- the Sativ tween the allied fleets and that of the Saracens, the for- cers.
mer weie completely defeated, and almot all the Venetian galleys were either taken or dettroyed. On the news of this defat, the capital was thrown into the greatelt confternation, juflly dreading an attack from the victorious Saracens. This alarm, however, foon fublided, on finding that the barbarians had turned oft on the fide of Ancona. The city now became a prey to intermal diffenfion. Popular tumults were frequent, and in one of there the doge was murdered. By the prudent and vigorous adminiftration of a fucceeding doge, Orfo Participato, good order was re-eflablithed, and at the commencement of the roth century, the reputation of the republic for military prowefs was much advanced by a victory gained over the Huns, who had invaded Italy, and defeated Berengarius.

Towards the clofe of the irth century, Venice began to make a confiderable figure among the ftates of Europe, having acquired the fovereignty of Dalmatia and Croatia, with which in 1084 they were formally invelted by the Conflantinopolitan emperor.

About this time a crufade, or holy war againf the Saracens, was preached up by the emillaries of the pope, and the Venetian republic engaged in the undertaking with fuch ardour, as to equip a fleet of 200 lail, under the command of the doge Vitalis Michael. Before he failed for the coaft of Afia, however, the doge found it noceflary to chaftife the Pifans, whom he defeated in a terrible engagement. He then failed for Afkalon, at that time befieged by the Chriltian forces, and it was chiefly by his valour that that city, as well as Caipha and Ciberias, fell into the hands of the Clurifians. From thefe victories he was recalled to repel an invafion of Dalmatia by the Normans, whom he alfo defeated, carrying off confiderable booty. His fucceffor affifed Baldwin in the conqueft of Ptolemais, but was defeated and killed in attempting to quell a rebellion of the Croatians.

Under the government of Domenico Micheli, who fucceeded Ordelapho, the pope's nuncio arrived at Venice, and excited fuch a fpirit of enthufiafm among all ranks and degrees of men, that they frove whofe names fhould be firft enrolled for the holy war. The doge, having fitted out a flect of 60 galleys, failed with it to Ioppa, which place the Saracens were at that time befieging. The garrifon was reduced to the lant extremity when the Venetian fleet arrived, which furprifed and defeated that of the enemy with great flaughter; foon after which the Saracens raifed the fiege with precipitation. Tyre was next befieged, and foon was obliged to capitulate; on which occafion, as well as on the taking of Afcalon, the \(V\) 'enetians flared two-thirds of the fpoils. While the doge was ablent on thofe important affairs, the cm peror of Conflantinople, jealous of the growing power of the Venctians, refolved to take advantage of their apparent incapacity to refift an attack at home. The Venetians, however, had timely notice of his approach, and inftantly recalled the doge, who on his return laid wafte and deftroyed the country round Chios, feized on \(1^{2}\) iflands of Samos, Lefhos, and Andros, then belongit.c. to the emperor, and reduced feveral places in Dalmatia which had revolted.

In 1173 , the republic ventured to oppofe Frederick Barbaroffa in lis attack on the pope. Frederick, after a haughty reply to an embalfy fent him Ly the Vene. tians, difpatched againd them lis fon Otho, who foon
arrived before the city with 75 galleys. The doge Ver, Sebaftiano Ziani lailed out with the few veffels he had got equipped, to give the enemy battle. The fleets met off the coalt ot IItria, and a terrible engagement enfued, in which the imperial Heet was totally defeated, Otho himfelf taken prifoner, and 48 of his Mhips deAroyed. On the doge's return, the pope went out to meet him, and prefented him with a ring, fuying, "Take this, Ziani, and give it to the fea, as a teflimony of your dominion over it. Let your fucceffors annually perform the fame ceremony, that pofterity may know that your valour has purchafed this prerogative, and fubjected this element to you, even as a hufland fubjecteth his wife." Otho was treated with the refpect due to his rank, and foon conceived a great friendhip for Ziani. At laft, being pernitted to vifit the imperial court, on his parole, be not only prevailed on his father to make peace with the Venctians, but even to vift their city, fo famed for its commerce and naval power. He was received with all poffible refpect, and on his departure attended to Ancona by the doge, the fenate, and the whole body of the nobility. During this journey he was reconciled to the pope; and both agreed to pay the highef honours to the doge and republic.

In the beginning of the \(13^{\text {th }}\) century, the Venetians They II in conjunction with the French, befieged and took Con-pofferfion fantinople, as has been related under the article Con-Couftan stantinopolitan History, \({ }^{0} 144-146\), which nople. they held till the year 126 .

In the mean time the Genoefe, by their fuccefsful War wit application to commerce, having raifed themfelves in the Ge fuch a manner as to be capable of rivalling the Vene-noefe. tians, a long feries of wars took place between the republics; in which the Venetians generally had the advantage, though fometimes they met with terrible overthrows. Thefe expenfive and bloody quarrels undoubted. ly contributed to weaken the republic notwithftanding its fucceffes. In the year 1348, however, the Genoefe An. 134 were obliged to implore the pretection of Vifconti duke of Milan, in order to fupport them againft their implacable enemies the Venetians. Soon after this, in the year 1352 , the latter were utterly defeated with fuch lofs, that it was thought the city itfelf mult have fallen into the hands of the Genoefe, had they known how to improve their victory. This was in a fhort time followed by a peace; but from this time the power of the repub. lic began to decline. Continual war with the fates of Italy, with the Hungarians, and their own rebellious fubjects, kept the Venetians employed, fo that they had no leifure to oppofe the Turks, whofe rapid adrances night have alarmed all Europe. After the deflruction of the eaftern empire, however, in 1453 the Turks began more immediately to interfere with the republic. Whatever valour might be thewn by the Venetians, or whatever fuccefles they might boall of, it is certain the Jurks ultimately prevailed; fo that for fome time is feemed fearcely poflible to refift them. What alfo contributed greatly to the decline of the republic, was the difcovery of a paffage to thee Eati Indies by the Cape of Good Hope in 1497. Till then the greatelt part of the Eait India goods imported into Europe patied througiz the hands of the Venetians; but as foon as the Cape was difcovered, the conveyance by the way of Alexandria al. molt entitely ceafed. Still; however, the Venetian
enicc.
continual ftruggles with Turkey, had declined in power and in confequence, and was incapable of oppofing a barrier to the cncroachments of its more powerful neighbours. During the fifft war which the French republic maintained againft the emperor in Italy, the flates of Venice afforded a tempting ohject to each of the con-
power was frong; and in the beginning of the roth century they maintained a war againft almofe the whole force of France, Germany, and Jtaly, aflociated againft them in what has been called the League of Cambray. Soon after, however, we find them entering into an alliance with the king of France againft the emperor.

After this, nothing of importance occurs in the hiftory of the Venetian republic till the year 1645 , when the republic was involved in a new and fanguinary conflict with the Turks, in defence of the important ifland of Candia. The tranfactions to which this war gave rife, and the fpirit and bravery difplayed by the Venetians, in defending their colonial pofieftions, are amply detailed under the article Cinimis.

At the end of the \(17^{\text {th }}\) century, the Venetians obtained an important acquiftion of territory by the conqueft of the Morea, which at the peace of Carlowitz in 1699, was formally ceded by Jurkey to the flate of Venice *.

During the war of the Succeffion, the flates of Venice oblerved a Arict neutrality. They confidered that difpute as unconnected with their interefts; taking care, however, to keep on foot an army on their frontiers in Italy, of lufficient force to make them refpected by the belligerent powers. But foon after the peace of Utrecht, the Venetians were again attacked by their old enemies the Turks, who beholding the great European powers exhaulted by their late efforts, and unable to affift the republic, thought this the favourable moment for recovering the Morea, which had been fo lately ravifhed from them. The Turks obtained their object, and at the peace of Paflarowitz in 1715 , which terminated this unfuccefsful war, the Venetian fates yielded up the Morea; the grand feignior on his part rettoring to them the fmall iflands of Cerigo and Cerigetto, with fome places which his troops had taken during the courfe of the war in Dalmatia.

From the peace of Palfarowitz to the conclufion of the 18 th century, the affairs of Venice ceafed to form an interefling part of the hiftory of Europe. Ever fince the league of Cambray, the republic, weakened by its tending parties; and in May 1797, the capital was occupied by a body of French troops, who, under pretence of quelling a tumult that had arifen in the city, took poffeffion of the forts, and fubverted the exifting authorities. By the treaty of Campo Formio, concluded between the emperor and the French republic in October of the fame year, the French confented that the emperor flould take poffeffion of the Veretian territory, with the iflands in the Archipelago, which had been fubjected to the Venetion republic; and by the fublequent treaty of Luneville in 1801 , this accelfion of tersitory to the houfe of Auftria was confirmed, fo that the Venctian republic mult now be confidered as an Auftrian province.

It is not neceflary for us to be very minute in our account of the late conftitution and government of Venice. The government was frictly ariftocratical, being vefled in the great council or fenate, in which each of the nobi-
lity liad a feat. The nobility were extremeiy numerons, being computed at not fewer than 2000, whereas the whole population of the llate did not exceed \(2,500,050\). Befides the great council, or il comfiglio granat, there were four others; one compofed of the doge and its counfellors, called Ia fognorin; another called il confishir dus pregodi, confifing of about 252 of the mobility; a third united to la fignoria, confiting of 28 affiliors, or great fages, which gave audience to ambaffidors; and a fourth, compofed of to counfellu:s, who took cognizance of all criminal mattere, and before whom escra the doge himfelf mull appcar, if acculed. The fecret bufinefs of the flate was often carried on by fpies and informers; and there were in the ducal palace icveral ftatues of lions with open mouths, which formed fo many receptacles for fecret and anonymous information.

The office and privileges of the doge of Venice have been already mentioned under the article Doge. Of late this office was little more than nominal; and the doge was a mere Itate puppet, without authority and without power. His ellablihment, however, was fiplendid, and his revenue not contemptible. The mode of electing the doge deferves notice, as it was well calculated to prevent bribery, or the exertion of party iiblluence. He was elected by a plurality of voices, and held his dignity for life. In his election they made ufe of gold and filver balls, which were put into a vefiel, and ferved for balloting. Thole who drew nine golden balls, firt elected 40 counfellors, who drew 12 others, and elected 25 in addition. Of this number nine perfons, who had drawn golden balls, chofe 40 more; ir of thofe, appointed in the fame way, chofe 41 counfellors, who finally proceeded to the election, till 25 votes or more fell upon the fame perfon, who was then declared doge. After this election they placed the ducal cap upon his head, upon which he took pofieffion of the doge's palace. He never uncovered his head to any perfon, becaule he did not wear the cap in his own name, but in that of the republic.

The military ftrength of the Venetians confifted of nearly 30,000 land forces, under the command of a capitane, who was always a foreigner of diftinction ; befides a confiderable fleet, which they bonfted could, in time of war, be increaled to 60 men of war, and above rco galleys. The ordinary revenues of the fate have been computed at rather more than \(1,000,0001\). Aterling, a confiderable part of which arofe from the cultoms, and the du!y on falt made at Corfu and Chiofa.

Vfinice, the city which was the feat of government of the Venetian republic, is built on 72 rmall illands at the head of the Adriatic or gulf of Venice, about five miles from the main land. That part of the gulf which lies between the city and the continent forms a kind of laguna or luke, which, at low water, is very fhallow, and on the oppofite fide of the iflands there are numerous fhallows, the channels between which are marked by fakes, to direef fhips in entering the port. The lagunes that lie between the iflands form fo many canals that interfect the city in all directions, and over thefe the flreets communicate by not fewer than 500 bridges. The principal or great canal is broad, and has a ferpentine courfe through the middle of the city, but the others are narrow and crocked. The frcets are alfo narrow and winding, but clean and neat. The houles are built on piles, and have each a doos opening to the

\section*{V E N [ \(\left.54^{6}\right] \quad\) V E N}

Ficnice adjuce:t canal, and anothe: to the ftreet. As the nar. medy by the ufe of his ventilators; his account of which rowne's of the ftrets but ill adapts then for walking in, the only places of refort on land are the Riaito, a noble bridge acrofs the great canal, bordered with booths and Thops, and the gieat 〔quare of St Mark, or Diazza di St Marco, an irregular quadrangle, formed of feveral buildinge, fone of which are magnificent. Of the?e, the ducai palace, where thic bufinef of the flate ufed to be tranlacted; the patriarchal church of St Mark; the iteeple of St Mark, at a little diftance from the church; the church of St Geminiano; and the nerv and old Procuraries, are mot deferving the notice of travellers. The canals form the great medium of communication, as well as the primcipal feene of celaxation and amufement to the inhabitants. Here ply numerous gondulas, (fee Gondola, and Macgill's Tranels, vol. i.) which sre rowed with adnirable fpeed and dexterity by the gondoliers; and here are occafionally lield races, or rather rowing matches. As the camals are, of neceflity, the receptacles of all the filth of the city, they become, in hot weather, very offenlive; while, in winter, from their free communication with the gulf, they are frequently agitated by the Alriatic forms. The whole city is about fix miles in circumference, and the inhabitants are effimated at 160,000 .

The inhabitants of Venice carried on a flourilling trade in filk manufnctures, grold lace, mirrors and other arricles of glars, befides military 1 tores and implements of war. At fome diftance from the city there is a la:ge and cormodious lazaretto, where flips coming from the Levant unioad their goods, and ferform fuarantine from 20 to 10 days.

This cele'ra'ed city, once the [eat of power, opulence and the fine arts, whofe carnival revelries have been the fubject of fo many animated defriptions, has undergone a melancholy change. Her ftreets and canals no longer refomd with the flrains of the mufician and the ferenades of watchful lovers, and her gay gondolas, which were formerly occupied by faftionable groups and parties of pleafure, are now becone the veJicles of trade, or Cerve for the accommodation of the foldier and the mechanic. The trade of the city, which had long declined, has, fince the celtion of the Venetian territory to Aulfria, been almoft entirely transferred to Trient. Venice is 72 miles E. by N. of MJantua; 115 N. E. of Florence; 140 E , of Milan ; 212 N . of Rome, and 300 N . by W. of Naples. E. Long. \(12^{\circ} 33^{\prime}\). N. I.at. \(45^{\circ} 26^{\prime}\).

VENIRE facias, in Laut, is a judicial writ lying where two parties plead and come to ifite, direeted to the fherilf, to caufe 12 men of the fame neighbourt:ood to meet and try the fame, and to fay the truth upon the iflue taken.

VENTER, firnifies the helly; bitt it is alfo uferd for the chitdren by a woman of one marriage : there is in law a freft and fecond venter, \&ec. where a man hath children by feveral wives; and how they thall take in defcents of lands.

VENTILATOR, a macline by which the noxious air of any clofe place, as an hofpital, saol, flip, chamher, \&ec. may be difcharged and changed for frefl.

The noxious qualities of bad air have been long known; and no one bas taken greater pains to fet the mifchiefs arifing from foul air in a juft light than Dr Hales; who has alfo propofed an eafy and effectual te-
was read to the Royal Society in May 1.7+1. In the November following M. 'Thiewald, miliaty arclite of to the king of Sweden, intormed Dr Mortimer fecretary to the linyal Society, that he had in the preceding finimg iavented a machine for the ufe of his majeth's mers of war, in order to draw ont the bad air trom wader their decks, the leatt of which exhartled 36,172 cubic teet is an hour, or at the rate of 21,732 tons in 2.4 hours. In 1742 lie fent onc of them, formed for a 60 gun hisp to France; which was approved of by the Ri,yal Academy of Sciences at Pais; and the hing of Fiance ordered all the men of war so be furnilhed with the like ventilators.

The ventilators invented by Dr Ifales confin of a fquare box ABCD (ing. 1.) of any fize; in the middle of one fide of this box a broad partition or midrifif is fixed by hinges \(X\), and it nooves \(u\) ? and down from it to C, by mems of an iron ted Zh, fixed at a proper diflance from the other end of the midrif, uld paffing through a fmall hole in the cover of the box up to li . Tiwo boxes of this kind may be employed at orce, and the two iron rods may be fived to a lever FG (fig. 2.) moving on a fixed centre \(O\); fo that by the altcrnate raifing and prefling down of the lever 1 G , the midrifs are alo alternately raifed and deproficd, wheteby thefe double bellows are at the fanme time both drawing in air, and pouring it out, through apertures with valves made on the fame fide with, and placed toth atove and below the hinges of the midrifis, In order to render the midritfs light, they are made of four bazs lengthwife, and as many acrofs them breadhwife, the vacant fraces being filled up with thin pannels of fir boand; and that they may move to and fro with the greater eafe, and without touching the fides of the boves, there is an iron regulator fixed uprighe to the middle of the end of the hos AC (fig. 1.) from N to I , with a notel cin into the middle of the end of the midriff at Z ; fo that the midriffs, in rifing and failing, fuffer no other friction than what is made between the regulator and the noich. Moreover, as the miditi ZX moves with its edges only one-twentieth of an inch from the fides of the box ABCDFE, very little air will efcape by the edges; and, therefore, there will be no need of leathern fides as in the common bellows. The end of the box at AC is made a litule circular, that it may be better adapted between A and C to the rifing and falling nidriff; and at the other end \(X\) of the midriff a flip of leather may be nailed over the joints if necdful. The eight large valves through which the air is to pafs, are placed at the hinge.end of the hoxes \(\mathbf{R K}\) (fig. 2.) as at 1, 2, 3, \&c. Whe valve 1 opens inward to admit the air to enter, when the midniff is deprofled at the other end by means of the lever FG. And at the fane time the vaive 3 in the lower ventilator is flut by the compreffed air which pufles out at the valve 4. But when that midriff is mifed, the valve 1 thuts, and the air paffes out at the valve 2. And it is the fome with the valves \(5,6, \& \& c\) of the other box; fo that the midsifs are altemately tifing and falling, and two of the ventilators drawing in air, and two blowing it out ; the air entering at the valses \(1,3,6,8\), and pafling cut at the valves \(2,4,5,7\). Befure the fe latt valves there is fixed to the ventilators a box QQNM (fig. 3.) as a common recep. tacle for all the air which comes out of thele valves;
filator which air pafies off by the trank P , through the wall H- of a builuing. See Defciption of Veatilators by Stephetr Hiles, D. D. Lond. \(17+3,8 \mathrm{vo}\). ; and for the method of freeing mintes, hips, prifons, \&c. from noxious air by means of fire-pipes. fee l'seusatics, \(N^{1 / 3} 37^{1}\).

Ventri Infpicicondo, is a writ to fearclı a weman that fivith the is with chitd, and therehy witholdeth lands from the nest hicir: the trial whereof is by a jury of women.

VIENCRICLE, properly denotes any little cavity; but is more particularly ufed by pliyficians and anatomints for the tomach and certain cavities of the heart and brail?.

VENIRILOQUISM, an art by which certain perfons can to motlify their voice, as to make it apmpear to the rudience to proceed from any difance, and in any direction. See Prysiolocy Index.

VENUS, in l'agan worlhip, the goddefs of love and beauty. Cicero mentions two other deities of this name. Venus, Cyled Urania and Celeffis; and the Veruus PanKemos or Poputarif, the wife of Vulcan, and the goddefs of wanton and efieninate love. To the fift the Wamans afrribed no attributes but fuch as were agreeable to the ftricteft chatlity and virtue ; and of this deity they adinitted no corporeal refemblance, the being only reprefented by the form of a glohe, ending conically. Her facritices were termed nephalio, on account 0 . their fobriety. To her honey and wine werc offered, and no animal except the heifer; and on her altars the wood of figs, vinee, or nulberries, was not fuffered to be bumt. The Romams dedicated a temple to this goddefs, to whom they gave the name of Verlicordia; becaufe fhe turned the bearts of lewd women, and infpired then with modelty and virtue.

But the molt famous of thefe godefefes is the wife of Vulcan; who is reprefented as fpringing from the froth raifed by the genitals of Saturn, when cut off by Jupiicr and thrown iato the fea. As foon as the was formed, the was laid in a beautiful hell embellihed with pearl, and wafted by gentle zephyrs to the ifle of Cy therea, whence the failed to Cyprus. At her landing, Howers rofe beneath her feet; the was received by the Hours, who braided her hair with golden fillets; and then wafted her to heaven, where her charms appeared To attractive, that moft of the gods defired her in marriage; but Vulcan, by the advice of Jupiter, gained polieffion by putting poppies into her nectar. As Venus was the goddef of love and pleafure, the poets have been lavith in the defcription of her beatities; and the painters and faturies have endeavoured to give her the mot lovely form. Sometimes the is reprefented clothed in purp: \(:\), glittering with gems, her head crowned with rofes, and drawn in an ivory car by fwans, doves, or fparrows; at others the flands attended by the Graces; but in all pofitions, her fon Cupid is her infeparable companion. - She was honoured as the mother of Hymeneus, Cupid, Æneas, and the Graces, and was paffionately fond of Adonis and An-- chifes.

This goddef was principally worfhipped at Paplons and Cyprus; and the facrifices offered to her were white goats and fwine, with libations of wine, milk, and honey. Her victims"wete crowned with flowers, or wreaths of

VERDITER, or Yerdater, a preparation of copper, fometimes ufed by painters, \&xc. for a blue; 3 Z2

\section*{}

Verge but morc ulually mixed with a jello:v for a green colour. See Copper, Chemistry Index, and ColouliMiding, \(\mathrm{N}^{\circ} 28\).

TERGE (Virgata), in Laut, fignifies the compals of the king's court, which bounds the jurifdiction of the lord feward of the hourchoid ; and which is thought to have been 12 miles round.

The term verge is alfo ufed for a flick or rod, whereby one is admitied tenant to a copyhold eliate, by holding it in his hand, and fwearing fealiy to the lord of the manor.

VERGERS, certain officers of the courts of king's bench and common pleas, whofe bufinefs it is to carry white wands before the judges. There are alfo vergers of cathedrals, who carry a rod tipped with filver before the bifhop, dean, \&c.

Vergil, Polydore. See Virgil.
VERJUICE, a liquor obtained from grapes or apples, unfit for wine or cyder; and chiefly ufed in fauces, ragouts, \&c.

VERMES, the fixth clafs of animals in the Linnæan fyftem, comprehending five orders. See Natural History, and Conchology and Helminthology Index.

VErMicelli, or Vermichelly, a compofition of flour, cheefe, yolks of eggs, fugar, and faffion, reduced to a pafte, and formed into long flender pieces like worms, by forcing it with a pifton through a number of little holes. It was frif brought from Italy ; and is chielly ufed in foups and pottages.

VERMICULAR, an epithet given to any thing that Lears a relation or refemblance to worms.

VERMIFORMIS, in Anatomy, a term applied to various parts in the human body, bearing fome refemblance to worms.

VERMILION, a bright and beautiful red colour, compofed of quickfilver and fulphur, in great effeem among the ancients under the name of minium. See Chemistry, \(\mathrm{N}^{0} 1701\), and 1713 ; but what goes by the name of minium amonght us, is a preparation of lead, known alfo by the name of red-icad. See Chemistry, No 1832.

VERNIIN is a general term, denoting thofe animals which are either direfty or indireally injuious to mankind, the inferior animale, or the fruits of the earth; as Heas, caterpillars, llics, worms, \&c.

Vervisis, Defluction of. As we propofe in this article to point out the means of deftroyintg fome of thofe animals that archurtful or troublefone to man, we fhall employ the terna vermin, in a more extended fenfe, including alfo under it, mice, rats, moles, \&c. . We thall endeavour to collect the moft ufeful obfervations that have been made on the means of diminilhing or extirpating fuch animals as are obvioufly injurious. We cannot avoid here remarking, that allhough the feemingly excelfive increafe of one fpecies of animals is huriful or inconvenient to another, or to man himfelf, and their exiftence is attended with great lofs and damage, by their infelling and defroying grains and other fruits of the carth deltined for the f.od of man or thofe animals that are fubfervient to him; we are not of opinion that this excefs" ought to be confidered mercly as a wfelefs excrefcence in the great fale of being; norare we of 'opinion that their numbers ought not to be reduced, becture ne are too thort-fighted to comprehend the wife
purpoles fas which they are called into lifo, We tave heard fuch a doctrine held up, although we are inclined to fufpect that it is founded on. a lore of fingularity, or indolence, rather than procecding from pure matives of wenevolence. But we mult abitais from fuch, difcuf fions, and occupy the limits allotted to the proper fubject of cunfideration.

Rats ond Mice. - Various methods have been propored sor the delhaction of thele vermin. The following preparation has been recummended as very effectual. 'Iake of the leeds of flavefacre (delplimium fapliffogrin), or of loufewort (pedicularis pailffris), powdered, more or lefs as the occation requites, one part ; of oat meal, three parts: mix them well, and make them up into a pafte with honey. Lay pieces of this pafte in the holes, and on the places where mice and rats frequent ; and itwill effectually kill or rid the places of thofe kind of vermin by their cating of it.

Some time ago the fociety for encouraging arts propofed a premium of 501 . for a preparation capable of alluring or fafcinating rats fo that they might be taken alive. In confequence of this, a great number of new traps, \&c. were invented, and the following methods of alluring the rats to a certain place were publithed. One of the methods which is mont eafily and efficaciounly praciifed, is the trailing of fome pieces of their molt favourite food, which mould be of the kind which has the ftrongeft feent, fuch as toafted cheefe or boiled red herrings, from the holes or entrances of the clofet to their receffes in every part of the houfe or contiguous build. ing. At the extremities and at different parts of the courfe of this trailed track, fmall quantities of meal, or any other kind of their food, ihould be laid to bring the greater number into the tracks, and to encourage them to purfue it to the place where they are intended to be taken; at that place, when time admits of it, a more plentiful repaft is laid for them, and the trailing repeated for two or three nights.

Befides this trailing and way-baiting, fome of the moft expert of the rat-catchers have a Phorter, and perhaps more effectual method of bringing them together; which is the calling them; by making fuch a whitling noife as refembles their own call; and by this means, with the affilance of the way-baits, they call them out of their holes, and lead them to the repaft previoully prepared for them at the places defigned for taking them. But this is much more difficult to be practifed than the art of trailing ; for the learning of the exact notes or cries of any kind of beatts or birds, fo as to deceive them, is a peculiar talent which is attained only by few.

In practifing either of thofe methods of trailing or calling, great caution mult be ufed by the operator to fupprefs and prevent the feent of his feet and body from being perccived; which is done by overpowering that fcent, by other fcents of a fironger nature. In order to do this, the feet are to be covered with cloths rubbed over with afafoctida, or other, frong fmelling fubitances; and even oil of rhodium is fometimos ufed for this purpofe, but. fparingly, on account of its high price, though it has a very alluring as well as difgufting effect. If this caution of avoiding the fent of the opc. rators feet, near the track, and in the place where the rats ase propofed to be collected, be not properly obferved, it will very much obitruet the fuccefs of the ata
temp:

\section*{Vi E R \(\quad\) [ 549\(] \quad \mathrm{F}\)}
serind tempt to take them ; for they are rery fly of coming where the feent of human feet lies very freh, as it intimates: to their fagacious inftinct the prefence of human creitures, whom they naturally dread. 'To the abovementioned means of alluring by trailing, w?̨-bating and calling, is added another of very material efficacy, which is the ule of oil of rhodium, which tike the marum fyrincum and valerian in the cafe of cats, has a very extraordinary fatcinating power on thefe animals. This oil, as it is extremely dear, is therefore faringly ufed. It is exalted in a fmall quantity in the place, and at the entrance of it, where the rats are intended to be taken, particularly at the time when they are to be latt brought together," in order to their defruction; and it is uled allo by fmearing it on the furface of fome of the implements ufed in taking by the method below defcribed; and the effect it has in taking off their caution and dread, by the delight they appear to have in it, is very extraordinary.

It is ufual, likewife, for the operator to difguife his figure as well as fcent, which is done by putting a fort of gown or cloak, of one colour, that hides the natural form, and makes him appear like a poft, or fome fuch inanimate thing, which habit mult likewife be feented as above, to overpower the fmell of his perfon; and be. fides this, he is to avoid all motion till he has fecured his point of laving all the rats in his power.

When the rats are thus enticed and collected, where time is afforded, and the whole in any houfe and outbuildings are to be cleared away, they are fuffered to regale on what they mon like, which is reatly prepared for them, and then to go away quietly for two or three nights; by which mcans thofe that are not allured the fitt night, are brought afterwards, either by their fellows, or the effects of the trailing, \&c. and will not fail to come duly again, if they are not diflurbed or molefted. But many of the rat-catchers make thorter work, and content themfelves with what can be brought together in one night; but this is never effectual, unlefs where the building is fmall and entire, and the rats but few in number.

The means of taking them when brought together are various. Some entice them into a very large bag, the mouth of which is fufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by fmearing fome veffel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of food. This bag, which before lay flat on the ground with the mouth fpread open, is to be fuddenly clofed when the rats are all in. Others drive or frighten them, by flight noifes or motions into a bag of a long form, the mouth of which, after all the rats are come in, is drawn up to the opening of the place hy which they entered, all other ways of retreat being fecured: Others, again, intoxicate or poifon them, by mixing with the repaft prepared for them, the cocutus indicus, or the nux somica. They direct four ounces of coculus:indicus, with 12 ounces of oatmeal, and two ounces of treacle or honey, made into a moilt patto with ftrong beer; but if the nize vomica be uled, a much lefs proportion will ferve than is here given of the coculus. Any fimilar compofition of thefe drugs, with that kind of fond the rals ate mof fond of, and which has a Atrong theour to hide that of the drugs, will

be weil powdered, and infufed in ftrong teer for fome time, at leat half the quantity here directed will Serve as well as the quantity before mentioned. When the rats appear to be thoronghly intoxicated with the coculus, or fick with the nux vomica, they may be taken with the hand and put into a bayg or cage, the door of the place being firf fhut, Ifit thofe who have Arength and tenfe remaining fhould efcape.

In deltroying rats, advantage may be taken of that remarhable degree of inftinct which they pofiefs of deferting one place, where they find themfelves diturbed or haraffed, and retiring to new haunts. It is well known, that after one or two rats are poifoned, or taken in traps, or wounded or otherwife itijured, and alterwards permitted to efcape, the whole colony immediately difappears. 'The practice, however, of deftroying rats that frequent dwelling-houfes, 1 y poifon, fhould be as much as polfible avoided; for they retire to places behind the wainfoot, \&c. from which, after death, their putrid bodies emitting a moft offinfive fmell cannot be removed. But it is far lefs difticult than is generally imagined to fecure the different apartments of a dwelling houfe, and even the cellars, from the inroads of rats and mice, and thus to prevent their unwelcome vifits, by thutting up the paffages through which they enter. Stone and lime, when they can be applied, are effectual; but common plafter, by introducing pieces of broken pottery ware or glafs, along with it, will alfo anfwer the purpofe; and even a piece of cork, with : pin or two ftuck through it to prevent them from eating it away, is a complete barrier to mice entesing through a hole in wood, and may even prevent the entrance of rats.

We have feen this method of fhuting up the holes, as foon as they were opened by the induttry of the enemy, fleadily purfued for fome time, attended with the fullett fuccefs, even in an old houfe of confiderable extent, and finifhed from top to bottom with wood, fome of which was much decayed.

Ofien for the fake of food, rats and mice frequent gardens, fields, and woods, in the fummer feafon ; but, on the approach of winter, they return to their former haunts in the habitations of man; and, accordingly, it is obferved, that houles which are free from thofe vermin during the fummer, fwarm with them about the end of harveft. Attention to this circumftance in the habits of thefe animals, may be the means of fecuring us from their vifits and depredations; for if, at the time alluded to, every hole and cranny through which rat or moufe can enter, be lhut up, and carcfully kept clofe and fecure, the perfeverance of the foe is exhaufted and overcome by repeated and conftant reffifance, and thus he is forced to abandon the unequal content, and to retire to other haunts where his motions are lefs inter. rupted:

Varinus other methods have been propofed for the deftuction of rats; and although we have thrown out a hint againt the ufe of arfenic for this purpofe, in dwelliag houfes; yet where it can be employed with perfect fafety, and without rifk of the nuifance alluded to, ras in cellars and outhoules, it is undoubtedly one of the moft effectual to which we can have recourle.

Suffocating thefe vermin by means of the fumes of fulphur, as on board of Mips, in granarics and other buidings which can be Thut up, is lometimes allo fuc.

\section*{V E R [ 550\(] \quad \mathrm{V}\) E R}

Termin. cefffully practifed. Rats and other vermin have alfo been elfectually deftroyed and cradicated by burning wood in clofe apartments, thus producing fixed air or carbonic acid gas, by which they are alfo fuffocated.

Moles.-Various miethods have been propofed for the defruction of thefe animals. But the following obfervations on this fubjeet, which we fiall give in the words of the author, feem to be more fatisfactory than any thing we have met with.

The great damaye (fays he) which moles occafion in cultivated land, and particularly gardens, is well known; and the bett means of remedying this cuil is by deftroying all thofe that make their appeatance, as far poffiole. The fecrets which quacks fell for extirpating thefe deffructive animals are of very little avail; and even poifon produces no effect, as the mole does not drinl, and lives only on roots and worms. In regard to gins and traps, the moles mult be enticed to them by fome kind of bait, which does not always produce the intended effect. Buffon advices a trench to be dug around the hills under which they conceal themfelves, and thes to cut them off from all commurication with the neighbouring ground. This method requires three or foar people to dig trenches; and though it may prove effectual, it is attended with too much trouble. The other methods propofed by different naturalifts are neither eafier nor more certain.
"It is woll known that this animal lives under the earth; and if at any time it comes forth from its holes, it is only when compelled to do fo, in confequence of large quantities of water accumulated after the heavy rains which fall in fummer, or when the earth is fo much parched and dried by the continued drought, that it can no longer continue its labour ; but it again creeps back into the earth when it finds a fpot convenient for its purpofe.
"This animal, as already remarked, feeds upon roats and worms, and for this reafon is generally found in rich fertile foil; but never in that which is marfhy of fony. In the winter time it retires to elevated places, becaufe it is there beft fecured from inundations. In fummer, however, it defcends to the low hillocks and flat land, and above all makes choice of meadows for the plact of its refidence; becaufe it finds the earth there frefther and fofter for it to dis throngh. If the weather continnes Iong dry, it repairs to the borders of ditches, the banhs of rivers and itreame, and to places comiguous to hedges.
"The mole breeds generaily at the beginning of wintor, and the months when they are found big with young are January and February. In the month of April a great many of their young may be feen. Among 122 caught in the month of May by my method, there were only four hig with vounc. This animal cannot live rvithout digging ; it is obliged to find its nourihment in the bowels of the earth; and on that account is under the necefity of making thofe lorg fubtertatnen paffages which are found between one mole-hill ard another. In general it begins to dig five or fix inches under the furface; it licrapes the earth tefore it on one fide till the gruantity becomes tod great for it to labour wilh cale ; it then works towarcis the furfece; and by pulhing with its head, and the affilance of its nervous pars, gradually raifes ep the earth which incommodes it, and which produces thoic finall hills to common in fields. After getting rid of the earth in this manner, it pro-
ceeds furwards, and continues its labour as before? The tiome father it gocs the more hitls are produced. At cach \(r\), period of its labour it thrors up four of five.
"In places overgrown with grafs and thrubs, the mole is often contented with only forcing a.paliage through between the roots; and when the earth in garders hes been newly watered, it kecps iffelf at the depth of fearcely half an inch under the furface. This animal fhews an equal averfon to great cold and violent heat ; and in order to avoid both, it furces its way, when eithe's previlil, 10 the greatefl depth in the earth.
"It continues its labour at all limes, becaufe it is neceflary for it to procure nouritiment. It is abfolutely falfe that it fleeps throughout the winter, as fome naturalifls have afferted; for it throws up the earth in the coldeff feafon, as well as during the fummer. It is meft bufily employed towards the end of winter, and at that period forms the greatetl number of hills. To this it is impelled by more than one reafon. "In the firf place, it muit provide nourifment for its young; feconcly, it finds it eafient at that time to dig its way through the earth; and lally, as the air begins to be milder, the animal then recovers that frength which it had loft during the inten?e cold. At this leafon, therefore, it is moot proper to furlue mieans for extirpating this animal, as it can be deflroyed with greater eafe while employed at its labour.
"The male is much fronger than the female, and the hills thrown up by the forner are much larger as well as more numerous. The periods when the mole is mof bufily employed in diyging are in the morning, at funrife, at noon, and at funfet. In dry weather moles are oblerved to throw up the earth for the moft part only at furrife, ard in winter when the eath has been fomewhat heated by the lun's rays.
"A perfon may eafily dilcover how many mnles are contaired in a certain face of ground, by ccunting the freth railed mole hills which have no communication with each other. I munt remark alfo, that this arimal has very bad fight, being almofl totally blind; but its hearing, on the other hand, is fo much the more acuie.
"I fhall now proceed to the method of deffroying them. Inmediately at day-break it will be necelfary to mike a tour round the garden or meadow, from which it is wifhed to extirpate the moles; for at that time they will be all found at work, as may be feen by the hills newly thrown uf. If the perfon is then clofe to the hill, he mult prected as the gardeners do, and turn up with a froke of the fpade the hill togcther with the digger. The paffage is then cut through before the animal is 2 wate of the attack, and therefore it has not power to efcape. If the innle-hill be freth, even though the animal may not be throwing up earth, the perfon ought not to lofe his time in waiting, but fhould imnocdiatcly proceed to the operation above mentioned.
"If ycu find a frccls hill nanding by itfelf, which feems to fiew by its firmanim that it has no communication with anv nther, which is always the cafe when the mole has worked from the furfere dounwards in endearouring to procure a more convenient habilation, aficr the bill has licen turned on wibtter frade, a bucket of witer fionld be poured ower the month of the pregre. By thefe menns the animal, which is at no great difance. will be obliged to conce forth, and may be eafily caught

\section*{with the hand.}

\section*{Y E R [ 551\(]\) V E R}
\%rmin. "Youmay difover aifo whether a hiill has any communication with :mother, if you apsly your car to it, and then cough or smake a loud moile. If it has no communication with the neighbouring hills, fou will heas the terrifed animal mike a nuife by its motion. It will thein be imponible for it to efeape; and you may cither pour water into the hoie, or wru un the hill with a fipade umil the mole is found ; for in general it never gocs deoper into the earth that from fititen to eig!teen inches.
"When any of the beds in a garden have leen newly wacred, the mole, atuacted by the conlnefs and muiilure, readily expairs thither, and t.akes up jits refidu.ce in them, making a paflige at the depth of fearcely an inch below the lufface. In that cale it may be catily conught. When you lee it at mork, you need onily tread belinnd the animal wilh your feet on the pafage to prevent its retreat, and then turn up the hill with a fade; by which means you will be fure to catch it.
"When you dig after it wih a fpade, the animal forces its way dowasards into the earth in a perpendicular directim, in o:der that it may botler efcape the threatened danger. In that cafc it will not be necefinary 10 dig long, but to pour water over the place, which will foon make the animal return upwards.
" l'eople in general are not aware of the great mifchief occafioned in fields and gardens by thele animals. We are, however, informed by Buffon, that in the year 1740 he planted 15 or 16 acres of land with acoras, and that the greater part of then were in a little time carried away by the moles to their fubterranean retreats. In many of thefo there were found half a buhtel, and in others a bufhel. Buffon, after this circumfance, caufed a great number of iron traps to be conltructed, by which in lefs than turee wekis he caught 1360 . To this infance of the devaltation occafionied by thefe animals, we many add the following: In the year 1742 they were fo, numerous in fome parts of Folland, that one farmer alone ciught between five and fix thoufand of them. The deflruction occafioned by thefe animals is, however, no new phenomenon. We a:e informed by hiflory, that the imbabitants of the itland of Teneclos, the Trojins, and the Folians, were infetted by them in the earlieit ages. For this reafon a temple was ere \(\ell\) ed to Apollo Sinynthius, the dellroyer of moles.
infects.-Many infects, in the different ftates of exialence throurg which they pals, are exceedingly troublefome and defructive. Sometimes they fpread their dicvaflations in the ftate of larva or \({ }_{g} r u b\), and fometimes in that of perfect infect.

Of the coleopterous infects, the grub of the cockchaffer, which is a browniti or chefnut-coloured beetle, co:nmils the greateft ravares. This beetle appears during great part of the fummer, the moft plentiful in May or June, and bence called the Mifdy bug. It flies only in the evening, and lodyes during the day unde: the leaves of trees, which it devours, and is fometimes in fuch numbers, as to defoliate whole woods. The beeto depofits its cggs in the earth, and from thefe are latched white or bluill grabs, that feed on the roots of grafs, com, and other vegetables, during the whole fummer. In the swinter they lie decp in the earth; but in the fprirg, as vegetation advances, they rife to the furface, and renew their work of deftruation. In this flate they continue for four, five, or fix years, before they
change to the chryfalis fate, in which they remain till remurn the morth of Miny, what he petcect inlect appears. As thefe infoas requirc fo many yeats to antume the perfect furm, they ouly appear occationally finticienty numerous to be extentively defrucive to the capps of gian, or vegetables in gencral. Their numbers, havyo ever, have ofton produced g:eat alarm, and even eacited the attention of governments to oller sewards for an ef. feilual method of defroying them.

In the fpring leafon, it the weather prove warm, when the land is ploughed up, thefe grabs are generally fo wear the furface as to be turned up with the phough ; and being thus expofed, they are picked up and devoared by various birds, which, it is fuggelied, fhould not be difurbed or diven away ia thas falutary labeur. When thele grubs infert meadow land, it has been propoled to drown them in their loles by overfowing it. But it is fuppoied that this plan would not be fucce: sfal, even where it is pracicuble, unlefs there is a bed of clay immedistely under the foil, to retain the water for a fulticient length of time. A more chicacious way is reconmended to prevent the increafe of the grabs, by detroying the thics in May or June, before they have depulited their egses. This may be done by thaking and beating the trees and heciges in the niddle of the day; and, as this is a work which may be performed by chil?dren, it is a iefs dificult talk than would at firlt Gight be imagined. Domeftic fowls are remarkably foud of thefe beetles, fo that a double object is thus :gained, the defruction of the bectles and the procming of food for the pouitry.

Some fpecies of the dermefles, and alfo of the genus pinur, are cxccedingly defructive in the cabincts of naturalifts, and allo to lurniture. Various methods have been recommended to fop their mavages. We belicve the mofl effectual is [pirit of turpentine, when it can be properly applied. A folution of corrofive fublimate is Jometimes employed, but it flould be recolleled that it feldom fails in time to produce fome chemical change on animal aud vegetable matters. Objects of natural hillory as birds, animals, \&cc. are fometimes expofed to the moderate heat of an oven, or before a fire, for feveral hours; but this method will alfo be attended with injurious cffeets, unlefs practiicd with great care. Infeats which infeft furniture have been deftroyed by the appicalion of oil, and allowing it to remain for a day or two, before the funniture is rubbed up. Japanned or varrithed furniture may be fecured from the effects of thefe infects, by re-coating it, when they are in the larva ftate, by which they are deprived of air. Railing, and other works cut of doors, which are expofed to the weather, are fometimes eaten with infects, and particularly by fome of the larvere of the genus curculio. The wood thus attacked may be prevented from farther ra* rages, by a frefh coat of paint.

The earwig is a defruaive infca in the flower, kitchen, and fruit garden. To prevent their deptedations, it has been recommended to take tham by the hand, when they come out during the night in feasch of fond. Ihey may be taken alfu i,y rolling up a piece of paper, and hanging it up on the plants which they infoft; for in thefe places they take thelter through the day. Another method of deftroying them has been mentioned, and that is to watch them towards morning with the view of difcovering the baunts to which

\section*{V E R}

Vermin. they refort during the day; and this difcovery being made, which may perhaps be a melon frame, dunghill, or heap of rubbilh, the removing of which will deftroy the greater number of thefe troubiefome infects.
The fmall infect which commits fuch depiedations among turnips, by eating the fcedling leaves as foon as they appear, as frequently to deftroy whole crops, is fuppofed to be a fmall black polifhed beetle, belonging to the genus chryfomela. It does not feem to be well afcertained whether this fmall beetle, which is better known by the name of turnip fly, commits its ravages in the larva or in the bectle flate. It is faid that it prefers the leaves of the common radifh to thofe of the turnip, and it is therefore recommended to forv radifhes along with the turnips, to prevent the deftruction of the latter.

Of the infects belonging to the order hemiptera, there are fome which are exceedingly deftructive. The cock-roach, a native of the warmer parts of America and the Weft Indies, is a very troubleforme, and a very voracious infect. It has been introduced into this country, and particularly into the feaport towns, in confequence of commercial intercourfe. It comes out to feed in the night-time, and eats almoft of every thing that comes in its way. Cock-roaches are eafily taken by the following method. Cover the outfide of a deep glafs or bafon with paper ; introduce fome bits of bread or fugar into the bafon or glafs, and fet it in a place frequented by the cock-roaches. They creep up by means of the paper on the outfide, and drop into the veliel; but in confequence of its fmooth poliflied furface, they cannot effect their efcape. In the fame way crickets and beetles may be taken and deftroyed. It is quite unneceffary to feak of the means of deftroying the myriads of locults which not unfrequently infeft eaftern countries, and particularly Egypt and Syria; for no means are likely to be devifed, which promife to refift the effects of fuch a hoft of foes, by whofe ravages every green thing is confumed; but the infect itfelf becomes, among the poorer inbabitants of thofe countries, a partial fubflitute for the fruits of the earth which it has deffroyed. The infects are taken, reduced to yowder, and converted into a kind of meal.

The common or the bed-bug is a very troublefome, and a very common inmate in the crowded houfes of many large towns in this country. Its ufual haunts are the crevices of wood, and particularly thofe pieces of furniture which are ufually kept in the warmeft corners of the apartment. Cleanlinefs will perhaps be found the beft prefervative againft the introduction and increafe of thefe infects; but fometimes even the greatelt care and attention are ineffectual in keeping houfes entirely free from them. When it can be conveniently done, they are completely deftroyed by immerfing the furniture in boiling water, or by baking it in an oven; and by filling up the crevices or holes which were their haunts, with glazicts pulty, their return and increafe will thus be prevented. But a very effectual method of deftroying bugs, is to wafh the places which they frequent with firit of turpentine, and then filling up the boles as already mentioned. It is a curious circumflance in the hiftory of thefe infects, that fome pesfons entirely efcape from their attacks, while to others they are exceedingly troublefome and difteffing. It is faid shat lavender-water, fyrinkled over the bod-clothes,
ofien prevents their approach. How far this is the cafe, we have had no opportunity of afcertaining.

The lmall moth, which in the caterpillar ftate commits luch ravages on woullen cloths, furs, and other animal fubitances, which remain for any length of time in dark unoifturbed places, may be deftroyed with the giedteft certainty and facility, by expoling the fubltances on which they are fuipected to make their depreda. tions, to the vapour of ipirit of turpentine, or brufting them with a brath dipped into the fame tluid. This thould be done about the months of September or October; but their effects may be prevented by placing the cloths, furs, \& c. which are likely to become their refidence, in an airy fituation, about the months of July and Auguit.

The different linds of lice are very numerous. Evely animal has its peculiar fpecies, and even mankiu:d are not free from this pelt. It is often the confequence of indolence and nationefs, and it is obferved that the lice which infett any animal increafe prodigioufly when that animal becomes languid and fickly. We believe that the application of fpirits of turpentine, already fo often recommended, would alio be effectual in this cafe; but mercurial preparations afford a certain ren:edy againft thefe infects. For this purpofe a very fmall quantity of what is called mercurial ointment may be employed. At the fame time it ought to be recollected, that cleanlinefs is the beft prefervative. A fingular notion prevails in this country, and even among perfons who are by no means in the loweft rank of life, that it is a good fign of health when children's heads are infefted with thefe animals ; and on this account they are not very. anxious in having them entirely eradicated. A moment's reflection may how the abfurdity of fuch an opinion, fo that it would be a wafte of time to adduce ferious arguments againft it.

It is perhaps more difficult for mankind to fecure themfelves and their habitations from the vifits of the common flea. Cleanlinels, however, may do much even in effecting this ; and in particular it appears to us, that it would be extremely ufeful, frequently to rub up with a piece of cloth the morc inacceffible parts of furniture or apartments, or perhaps it would anfwer better to employ a fmall hard brufth. By the lefs acceffible places we mean the corners and crevices of rooms and furniture where duft is apt to collect, and efpecially the canvas part of a bed. We are perfuaded that firits of turpentine might alfo be found ufeful for the deftruction of thefe very troublefone infects. The Scotch myrtle (myrico gale, Lin.) a plant very common is low and moift moorifl places in this country, is faid to be an excellent remedy, in confequence of its powerful aromatic odour, againft the attacks of thefe animals. For this purpofe, the plant is ftrewed about the apartment or bed which is infelted with lleas.

The following method of deftroying or driving away all kinds of noxious vermin ficm fields and gardens, it is faid, has teen proved by expericnce to be effectual. It is recommended by \(M\). Socoloff, and the account of it is taken from the Petermurgh Tranfactions *. As the * Fhit. deftructive power of quicklime (fays the author), height- 1/9as. is ened by a fixed alliali, which corrodes, diffolves and de- \({ }^{169}\). froys all the tender parts of animals, las been long known, I thought this misture would be the bef means for acconplifhing the object I had in view. I took

\section*{V E R [ 553 ] V E R}
wan.' threc parts, therefore, of quicklime, newly made, and two parts of a faturated folution of fixed alkali in water, and thence obtained a formewhat milky liquor fufficiently caullic, highly hotile and poifonous to earth-worms and wher fmall animals; for, as foon as it touched any part of their bolies, it occafioned in them violent fymptoms of great uneafinefs. If this liquor be pourect into thofe holes in which the earth-worms refide under ground; they inmediately throw themfelves out as if diven by fome force; and, after various contorions, either languilh or die. If the leaves of plants or fruit-trees, frequented by the roracious caterpillars, which are fo defructive to them, be fyrinkied over with this liquor, thefe infects fuddenly contract their bodies and drop to the ground. For, though nature has defended them tolerably well by their hairy fkins from any thing that might injure thicir delicate bodics, yet, as foon as they touch with their feet or mouths leaves which have been moiftened by this liquor, they become as it were fupefied, infantly contract themfelves, and fall down.
"I had not an opportunity of trying a like experiment on locufts; yct we may conclude, and not without probability, from their nature and the general deftructive qualities of the above liquor, that they, in like manner, may be driven from corn-fields, if it be poffible to fprinkle the corn with the liquor by means of a machine.
"With regard to plants or corn, thefe fuftain no injury from the liquor, becaufe it has no power over the productions of the vegetable kingdom, as I have fully learned from experience; or, if any hurt be fufoeited, all the danger will be removed by the firft thower that falls. This liquor may be procured in abundance in every place where lime is burnt. If the lime be frefh, onc part of it infufed in about feventy parts of common water will produce real lime-water. The want of the fixed alkali may be fupplied by boiling wood afhes in water, and thickening the ley by evaporation.
- "The liquor might be employed alfo to kill bugs and other domeftic infects which are noxious and troublefome; but on account of its frong lixivious fmell, which difpofes the human body to putridity, i dare not recommend the ufe of it in houres that are inhabited. Befides, bugs may be eafily got rid of, as I have repeatedly found from experience, by the oily pickle that remains in calks in which falted herrings have been packed. To this liquor they have a ftrong averfion; and, if they are moiltened with it, they die in a very thort time *."
i. 16 g. For deftroying infects and caterpillars, which infoft fruit trees, the following method is recommended as having been fuccefsfully practifed. The author obferves that "The prefent year, for inflance, (1805), offers a fingularity which I have not before perceived. In fome diftricts the cherry-tree has experienced, at the time of its bloffoming, colds and winds which have prevented it from fetting; but another plague, not lefs difaftrons, has attacked the cherry-trees and plum-trees over feveral diftricts in France. Great fwarms of little animals refemhling vine-fretters, but which are not fo in reality, eftablified their habitations at the extremity of the kranches of the cherry-tree:. As foon as a branch was attacked, the leaves curled, and the juice was dried up, On opening the leaf, a confiderable number of ants was Vol. XX. Part II.
difcovered, which, jointly with the infeet which began the ravages, fucked, the branch, and made it wither. What I lave remarked is, that ufuatly, when the vinefretters attack any tree, the ncighbouring tree very foon experiences the fame fate; but the attack of this year is only partial. In an alley of cherry. trees which's I poffefs feven trees have been attacked, but not thofe which are next each other. One tree was placed between two which were rety much damaged by thefe in. fects, and yet this one was not hurt.
"On thefe vermin the fmole of tobacco had no effect at all : this convinces me that they are different frem the ordinary kind.
"Plum trecs, when attacked by the fame infeet, do not lofe their fruit like the cherry.trees; bet the little animals cover them with more rapidity, fo as to exti-pate even the appearance of fruit.
"Having effectually watered a plum-tree, I covered it with athes, in the manuer we treat beans and cabbages, and the vermin were delroyed : but this is only practicable with a tree of low height.
"I made one remark, whichs I think is effential to communicate: it is, that plum-trees planted in ground which is not neceffarily watered, are lefs attacked by thefe infects than thofe which have experienced a humidity communicated by the plants in their neighbourhood. to which watering is atbfolutely neceliary. I had one planted in a bed of artichokes : we know very well that this plant requires plenty of water; and the tree was entirely covered with infeas. Its leaves withered, and the fruit fell off; while two other plum-trees, in ground not watered at all, were much lefs attacked. This convinces me that thefe were not the ordinary vermin abundant in dry feafons.
"I was only able to proted my cherries a hittle, by cutting of the extremisies of the damaged branches.
"Several pcople had recourfe to fulphur; but I did not follow that method. Thic fmoke of fulphur deitroys the infect, I admit, but it is at leaf equally danyercus to the tree; I alivays prefer an afperfion of the tree with foap-fuds. This very year I experienced the good effiects of it. I faw my plun-trees look green again, and thee infects abandon them. The alperfion is very eafily managed, by means of watering-pots or finall garden-enginies. I have alfo employed a ley of wood-athes with the fame fuccefs as foap and water.
"An obfervation equally important which I have made is, the great damage done this feafon in all orchards by the caterpiliar. As foon as they devoured the young leaves, they attacked the fruit. In fite of the great care taken in fpring to get rid of them, the number of thefe infcets is incredible. I have feen them unite on the large branches, fix their nefts to them, and protect them by means of the downy matter which covers the buds of the erifuing feafon. Whatever precaution is taken, it is almof impofible not to defroy thefe buds. It is only neceflary to take off thefe neils and burn them; and this is the only way of getting rid of the coveys. I employcd the fame afperfion for my apple-trees, and by that means got rid of their enem:es allo*.
" The following methods are pratifed in Germany for Mag. xyiv. freeing granaries from mites or weevils: \(\quad=: 13\).
"r. Cover completely the wails and rafiers, above and below, of the granaries which are infefted by wee0.4 A
vils,

 frili ,

Vermin. vils, with quicklime flaked in water in which trefoil, wormwood, and hyffop lave been boiled. This compolition ought to be applied as hot as poffible.
"2. A very fagacious farmer has fucceeded in deAroying weevils by a very ealy procefs. In the month of June, when his granaries were all empty, he collected great quantities of the largeft-fized ants in facks, and then feattered them about the places infented witb the weevils. The ants immediately fell upon and devoured every one of them; nor have any weevils fince that time been feen on his premifes.
" 3. Another method, not lefs efficacious, but which requires a great deal of care and attention in the application of it, is the following :-Place in your granaries a number of chafing.dihes filled with lighted pieces of wood. Every aperture mult then be carefully clofed, in order to prevent any frefls air from entering. 'The carbonic acid gas, produced from the burning wood, proves fatal to the infects. Rats and mice, alfo, are fo ftrongly affected by it, that they are feen running out of their holes, and dying in all directions. The perlons employed to manage this procefs muft take great care of their own fafety, by keeping a current of air around them until the burning wood is properly placed. Another danger may arife from the premifes taking fire; but this alfo may be avoided by proper cantion, particularly if they are paved with brick or ftone *."

Grain, it is faid, has been preferved from weevils and other deftructive infects, by covering the heaps with pieces of hemp cloth dipped in water and wrung out. At the end of two hours the weevils are found adhering to the cloths, which are to be removed carefully and plunged in water for fome time to drown. A plant of henbane placed in the middle of a heap of grain is faid alfo to drive away the infects. They mult then be watched and deftroyed as they attempt to efcape.

Sulphur or flower of brimftone is recommended as being an excellent remedy againit the effects of infects on flants. It may be applied by duiting the leaves affected, either by tying it up in mullin cloth, or with a puff for hair powder, or with a dredging box. But the fulphur not only deflroys the worms and infeets which infent trees; it feems alfo to render the trees more healthy and vigorous. This was particularly the cafe with fome peach trees on which it was frinkled,

The following method, difcovered by M. Catin, is propofed for deftroying earth-iteas, bugs, ants, \&c.
"Take black foap, of the beft kind, one pound three quarters, the fame quantity of flowers of fulphur, mulhrooms two pounds, and fixty meafures of river or rainwater. Divide the water into two parts, one of which mult be poured into a veffel deftined for that purpofe: fuffer the foap to diffolve in it, and add the mufhrooms after they have been a little pounded. Boil the other half of the water in a kettle, and tie up the fulphur in a bit of rag or piece of fine linen, and fufpend from it a fufficient weight in order that it may fink in the water: During the time the water is kept boiling, which mult be al leaft twenty minutes, fir it continually with a flick, and pre's the bag containing the fulphur, that the latter may be forced out into the water, and communicate to it die neceffary 11 rergth and colour.
"When the liquor is taken from the fire, pour it diseefly into the cads, and ftir it round for a confiderable tizle : the procefs of thiring muft be repeated daily till
it aequire a fetid fmell. Experience has fhown that the more fetid the mixture is, its activity is the greater. Each time that the mixture is firred, the catk mult be flop: ped immediately after. When you with to ufe the liquid, nothing is necellary but to fpsimkle a litule of it on the plants which you are defirous of preférving, or to dip their branches in it. It will be better, however, to malie ufe of a fyringe, having at the end a head, an inch or an inch and a halt in diameter, pierced with frall holes. This inflrument may be uled for tender plants; when you apply the liquid to trees, a fyringe with larger holes mult be employed.
"Caterpillars, beetles, carth-fleas, bugs, and the treelice which infelt orange irees, will be deftroyed by the firt application of the liquid. Infects which refide below the earth, fuch as wafps, homets, ants, \&c. require that the liffuid mould be fquirted ou: gently, and vithout intermilion, that it may better penetrate to their nefts. Auts nefts, according to their fize, require from two to three meafures of liquid, and in many cafes it mult be applied for twenty-four hours. When the ants affemble in another place, the procels muft be repeated. Two ounces of nux vomica may be added to the mixture, and boiled along with the fulphur. This fubllance, particulatly when you with to deftroy ants, will be of great fervice. When the whole of the liquid in the cafk has been ufed, the refiduum mult be buried in the earth to prevent domeftic animals from eating it *."

The ufe of elder as a prefervative to vegetables againft the depredations of infects is detailed in the following ob- 18 g . fervations.
"Common elder has appeared to me ufeful, ift, For preventing cabbage plants from being devoured or damaged by caterpillars ; 2d, To prevent blights, and their effects on fruit and other trees; 3 d, To preferve corn from yellow flies and other inlects; \(4^{\text {th, To fecure }}\) turnips from the ravage of Hies, \&c.
"If, The ftrong and fetid odour of a bunch of elder leaves induced me to think that different kinds of butterflies might be incommoded by it in proportion to their delicacy. I therefore took fome young twigs of elder, at the period when buttentlies began to appear, and whipped well with them fome cabbage plants, but in fuch a manner as not to damage them. Since that time, during two fummers, though the butterflies hovered round the plants, I never faw one of them fettle on them ; and I do not think that a fingle butterfly was hatched on the cabbages treated in this manner, tl:ough a neighbouring board was dirtied by them in the ufual manrier.
" 2 d , After a fhort reflection on the effects here mentioned, and on blights, which, in my opinion, are chiefly occafioned by fmall flies and fmall infects, whofe organs are fill mose delicate than thofe of the former, I was induced to whip in the fame manner wilh elder twigs, as high as I could reach, the branches of a plumtree which giew in an efpalier. The \(r\) hipped leaves remained green and in a good condition, while from at leaft fix inches above to the top of the tree the reft of the leaves were blighted, wrinkled, and full of worms. It is here to be obferved that the tree was in fall flower whon I whipped it, therefore much too late for this operation, which ought to have been performed once or twice before fowering \({ }^{\prime \prime}\) But I an of opinion, that if trees were befprinkled with a ftrong infution of elder

\section*{V E \(\boldsymbol{R} \quad \mathrm{F} 5 \mathrm{~T}\) V E R}
momio, every eight or 15 days, the fuccefs would be certain, and that there would be no danger of injuring cither the flowers or the fruit.

3 d, What the farmers call the yellows in corn, and which they confider as a kind of biight. is the effect, as every, one knows, of a fmall yellow tly with blue wings, nearly of the fize of a gnat. It lays its eggs in the ear of wheat, and produces a worm almoft invifible to the naked eye, but which, when feen by a magnifying gilafs, is a large yellow larva, having the flining colour of amber. This fly is fo productive, that I hare counted upwards of forty worms in the chaff of one ear of wheat, which was a number fufficient to deftroy it entirely. I therefore propofed to make my experiment as foon as poffible; but the heat and drought of the feafon having advanced the wheat more than ufual, it was in flower before I could attempt it. Next morning, however, at break of day, two fervants having drawn bundles of elder over the ears of wheat on each fide of the furrow, backwards and forwards, in places where the wheat was not fo far advanced, I hoped that the fetid effluvia of the elder would prevent the flies from remaining on the ears that were covered with them : and, indeed, I was not entirely difappointed; for, on examining my wheat fome time after, I found that the part which had been beaten with elder was much lefs damaged than that which had not been treated in the fame manner. I have no doubt, that, had I employed this precaution fooner, the corn would have been completely preferved. Should this be the cafe, the procefs is fimple; and 1 flatter myfulf that fine crops of corn may be faved by thefe means from this fmall infect, which is fo deftructive to them. One of thefe yellow flies laid on my thumb at leaft eight or ten eggs, of an oblong form, in the fmall interval of time which I employed in walking over two or three furrows, holding it by the wings, and which I conld not obferve without the affiflance of a magnifying glafs.
" 4 th, It often happens that whole crops of turnips are deftroyed while young, in confequence of being pricked by certain infects. I have great reafon to think that this evil may be preveited in an effectual manner, by caufing a perfon to draw a bunch of elder, fufficiently large to cover about the breadth of a foot, over the young turnips, going backwards and forwards. What confirms me in this idea is, that, having drawn a bunch of elder over a bed of young caulifiowers which had begun to be pricked, they afterwards remained untouched by thefe infens.
"A nother fact which tends to fupport this idea is, that when my neigl:bourhood, about eight or nine years ago, was fo infefled with caterpillars that they devoured all the vegetables, leaving fcarcely a green leaf untouched, they, fpared the elder trees amidit this general devaftation, and never molefled them. In reflecting on thefe circumitances, I am of "opinion that the clder might be introduced with advantage into our gardens, as the means of preferving fruit-trees and rarious plants from the rapacity of infects.
- "The dwarf elder appears to me to cxhale a muci more fetid fmell than the common clder, and therefore ought to be preferred in making experiments on this fubject *".

VERNACUL'AFi, a word applied to fomething that is peculiar to any one comntry.

VERNAL, fomething belonging to the fpring-feafon.
vernier scate, a feale excellently adapted for the graduation of mathematical inftruments, thus called from its inventor Peter Vernier, a perfon of diflinction in the Franche Comté. See Nonrus.
Vernicr's method is derived from the following principle. If two equal right lines, or circular arcs, \(\mathrm{A}, \mathrm{B}\), are fo divided, that the number of equal divifions in \(B\) is one lefs than the number of enual divifions of \(A\), then will the excefs of one divifion of 13 above one divifion of \(A\) be compounded of the ratios of one of \(A\) to \(\Lambda\), and of one of B to \(B\).

For let \(A\) contain II parts, then one of \(\Lambda\) to \(\Lambda\) is as I to is, or \(\frac{1}{I I}\). Let \(B\) contain ro parts, then one of \(B\) to B is as I to 10 , or \(\frac{1}{10}\). Now \(\frac{1}{10}-\frac{I}{11}=\frac{I I-10}{10 \times 1 I}=\) \(\frac{1}{10 \times 11}=\frac{1}{10} \times \frac{1}{11}\).

Or if B contaitis \(n\) parts, and A contains \(n+\mathrm{r}\) parts; then \(\frac{1}{n}\) is one part of \(B\), and \(\frac{1}{n+1}\) is one part of \(A\) in And \(\frac{1}{n}-\frac{1}{n+1}=\frac{\overline{n+1}-n}{n \times n+1}=\frac{1}{n} \times \frac{1}{n+1}\).

The mof commodious divifions, and their aliquot: parts, into which the degrees on the circular limb of an inftrument may be fuppofed to be divided, depend on the radius of that inftrument.
Let R be the radius of a circle in inches; and a dcgree to be divided into \(\pi\) parts, each being \(\frac{1}{\rho}\) th part of an inch.
Now the circumference of a circle, in parts of its diameter 2 R inches, is \(3,1415926 \times 2 \mathrm{R}: 3 \cdot 1^{0}: \frac{3,1415926}{360} \times\) 2 R inches.

Or, \(0,01743329 \times R\) is the length of one, degree itit inches.

Or, \(0,01745329 \times \mathrm{R} \times p\) is the length of \(\mathrm{r}^{\circ}\), in \(p\) th parts of an inch.

But as every degree contains \(n\) times fuch parts, therefore \(n=0,01745329 \times R \times p\).

The moft commodious perceptible divifion is \(\frac{1}{8}\) or \(\frac{1}{10}\) of an inch.
Examplc. Suppofe an inftrument of 30 inches radius, into how many convenient parts may each degree be diviled? how many of thefe parts are to go to the breadth of the vernier, and to what parts of a degree may an ob. fervation be made by that infrument?

Now \(0,01745 \times R=0,5236\) inches, the length of each degree : and if \(p\) be fuppofed about \(\frac{1}{8}\) of an inch for one ditifion ; then \(0,5236 \times p=4,188\) fhores the number of fuch parts in a degree. But as this number mult be an integer, let it be 4 , each being \(15^{\prime \prime}\) : and let the breadth of the vernier contain \(3^{1}\) of thofe parts, or \(73^{\circ}\), and be divided into 30 parts.

Fere \(n=\frac{1}{4} ; n=\frac{1}{30}\); then \(\frac{1}{4} \% \frac{1}{30}=\frac{1}{120}\) of a de

Yernat, \(\underbrace{\text { Vucrier. }}\)

Lemies gree, or \(3^{\circ}{ }^{\prime}\), which is the leaft part of a degree that invertilles. firument can fhow.
\(\xrightarrow{-}\) If \(n=\frac{1}{5}\), and \(m=\frac{1}{3^{6}}\); then \(\frac{1}{5} \times \frac{1}{36}=\frac{60}{5 \times 36}\) of a sainute, or \(20^{\prime \prime}\).

The following table, taken as examples in the inftruments commonly made from 3 inches to 8 feet radius, fows the divifions of the limb to neareft tenths of inches, fo as to be an nliquot of 60 's, and what parts of a degree may be eftimated by the vernier, it being divided into fuch equal parts, and containing fuch degrees as their columan how.
\begin{tabular}{|c|c|c|c|c|}
\hline Rad. inches. & Parts of a degree. & Parts in vernier. & Broadth of vernier. & Parts oblerved. \\
\hline 3 & 1 & 15 & \(15 \frac{\pi}{4}\) & \(4^{\prime} 0^{\prime \prime}\) \\
\hline 6 & 1 & 20. & \(20 \frac{1}{7}\) & 30 \\
\hline 9 & 2 & 20 & \(10 \frac{1}{4}\) & 130 \\
\hline 12 & 2 & 2.4 & \(12 \frac{3}{4}\) & 15 \\
\hline 35 & 3 & 20 & \(6 \frac{3}{1}\) & 10 \\
\hline 18 & 3 - & \(3{ }^{\circ}\) & \(10 \frac{1}{4}\) & - 40 \\
\hline 21 & 4 & 30 & \(7{ }^{\frac{1}{4}}\) & - \(3^{\circ}\) \\
\hline \({ }^{2} 4\) & 4 & 36 & \(9{ }^{\frac{3}{4}}\) & - 25 \\
\hline 30 & 5 & 30 & \(7{ }^{\frac{1}{2}}\) & - 20 \\
\hline 36 & 6 & 30 & \(5 \frac{1}{7}\) & - 20 \\
\hline 42 & 8 & 30 & \(3^{\frac{7}{8}}\) & - 15 \\
\hline 48 & 9 & 40 & \(4{ }^{5}\) & - 10 \\
\hline 62 & 10 & 36 & 3\%\% & - 10 \\
\hline 72 & 12 & 30 & \(2{ }^{-7}\) & - 10 \\
\hline \(8+\) & 15 & 40 & \(2 \frac{2}{3}\) & - 6 \\
\hline 96 & 15 & 60 & 4 & 04 \\
\hline
\end{tabular}

By altering the number of divifions, either in the degrees or in the vernier, or in both, an angle can be obferved to a different degree of accuracy. Thus, 10 a radius of 30 inches, if a degree be divided into 12 parts, each being five minutes, and the breadih of the vernier be 21 fuch parts, or \(1^{\frac{3}{4}}\), and divided into 20 parts, then \(\frac{1}{12} \times \frac{1}{20}=\frac{1^{\circ}}{240}=15^{\prime \prime}\) : or taking the breadth of the vernier \(2 \frac{-0}{1 \frac{0}{2}}\), and divided into \(3 \supset\) parts; then \(\frac{1}{12} x\) \(\frac{1}{30}=\frac{1^{0}}{360^{\prime}}\) or \(10^{\prime \prime}:\) Or \(\frac{1}{12} \times \frac{1}{50}=\frac{1^{\circ}}{600}=6^{\prime \prime} ;\) where the breadth of the vernier is \(4^{1^{\circ}}\).

VERONA, a city of Italy, capital of the Veronefe, and in the territory of Venice ; fituated on the river Adige, in E. Long. 11. 24. N. Lat. 45.26. It is feven miles in compafs; and is frongly fortified. It contains \(57-400\) inhabitants.

VERONESE, a territory of Italy, in the republic of Venice ; bounded on the north by the Trentino, on the waft by the Vicentino and P duano, on the fouth by the Mantuano, and on the wer by the Brefciano. It is obout 35 miles in length, and 27 in breadtb; and fertile in corn, wine, fruits, and cattle.

\section*{Veronfse. See Cagliary.}

VEHONICA, a genus of plants of the chafs of diandria; and in the natural ryfeem arranged under the 4oth order, Perfonate. See Botany Index.

VERSAILLES, a torn of Fiance, in the depart--ent of Serine and OVe, 10 miles weft-fouth-wett of Pa-
ris. It contains 60,000 inhabitants, and fince the Re: Veriei:3 volution has been created a bifhop's fee... In the reign trill. of Louis XIII. it was only a fmall village. This prince built here a hunting-hut in 1630 , which BaHompierre calls "the paltry chateau of Verfailles." "Although the fituation was low and very unfavourable, Louis XIV. built a magnificent palace here, which was the ulual refidence of the kings of France till the Gth of October 178 g , when the late unfortunate Louis XVI. and his family were removed from it to the Jhuilleries. The buildings and the gardens are adorned with a valt number of ftatues, done by the greatelt mafters, and the water-works are all worthy of admiration. The great gallery is thought to be as curious a piece of workmanflip of that kind as any in the world: nor is the chapel lefs to be admired for its fine architecture and ornaments. The gardens, with the park, are five miles in circumference, and furrounded by walls. There are three fine avenues to Verfailles; one of which is the common road to Paris, the other contes from Seaux, and the third from St Cloud. E. Long. 2. 12. N. Lat. 48. \(4^{8}\)

VERSE, in Poetry, a line confilting of a number of long and thort fyllables, which run with an agreeable cadence.

Verse is alfoufed for a part of a chapter, fection, \&c.
VERSIFICATION, the art or manner of making verfe; allo the tune and cadence of verfe. See Poerry, Part Ill.

VERSION, a tranflation of fome Look or writing out of one language into another. See Translation.

VERT, in Heraldry, the ierm for a green colour. It is called vert in the blazon of the coats of all under the degree of nobles: but in coats of nobility it is called emerald; and in thofe of kings venus. In engraving it is expreffed by diagonals, or lines drawn athwart from right to left, from the dexter chief corner to the finifter bafe.

VERTEBR IE. See ANatomy, No 30.
VERIEX, in Anatomy, denotes the crown of the head. Hence vertex is alfo ufed figuratively for the top of other things: thus we lay, the vertex of a cone, fyramid, \&c.

Vertex, is alfo ufed in Afronomy for the point of the heaven dircctly over our heads, propetly called the zenilh.

VER'TICILLA'T \(E\), the name of a clafs in Ray's and Boerhaave's Methods, confining of herbaceous regetables. It is alfo the name of the 12 d order in Lin. næus's Fragments of a Natural Method.

VERTICILLUS, a mode of flowering, in which the: flowers are produced in rings at each joint of the fem, with very foort foot-italks. The term is exemplifed in mint, horchound, and the other plants of the natural order defcribed above.

VERTICITY, is tat property of the loadfone whereby it turns or directs irfelf to one particular pcint. VERTIGO, in Medicme. Sce there. N \({ }^{\circ} 82\).
VERTUMNUS, in Mfythology, a god who prefided orer gardens and orchards, honoured among the Etrufcans, from whom the worhip of this deity was tranimitted to the liomans.

Vertumnus had a temple near the market-place at Rome, being reprefented its one of the tutelar deities of the merclants . The commentators on Ovid fay,
sumori－that he was an ancient king of Hetruria，who，by anum his diligent and fucceffful cultivation of fruit and gar－ dens，obtained the honour of being rauked annong the gods．
，VERUMONTANUM，in Anatony，a rmall emi－ nence near the paffages where the femen is difcharged into the urethra．
vervain．See Verbena，Botany Index．
VERTO＇d＇Auboef，Rene Aubert de，a celebrated hittorian，was defcended from a noble and ancient fami－ ly in Normandy，and born in 1655．At 16 years of age he became a Francifcan friar ；afterwards he enter－ ed into the order of the Premonfleatenfes，in which he had feveral benefices：and at length was a fecular eccle－ fiatic．He became fecretary to the duchefs of Orleans， member of the Academy of Infcriptions，and hillorio－ grapher of Nialta．He died at Paris in 1735．His principal works are，i．The Hifory of the Revolutions of Siveden．2．The Revolutions of Purtugal．3．The Revolutions of the Romans．4．The Hiftory of Malta． Thefe works are written in elegant French，and tranf－ lated into moft of the languages of Europe．
verulam．See Bacon．
VESALIUS，Andreas，a celebrated phyfician and anatomift，was born at Brufiels about the year I 512 ． He ftudied plyyic at Paris under James Sylvius；but applied himfelf chiefly to anatomy，which was then very iittle known，diffections being efteemed unlawful and impious：and it appears from kis work De humani cor－ poris fabrica，that he perfected himelf in this ufeful knowledge very eally，About the year 1537，the re－ public of Venice made him profeffor in the univerfity \({ }^{\circ}\) e Padua，where he taught anatomy for feven years； Charles V，called him to be his phyfician，as he was allo to Philip II．king of Spain．Vefalius was now at the height of his glory，when all of a fudden he formed the defign of taking a journey to Paleftine ；concerning which jorrney we are told the following fory．A young Spaninh nobleman he attended，being believed to be dead，Veflius obtained leave to open him to explore the true caufe of his illnefs；but when he opened the breatt，he perceived fymptoms of life，and faw the heart beat．The parents，not fatisfied with profecuting him for murder，accufed him of impiety to the inquifition，in hopes that tribunal would punith him with greater ri－ gour：but the king interpofing，faved him on condition of his making a pilgrimage to the Holy Land．He was thipwrecked on his return，and thrown upon the inand of Zantc，where he peerilhed，in 1564 ．Hie was the author of Several works，the principal of which is De humani carporis fabrica．

VESICATORIUM，a Blister ；an application of an acrid nature made to any part of the body，in order to drasy a flux of humpurs to that part，and thus clevate the fcarfskin into a blifter．

VESPA，the WASP；a genus of infeets belonging to the order of hymenoptera．＂Sce Extomelogy Indicr．＂
VESPASIAN，the soth emperor of Rome ：vemark－ able for his clemency and other virtues．Sce Rome， \(\mathrm{N}^{\circ}\) ミママー
VESPERS，in the chuach of Rome，denote the af－ ternoon fervice；anfwering in fome meafure to the even－ ing nrayers of the church of England．
VESPERTILIO，the BAT；a genus of quadrupede，
belong：ig to the order of primates．See Mammalia Index．

VESSEL，a general name given to the different forts of hips which are navigated on the ocean，or in＂canals and rivers．It is，however，more particularly applied to thofe of the fmaller kind，furnifhed with one or two mafls．See Surp．

VESTA，in pagan worlhip，the fame with Cybele． Sce Cybele．
Vesta the Younger，in pagan wornip，the goddefs \({ }^{\circ}\) of Fire，was the daughter of Saturn and Cybele，and the filler of Ceres．She was fo much in love with chafity， that on Jupiter＇s afcending the throne and offering to grant whatever the afised，the only defired the preferva－ tion of her virginity，which the obtained．－Vefta was not reprefented in her temple by any image．

VisT．2，one of the lately difcovered plancts，of which the elements have been determined by Dr Gaufs in a， communication to the looyal Society of Gottingen．

－VESTALIA，in Roman antiquity，a fettival cele－ brated in honour of the goddefs Vefta，on the 5 th of the ides of June ：that is，ois the ninth of the month．

VESTALS，among the ancient Rumans，were prief． effes of the goddefs Vefta，and had the perpetual fire committed to their charge；they were at firf only four in number，but afterwards increafed to fix＇；and it does not appear that their number ever exceeded fix，amonng whom was one fuperior to the rent，and called veg \(/ a / \hat{f}\) maxima．

The veftals were chofen from fix to ten years of age， and obliged to ftrift continency for 30 years；the fint ro of which were employed in learuing the ceremonies of religion，the next is m the perfomiance of them，and the ro laf in teaching then to the younger veftals＂

\section*{E S \(\quad[558] \quad \mathrm{V}, \mathrm{E}+\mathrm{S}\)}

Veftible if
Vefuvius. called infula, which fat clofe to the head, and from whence hung certain laces called entta; a kind of furplice made of white linen, and over it a purple mantle with a long train to it.

VESTIBLE, or Vestibute, in Architecture, a Lind of entrance into a large building; being an open place before the lall, or at the bottom of the flaircale.

VESTRY, a place adjoining to a church, where the veftments of the minitter are kept ; and alfo a meeting at fuch place, confifing of the minifter, church-wardens, and chief men of moft parihes, who make a parifh veftry or meeting. By cuftom there are felect veftries, being a certain number of perfons chofen to have the goverument of the parifh, make rates, and take the accounts of church-wardens, \&c.

VESUVIAN, a mineral fubfance. See MineRalogy Index.

VESUVIUS, a celebrated volcano of Italy, fir miles eaft from the city of Naples. 'This mountain has two tops; one of which only goes by the name of \(V\) efurius, the other being now called Somma; but Sir William Hamilton is of opinion, that the latter is what the ancients called \(V_{\text {efuvius. }}\)

General defcription of the mountain.
ccount of the firft cruption recorded in hiftory.

The perpendicular height of Vefuvius is only 3700 feet, though the afcent from the foot to the top is three Italian miles. One fide of the mountain is well cultivated and fertile, producing great plenty of vines; but the fouth and weft fides are entirely covered with cinders and athes; while a fulphureous fmoke conflantly iflues from the top, fometimes attended with the moft violent explofions of fones, the emifion of great fleams of lava, and all the other attendants of a molt formidable volcano. The firft of thefe eruptions recorded in hiftory took place in the year 79; at which time the two cities of Pompeii and Herculaneum were entirely buried under the fones and ahes thrown out. Inaredible mifchief was alfo done to the neighbouring country, and numbers of people loft their lives, among whom was Pliny the Elder.
\({ }^{4}\) It is the opinion of the beft judges, however, that this eruption was by no means the firft that had ever happened. The very ftreets of thofe cities which were at that time overwhelmed are faid to be partly paved sith lava. Since that time 30 different eruptions have been recorded, fome of which have been extremely violent. In the year \(15 \hat{y}^{8}\), a mountain, three miles in circumference and a quarter of a nile in perpendicular height, was thrown up in the courfe of one night.

The firft great eruption taken notice of by Sir William Hamilton was that of 1767 , whicb, though very violent, was mild in comparifon with that of 1538 .
From this time ( 1767 ) Vefuvius never ceafed for ten years to fend forth froke, nor were there many months in which it did not throw out flones, fcorix, and cinders; which, increafing to a certain degrec, were ufually followed by lara; fo that from the year iyby to 1779 there were nine eruptions, fome of them yery confiderable. In the month of Auguft that year, however, an eruption took place, which, for its extraordinary and terrible appearance, may be reckoned among the moft remarkable of any recorded concerning this or any other volcano.
During the whole month of July the mountain con-
fions and rumbling noifes were heard; quantities of
fmoke were thrown up with gricat violence, fometimes with red-hot ftones, fcorix, and afhes; and towards the end of the month thefe fymptomis increared to fuch a cegree as to exhibit, in the night-time, the moft beautiful fireworks that can be imagined.

On Thurfday 5 th Auguft the volcano appeared mort violently agitated; a white and fulphureous fmoke if fucd continually and impetuounly from its crater, one puff feerning to impel another; fo that a mafs of them was foon accumulated, to appearance four times the height and fize of the volcano itfelf. Thefe clouds of fmoke were exceedingly white, fo that the whole refembled an immenfe accumulation of bales of the whiteft collon. In the midnt of this very white finoke, valt quantities of fones, fcorix, and afhes, were thrown up to the height of 2000 feet; and a quantity of liquid lava, feemingly very heavy, was lifted up juft high enough to clear the rim of the crater, and take its way down the fides of the mountains. This lava, having run violently for fome hours, fuddenly ceafed, juf before it had reached the cultivated parts of the mountain, near four miles from the fpot whence it iffued. The heat, all this day, was intolerable at the towns of Somma and Ottaiano; and was fenfibly felt at Palma and Lauri, which are much farther off. Reddifh afthes fell fo thick on the two former, that the air was darkened, and that objects could not be diftinguifhed at the diftance of ten feet. Long filaments of a vitrified matter, like fpun glafs, were mixed, and fell with thefe affes; feveral birds in cages were fuffocated, and the leaves of the trees in the neighbourhood of Somma were covered with white and very corrofive falt.

About 12 at night, on the 7 th, the fermentation of Extracric. the mountain feemed greatly to increafe. Our author nars efiuwas watching the motions of the volcano from the mole fion of fire at Naples, which has a full view of it. Several glo- by the aprious picturefque effects had been oblerved from the re- proach of flection of the deep red fire within the crater of Vefu-clouds vius, and which mounted high amongh thofe huge clouds on the top of it: when a fummer form, called in that country a tropec, came on fuddenly, and blended its heavy watery clouds with the fulphureous and mineral ones, which were already like fo many other mountains piled up on the top of the volcano. At this moment a fountain of fire was fhot up to an incredible height, cafting fo bright a light, that the fmalleft objeets were clearly dintinguiftuable at any place within fix miles or more of Vefuvius. The black formy clouds, paffing firiftly over, and at times covering the whole or a part of the bright column of fire, at other times clearing away and giving a full view of it, with the varinus tints produced by its reverberated light on the white clouds above in contran with the pale flathes of forked lightning that attended the tropea, formed fuch a feene as no power of art can exprefs. One of his Sicilian majefy's gamekcepers, who was out in the fields near Ottaiano whilif this form was at its height, was furprifed to find the drops of rain feald his face and hands; a phenomenon probably occafioned by the clouds having acquired a great degree of heat in paffing through the abore-mentioned column of fire.
On the 8th, the mountain was quiet till towards fix o'clock in the evening, when a great fmoke began to gather over its crater'; and about on hour after a rumbling
bling fubterraneous noife was heard in the neighbourhood of the volcano; the ufual throws of red-hot frones and forix began and increafed every inflant. The crater, viewed through a telefcope, feemed much enlarged by the violence of laft night's explolions, and the little mountain on the top was entirely gone. About niné o'clock a moft violent seport was heard at Portici and its neighbourhood, which fhook the houles to luch a degree as made the inhabitants run out into the ftreets. Many windows were broken, and walls cracked by the concuffion of the air on this occafton, though the noife was but faintly heard at Naples. In an inflant a foumtain of liquid tranfparent fire began to rife, and gradually increafing, arrived at laft at the amazing height of ten thoufand feet and upwards. Puffs of fmoke, as black as can poffisly be imagined, fucceeded one another haftily, and accompanied the red-hot, tranfparent, and liquid lava, interrupting its fplendid brightnefs here and there by patches of the darkeft lue. Within thele puffs of Cmoke, at the very moment of emiffion, a bright but pale electrical fire was obferved playing brikly about in zig-zag lines. The wind was fouth-welt, and, though gentle, was fufficient to carry thefe puffs of fmoke out of the column of fire; and a collection of them by degrees formed a black and extenfive curtain behind it; in other parts of the \(\mathbb{k y}\) it was perfectly clear, and the fars bright. The fiery fountain, of fuch immenfe magnitude, on the dark ground juft mentioned, made the fineft contralt imaginable; and the blaze of it reflected from the furface of the fea, which was at that time perfcetly fmooth, added greatly to this fublime view.

The lava, mixed with fones and fcorix, having rifen to the amazing height already mentioned, was partly dirested by the wind towards Ottaiano, and partly falling, ftill red hot and liquid, upon the top of Vefuyius, covered its whole cone, part of that of the fummit of Somma, and the valley between them. The falling matter, being nearly as inflamed and vivid as that which was continually iffuing freih from the crater, formed with it one complete body of fire, which could not be lefs than two miles and a half in breadth, and of the extraordinary height above mentioned, and calt a heat to the diftance of at leaft fix miles romnd. The brathwood on the mountain of Somma was foon in a blaze, and the Rame of it being of a different colour from the deep red of the matter thrown ont by the volcano, and from the filvery blue of the electrical fire, fill added to the cortraft of this molt extraordinary feene.

The black cloud, increafing greatly, once bent towards Naples, and threatened the city with Speedy defruction; for it was charged with electrical fire, which kept conftantly darting about in bright zig-zag lines. 'This fire, however, rarely quitted the cloud, but ufually returned to the great column of fre whence it proceeded; though once or twice it was feen to fall on the top of Somma, and let fire to fome dry grals and buthes. Fortunately the wind carried back the cloud juft as it reached the city, and had begun to occafion great alarm. The column of fire, however, fill continued, and diffufed fuch a Ifrong light, that the mof minute objects could be difcerned at the diftance of ten miles or more from the monntain. Mr Morris informed our au thor, that at Sorrento, which is 12 miles, diftent from

\section*{V E S [ 560 ] V I C}

Vefurius that his fon, the duke of Popoli, who was at Monte Nileto the 8th of Auguf, had been alarmed by the fhower of cinders that fell there ; fome of which he had fent to Naples weighing two ounces; and that tones of an ounce weight had fallen upon an eftate of his ten miles fazther off. Monte Mileto is about 30 miles from the volcano. The abté Cagliani alfo related, that his fitter, a nun in a convent at Manfredonia, had written to inquire after him, imagining that Naples muft have been deftroyed, when they, at fo great a diflance, had been alarmed by a flower of aftes which fell on the city at I.I o"clock at night, fo much as to open all the churches, and go to prayers. As the great eruption happened at nine o'clock, thefe anes mult have travelled 100 miles in the fpace of two hours.

Nothing could be more difmal than the appearance of Ottaiano after this eruption. The houfes were unroofed, balf buried under the black fcoria and athes; ali the windows towards the mountain were broken, and fome of the houfes themfelves burnt ; the freets choked up with athes, in fome narrow places not lefs than four feet thick; and a few of the inhabitants who had juf returned, were employed in clearing them away, and piling them up in hillocks, to get at their ruined houles. The palace of the prince of Ottainno is fituated on an eminence above the town, and nearer the mountain. The fteps leading up to it were deeply covered with volcanic matier; the roof was totally deftroyed, and the windows broken, but the houfe itfelf, bcing ftrongly built, had not fuffered much.

An incredible number of fragments of lava were thrown out during the emption, fome of which were of immenfe magnitude. The largeft meafured by Sir William Hamilton was 108 fcet in circumference and 17 in height. This was thrown at leall a quarter of a mile clear of the mouth of the rolcano. Another, 66 fect in circunference and 19 in beight, being nearly of a fpherical figure, was thrown out at the fame time, and lay near the former. This lat had the marks of being rounded, nay almof polified, by continual rolling in torents or on the fea-more. Our author conjectures that it might be a foherical volcanic falt, fuch as that of 45 feet in circumference mentioned by M . de St Fond, in his Treatife of Extinguifhed Volranoes. A third of 16 feet in height and 92 in circumference was thrown much father, and lay in the valley between Vefurius and the Hermitage. It appeared alfo, from the large fragments that furrounded this mafs, that it had been much larger while in the air.

Vefuvius continued to emit fmoke for a confiderable time after this great eruption, fo that our author was apprehenfive that another would foon enfue; but from that time nothing comparable to the above has taken place. From the time of this great cruption to the year 1784 our author kept an exact diary of the operations of Vefuvius, with drawings, howing, by the quantity of froke, the degree of fermentation wilhin the volcano. The opcrations of the fubterraneous fire, lowever, nppear to be very capricious and uncertain. One day there is the appearance of a violent fermentation, and the next every thing is trarquil; but whenever there has been a confiderable ejection of fonixe and cinders, it has been a conftart olfervation, that the Lava foon made its appearance, cither by boiling over the
crater, or forcing its way through the crevices in the conical part of the mountain. An eruption took place in the month of November \(17^{84}\), and continued for fome time, but without any remarkable circumnance.

VEl'CH. See Vicia, Botany Index.
VETERAN, among the ancient Iomans, an appellation given to a foldier grown old in the fervice, or who had made a certain number of campaigns.

VETERINARY art. See Farrilry.
VEXILLUMT, in Botany; the upper petal of a peabicom, or butterlly-fhaped flower, which is generally larger than any of the others.

VlALES, in mythology, a name given among the Romans to the gods who had the care and guard of the roads and bighways.

VIAIICUM, in Roman antiquily, on appellation given in common to all officers of any of the magillrates; as liffors, accenfi, foribes, criers.

VIBEX, is fometimes uled by phyficians, for a black and blue fpot in the thin occafioned by an efflux or extravafation of blood.

VIBRATION, in Mechanics, a regular, reciprocal motion of a body, as a pendulum.

VIBURNUM, a genus of plants of the clafs pentandria; and in the natural fyitem arranged under the 43 d order, Dumofre. See Botany Indere.

VICAR, a petfon appointed as deputy to another, to perform his functions in his abfence, and under his authority.

Vicar, in the canon-law, denotes a prich of a parill, the predial tithes whereof are impropriated or apptopriated; that is, belong either to a chapter, religious houfe, \&c. or to a layman who receives them, and only allows the vicar the fmall tithes, or a convenient falary. See the article PARSON and Vicar.

VICE, in ethics, is ordinarily defined an elective habil, denoting either an excefs or defeet from the juft medium wherein virtue is placed.

VICF, in finithery and other arts converfant in metals, a machine or inftrument ferving to bold faft any thing they are at work upon, whether it is to be beaten, filed, or rivetted.

Vice is allo ufed in the compofition of divers words to denote the relation of fomething that comes inftead or in the place of another; as vicc-admiral, vice-chancellor, \&c. are officers who take place in the abfence of admials, \&xc.

VICEROY, a governor of a kingdom, who commands in the name and infead of a king, with full and fovereign authority.

VICIA, a genius of plants of the clafs diadelphia; and in the natural fyflem arranged under the 32 d order, Papilionacere. Sce Botany Index.

VICISSITUDE, the regular fucceffion of one thing after another; as the viciflitude of day and night, of the feafons, \&ic.

VICIIM, denotes a facrifice officred to fome deity, of a living creature, as a man or beaft, which is flain to appeafe his wrath, or to obtair fome favour.

VICTOR, SExtus Auretive, a Roman hiftorian, who dounifhed witer the emperors Confantius and Julian ; as we learn from many paffages in his own writings, and alfo from Armmianus Marcellinus. This hiftorian relates, that Contlantius made him conful, and

\section*{V. I E [ 561 ] V I G}
excellent qualifications; although, as he owns of him. felf, he was born in an obfcure village, and of poor and illiterate parents. It is commonly believed that he was an African : it is certain, that he divells much upon the praifes of that country, which he calls the glory of the earth; decus terrarum. Two books of his are extant in the hiftorical way : one De viris illuffribus urbis Romac'; the other, De Ciefaribus; to which is prefixed Libellus de origine gentis Romanc. The whole makes an abridged hillory of Rome, from its foundation down to the reign of Julian inclufive.

VICTORY, the overthrow or defeat of an enemy in war or combat.

Victory, in Pagan worflip, is reprefented by Hefiod as the daughter of Styx and Pallas; and Varro calls her the daugher of Heaven and Earth. The Romans erected a temple to her, where they prayed to the gods to give fuccel's to their arms. They painted har in the form of a woman, clad in cloth of gold. In fome medals, fhe is reprelented with wings flying through the pir, holding a laurel crown in one hand and a palm in the other; but in other medals, the is feen ftanding upon a globe, with the fame crown and branch of palm.

Vida, Marcus Hieronymus, bifhop of Alva, in Montferrat, and one of the moft excellent Latin poets that have appeared fince the Auguftan age, was born at Cremona in 1470. Having diftinguilhed himfelf by his learning and talte for literature, he was made bifhop of Alva in 1552. After continuing two years with Pope Clement VII. at Rome, he went to refide upon his fee; where, for 30 years, he performed all the offices of a good bifthop and a good man; and though he was mild, gentle, and full of goodnefs, he was fo far from wanting firit, that when the city of Alva was befieged by the French, he ufed all poffible means to prevent its being given up, by ftrenuoufly exhorting the people, and, when provifions were fcarce, by fupplying them at his own expence. His Poetics, and poem on the filkworm, pals for his mafterpiece; his poem on the game of chefs is alfo greatly admired. He alfo wrote hymns, eclogues, and a poem entitled Chrifiados in fix books; all which are in Latin, and have gained him a great reputation. His works in profe confift of dialogues, fynodical conftitutions, letters, and other pieces. He died in 1566 , foon after being made bihop of Cremona.

VIENNA, the capital of the circle of Aufria, in Germany, and of the whole German empire, is the place where the emperor refides. The city itfelf is not of very great extent; nor can it be enlarged, it being limited by a very ftrong fortification; but it is very populous. The ftreets, in general, are narrow, and the houfes built high. Some of the public buildings are magnificent; but they appear exterinally to no great advantage, on account of the narrownefs of the flreets. The chief of them are the imperial palace, the library, and the mufeum; the palaces of the princes Lichtenftein, Eugene, \&ic. . Vienna was twice ineffectually befieged by the Turks; namely, in 1589 and 1683 . At the latter period, the fiege was railed by John Sobiefki, king of Poland, who totally defeated the Turkith army before the walls of this place. There is no great danger that Vienrad will ever again be fubjected to the inconveniences of a fiege. Yet, in cafe that thould happen, a mealure has
Vol. XX. Part II.
been taken, which will prevent the neceffity of deftroy: ing the fuburbs; namely, no houfes without the walls are allowed to be built nearer to the glacis than 600 yards; fo that there is a circular ficlid of that breadith all round the town, which, exclufive of the adrantage above-mentioned, has a very beautiful and laluary ciffect. Thefe magnificent fuburbe, and the town together, are faid to contain above 300,000 inhabitants; yet the former are not near fo populous, in proportion to thecir fize, as the town; becaufe many houfes in the fuburbs have extenfive gardens belonging to thein, and many \(f_{d}-\) milies, who live during the winter within the fortifications, fpend the fummer in the fuburbs. The cathedral is built of frec-fone, is 114 yards long, and 48 brad , and the fleeple is 447 feet high. Inftead of a weathercock there was a Turkifl crefcent, in memory of the fiege in 1589 ; but, after the fecond fiege in 1683 , it was changed for a golden crofs, which three months after was thrown down by a florm. At prefent there is a black fpread eagle, over which is a gilded crofs. Joining to this church is the archbilhop's palace, the front of which is very fine. The univerfity had feveral thoufand fudents, who, when this city was beficged, mounted guard, as they did alfo in 1741. Befide this, there is the acadeny of Lower Auftria ; and the archducal library is much frequented by foreigners, as it contains above 100,000 printed books, and 10,000 manufrripts. The academy of painting is remarkable for the fine pictures it produces. The archducal treafury, and a cab:net of curiofties of the houfe of Auftria, are great ratities. The inhabitants, in general, live in a fplendid manner ; and people of diflinetion have all forts of wines at their tables, which they are very free with to foreigners. There is a fort of harbour on the Danube, where there are magazines of naval fores, and fhips have been fitted out to ferve on that river againft the 'Turks. Vienna is an archbifhop's fee. It is feated at the place where the river Vienna or Wein, falls into the Danube, 30 miles wefl of Prefburgh, 350 north-north-ealt of Rome, 520 fouth-eaft by fouth of Amfterdam, 565 eall of Paris, and 680 ealt-fouth-eaft of London. E. Long. 16. 28. N. Lat. \(4^{8 .}\). 3 .

VIGIL, in church hifory, is the eve or next day bebefore any folemn feaft; becaufe then Chriftians were wont to watch, faft; and pray, in their churches.

VIGILS of Plants, a termi under which botanifts comprehend the precife time of the day in which the flowers of different plants open, expand, and thut.

As all plants do not flower in the fame feafon, or month ; in like manner, thofe which flower the fame day, in the fame piace, do not open and fhut precifely at the fame hour. Some open in the morning, as the lip flowers, and compound flowers with flat fpreadirg petals; others at noon, as the mallows; and a third fet in the evening, or after funfet, as fome geraniums and opuntias : the hour of thutting is equalily determined. Of thofe which open in the morning, fome fhut foon after, while others remain expanded till night.
Ihe hours of opening, like the time of flowering, feem to vary, according to the. fpecies of the plant, the temperature of the climate, and that of the feafon. Flowers, whofe extreme delicacy would be hurt by the firong imıpreffions of an ardent fun, do not open till night; thoie which require a moderate degree of heat to elevate their juices; in other words, whofe juices do not rife but in
 Vigil.

\section*{V I [ 562 ] V I I}

Vicil the morning or evening, do not expand till then; whilla thofe which need a noore lively heat for the fane pur. pofe, expand at noon, when the fun is in his meridiaa frength. Hence it is, that the heat of the air being greater betwixt the tropics than elfervisere, plants which are tranfuorted from thofe climates into the cold or \(t \mathrm{~cm}\) perate climates of Europe, expand their flowers much later than in their native foil. Thus, a flower which opens in fummer at fix o'clock in the morning at Sencgal, will not open at the fame feafon in France and England till cight or nine, nor in Sweden till Len.

Linneus dillinguities by the general name of folar (flores folares) all thofe floweis which obferve a determinate time in opening and flutting. Thefe flowers are again civided, from certains circumftances, into three \(\oint_{\mathrm{p}} \mathrm{e}\) cies, or kinds:

Equinoctial Howers (fores arquinoctiales) are fuch as open and fhut at all featons, at a celta i fixed or determinate hour.

Tropical Howers ( flores tropici) are fuch whofe hour of opening is not fixed at all leafons, but accelerated or retarded according as the length of the day is increafed or diminithed.

Meteorous flowers (fores metcorici) are fucly whofe hour of expanfion depends upon the dry or humid tlate of the air, and the greater or lefs preffure of the atmofphere. Ot this tind is the Siberian fow-thifte, which thuts at night if the enfuing day is to be clear and ferene, and opens if it is to be cloudy and rainy. In like manner the African marigold, which in dry ferene weather opens at fis or feven in the morning, and fhuts at four o'clock in the afternoon, is a fure indication that rain will fall during the courfe of the day, when it conti:ues fhut afte: \{even.
* VIGO, a fea port town of Galicia in Spain, with an old caftle and a fort. It is feated in a fertile country by the fea.fide. It was rendered famous by a fea-fight between the confederate feet commanded by Sir George Rork, and a fquadron of French men of war, wliife the duke of Ormond with a body of land forces drove the Spaniards from the cafles which defended the harbour. Admiral Hopfon having with infnite danger broken through the boom made acrofs the mouth of the harbour, the Englifi took four galleons and five large men of war, and the Dutch five galleons and one man of war. Four galleons, with 14 men of war, were deftroy\(\epsilon\) d, with abundance of plate and other rich effects. WV. Long. 8. 21. N. Lat. 4 2. 3.

Vilid Franca, the name of feveral towns; one in Piedmont, three miles eaft of Nice ; another of Catalonia, 38 miles weft of Barcelona; a third, the capital of St Michael, one of the Azores; and a fourth, a town of Effremadura in Spain, 57 miles fouth eall of Salamanca.

VIL.LAGE, an aftemblage of houfes inhabited chiefly by peafants and farmers, and having no market, whereby it is difinguifled from a town. The word is French, formed of vil or vilis, " low, mean, contemptible:" or sather, from the Latin villa, a country-houfe or farm.

Vili.Ain, or Vifilin, in our ancient cuftoms, denotes a man of fervile or bafe condition, viz, a bondman or Servant.

VILL.ENAGE, in Law. The folk-land or eftates held in villenage, was a feccies of tenure neither fitielly feodal; Norman, or Saxon; but mixed and compounded
of them all; and which alfo, on account of the heriots Villera; that ufually attend it, may feem to have tomewhat Datiith in its compofition. Under the Sason government there were, as Sir Willian 'Jemple fpeaks, a fort of people in a condition of downight fervitude, ufed and employed in the moff fervile works, and belonging, buth they, their children, and effels, to the lord of he foil, like the seft of the eattle or llock upon it. 'Thefe feem to have been thofe who held what was called the folkland, from which they were removeable at the lord's pleature. On the artival of the Normans here, it feems not improbable, that they, who were thangers to any other than a feodal flate, might give fome iparks of enfranchifement to fuch wietched perfons as fell to their fhare, by admitting them, as well as others, to the oath of fealiy; which couferred a right of protection, and rair. ed the tenant to a kind of eltate fuperior to downright flavery, but inferior to every other condition. This they called villenage, and the tenants villeinis.

Thefe villeins, belonging principally to lords of manors, were either villeins regardent, that is, annexed to the manor or land: or elle they were ingofs, or at large, that is, annexed to the nerfon of the lord, and transfe 1able by deed from one owner to another. They could not leave their lord without his permiffion; but, if they ran away, or were purioined from him, might be claimed and recovered by action, like healls or other chattels. They heid indeed fmall portions of land by way of fufaining themfelves and lamilies: tut it was at the mere will of the lord, who might difpoffefs them whenever he pleafed; and it was upon villein fervices, that is, to carry out'dung, to hedge and ditch the lord's demefnes, and any other the meaneff offices: and tleeir fervices were not only bale, but urcertain both as to their time and quantity.

A villein could acquire no properly either in lands or goods: if he purchated cither, the lord might feize them to his own ufe; unlefs he contrived to dif?ole of thenm again before the lord had feized thern, for the lood had then tol his opporturaty.

In many places alio a fine was payable to the lord, if the villein prefumed to marry his daughter to any one with leave from the lutd: and, by the common law, the lord might alfo bring an action acrainft the hufband for damages in thus purloining his property. For the children of villeins were alfo in the fame flate of bondage with their parents; whence they were called in Latin notivi, which gave rife to the female appellation of a villein, who was called a neife. In cale of a marriage between a freeman and a neife, or a villein and a freewoman, the iffiue followed the condition of the father, being free if he was free, and a villein if he was villein, contrary to the maxirn of the civil law, that partus \(f\) equitur ventrem. But no baftard could be born a villein, becaufe by'another maxim of our law he is nullins filius; and as he can gain nothing by inherilance, it were hard that he floould lofe his natural fieedom by it. The latr, however, protected the perfons of villeins againf atrocious injuries of the lord: for he might not kill or maim his villein; though be night beat him with impunity.
Villcins might be enfranclifed by manumifion. In procefs o time they gained confiderable ground on their Jords; and in particular fireng thened the tenure of their eflates to that degree, that they came to have in them an intereft in many places full as good, in others better

\section*{V i l [ 503 ] V I N}
matore than their dords. For the gond mature and benevolence of enany lords of manors having, time out of mind, permitted their villcins and their children to enjoy their poffeffions without interruption, in a regular courle of defcent, the comnun law, of which cufton is the life, now gave them title to pretcribe agraint their lords; and, on performance of the fame fervices, to hold their lands, in fipite of any determination of the lord's will. For though in general they are ftill faid to hold their eltates at the will of the lord, yet it is Cuch a will as is agreeable to the cuitom of the manor; which cultoms are prefer ved and evidenced by the rolls of the feveral courts-baron in which they are entered, or kept on foo by the conlant immemorial ufage of the fiveral manors in which the lands lic. And as fach tenants had nothing to thow for their citates but thofe cuftome, and atmifions in purfuance of them, entered on thefe rolls, or the copies of fuch entries witneficd by the Reward, they noiv began to be called tenants by copy of court-roll, and their temure itfulf a conyhold.

Privileyed VIILENAGE, a fpecies of tenure otherwife called villein-focage. Sue Terure.

Aacient demefine confifs of thofe lands or manors which, though now periaps granted out to private fubjects, were actually in the hands of the crown in the time of Edward the Confenfur, or William the Conqueror ; and fo appear to have beea, by the great furvey in the exchequer, called the dioomfday-book. The tenants of thefe lands, under the crown, were not all of the fame order or degzee. Some of them, as Britton teftifies, continued for a long time pure and abfolute villeins, depentent on the will of the lord; and common copyholders in only a fow points. Others were in a great meafure cufranchifed by the ruyal favour; being only bound in refpect of their lands to perform fome of the better fort of villein-fervices, but thofe determinate and cettain ; as, to plougla the king's land for fo many days, to Cupply his court with fuch a quantity of prorifions, and the like; all of which are now changed into pecuniary rents: and in conlideration hereof they had many immunitics and privileges granted to them; as, to try the right of their property in a peculiar court of their own, calle:l a court: of ancient demefine, by a peculiar procels denomianted a writ of right clofe; not to pay toll or taxes; not to contribute to the expences of knighits of the flire ; not to be put on juries, and the like.

Thefe tenants therefore, though their tenure be abfolutely copyhold, yet have an intereft equivalent to a freehold: for though their fervices were of a bale and and villenous original, yet the tenants were efleemed in all others refpects to be highly privileged villeins; and efpeciaily for that their fervices were fixed and determinate, and that they could not be compelled (like pure villeins) to relinquill thofe tenements at the lords's will, or to hold them ayaingt their own : et ides (fays Bracton) dicuntur libcri.

Lauds hoiding by this tenure are therefore a fpecies of copybold, and as fuch preferved and exempted from the operation of the fatute of Charles II. Yet they differ from common copyholds, principally in the privileges before mentioned: as allo they differ from freehoiders by one efpecial mark and tincture of villenage, noted by Brakon, and remaining to this day; viz. that they cannot be conveyed from man to man by the general common-law conveyances of feofment, and the reft ;
but muft pafs by furrender to the lord or his feward, in the manner of common copyholds: yet with the difference, that, in the furrenders of thefe lands in ancient de. mefne, it is not ufed to fay, "to hold at the will of th:cir lord," in their copies; but only, " to hold according to the cuftom of the manor."

V1LLII, among botanits, a kind of down like fhort hair, with which lome trees abound.

VILLOSE, or Vili,ous, fomething abounding with villi or fiores like fhort hair; fuch is one of the coats of the flomach.

VINCA, a genus of plants of the clafs pentandria; and in the natural fyllem arranged under the goth order, Contortce. See Botany Indes.

Sr VINCENT, one of the windward Caribbee illands, which received its name from being difcovered on the 22d of January, the feaft of that Saint. It is inhatuited by a race of people, of whom Dr liobertion gives this account: "There is a great diftinetion in charafter between the Caribbees and the inlabitants of the larger illands. The former appear manifeitly to be a feparate race. Their language is totally different from that of their neighbours in the large illands. They thenifelves have a tradition that their anceftors came originally from forne part of the continent, and having conquered and exterminated the ancient inlabitants, took polfetion of their lands and of their women. Hence they call themfelves Banaree, whicl fignifies a man come from beyond fea. Accordingly, the Caribbets ftill ufe two diftinct languages, one peculiar to the men, and the other to the women. The language of the men has nothing common with that fpoken in the large inands. The dialect of the women confiderably refembles it. This firongly confirms the tradition which I have mentioned. The Caribbees themfelves imagine that they were a colony from the Galibis, a powerful nation of Guiana in South America. But as their fierce manners approzch nearer to thofe of the people in the northern continent, than to thofe of the natives of South America, and as their language has likewife fome aftinity to that fpoken in Florida, their origin frould be deduced rather from the former than from the latter. In their wars they fill preferve their ancient practice of deftroying all the males, and preferving the women either for fervitude or for breeding."

It remained a long time after it was difcovered inhabited by thefe people, and by another race improperly ftyled Black Carils, who arc in reality negrees defeended, as is generally believed, from fome who efcaped out of a Guinea hio wrecked upon the coalt, and gradually augmented by fuch as fromi time to time fled thither from Barbadoes. Thefe nations were often at war; but when their quarrels were compofed, they had a frength fufficient to prevent itrangers from fettling by force. The Fiench, about half a century ago, at the requeft of the Caribs, made a defent from Martinico, and attacked the negroes, but were repulfed with lofs; and found it their intereft to conciliate a friendhip with both nations by means of prefents, and furnining them with arms and ammunition.
St Vincent was long a neutral ifland; but, at the peace of 1763 , the French agreed that the right to it flould be vefted in the Englifin who, in the fequel, at the inftance of fome rapacious planters, cngaged in an unjuft war againft the Caribbees, who inhabited the

\section*{\(V\) IN}

St Vinecnt, windward fide of the ifland, and who were obliged to Vinci. condent to a peace, by which they ceded a very large tract of valuable land to the crown. The confequence of this was, that in the next war, in 1779, they greatly contributed to the reduction of this illand by the French, who, however, reftored it by the peace of 1783 . Since that time it has continued in the poffeffion of Great Britain. During the French revolutionary war, the Caribs revolted; and, affifted by the Frerich, Spread defolation over the whole illand; but by the exertions of the governor and the Britith forces in the Wefl Indies, the re:olt was quelled.
St Vincent is in length about 24 miles, and about 18 in breadth. The climate is very warm. The country is in generally hilly, in fome piaces mountaincus; but interfiferfed with a variety of pleafant valleys, and fome luxuriant plains, the foil being everywhere very fertile, and the high grounds are at leant in general eafy of afcent. Few illands are fo well watered with rivers and fprings. The inhabitants raife all kinds of ground provifions in plenty. The rivers fupply them with variety of fifh. W. Long, \(61^{\circ}\). N. Lat. \(13^{\circ}\).

VINCI, Leonardo Da, an illuftrious Italian painter, defcended from a noble Tufcan family, was born in the calle of Vinci, near Florence in 1445. He was placed under Andrea Verochia, a celebrated painter in that city; but foos furpaffed him and all his predeceffors fo much, as to be reputed the mafter of the third or golden age of modern painting. But his ftudies were far from terminating here; no man's genius was more univerfal : he applicd himfelf to arts, to literature, and to the accompliilments of the body; and he excelled in every thing which he attempted. Lewis Sforza duke of Milan prevailed on him to be director of the academy for architeRure he had jult eftablithed; where Leonardo foon banifhed all the Gothic fathions, and reduced every thing to the happy fimplicity of the Greek and Roman flylc. By the duke's order he conftructed the famous aqueduct that fupplies the city of Milan with water: this canal goes by the name of Mortefana, being above 200 miles in length, and conducts the water of the river Adda quite to the walls of the city. In 1479, he was defired to confluct fome new device for the entertainment of Louis XII. of France, who was then to make his entrance into Milan. Leonardo accordingly made a very curions automaton in the form of a lion, which marched out to meet the king, reared up on its hinder legs before him, and opening its brealt, difplayed an efeutcheon with fleurs de lys quartered on it. The diforders of Lombardy, with the misfortunes of his patrons the Sforzi, obliging Leonardo to quit Milan, he retired to Florence, whore he flourithed under the Medici: here he raifed the envy of Michael Argelo, who was his contemporary; and Raphael, from the fludy of his works, acquired his belt manner of defigning. At length, on the invitation of Erancis I. he removed to France whell above 70 years of age; where the journey and change of climate threw him into his laf ficknefs: he languithed for fome months at Fontainbleau, where the king came frequently to fee him; and one day rifing up in his bed to acknowledge the honour done hin, he fainted, and Francis fupporling him, Leonardo died in his arms. His death happened in 1520 . Some of his paintings are to he feen in England and other countries, but the greateft part of them are in Florence and

France. He compofed a great number of difcourfes on Vinculif curious fuibjects; but none of them have been publimed but his treatife on the Art of Painting.-For his anatomical knowledge, fee Anftouy (hiitory of), p. 669 .

VINCULUM, in Algebra, a characterin form of a line or flroke drawn over a faetor, divifor, or dividend, when compounded of feveral letters or efuantities to connect then, and fhows that they are to be multiplied or divided, \&c. together by the other teim.
Thus \(d \times \overline{a+b-c}\) flows that \(d\) is to be multiplied into \(a+b-c\).

Vine. See Vitis, Botany Index.
VINEGAR, Acetum, an agreeable acid, prepared from wine, cyder, beer, and other liquors; of confiderable ufe, both as a medicine and a fauce. The word is French, vinaigre; formed from win, " wine;" and aigre, "four." See Acetic Acid, and Chemistry Index.

Eels in Vinegar. See Animalcule, \(\mathrm{n}^{0} 9\).
VINEYARD, a plantation of vines. The beff fituation of a vineyard is on the declivity of a hill facing the fouth.

ViO, Thomas de. Sec Cajetan.
VIOL, a mufical inftrument of the fame form with the violin, and, like that, Aruck with a bow.

VIOLA, a genus of plants of the clafs fyngenefia; in the natural fyltem arranged under the 29 th order, Campanacea. See Botany Index.

VIOLATION, the act of violating, that is, forcing a woman, or committing a rape upon her.-This term is alfo ufed in a moral fenfe, for a breach or infringement of a law, ordinance, or the like.
violet. See Viola, Botany Index.
Violet-Crab. See Cancer, Entomology Index.
VIOLIN, or Fiddle, a mufical infrument mounled with four frings or guts, and flruck or played with a bow. The fyle and found of the violin is the gayelt and moft fprightly of all other inftruments; and hence it is of all others the fittell for dancing. Yet there are ways of touching it, which render it grave, foft, languifhing, and fit for chureh or chamber mufic.-It generally makes the treble or higheft parts in concerts. Its harmony is from fifth to fifth. Its play is compofed of bafs, counter-tenor, tenor, and treble; to which may be added, a fifth part : each part has four fifths, which rife to a greater feventeenth.
VIOLONCELLO, of the Italians, is properly our fiftl violin; which is a little bafs violin half the fize of the common bals violin, and the frings bigger and longer in proportion : confequently its found is an octave lower than our bafs violin; which has a noble effect in concerts.

\section*{VIPER. See Ofhiology Index.}

VIKAGO, a woman of extraordinary flature and courage; who has the mein and air of a man, and performs the actions and exercifes of men.
Virgile, or Publius Virgilius Maro, the mon excellent of all the Latin poets, was the fon of a potter of Andes, near Mantua, where he was born, 70 years B. C. He ftudied firlt at Mantua; then at Cremona, Milan, and Naples; whence going to Kome, he acquircd the elleem of the greateft wits and moft illuftrious perfons of his time; and among others of the emperor Auguflue, Mixcenas, and Pollio. He was well flilled not only in polite literature and poetry, but allo in philofophy,

Figit, the mathematics, geography, medicine, and natural hiflory. Though one of the greatelt geniufes of bis age, and the admiration of the Romans, he always preferved a Gingular modelly, and lived chalte at a time when the manners of the people were extremcly corrupt. He carried Latin poctry to fuch an high perfection, that he was jufly efteemed the prince of Latin poets. He firflturn. ed himiclf to paforal; and being captivated with the beauty and fweetnefs of. Theocritus, was ambitious to introduce this new fpecies of poetry among the liomans. His fifft performance in this way is fuppofed to have been written U. C. 907 , the year before the death of Julius Cæfar, when the poet was in his \(25^{\text {th }}\) year: it is intitled Alexis. Poffibly Palcomon was his lecond: it is a clofe imitation of the fourth and fifth Idylls of 'theocritus. Mr Wharton places Silenus next; which is faid to have been publicly recited on the ftage by Cytheris, a celebrated comedian. Virgil's fifth eclogue is compofed in allufion to the death and defication of Ciefar. The battle of Philippi in 712 having put an end to the Roman liberty, the veteran foldiers began to murmur for their pay; and Auguftus, to reward them, dillributed among them the lands of Mantua and Cremona. Virgil was involved in this common calamity; and applied to Varus and Pollio, who warmly recommended him to Augultus, and procured for him his patrimony again. Full of gratitude to Auguftus, he compofed the Tityrus, in which he introduces two flepherds; one of them complaining of the diftraction of the times, and of the havock the foldiers made among the Mantuan farmers; the other rejoicing for the recovery of his eftate, and promifing to honour as a god the perfon who reflored it to him. But our paet's joy was not of long continuance; for we are told, that when he returned to take poffefion of his farm, he was violently affaulted by the intruder, and would certainly have been killed by him if he had not efcaped by fwimming hantily over the Mincio. Upon this unexpected difappointment, he reiurned to Rome to renew his petition; and during his journcy feems to have compofed his ninth eclogue. The celebrated eclogue, intitled Polli 9 , was compofed U. C. 714 , upon the following occafion: The conful Pollio on the part of Antony, and Miecenas on the part of Cæfar, had made up the differences between them ; by agreeing, that Octavia, half-fifter to Cæfar, flould be given in marriage to Antony. This agreement caufed an univerfal joy; and Virgil, in his eclogue, tentified his. Octavia was with child by her late hutband Marcellus at. the time of this marriage; and whereas the Sibylline oracles had foretold, that a child was to be born about this time, who thould rule the world, and eflablifh perpetual peace, the poet ingenioully fuppofes the child in Ollavia's womb to be the glorious infant, under whofe reign mankind was to be happy, the gelden age to return from heaven, and fraud and violence to be no more. In this celebrated poem, the author, with great delicacy at the fame time, pays his court to both the chiefs, to his patron Pollio, to O\&avia, and to the unborn infant. In 715, Pallio was fent againf the Parthini, a people of Illyricum; and during this expedition, Vir. gil addreffed to him a beautiful eclogue, called Phar-: maceutria. His tenth and laft eclogue was addreffed to: Gallus:
In his 3 th year, he retired to Naples, and laid the olan of his Georgics ; which be undcrtook at the intrea-
ties of Mrecenas, to whom he dedicated them. This wife and able minifler refolved, if poflible, to revive the decayed fpirit of hufbandry; to introduce a tafte for agriculture, cven among the great; and could not thiak of a better method to efleet this, than to recommend it by the infinuating charms of poetry. Virgil fully anfwered the expectations of his patron by his Georgics. They are divided into four books. Com and ploughing are the fubject of the firt, vines of the fecond, cattle of the third, and becs of the fourth.

ITe is fuppofed to have been in his \(45^{\text {th }}\) year when he began to writc the Aineid; the defign of which was to reconcile the homans to the government of Auguftus. Augultus was eager to perule this poem before it was finilhed; and intreated him by letters to communicate it. Nacrobius has preferved to us part of one of Virgil's anfwers to the emperor, in which the poet excules himfelf: who, however, at length complied, and read himfelf the fixth book to the emperor; when Octavia, who had juft loft her fon Marcellus, the darling of Rome, and adopted fon of Auguftus, made one of the audience. Virgil had artfully inferted that beautiful la. mentation for the death of young Marcellus, beginaing with-O nate, ingentem luclum ne quare tuorum-but fupprefled his name till he came to the line-Tu Marcellus eris: upon hearing which, Octavia could bear no more, but fainted away, overcome with furprife and forrow. When fle recovered, fhe made the poet a prefent of ten feflerces for every line, which amounted in the whole to above 20001.

The Aneid being brought to a conciufion, but not to the perfection our author intended to give it, he refolved to travel into Greece, to correct and polifh it at leifure. It was probably on this occafion that Horace addreffed that affectionate ode to him, Sic ie Diver potens Cypri, bic. Auguftus returning victorious from the eatt, met with Virgil at Athens, who thought himfelf obliged to attend the emperor to Italy : but the poet was fud. denly feized with a fatal diftemper, which being increaled by the agitation of the veffel, put an end to his life as foon as he landed at Brundufium, in his 52 d year. He had ordered in his will, that the Eneid flould be burnt. as an unfinifhed poem; but Auguftus forbade it, and had it delivered to Varius and Tucca, with the ftricteft charge to make no additions, but only to publifh it correctly. He died with fuch feadinefs and tranquillity, as to be able to dictate his own epitaph in the following words:

Mantua mie genuit : Calabri rapuere, tenet nunc
Pavlienope: cecini Pafcua, Rura, Duces.
His bones were carried to Naples, according to his earnelt requell ; and a monument was erected at a fmall di. fance from the city.
Virgil was of a fivarthy complexion, tall, of a fickly conllitution, and aflicled with frequent headachs and, fpitting of blood. He was fo very bafliful, that he often ran into the flops to prevent being gazed at in the Atreets; yet was fo honoured by the lioman peopie, that once coming into the theatre, the whole audience rofe up out of refpect to him. He was of a thoughtful and melancholy temper; he fpolie little, and lyed retirement and contemplation. His fortune was aflluent; he had a fine houfe and well furnifhed library near Mrecc. nas's gardens, on the Efquiline mount at Rome, and alm'

\section*{\(V\) I}
fo a delighful villa in Sicily. He was fo benevolent and inofienfive, that moll of his contemporary poets, though they envied each othcr, agreed in loving and efteeming him. He rcvifed his veries with prodigious fevenity; and ufed to compare himfelf to a the bear, which licked her culs into fhape.
The belt edition of Virgil's works are thofe of Mofvicius, with the notes of Servius, primted at Lewarden in 1717 , two vols 4 to; and that of Burman, at Amferdam, \({ }^{17} 74\), in four vols 4 to. There arc ieveral Englith tramlations, which are well known.

Virgri, Polydore, an Englith hiltoiian, born at Ur. bino in Italy, was fent in the beginning of the 16 th century, by Pope Alexander VI. as fub-collector of the Papal tax, called Peter-pence, in this kinglom. He had not beèn long in England before he obtained preferment in the church; for in 1503 he was preferted to the rectory of Church-Langton in the archdeaconry of Leicofter. In 1507 he was collated to the prebend of Scamlefby in the church of Lincoln; and in the fame year was made archdeacon of Wells, and prebend irv of Hereford. In 1513 , he refigned his prebend of Lincoln, and was collated to that of Orgate in St Paul's, London. We are told, that on his preferment to the archdeaconry of Wells, he refigned the office of fubcollector to the pope, and determined to fend the remainder of his life in England, the Hifory of which kingdom he began in the year 1505 , at the command of Henry VII. That work cof him 12 years labour. In 1526, he finifhed his treatife on Prodigies. Polydore continued in England during the whole reign of Henry VIII. and part of that of Edward VI. whence it is concluded that he was a moderate Papift. In 1550 , being now an old man, he requefled leave to revifit his native country. He was accordingly difmiffed with a prefent of 300 crowns, together with the privilege of holding his preferments to the end of his life. He died at Urbino in the year \({ }^{1} 555\). As an hiftorian, he is accufed by fome as a malignant flanderer of the Englifh nation; yet Jovius remarks, that the French and Scotch accule him of having tlattered that nation too much : (See his Elog. cap. 135. p. 179.). Befiles the above, he wrote, 5. De Rerunn Inventoribus; of which an Englifh tianflation was publifhed by Langley in 1663 . It was alfo tranflated into F ench and Spanin. 2. De Prodigüs of Sortibus. 3. Enifoporuan Ans!ica Cainlogus. Manuicript. 4. De Vita Perfecta, Bałil, 1546, 1553, 8vo. 5. Fpinole Eruditer: and fome other woiks.

VIRGINIA, one of the United States of North A. merica, is bnurded on the eaft by the Atlantic octan, on the north by Pennfylvania and the river Ohio, on the welt by the Miffiflippi, on the feuth by North Carolina.
Theife bouadaties include an ares fomewhat trianguiar of 121,525 miles, whereof 79.650 lie wefward of the Alleglany mountains, and 57,034 weflward of the meritian of the mouth of the Grent Kanhaway. "This ftate is therefore one third larger than the iilands of Great Britain and Ireland, which are reckoned at \(\$ 8,357\) f quate miles.

The principal rivers in Virginia are, Roanoke, James river, whel receives the Rivanna, Appammatox, Chickunminy, Nanfemond, and Elizabeth rivers; York river, wlich is formed by the junction of Pamurky and Mattapony rivers; Rapl ahannuck, and Patomack.

The monntains are not, folitary and featiered confurn edly over the face of the country; they commence at about 150 miles from the fea coatt, and are difpofed in ridges one behind another, ruming nearly parallel with the coalt, though rather approaching it as they advance nortlieaflwardly. To the funth-wett, as the tract of country between the lea-coaft and the Miflilipi becomes narrower, the mountains converge into a fingle ridge, Yefferjon which, as it approaches the gulf of Mexico, fubfides into plain country, and gives rife to fome of the waters of that gulf.

From the great extent of Virginia, it may be expected that the climate is not the fame in all its patts. It is remarkatle that, proceeding on the fame parallel of latitude weftwardly, the climate becomes colder in Like manner as when you proceed northwardly. Ihis continues to be the cafe till you attain the Jummit of the Alleghanv, which is the highen land between the ocean and the Mefiflippi. From thence, deleending in the fame latitude to the Mififli, pi, the change reverfes; and, if we may believe travellers, it becomes warmer there than it is in the fame latitude on the feafode Their teftimong is ttrengthened by the vegetables ans! animals which fubfitt and multiply there naturally, and do not on the fea-coaft. Thus catalpas grow jpontaneoully on the Mififippi as far as the latitude of 37, and reeds as far as 38 , degrees. Perraquets even winter on the Soto in the 39th degree of latitude. In the fummer of 1779 , when the thermoneter was at 90 dc grees at Monticello, and 96 degrees at Wilhiamilurg, it was 110 degrees at Kafialkia. Perhans the nountain, which overhangs this village on the noth fide, may by its sctlection lave contributed fomewhat to produce this heat.

The number of free inhabitants in this flate in 1790 was \(454: 9^{8} 3\), and of thares 292,627. The whole imports of the flate of Virginia amounted in 1796 to 5,268,6I 5 dollars.

The co'lege of William and Mary is the only public feminay of learming in Virginia. It was founded in the time of King William and Qucen Mary, who granted to it 20,000 acres of land, and a penny a pound duty on certain tabaccoes exported from Virginia and Maryland. The affembly alfo gave it by itmporary law a duty on liquors imported, and flins and furs exported. From thefe refources it received upwards of 30001 . cem mumibur anmis. The buildings are of brick, fufficient for an indiferent accommodation of perhaps 100 ftudents. By its charter it was to be under the goremment of 20 vifitors, who were to be its legiflators; and to have a prefident and fix profefforfhips, which at prefent fand thus:- A profefformip for Law and Police; Anatomy and Medicine; Natural Philofophy and Mathematics; Moral Philofophy, the Law of Nature and Nations, the Fine Aits; Modern Languages; and a fixth, called the profefiormip of Brafferton, for the inAtuction of the Indians. In 1787 , there were about 30 young gentlemen members of this college, a large proportion of which were law fludents. There are fome flourinling academies in Virginia; one in Prince Eds ward county, one at Alexandria, one at Norfolk, one at Hanover, and others in other places:

The prefent denominations of Chriftians in Virginia are Preflytcrians, who are the moll numerous, and in-

\section*{V I R}
habiuthe weftern parts of the fate; Itpifcopalians, who are the moft anctent fettlers, and occupy the eaftcin' and"firt feltled parts of the flate. lutermingled with thefe are greal numbers of Baptilts and Methodilts. The bulk of thefe latt mentioned religiun, lects are of the poover lort of people, and many of them are very ignorant (as is' indeed the cafe with the other denominations), but they are generally a vittuous well-meaning fet of people.

Virginia has produced fome of the moft diftinguifled men that have been active in effecting the two late im. portant revolutions in Amesica, whole political and military character will rank. among the firlt in the prare of hittory. The great body of the people do not concern themlelves with politics; fo that their government, though nominally republican, is in fact oligarchical or aritocratical. The Virginians who are rich, are in general fenfible, polite, and holpitable, and ot an independent \(f_{j}\) irit. The poor are ignorant and abject; all are of an inquifitive turn, and in many other refpects very much refemble the people in the eatlern lates. There is a much greater dilparity between the rich and the poor is Vigginia than in any of the northern Rates. A firit for literary inquinies, if not altogether confined to a few, is, among the body of the people, evidently fubordinate to a \{pirit of gaming and harbarous fports. At almoll every tavern or ordinary on the public ruad there is a billiard table, a backgammon table, cards, and other implements for various games. To thefe public houfes the gambling gentry in the neighbourhood refurt to kill time which hangs heavily upon them ; and at this bufinefs they are extroncly expert, having been accuftomed to it from their earlieft youth. The paftion for cockfiglting, a diverfion not on'y inhumanly barbarous, but infinitely beneath the dignity of a man of fenfe, is fo predominant, that they even advertife their matches in the public new!papers.

The executive powers are lodged in the hands of a governor chofen annually, and incapable of acting more than three years in feven. He is aflited by a council of eight members. The judiciary powers are divided among feveral courts. Legillation is exercifed by two houles of aflembly; the one called the Honfe of Delegntes, compofed of two members from each connty, chofen annually by the citizens poffeffing an eftate for life in 100 acres of uninhabited land, of 25 acres with a houfe on it, or in a houle or lot in fome town. The other called the Senate, confifing of 24 members, chofen quadrennially by the fame electors, who for this purpofe are diftributed into 24 difficts. The concurrence of both houfes is ueceffary to the pafizge of a law. They have the appointment of the governor and council, the judges of the funcrior courts, auditors, attorney-general, treafurer, regifter of the land oflice, and delegates to Congref.

Before the war, there was exported from this flate, communibus annir, to the amount of 850,0001 . Virginia money, or \(607,14^{2}\) guineas.

The whole country before it was planted was one continued foreft interfperfed with marthes. No country now produces greater quantities of excellent tobacco; and the foil is generally fo fandy and fhillow, that after they have cleared a freth piece of ground out of the wood, it will not bear tobacco after two or thrce years unlefs well manured. The forefts yield oaks, noplars, pines, cedars, cypreffes, fweet myrtles, cloefnuts, hic-
kery, live oak, walnut, dog-wood, alder, hazel, chinkapias, locuft- Irees, faffifrets, elm, afh, beech, with a great variely of fweet gums and incenfe, which diflil frum feveral trees; pitch, lar, rofin, turpentinc, plank timber, inalls, and yards. Viginia yields allo rice, hemp, Indian corn, plenty of palture, with coal, quarries of itone, and lead and irun ore.

VIliGO, in Afronomy, one of the figns or conftellations of the zodiac.

VIRGUI.A divinatoria, divining rod. See Mine.

VhKlUd , or Potrantal; fomething that has a power or virtue of acting or doing. The term is chiclly underioud of fomething that acts by a fecret invifible caufe, in oppofition to actual and lenfible.

Vllil'UE, a term ufed in various fignifications. In the general it denotes power, or the perfection of any thing, whether natural or fupernatural, animate, or inanimate, effutial or acceflory. But, in its more proper or reflrained lenfe, virtue lignifies a habit, which improves and perfects the polfefior and his adions. See Moral Philosopiry, No 8 \(_{4}\).

VHITUOSO, an Italian term lately in!roduced into the Luglith, fignifying a man of curiofity and learning, or one who loves and promotes the arts and fciences. But among us the term feems to be appropriated to thofe who apply themfelves to fume curious and quaint rather than immediately ufeful art or fudy; as antiquaries, cullectors of rarities of any kind, micrufcopical obfervers, \&c.

VIRULENT, a term applicd to any thing that yields a virus; that is, a contagious or malignant pus.

VISCERA, in Anatomy, a term fignifying the fame with entrails; including the heart, liver, lungs, fpleen, inteftines, and other inward parts of the body.

VISCIDITY, or Viscosity, the quality of fomething that is vilcid or vifcous; that is, glutinnos and fticky like bird-lime, which the Latins call by the name of

VISCOUNT (Vice Comes), was ancienily an officer under an earl, to whom, during his attendance at court, he acted as diputy to look after the affaits of the country. But the name was afterwards made ufe of as an arbitrary title of honour, without any fladow of office pertaining to it, by Henry VI.; when, in the 18 th year of his reign, he created John Beaumont a peer by the name of Vifcount Becumont; which was the frit infance of the kind.

A vifcount is created by patent as an earl is; his title is Righe Honourable; his mantle is two doublings and a half of plain fur; and his coronet has only a row of pearls clofe to the circle.

VISCUM, a genus of plants of the clals diøecia, and in the natural fyftem arranged under the 48 th order, aggregatia. See Botany Index.

VISHNOU, that perfon ir the triad of the Bramins who is confidered as the preferver of the univerfe. Brahma is the creator, and Sion the deftroyer; and thefe two, with Vifhnou, united in fome inexplicable manner, conflitute Brahme, or the fupreme numen of the Hindoos. See Polytheish, \(N^{+0} 36\).

VISIBLE, fomething that is an object of fight or vifim; or fomething whereby the eye is affected fo as to produce this fenfation.

VISIER, an oficer or dignitary in the Ottoman em. pire,

Viliou pire, whereof there are two kinds; one called by the Turks \(V_{\text {lher-azem, that is, " grand vifier," }}\) is the prime minifter of fate in the whole empire. He commands the army in chief, and prefides in the divan or great council. Next to him are fix other fubordinate vifiers, called vifiers of the bench; who officiate as his counfellors or affeffors in the divan.

VISION, in Optics, the act of feeing or perceiving external objects by means of the organ of fight, the eye. See Anatomy, \({ }^{\circ}{ }^{\circ}\) 142, and Metaphysics, \(N^{\circ} 49-\) 54.

VISTULA, or Weisel, a large river of Poland, which taking its rife in the mountains fouth of Silefia, vifits Cracow, Warfaw, \&ec. and continuing its courle northward, falls into the Baltic fea below Dantzic.

VISUAL, in general, fomething belonging to vifion.
VITAL, in Phiy \(f_{0}\) ology, an appellation given to whatever minifters principally to the contlituting or maintaining life in the bodies of animals: thus the heart, lungs, and brain, are called vital parts; and the operations of there parts by which the life of animals is maintained are called vital functions.

VITELLUS, the yolk of an egg.
VITIS, or Vine, a genus of the clafs pentandria, and in the natural fyitem arranged under the 46 th order, Hederacue. See Botany Index; and for its culture, fce Gardening.

Vitreous humour of the eye. See Anato\(\mathrm{MY}, \mathrm{N}^{\circ} 142\).

VITRIFICATION, in Chemiffry, the converfion of a body into glafs by means of fire. See Glass.

VITRIOL, a compound falt, formed by the union of iron, copper, or zinc, with fulphuric acid, hence called from the colours white, blue, and green, according to the metal. See Chemistry.

VITRIOLATED, among chemift, fomething impregnated, or fuppofed to be fo, with vitriol or its acid.

Vitriolic acid. See Sulphuric Acid and Chemistry Index.
Vitruvius pollio, Marcus, a very celebrated Roman architect, was, according to the common opinion, born at Verona, and lived in the reign of Auguftus, to whom he dedicated his excellent treatife on architecture, divided into ten books. William Philander's edition of this celebrated work is efteemed. Claudius Perrault has given an excellent tranflation of it in French, with learned notes. There are alfo feveral EngIifh tranflations of Vitruvius.

VituS's dance. See Medicine, \({ }^{0} 284\).
VIVERRA, the Weasel; a genus of quadrupeds belonging to the order of fere. See Mammalia Indcr.

\section*{Vives. See Farriery.}

VIVIPAROUS, in Natural Hifory, an epithet applied to fuch animals as bring forth their young alive and perfect ; in contraditinction to thofe that lay eggs, which are called oviparous animals.

UKRAINE, a large country of Europe, lying on the borders of Turkey in Europe, Poland, luufia, and Little Tartary. Its name properly fignifies a frontier. By a treaty between Riuflia and Poland in 1693, the latter remained in poffeffion of all that part of the Ukraine lying on the weft fide of the river Dnieper, which is but indififently cultivated; while the country on the eaft fide, inlabited by the CoCacs, is in much
better condition. The liuflian part is comprifud in the government of Kiof; and the emprefs of Ruflia having obtained the Polith palatinate of Kiof, by the treaty of partition in 1793, the whole of the Ukraine, on both indes of the Dnieper, belongs now to that ambitious and formidable power. The principal town is Kiof.

ULCER, in Surgery. See Surgley Index.
Ulcer, in Farriery. See Farrifry.
ULEX, a gemus of plants of the clafs of diadelphia, and in the natural fyltem arranged under the 32 d order, Papilionacere. See Botany Index.

ULILTEA, one of the Society iflands in the South fea. This ifland is about 21 leagues in circuit. Its productions are plantains, cocoa-nuts, yams, hogs, and fowl ; the two latter of which are โcarce. The foil on the top of one of the hills was found to be a kind of ftone marle; on the fides were found fome fcatered flints, and a few fmall pieces of a cavernous or fpongy ftone lava, of a whitifi colour, which feemed to contain fome remains of iron, fo that it may poffibly be here lodged in the mountains in a great quantity. Nothing was feen on this illand to dillinguifh either its inhabitants, or their manners, from the other neighbouring illands. The firt Europeans who landed on this flore were Mr (now Sir Jofeph) Banks and Dr Solander; they were received by the natives in the mofl courteous manner, reports concerning them having been their harbingers from Otaheite. Every body feemed to fear and refpect them, placing in them at the fame time the utmoft confidence : behaving, as if confcious that their vifitors poffefled the power of doing them mifchief without a difpofition to make ufe of it.

ULIGINOUS, in Agriculture, an appellation given to a moift, moorifh, and fenny foil.

ULLAGE, in gauging, is fo much of a calk or other veffel as it wants of being full.

ULM, a free and imperial city of Germany, in the circle of Swabia, feated on the river Iller. It is a pretty large place, defended by fortifications; and the inhabitants are Proteflants. Here the archives of the circle are depofited, and it carrics on a very great trade. The elector of Bavaria became mafter of it in 1702, by a ftratagem; but, in 1704, the French being vanquinlied at the battle of Hochlite, the Bavarians furrendered it by capitulation. The Roman Catholics have but two churches, all the reft belonging to the Proteftants. E. Long. 10. 12. N. Lat. 48. 25.

ULMUS, a genus of plants belonging to the clafs of pentandria; and in the natural fyftem arranged under the \(53^{d}\) order, Scabride. See Botany Index.

ULSTER, the mofl northerly province of Ireland. In Latin it is called Ulonia, in Irilh Cui Guilly; and gives the title of earl to the dukes of York of the royal family. It is bounded by the Atlantic ocean on the weit, St George's channel and the Irifh fea on the eaft, the Deucaledonian ocean on the north, and on the foutls and fouth-weft the provinces of Leinfter and Connaught. Its greaten length is near 120 miles, its breadth about 100 ; and its circumference, including the windings and turnings, 460 ; containing 9 counties. 58 markettowns and boroughs, a archbifhopric, 6 bilhoprics, and 214 parihes. Ulfer abounds in lakes and rivers, which fupply it with variety of fine fill, efpecially falmon, befides what it has from the . fea, with which a great part of it is bounded. Thic fouthern parts of it are zich, fer-

\section*{U IM B \\ tile, well cultivated, and inclofed ; but the greater part} of the northern is open and mountainous.- The towns of this province are in general the neateft and beft built of any in Ireland, as well as the farm-houfes; which in mott parts of the kirgdom are conftructed of no better materials than clay and flraw. The inhabitants of Uliter are alfo more like the Englifh in their manners and dialect than thofe of the other three provinces: for as it includes within itfelf the whole, or by far the greater part, of the linen manufactory, the beft branch of trade in the kingdom, they have confequently the greatelt intercourfe with England. An Englihman, in fome parts of it, indeed, will imagine himelf, from the fimilarity of their langlage and manners, in his own country. This province had anciently petty kings of its own. It was firf fubjected to the Englih in the reign of Henry II. by Jolin Courcy, the firlt who bore the title of earl of Ul/Ier; but it afterwards threw off the yoke, and was never entirely reduced till the reign of James I. when great numbers of Scote by his encouragement went and lettled in it. \(O^{-}\)thefe, moft of the prefent inhabitants are the defcendants. This province was the firt and principal fcene of the bloody maffacre in \(16 \not{ }_{7}\).

ULTERIOR, in Geogrably, is applied to fome part of a country or province, which, with regard to the reft of that country, is fituated on the farther fide of the river, mountain, or other boundary which feparates the two countries.

ULTRAMARINE, a beautiful blue colour ufed by the painters, prepared from the lapis lazuli by calcination. See Lazulite, Mineralogy Index.

ULTRAMONTANE, fomething beyond the mountains. The term is principally applied in relation to France and Italy, which are feparated by the Alps.

ULVA, a genus of plants of the clafs of cryptogamia. See Botany Index.

ULUG Beic, a Perfian prince and learned aftronomer, was defcended from the famous Tamerlane, and reigned at Samarcand about 40 years; after which he was murdered by his own fon in 1449 . His catalogue of the fixed ftars, rectified for the ycar 1434 , was publihhed at Oxford by Mr Hyde, in 1665 , with learned notes. Mr Hudfon piinted in the Englifh Geography Ulug Beig's Tables of the Longitude and Latitude of Places; and Mr Greaves publihed, in Latin, his Aftronomical Epochas, at London, in 1650 . See Astronomy Index.

ULYSSES, king of Ithaca, the fon of Laertes, and father of Telemachus, and one of thofe heroes who contributed moft to the taking of Troy. After the deftruction of that city, he wandered for 10 years; and at laft returned to Ithaca, where, with the affitance of Telemachus, he killed Antinous and other princes who intended to marry his wife Penelope and feize his dominions. He at length refigned the government of the kingdom to his fon Telemachus; and was killed by Telegonus, his fon by Circe, who did not know him. This hero is the fubject of the Odyfley.

UMBELLA, an UMBEL, a fpecies of receptacle; or rather a mode of flowering, in which a number of flender footfalks proceed from the fame centre, and rife to on equal height, fo as to form an even and generally round furface at top. See Botany.

UMIBELLATE, the name of a clafs in Ray's and Vol. XX. Part II.
'Tournefort's methods, confiting of plants whofe Hoxers Umbetlase grow in umbels, with tive petals that are often unequal and two naked feeds that are joined at top and feparated below.

Undecem-
vir.
The fame plants conftitute the \(45^{\text {th }}\) order of I inneus's Fragments of a Natural Method. See Botisiry. UMBELLIFElROUS PLANTS, are fuch as have their tops branched and fpread out like an umbrelia.

UMBER, or UMBRE, a foffil brown or blackint fub) Sance, ufed in painting. Ste Mineralogy Indix.

UMB1L.1CAL, among anatomilts, fomething relating to the umbilicus or navel.

UMBRLLLA, a moveable cannpy, made of lilk or other clath fpread out upon ribs of whale-bone, and fipported by a itaff, to protect a yerfon from rain, or the fcorching beams of the fun.

UM1'IRE, a third perfon chofen to decide a contro verfy left to arbitration.

UNCIA, in general, a Latin term, denoting the twelfth part of any thing; particularly the twelfth patt of a pound, called in Englith an ounce; or the twelfuts part of a foot, called an inch.

UNCTION, the ast of anointing or rubbing with oil or other tatty matter.

UnCTION, in matters of religion, is ufed for the character conferred on facred things by anointing them witis oil. Unctions are very frequent among the Hebrews. They anointed both their kings and high-prielts at the ceremony of their inauguration. They alfo anointed the facred veffels of the tabernacle and temple, to fanctify and confecrate them to the fervice of God. The unction of kings is fuppofed to be a ceremony introduced very late among the Chriftian princes. It is faid that none of the emperors were ever anointed before Jutinian or Juttin. The emperors of Germany took the practice from thofe of the ealtern empire: King Pepin of France was the firlt who received the unction. In the ancient Chrittian church, unction always accompanied the ceremonies of baptifm and confirmation. Extreme unction, or the anointing perfuns in the article of death, was alfo practifed by the ancient Chritians, in compliance with the precept of St James, chap \(v .14\) th and 15 th verles; and this extreme unction the Romith church has advanced to the dignity of a facrament. It is adminitered to none but fuch as are affected witl fome mortal difeafe, or in a decrepit age. It is refufed to impenitent perfons, as alfo to criminals. The parts to be anointed are the eyes, the ears, the noftrils, the mouth, the hands, the feet, and the reins. The laity are anointed in the palms of the hands, but prietls on the back of it; becaufe the palms of their hands have been already confecrated by ordination.

The oil with which the fick perfon is anointed reprefents the grace of God, which is poured down into the foul, and the prayer ufed at the time of anointing exprefles the remiffion of fins thereby granted to the fick perfon; for the prayer is this: "By this haly unction, and his own moft pious mercy, may the Almighty God forgive thee whatever fins thou hat committed by the fight," when the eyes are anointed; by the hearing, when the ears are anointed; and fo of the ctlaer* The Sinfenfes*.
cere Cbrifo
UNDECAGON, is a regular polygon of II fides. tian inr-
UNDECENVIR, a magitrate among the arcient from the Athenians, who had 10 other colleagues or affociates Witten \({ }_{4} \mathrm{C}\)

Endecem- joined with him in the fame commilfion. The functions vir of the undecemvisi at Athens were much the fame with took care of the apprehending of criminals; fecured
them in the hands of juflice; and when they were con. demned, took them again into cuftody, that the fentence might be executed on them. They were chofen by the tribes, each tribe naming its own; and as the number of the tribes after Callifthenes was but 10 , which made 10 members, a fcribe or notary was added, which made the number 11.
understanding. See Metaphysics and Loeic.

UNDERWALDEN, a canton of Switzerland, and the firth in rank. It is bounded on the north by the canton of Lucern and by the lake of the Four Cantons, on the eaft by the high mountains which feparate it from the canton of Bern, and on the wen by the canton of Bern. The religion of this canton is the Roman Catholic.

UNDULATION, in Physics, a kind of tremulous motion or vibration obfervable in a liquid, by which it alternately rifes and falls like the waves of the fea.

UNG Uent, or Ointment, in Medicine and Surgery, a topical remedy or compontion, chiefly ufed in the direfling of wounds or blifers. See Materia Medica.

UNICORN, an animal famous among the ancients, and thought to be the fame with the rhinoceros.

Sparmann informs us, that the figure of the unicorn defcribed by the ancients has been found delineated by the Snefe Hottentots on the plain furface of a rock in Caffraria; and therefore conjectures, that fuch an animal either does exifl at prefent in the internal parts of Africa, or at leaft orce did fo. Father Lobo affirms that he bas feen it. Mr Barrow in his Travels in Southern-Africa, affords additional reafon to believe in the exilence of this curious animal.

Unicorn-Fi/b. See Monodos, Cetology Index.
UNIFORM, denotes a thing to be fimilar, or confiffent either with another thing, or with itfelf, in refpect of figure, Aructure, proportion, or the like; in which fenfe it flands oppofed to difform.

UNIFORMITY, regularity, a fimilitude or refemblance between the parts of a whole. Such is that we meet with in figures of many fides, and angles tefpectively equal, and anfwerable to each other. A late ingenious auther makes beauty to confif in uniformity, joined or combined with variety. Where the uniformity is equal in two objects, the beauty, he contends, is as the variety; and where the variety is equal, the beauty is as the uniformity.

Uniformity, is paricularly ufed for one and the fame form of public prayers, and adminiftration of facraments, and other rites, \&c. of the church of England, prefcribed by the famous flat. I Eliz. and 13 and 14 Cur. II. cap. 4. called the ACt of Unifornity. See Liturgy.

UNION, a junction, coalition, or affemblage of two or more different things in one.

Union, or The Union, by way of eminence, is more particularly ufed to expsefs the act by which the two feparate kingeoms of England and Scotland were incorporated into one, under the title of The kingdom of Grear Britain. This union, in vain attempted by King James I. was at langth effected in the year 1707,6 Annat, when 25 articles were agreed to by the parliament
of both nations; the purport of the moit confiderable being as follows:
1. That on the firft of May 1707, and for ever after, the kingdoms of England and Scotland thall be unsed into one kingdom, by the name of Great Britan.
2. The fucceflion to the monarchy of Grat Briain Mall be the fame as was before fettled with regard io that of England.
3. The united kingdom fhall be reprefented by one parliament.
4. There flall be a communication of all rights ard privileges between the fubjects of both kingdoms, except where it is otherwife agreed.
9. When Eigland raifes \(2,000,00 c l\). by a land-tax, Scotlard thall rate \(48, \mathrm{cool}\).

16,17. The flandards of the coin, of weights, and of meatures, fhall be seduced to thote of England throughout the united kingdoms.
18. The laws relating to trade, cufloms, and the excife, thall be the fame in Scotland as in England. But all the other laws of Scotland fhall remain in force; but alterable by the parliament of Great Britain. 'et with this caution, that law's relating to public policy are alterable at the difcretion of the parliament; laws relating to private right are not to be altered but for the evidenit utility of the pcople of Scotland.
22. Sixteen feers are to be chofen to reprefent the peerage of Scotlard in parliament, and 45 members to fit in the houfe of commons.
23. The 16 peers of Scotland hall have all privileges of parliament ; and all peers of Scotland haall be feers of Great Britain, and rank tiext after thofe of the fame degree at the time of the union, and hall have all privileges of pecrs, except fitting in the houfe of lords, ar.d roting on the trial of a peer.

Thefe are the pris.ipal of the 25 articles of union, which are ratified and confirmed ty itatule 5 Ann.c. 8 . in which flatute there are allo two aets of parliament recited; the one of Scotland, whereby the church of Scotland, and alfo the four univerlities of that kingdom, are efablithed for ever, and all fucceeding fovereigns are to take an oath inviolably to maintain the fame; the other of England, 5 Anne, c. 6 . whereby the acts of -uniformity of 13 Eliz. and 13 Car. II. (except as the fame had been altered by parliament at that time), and all other acts then in force for the prefervation of the church of England, are declared pupetual ; and it is fipulated, that every fubfequent king and queen fiall take an oath inviolably to maintain the farse within England, Ireland, Wales, and the town of Berwick-upon-Tweed. And it is enacted, that thefe tho acts " fhall for ever be obficued as fundamental and effential conditions for the union."
Upon thefe articles and aet of union, it is to be obferved, 1. That the two kingdoms are fo infeparably united, that nothing can cver difunite them; except the mutual confent of both, or the fucceffful relifance of either, upon apprehending an infringement of thofe points which, when they were feparate and independent nations, it was mutually flipulated fliculd be " fundamental and efiential conditions of the union." 2. That whatever elfe may be deemod " fundamental and effential conditions," the prefervation of the two churches, of England and Scotland, in the fame flate that they were in at the tinse of the union, and the maintenance
of the a ?s of uniformity which eftablinined the liturgy, are exprefly dechared fo to be. 3 . That therefore any alleration in the conftitution of cither of thefe churches, or in the liturgy of the church of England (unlees with the confent of the refpective churches, colleatively or reprefentatively given), would be an infringement of thefe "fundumental and eftential conditions," and greatly endanger the union. 4. That the municipal Jaws of Scotland are ordained to be ftill obferved in that part of the ifland, unlefs altered by parliament; and as the parliament has not yet thought proper, except in a few inftances, to alter then, they fill, with regard to the particulars unaltered, continue in full force.

For an account of the union of lieland with Great - Pritain, thus.forming the united Ainrdom of Great Bribain and Ireland, fee Ireland, No 120.

UNISON, in Mufic. See INTERVAL.
UNIT, or Unity, in Arithmetic, the number one; or one fingle individual part of difcrete quantity.

UNITARIANS, in ecclefialtica! hiltory, a name given to thofe who confine the glory and attribute of divinity to the One only great and fupreme God, and Father of our Lord Iefus Chrift.

UNited Brethren, or Unitas Fratrum; a focicty of Ciriftians, whole chief refifence is at Herrnhut in Saxony. They are commonly called Moravians, from their original country, and Herruhuters, from their chief place of refidence. Some account of this faciety has already been given under Hfrrnhut; but as that account may, by fome, not be deened fufficiently full, we thall here add a fummary of their in titutes, derived from a communication by one of their own clergy.
"Though the church of the United Brethren is epifcopal, their bithops poffeis no elevation of rank or preeminent authority, their church being governed by fynods or confiltorics from all the congregations, and by - fubordinate bodies, called conferences. The fynods are gencrally held once in feven years. In the fritt fitting a prefident is chofen; and the elders appointed by the former fynod to fuperintend the unity, lay down their - office, though they litll form a part of the affembly, as well as the bifhops, the lay elders, and thofe minifters who lave the infpection of feveral congregations in one province.

Queftions of importance, or of which the confequences cannot be forefeen, are decided by lot, though this is never ufed till after mature deliberation and fervent prayer. In the fynods, the late of the unity, and the concerns of the congregations and mifions, are taken into confideration.

Towards the conclufion of every fynod, a kind of executive hoard is appointed, called the elders conference of the uniry, confiling of 13 elders, and divided into four committees or departments, one for fuperintending miffions into heathen countries; a fecond for watching over the conduct of congregations; a third for managing the economical concerns of the unity, and a fourth for inaintaining the difcipline of the fociety. Thefe conferences, however, are amenable to a higher committee, called the elders conference, the powers of which are very extenfive. It aopoints and removes every fervant in the unity, authorifes the bifhops to ordain prefbvters or deacons, and to confecrate other'biThops, and in fhort, poffeffes the fupreme executive power over the whole fociety.

A bifhop of the United Brethren can difcharge no office but by the appointment of the lynod, or of the elders conference. Indeed their deacons can perform every office of the bilhops, except ordination, and appear to confirm young perlons when they firll become candidates for this communion. Even female deacons are employed for the purpofe of privatcly admonithing their own fex, and vifiting them in cales of ficknefs. There are alfo lay elders, whofe bufinefs it is to watch over the confitution and difcipline of the unity; to enforce the obfervance of the laws of the country in which mifitions are eftabliftied, and to guard the priviluges conferred on the brethren by the government under which they live.

On Sunday, befi les the public prayers, one or two fermons are preached in every church, and after the morning fervice, an exhortation is given to the children. Previous to the holy communion, which is adminiftered on fome Sunday once a month, and on Maunday Thurfday, each perfon before he cominunicates, mult converfe on the flate of his foul with one of the elders. Love fealts are frequent, and on Maunday Thurday the fociety have a folemn footwathing.

Our limits will not permit us to give a fyftematic. view of the doctrinal tenets of the Brethren. Theugl? they acknowledge no other Alandard of truth than the facted foriptures, they adhere to the Augibarg confeffion, and fpeak refpectully of the 39 articles of the church of England. They profefs to believe that the kingdom of Chria is not confiacd to any particular party, community, or church; and they confider themfelves as fpiritually joined in the bond of Chrillian love to all who are taught of God, and belong to the univerfal church of Chrift, however much they may differ in forms, which they deem non-efientials.' For a fuller \({ }^{\circ}\) account of this fociely, fee Crantz's Ancient and Mrderre Hiflory of the Proteflant Church of the United Bretliven, London \({ }^{1780}\), and An Expofition of Chrifian Docirine, as taught in the Proteflant Church of the United Bricthiren, London 1784.

United Provinces, othcrwife cal!ed the Republic of Situation Holland, or the Batavian republic, a maritime country and extent. of Europe, occupying that part of the Netherlands which lies between Auftrian Flanders and Brabant, now the French departments of Lys, Efcaut, Deux Nethes and Dyle on the fouth, and the diftriet of Eatt Frielland on the north-eaft ; being bounded on the north and weft by the German ocean or North fea, and on the eatt by the kingdom of Weftphalia. They are fituated between the parallels of \(51^{\circ} 10^{\prime}\), and \(53^{\circ} 35^{\prime} \mathrm{N}\). lat. and hetween \(3^{\circ} 10^{\prime}\), and \(7^{\circ} 5^{\prime}\) E. long. In Britifh miles the length of this country, from north to fouth, is elfimated at 165 , its breadth from weft to eaft about 100, and its area at 10,000 fquare miles.

Before the French revolution, this part of the Low Divifion. Countries was divided into leven provinces, viz. Gurr. derland or Gelders, Hollayd, Zealand, U. trecht, Friesland, Overyssel and Groningen, befides the dependencies of Dutch Brabant and Dutch Flanders. Of late the whole has furmed eight departments, which, except that called the Gereralité lands, were diftinguifhed by the old names. Tue following table gives a general vierr of the fubdivifions, area in gengraphical miles, population and chief towns of the ep provinces.
\(4 \mathrm{C}_{2}\) is: ¿. Prouinces.

Unated
Luret aring.
Provinces.

A great part of thefe provinces is compofed of illands formed by the mouths of the large rivers which here difembogue their waters into the German ocean. The principal illands are Walcheren, Joofland, South and North Beveland, and Wolferfdyk, compofing Wen Zealand; Schowen, Duiveland, Fertholen, and St Phillipsland, forming Eaft Zealand; Goerce in South Holland, the Texel, Vhieland, and Ameland, to the well and north of Frielland.

The Dutch had formerly confiderable colonial territory; but this is now reduced to part of Java, Sumatra, and the Molucca iflands, with fome other fettlements in the Eafl Indies; fome trifing factories on the Guinea coaft ; St Euftatius and part of Surinam in South America.

The face of the country is, in general, extremely uniform, confifing of large tracts of marfhy paftures, or fandy heaths, interfperfed with feveral large rivers, and numerous canals. There are a few hills in the eaftern diffricts, but the coatts are fo low, that, but for the dylkes or fea walls, they would be inundated by the fea. The foil confifts almolt entirely of alluvial earth and vegetable mold, and is very productive. The climate is moif, inconftant, and peculiarly infalubrious to ftrangers; intermittent fevers and fimilar difeafes, the attendants on a marthy and watery fuil, being extremely frequent. The winters are colder and the fummers hotter than in Britain.

Rhine, the Maefe or Meufe, and the Efcaut or Scheldt, which leparates them from French Flanders. There are few lakes of any note, except the fea of Haerlem, near the Zuyder Zee.

There is little interefting in the natural hiftory of Hol- Produce land ; the animals and plants refembling thofe of the ad- and agrio jacent countries of France and Germany, and its mine- culture. ral products being extremely few. Its chief artificial products are flax, tobacco, madder and flower roots, butter and cheefe. The flate of agriculture is but little advanced; as almoft the whole country is under grafs, and the corn produced is not nearly lufficient for home confumption.

The clianges which the coafts of the Dutch provinces Progrefive have undergone, in confequences of the (hifting of the geographro beds of rivers, the encroaclments or retiring of the fea, and tempefts from the German ocean, render their progreflive geography an interefting object. We find that in the latter periods of the lioman empire, the river Rhine divided itfelf into two great branches at Burginafium, the modern Schenk, aboul five miles north-weif of Colonia Trajana, near the prefent Cleves. The fouthern branch joined the Meufe at the town of Mofa or Muvi, while the notthern branch paffed by Durftadt, Utrecht, and Leyden, to the ocean. The northern branch of the Rhine was joined to the Yilel by the canal of Drufus (fee Batidobium Infula), while this latter river flowed into a confiderable lake called Flevo, now a fouthern portion of the Zuyder Zee. When the canal of Drufus
(A) See each of thefe articles in the general alphabet.

\section*{UN I [ \(\quad 373] \quad \mathrm{UN}\) N}
was neglected, the waters of the Rhine poured into the Yffel with fuch violence as to increafe the lake of Flevo to a great expanife of waters, fo that inflead of a river whichonce ran from that lale to the fea for nearly 50 Ro man miles, there was opened the wide gulf which now forms the eatrance. In the mean time, the northern branch of the Rhine became much diminifised, and the canal of Drufus gradually difappeared. The eftuaries of the Meufe and the Scheldt being open to great inroads from the lea, have allo materially changed their figure and pofition; and the latter in particular, which once formed merely a triangular illand, divided into four or five fmaller branches, which are now extenfive creeks, dividing the illands of Zealand and South Holland. In the beginning of the 1 g th century, the eftuary of the Meufe fuddenly formed a vant lake to the fouth-eaf of Dort, overwhelming 72 villages, and 100,050 inhabitants. By a fubfequent change, the Rhine was again lubdivided, the northern branch falling into the Leck, while the fouthern formed the modern Waal.

The early hiftory of thefe provinces, from their fubjection by the Romans, till they fell under the dominion of the Spanilh monarchy, has been already given under the article Netherlands, fo that we have here to relate only thofe tranfactions which have taken place fince the acceffion of Philip II. to the crown of Spain (B).
At the death of Charles V. the Dutch provinces were in a very flourilhing condition. In this fmall tract were then reckoned not fewer than 350 large walled cities, and 6300 confiderable towns or large villages, all become rich by their application to arts and commerce. The fame application had diffufed a fpirit of independence among the inhabitants, who were jealoully alive to every invation of their rights and privileges. The reformed religion had made confiderable progrefs among all ranks, and the doctrines of Calvin had been embraced by a great majority of the people. Hence, nothing could be more impolitic than the meafures taken by Philip to advance the caufe of popery, and to cnforce obedience to the tyramical acts of his deputies. The eftablithment of a court of inquifition, the increafe of the number of bihhoprics, the appointment of Cardinal Grandvele to be chief counfellor to the duchefs of Parma, then regent of the Netherlands, and the enormous taxes levied to fupport the Spanifh forces, were no trifling grievances, and created fich a firit of difaffection, that when the duchefs affumed the reins of government, in the year 1560 , the murmurs of the people could 110 longer be fuppreffed.

A deputation of the malcontents, at the head of whom were William prince of Orange, and his brother Louis of Naffau, with the counts of Egmont and Horn, waited on the duchefs at Bruffels, and infifted either on the difmiffal of Cardinal Grandvele, or the calling of an affembly of the ftates-general. The duchefs thought pro-
per to comply with the former of thefe requefts, but as that miniiller was fucceeded by two of his creatures, who trud exaclly in his footlleps, and in particular increafed the religious perfecutions, and the power of the inquifition, the popular ferment became greater than ever. 'The parriots fent Count Egmont to Madrid, to lay their grievances before the king ; but that monarch with his accultomed infincerity, returned a favourable onfwer to their remonftrances, without changing any of the obnoxious meafures of the government at Bruffels. In the mean time the diabolical combination that had been formed between Charles 1X. of France and Ifabella of Spain, for the maffacre of the proteltants, which foon after took place, had been whifpered in the Low Countries, and in confequence a general alfociation was formed for the purpofe of abolilling the court of iuquifition. This affociation, headed by Henry de Budenrode, a defcendant of the earls of Holland, waited on the regent in fuch a formidable hody, that fle was obliged to promile the exertion of her utmaft influence towards obtaining their demands. It is faid, however, that the could obtain no better terms from the bigotted Philip than that heretics thould in future be hanged intead of burnt.

As the people found that their dutiful remonfrances The people could obtain no redrefs, they determined to take into break out their own hands the neceffary reformation. In feve- into open ral towns in Flanders, the people affembled, deltroyed churches, pulled down images, and committed other atts of violence. The principal inhabitants, however, while they were preparing to reill the oppreffive acts of the government, behaved with more temperance and moderation ; a new oath of allegiance had been exacted, and this the counts of Egmont and Horn, probably with a view to temporife, were induced to take, but the prime of Orange feadily refufed, and retired into Germany, whither he was followed by great numbers of all ranks and conditions, fo that within a few days 100,000 families had left the Low Countries. This emigration fo much alarmed the duchefs of Parma, that the refigned the regency.

The duchefs was fucceeded by the duke of Alva, Duke of who had been fent into the Netherlands with an army Alva apof 10,000 veteran troops, to intimidate the people, and vernor of enforce obedience to the civil power. We have already the Netheia drawn the character of this bloody man (fee AlvA), lands. and have fhewn how well he was calculated to execute the orders of a tyrannical and bigotted mafter. He no fooner entered on his government than the whole country was filled with terror ; Counts Egmont and Horn were ignominioully executed, and the eflates of the prince of Orange were confifcated.

This prince and his brother had been labouring to fup. The prince port the caufe of thcir injured countrymen among the of Orange

German

Unitri. Provinces. \(\xrightarrow{\text { Provincte: }}\)
(B) There is no part of the hiffory of nations more interefting in itfelf, or more replete with ufeful leffons to rulers and to fubjects, than that which records the ftruggles of a brave people to preferve or regain their liberties: and independence. Hence the glorious conteft which the Dutch provinces maintained againft the power of Spain, and by which they finally triumphed over tyranny and oppreffion, might well deferve a much fuller detail than our confined limits will enable us to afford. In the compendious view which we have here given of thefe tranfactions, wc have endeavoured to catch the more prominent features, and thus in fome meafure preferve the finitit of the picture. We mave refer our readers for a minute account of thefe eveats to The Modern Univerfal Hifory, vol. as:ai, and Watfon's Hifory of the Reigns of Philitio. II. and Philip-III.

\section*{U N I \([574] \quad \mathrm{U}_{1} \mathrm{NrI}\)}

Cuited Srovinces.

German princes, and had raifed a detachment of Germans, by which they were enabled to make head agaimt the regent. The prince of Orange, who had been always a favourite with the people, was now rendered more popular in confequence of his fufferings in their caule, and was invited to take the command of the armed bodies which were preparing to refit the duke of Alva.
Commence- The prince firit penetrated into Brabant, and attemptment of ho-ed to furprife Ruremond, but was defeated by a detachitilities. An. 1569.

15 ment of the Spanilh army; but his brether foon after overpowered a bocty of Spaniards, and killed 600. In a fublequent engagement, however, with the main body of Alva's army, Prince Louis was entirely defeated, and all his infantry cut in pieces. The prince of O:ange finding that he could not at prefent keep the field againt fo formidable an enemy, and that his [oldiers deferted in confequence of his ill fuccefs and want of pay, was, in 1569 , obliged to difband his army, and return to Germany.

The duke of Alva did not fail to make the mof of his fuccefs. All the prifoners taken in the laft campaign were put to death, and the rooth part of every man's eftate, with a tenth of all merchandife, were exacted as an annual payment from the inhabitants, under the penalty of military execution. The flates offered to pay an annual fubfidy of \(2,000,000\) florins, in place of thefe taxes; but thefe offers were rejected with difdain.
The people thus driven to defpair, were refolved to flain every nerve to refift thele oppreffive acts. The tradefmen in the towns inut their flops, and the peafants refufed to bring provifions to the markets. In the mean time a fquadron of fhips, which is known by the name of guetux, had been fitted out by the prince of Otange, and the command given to Lumey. The triffing fuccels of this fquadron, which had captured Biel, in the illand of Voorn, and repulfed a force fent againgt it by the duke of Alva, induced the Zealanders to collect all their fhips, and allo oppofe the enemy at fea. A confiderable advantage was gained by this flect, againft a Spanifh fquadron commanded by the duke of Medina Celi. The duke was entirely defeated, many of his hips were taken, and the Zealanders carried off a booty of nearly 1,000,000 of livres.
the Orange fraty.

To increale his army, the governor had draughted men from the garrifons of moft of the fortified towns, and thus expofed thele to the attacks of the patriots. Accordingly, Lewis of Nallau furprifed Mons, the count de Bergues gained poffeffion of Ceveral towns in Overyffel, Guelderland, and Friefland; while another party of the maicontenis made themfelves mafters of North Holland. The duke of Alva now began to feel that he had gone too far, and attempted when too late, to conciliate the good opinion of the people. He publifhed an edict confenting to remit the mult oppreflive taxes, if the flate could fuggeft any other method of raifing the neceffary fupplies, and he convoked the flates-general of the Provinces to affemble at the Hague. His promifes and his threats were, however, now difregarded; and the "tates who, in contempt of his authority had afiembled 2t Dordrecht, openly efpoufed the caufe of their country, declared the prince of Orange commander of the national forces, and raifed a confiderable fum for the payment of his troops.

The prince's forces now amounted to 15,000 foot
and 7000 horfe, with which he advanced into Brabatit, and took Huremond by affault. He then poffelfed himfelf of Mechlin, Oudenarde, and Denderniond, and haying levied contributions on thofe inhabitants who adhered to the govemment, he marched towards Mons, then befieged by the duke of Alva, with an intentiun to raife the liege, by bringing the duke to a general action. This, however, Alva declined, and Mons was obliged to capitulate.

In the midll of thefe fucceffes, a damp was thrown Reverie over the ardour of the patriots, by the news of the horrid maflacie of St Bartholomew *, and in the fame de-* Se. gree the fpirits of the Spaniards revived. The prince of France, Orange found himfelf obliged to retire to the province \({ }^{\mathrm{N} 0} 14^{2}\) of Holland, leaving the cities which he had taken at the mercy of the army. Mechlin opencd its gates, and was pillaged without mercy, while the otber towns were cvacuated by the garrilons, and loaded with heavy impofitions. In a fhort time nothing remained to the prtriots, but the prorinces of Holland and Zealand; but thefe ftood firm in the caufe of liberty, and foon became the feat of a fanguinary warfare. Frederick de Toledo was detached by the duke of Alva to reduce the infurgents in thefe quarters. He quickly reduced Waerden, where his foldiers committed the moft holrid acts of barbarity. The capture of this place was followed by that of Haerlem after an obitinate refifance.

To balance this ill fuccefs by land, however, the Zea-Naval vi landers obiained many important advantages by fea. tories of They attacked the harbour of Antwerp, and carried off the Zea. feveral faips; and when the governor equipped a fquadron to oppofe them, it was thrice encountered by Wertz, the Zealand admiral, and totally defeated. In the mean time the Spanilh forces, under Frederick of Toledo, con-Heroic de fifting of 16000 veterans, lat down before Alkmaer, the fence of capital of Holland, a town without regular fortifications, Alkmaer. and defended only by 300 burghers and 800 foldiers, in great want of provifions, and without any profpect of fpeedy relief; yet this place, though attacked with great vigour, by a battery of 20 pieces of beavy cannon, which effected a breach in one of the walls, held out againft every attempt, and the Spanifh foldiers who attempted to fio m the place by the breach, were repulfed with great flaughter, and Frederick was at length compelled to raile the fiege.

Noiwithtanding there partial fuccefles, the affairs of the patriots were fill in a precarious fituation. Don Louis de Requefnes, who had fucceeded the dulie of Alva in the government, was directed to carry on the war with the utmoft vigour. The prince of Orange liad, after a long fiege, made himfelf mafter of Middleburgh, but had fuftained a great lofs by the defeat and death of lis bruther Louis. The patriotic caufe derived fome advantage, however, from a mutiny which took lace in the Spanifh army, but this advantage was of a tranfient nature.

In the commencement of the year 1575, an attempt The States at negociation took place between the contending par-apply for ties, but they could come to no terms of accommoda- afittanct 1 tion, and the war was contimued with great virulence. of England Though much diftreffed in his finances, Philip made ex- An. 1575 . traordinary efforts to crufh the patriots, and fucceeded Fo far, that they almof dsfpaired of ultimate fuccefs. In this dillemmathey frit or deputation to Queen Elizabeth of England, offering to become ker Jubjects, if the

\section*{\(\mathrm{U}^{1} \mathrm{I}\)}

IniteR vinices.
would hnord then her protection; but from political reifons the dectilied the offer. "Ihe diffeffes which Phillp" now' 'expetienced, and the death of his deputy Requefnes, 'did 'more for the caufe of the patriots than all their own exertions.
Profiting by thofe events, in the latter end of this year they attacked and carried the citadel of Ghent; while the inhabitants of Antwerp, in revenge for having been pillaged by the Spanill yarrifon that held the citadel; united in the common caule, by what was called the pacification of Ghent.

A fecond application to Queen Elizabeth met with more fuccefs, and the advanced them the fum of 20,0001 . fterling, on condition that they would not inviie the Fiench into their tervitories, that they would lifen to any reafonable terms of accommodation, and repay the loan in the courfe of the enfuing year. Agreesbly to thefe conditions, a ceffation of hollilities was granted to the flates hy Don John of Auftriz, the prcfent governor, and a treaty was ontered into with him for dibanding the foreign troops. The weak flate of the government required fome conceffions, and Don lohn acceded to the pacification of Ghent, by which moft of the demands of the patriots were granted. The provinces of Holland and Zealand, however conceiving that by this treaty the other provinces had conceded too much, refufed their concurrence, and hoftilities foon recommenced.

The king of Spain diffatistied with the conceffions of Don John, recalled that governor, and appointed the archduke Matthias in his room, while he made additional preparations for a vigorous profecution of the war. The flates-general in their turn made another application to Queen Elizabeth, and obtained from her, nut only a promife of 100,0001 . Aerling, but of a body of forces confilting of 5000 foot, and 1000 horfe; in return for which, the flates agreed to put into her poffeffion certain fortified towns, and to tranfport and pay the forces. The!e fupplies, however, Elizabeth afterwards declined fending, though the profefled all pofible good will towards the provinces and their caufe. A clange of meafures which about this time took place in the ftates of Guelderland and Groningen, in favour of the proteftant intereft, contributed not a little to aid the greneral caufe of the patriots, though feveral of the provinces were ftill torn by inteftine diffenfions and jarring interefts. At laft the prince of Orange, perceiving that little confidence was to be placed in the unanimity of provinces rent by faction, different in religton, and divided by ambition, political maxims, and private intereft, formed the fcheme of more clofely uniting the provinces of which he was governor, and cementirg them with thofe more contiguous, in which the protefant intereft prevailed. Such an alliance was fubject to fewer difficulties than attended the more general one of uniting all the provinces; it was in fact the only meafure that could be propofed with fafety, and it was profecused with that alacrity and addrefs for which William was defervedly celebrated.

On the 23 d of January 1579, deputies from the provinces of Holland, Zealand, Utrecht, Friefland, Groningen, Overyffel, and Guelderland, met at Utrecht, and figned the alliance ever fince knowi by the name of the Union of Utrechit, the bafis of that commonwealth fo renowzited by the appellation of the United Provinces. \(T\) ins treaty of alliance was founded on the infraction of

\section*{\(575] \quad \mathrm{U}\) N I}
the pacification of Ghent fulemnly acceded to by Philip, \({ }^{\text {I }}\) rinited and the late invafion of certain towns in Guelderland. Provinces. It was not hereby intended to divide the feven provinces frum the other ten, or to renounce the pacification of Ghent ; its object was to preterve the liberty llipullated in that pacification, by more vigorous operations, and united councils. The chief articles of this union were the follosing.

That the feven provinces fiall unite themfelves in intereft as one province, never to be feparated or divided by teftament, donation, exchange, fale, or agreement; teferving to each particular province and city all its privileges, rights, cuftoms, and ftatutes. In all difputes arifing between either of the provinces, the seft fhall interpofe only as mediators. They fall affin each other with life and fortune againft every foreign attempt upon any particular province, whether to eflablifh fovereignty, the Catholic religion, arbitrary meafures, or whatever elfe may appear inconfiftent with the liberties of the province, and the intention of the alliance. All frontier towns belonging to the United Provinces Mall, if old, be fortifed at the expence of the provinces; if new, at the joint expence of the union. That the public impofts and duties fhall be farmed for threc months to the higheff bidder, and employed with the king's taxes in the public \{ervice. No province, city, or member of the union, thall contract an alliance with any foreign prince or power, without the concurrence of all the other members. That foreign powers fhall be admitted into the alliance, only by confent of all the contracting parties. As to religion, the provinces of Holland and Zealand fhall act in that particular as they think advifable: the reft thall adhere to the purport of the edict publifhed by the archduke Matthias, which prefcribed, that no man thould be oppreflied on account of confcience. All the inhabitants, from the age of 18 to 60 , thall be trained and difciplined to war. That peace and war thall be declared by the unanimous voice of all the provinces; other matters that concern the internal policy flall be regulated by a majority. That the fates fhall be held in the ufual conftitutional manner, and coinage fhall be deferred to future determination. Finally, the parties agree, that the interpretation of thefe articles fhall remain in the flates-general; but, in cafe of their failing to decide, in the fladtholder.

Soun after the union of Utrecht, King Philip did all in his power to detach the prince of Orange from the new confederation. He offered to reflore him to all his eflates, to indemnify him for all his loffes, and give him the firt place in his efterm and favour; but William was too wife to rely on the promifes of a prince who had already thewn himifelf perfidious, and too generons 10 abandon a caufe in which he had embarked from no interefted motives. He determined to thare the fate of the United Provinces, and not to difappoiat the hopes which they had conceived of his comul. . .

In the inean time the duke of Parma was doing his Succeffer of utmoft to difconcert the projects of the pince of the cule of Orange, and to reduce the provinces to their ohedience Parman the to Spain. He befieged and took the town of Marfien ! United invelled Maellricht, and carried it after a fiege of four Provinces. months, and reduced the republican general La Noue to fuch flaits, that he was glad to retreat under the cannon of Antwerp. At length the Provinces, by the advice of the prince of Orange, refolved to folicit the

\section*{U.N I [ \(57{ }^{6}\) ] U,N I}
- Whited aflitance and protection of the duke of Anjou, to whom Provinces. they had formerly applied in vain, and to ofier him the fovereignty of their territories. Accordingly, in 1580 , they folemnly renounced their allegiance to Philip, and acknowledged as their fovereign, Francis Hercules de Vallois, duke of Alençon and Anjou; and in the following year they publifhed an edict, entitled the abdication of Philip king of Spain, for ever excluding that monarch from any right or authority over the Ne-

In the beginning of the year 1582, the duke of Anjou, who had already taken an active part in favour of his new fubjects, and had oppoled the dulse of Parma with fome fuccefs, arrived in Holland from England; and in the month of February he was folemnly initalled at Antwerp as duke of Brabant. It appears, however, that the prince of Orange, though he had been the great pronoter of this meafure, and even placed the ducal coronet on the head of the new fovereign, ftill poffeffed the greatel influence and authority in the United Provinces.

When Philip of Spain found that he could not bribe the prince of Orange to his interetts, he refolved to ufe every method to rid himfclf of fo dangerous an opponent. Soon after the figning of the union of Utrecht, Philip had profcribed the prince, and offered a reward of 25,000 crowns to any perfon that thould bring him dead or alive to Madrid. The greatnefs of the reward, and a bigotted regard for the interefts of the Catholic xeligion, prompted feveral to attempt murdering the prince of Orange. He narrowly efcaped affaffination in 1582 ; but, two years after, he met his unmerited fate at Delft, by the hands of one Guion, or, as he is commonly called, Balthazar Gerrard. About the fame time the duke of Anjou died in France; and the provinces of Holland and Zealand appointed Maurice, fon of the late prince of Orange, to be their Itadtholder and captain-general. For an account of the actions of this great man, fee the article MIAURICE of Naflau.

Philip II. died in 1598, and Philip III. profecuted the war with the United Provinces with as much rancour as his predeceflors, but with much worfe fuccefs. The great defeat fultained by the archduke Albert in 1600, and many fubfequent difafters, induced the court of Madrid at length to liften to terms of accommodation. In 1607 a fufpenfion of hoftilities took place, and the year following a treaty on terms favourable to the Provinces was concluded for 12 years.
At the expiration of the truce, both parties prepared for a renewal of hoftilities; but now the Spaniards fought with confiderable difadvantage : From a ftrange policy, which they have fince frequently pracifed, in their contelts with the powers of Europe, the Dutch contrived to advance their commercial interefts at the expence of their enemy. A very lucrative trade took place between the principal Dutch ports and thofe of Spain, by which the Spaniards were fupplied by their enemies cven with ammunition and warlike fores. At the fanse time the Dutch enriched themfelves by numerous prizes taken from the Spaniards, and, in particular, gave a fevere blow to the refources of the court of Madrid, by capturing the flota from Mexico, a plize valued at I \(5,000,000\) of livres.

Thefe repeatell loffes of the Spaniards proved the inutility of their continuing the war againft a people fo de-
termined as the Dutch. Accordingly, in 16.48, they agreed to a treaty of peace, by which his Catholic majelify renounced all right and fovereignty over the ftatesgeneral of the United Provinces; and thefe provinces were henceforth declared a free and independent republic. It was alfo agreed between the contending puwers, that each thould remain in unmolefted poffeflion of thofe places which they feverally held at the figning of the treaty.

From this time to the year 1670 we meet with Flourili nothing very remarkable in the hillory of the United flate of 1 Provinces. By invariably purfuing the maxims of pru- republic dence, induftry, and frugality, the repubiic had attain. ed the higheft pitch of grandeur. Amfterdam was become the emporium of Europe, and the richeft city in the univerfe. The population of the Provinces, efpecially of Holland, was much greater than at any former or fubfequent period, though it is fcarcely credible that, as lome authors affirm, Holland alone fhould then contain \(3,000,000\) of inhabitarits. The ftates defpatched minifters and confuls to China, Siam, and Bengal ; to the Great Mogul, the king of Perfia, and the khan of Tartary, the grand fignior, the czar of Ruffia, and the princes of Africa. They were confidered as an important weight in the fcale of Europe; and no treaty was concluded without the concurrence of their ambaffadors.

It is not furprifing that the fucceffes of the Dutch, and Dipute the profperous condition in which they now beheld with themfelves, fhould have rendered them rather arrogant France. towards the neighbouring fates. Louis XIV. of France had conceived himfelf affronted by a foolifh boaft of one of the Dutch minifters, and he was particularly jealous of the advantage which the new republic had acquired over his fubjects in the trade to India. The triple alliance formed about this time between England, Sweden, and the United Provinces, was an additional motive with the French king to break off all intercourfe with the Dutch, and to curb their growing power. He began by prevailing on Charles II. of England to abandon the triple-alliance; a requeft to which that worthlefs monarch, alive to nothing but his pleafures and his avarice, readily agreed, on condition of being well paid for his treachery. Louis alfo perfuaded feveral of the German princes to unite their forces with his againft the republic, and of all the Germanic body, only the elector of Brandenburg interefted himfelf for the fafety of the ffates-general. The French king affembled an army of 100,000 men, which he divided into four columns, one commanded by himfelf in perfon, with the affiftance of Marfhal Turcnne; another by the prince of Condé ; a third by General Crequi, and a fourth under the conduat of the duke of Luxemburg. Such an army drawing towards the frontiers could not but terrify the Dutch, now torn with civil and religious factions. The partifans of the Orange family were for abolifhing the perpetual edict, and raifing William prince of Orange to the dignity enjoyed by his predeceffors; but the De Witt faction oppofed hin violently, though they could not prevent the young prince from being chofen captain-general and high-idmiral. Many hoped that William's new dignity would incline his uncle Charles II. to return to the triple alliance; but that hope was fruffrated by the conduct of hiv majelly, who, in conjuncion with the Mon Chrillian king, de-

United
rovinces. rovinces. clared war againft the ftates-general on the \(7^{\text {th }}\) of April. A month after, the elector of Cologne and bifhop of Munfter followed the example of the two kings. The Dutch put themfelves in the belt polture of defence that circumftances would admit. Maellricht was ftrongly garrifoned ; the prince of Onange had affembled an army of 25,000 men, with which he advanced to the banks of the Yffel; and the Dutch fleet cruifed off the mouth of the Thames, to prevent the junction of the naval forces of England and France, which amounted to 150 hips. All Europe watched the firt motions of the two powerful kings, foconded by the beft generals of the age.

Holland could he attacked only by the Rhine or the Meufe, and the French generals and minitters differed by which of thefe inlets the firft impreftion fhould be made. At length, after much deliberation, it was determined to attack the Dutch on both thefe fides at the fame time, in order the more to difconcert their councils. The campaign began with the fiege of Rhinberg, Vefel, Orfoi, and Rurick, four towns well fortified, and deemed the keys of Holland. Nothing could oppofe armies fo well appointed, led by generals fo thilful and fo experienced. The four towns were compelled to furrender within a few days of each other ; and a fevere defeat fuftained by a body of Dutch troops, in attempting to defend the paffage of the Rhine, by the prince of Condé, ferved fill more to difhearten the troops of the ftates-general.

It is almon incredible with what rapidity towns and fortreffes yielded to the fortune of his majefty's arms. The reduction of Betau, the moft fruitful country of the United Provinoes, and the furrender of Tolbusfert, obliged the prince of Orange to abandon the Yffel, lelt he floould be attacked in the rear, and to retire to the very heart of the country, as far as Rhenen in the province of Utrecht. By this means the town of Arnheim, the forts of Knotfemborough, Voorn, St André, and Shenck, this laft the ftrongeft in the Netherlands, with a variety of other forts and towns, furrendered as foon as fummoned; and at laft Nimeguen, a town ftrong from the nature of the works and fortifications, and garrifoned by 800 fighting men, including the inhabitants, was invelted. After the citizens had for eight days exhibited fignal prools of courage in defence of their liberties, they were forced to yield to the fuperior akill of 'Turenne.
35
\(\qquad\) jompelled o inundate
heir counheir counry.

The only means by which the Dutch could arreft the progrefs of the enemy was, to open the fluices and inundate the country. The town of Utrecht fet the example, which was foon followed by many others, and in a fhort time Holland, Brabant, and Dutch Flanders, formed one vaft lake, the towns rifing like iflands in the midnt of the waters. An embally was alfo fent to the king of England, to requef that he would prevail on Louis to relax in the feverity of his attack. Charles pretended a compliance with this requeft ; but as his in. terference produced no effect, it is probable that he was not fincere. In the fpace of three months, Louis conquered the provinces of Guelderland, Overyffel, and Utrecht, took about 50 towns and forts, and made 24,000 prifoners. The latter, however, were foon relcaled for a trilling ranfom. The very fucceffes of the conquerors tended to weaken their force, as they were compelled to leatre behind them โeveral Arong bodies of Vol. XX. Part II.
troops, to garrifon the captured towns. This indured
Cinited the French to lillen to propolals for a neguciation, which, Provinece, however, came to nothing.

Marfal l'urenne, no:v appointed generaliftimo of the king's almy on his majelty's return to Paris, marched to oppofe the elector of Brandeuburg and the Gernan general Montccuculi, who had joined their furces, and were about to pafs the Rhinc. For three whole months were the elector and Montecuculi employed in abortive attempts to effect a paffige at Mentz, Cublentz, Strafburg, and other places. 'lhis anfwered the purpole of making a powerful diverfion in favour of the Dutch, though they could not accumplifh their defign of joining the prince of Orange. After repeated difappointments, the imperial army directed its march to Weftphalia; and Turenne followed, in order to keep the bithop of Munfter fteady to his engagements. For halt the campaign he, with a body of 16,000 men, hallled every ftratagem of the elector and Montecuculi, the latter the moft renowned general of the empire, at the head of an army near triple his ftrength. He obliged them to go into winter quarters, in a country harafled and exhaufted; and confirmed the bithop of Munfter in the alliance of France, at the very time he was on terms with the emperor. He obliged the elector of Brandenburg, who took the chief command during Montecuculi's illnefs, to abandon the fiege of Warle, took Unma Kamen, Altena, Berkemham, and feveral ather towns and fortreffes. By continuing his operations, he forced the elector out of his winter quarters again into the field, chafed him from poft to poit, until he obliged him to quit We phalia, repafs the Wefer, and retire with precipitation into the bilhopric of Hilderfheim. After taking poffeftion of the elector's towns in Weft. phalia, he purfued him into the bifhopric of Hilderfteim, and at length, by mere dint of fuperior genius, forced him to feek fhelter in his hereditary dominiuns. All this was effected after Louvois had appointed the marflal's army quarters in Alface and Lorrain, amidft the rigours of a fevere winter, oppofed by a fuperior enemy, by the artifices of Louvois, and feconded only by his own prudence, and the affection of his troops, which he maintained in defiance of all the difficulties, hardfhips and dangers, they encountered. It was indeed fuppofed, that Montecuculi was prevented from giving Turenne battle by the remonftrances of Prince Lobkovitz, the emperor's ambaffador, influenced by the gold of Louis. Certain indeed it is, that Montecuculi's illnefs arofe from his chagrin at feeing all his projects fruftrated by the unteady dilatory conduct of the court of Vienna. Louis's negociations difturbed Europe no lefs than his arms. His tools and creatures fwarmed in every court. Leopold could not be prevented frons declaring in favour of Holland; but his minifters were bought off from feconding the emperor's intentions. The whole Englifh nation exclaimed againtt the alliance of their kingdom with France; but Charles flood in need of French gold to fupply his extravagance and profligacy. The elector of Bavaria had indeed been compelled by Louis to retire to his capital ; but it was by dint of intrigue that he was forced from his alliance with Holland, and conflained to make a peace with France.

While the French generals were thus carrying all before them, the combined fleets of France and England

Change of torture,
were fcarcely lcfs fucceffful againf the maritime power of the Dutch. The Englifi fquadron under the duke of York, uniting to that of France under 1D'Eftrees, thrice engaged the Dutch fleet commanded by De Ruyter; and though neither party could boaft of much advantage, the check fuftained by the Dutch admiral was of effential fervice to the caufe of the allies.

At length the tide of fortune began to turn in favour of the United Provinces. The court of Spain, jealous of the growing power of France, embraced the caufe of the Datch ; and fent an army of 10,000 men to the affirtance of the prince of Orange, while the mercenary king of England was compelled by his parliament to withdraw from his unnatural alliance with the French king; and the late ill fuccofo among the allied troops of France and Germany cooled the elector of Cologne and the bifhop of Munfler, in their friendhip towards Louis. Thus that monarch, forfaken by his allies, was compelled to maintain fingly a war againf the empire, Spain, and the United Provinces. The acceffion of the prince of Orange to the throne of England, in 1688, gave an additional blow to the French power, by bringing on an intimate conrection between England and Holland.
and confe- . At length Louis was compelled to negociate for cannt pease peace, which was concluded in 1697, by a treaty exwinh tremely favcurable to the United Provinces.
France.
f... 1697.

After the copious detail which we have elfewhere given of the military tranfactions of Europe, fure the acSummary of ceffion of William III, to the crown of England, in the Durch which the Dutch bore a conficuous part, it will be affliars from bere fulficient for us to give a very brief fummary of the
the cnd of the chd of the 17 th to the beginring of the syinh cen-
tusy. principal events. After the death of William III. the fame plan of humbling the French king, was, in conjunction with the flates-gereral, purfued by his fucceffor Queen Anne ; and the numerous and important victories of the duke of Marlborough and Prince Eugene, ied to the famons treaty of Utrecht, in 1713 . See 3ritann, \(N^{0} 340-371\). In 1747 , the office of fadtholder uas declared hereditary in the princes of Ozange. In the war that took place in 1756, between France and England, a French party was formed in Holland, in oppofition to the fladtholder, who favoured the alliance wih England. Hence arofe a jealoufy between the two allies, which, during the American wras, inereafed to an open rupture. See Brictins, N0 427 , and \(\mathrm{N}^{0} .598\) et Jeq. In 1787 , fome difputes took. place between the flattholeder and the Itates-general, which induced the former to require the affiftance of the king of Prufin. That monarch accordingly fent an army of 18,000 Prulians to Amflerdam, under the duke of Brunlwick, who, in 1788 , brought the whole country into fubjection, and reinflated the ftedtholder in his anthority. See Prussia, No 73. In 1794 the republican armies of France having overrun the greater part of Tlanders, took pofleffion of the Dutch provinces, which they converted into the Batavian republic. The fadtbolder found refuge in England, and the allied armies of Germany and Prufla retreated into Germany. See Prance. N \({ }^{0} 469\), et feq. In the fummer of 1799 , a confiderable Hitith force landed in the Texel ifland, made themfelves maffers of the Dutch fleet, and, in conju cation with a body of Ruffians, gained fome advantages on the continent. Being oppofed, however, ty a fugerior French force, the army was obliged to re-
embark, and return to England. See Britain, No tinited 1069. By the treaty of Amiens, concluded in March Promitite! 1802, all the colomies taken by the Britifh were ieftored to Holland, except the iffand of Ceylon. Oin the renewal of hoftilities in 1803, the Batavian republic was again compelled to take an active part againit Britsin, and in confequence agani loft the Cape of Good Hope, and feveral other colomies, befides having her trade entirely ruined. Soon after the imperial diadern of France was conferred on Napoleon Bonaparte, the Dutch republic swas elevated to the rank of a kingdom, and the emperor's brother, Louis, was appoinied the firf king of Holland.

With refpect to the prefent Itate of this urfortunate country, we know rery little that can be relied on. The people are evidently in a fate of complete fubjection to the French government; and though the late rumours of their avowed anncsation to the empire of France may be premature, there can be little doubt of their being eventually confirmed.

According to the ftatifical table given in \(\mathrm{N}^{\circ} 2\), the Popuataion population of, the United Provinces in the vear 1,96 , of the appears to amount to \(1,880,469\) individunls ; though it Unied is generally eltimated at about \(2,000,000\). Sappoing this lattcr numbet to be correct, and that the area of the Dutch territory compreliends' 10, e00 fquare miles, there will be 200 individuals to each fquare mile; a proportion exceeding any thing that is to be found in any other part of Europe.

In the late republic of Hollased, previous' to the Confitutios French revolution, the fates-general formed the great and goven. council of the nation. That affermbly was formed by ment. deputies from the provincial thates, and was invefled with the fupreme legiffative power. It could not, however, make peace or war, form new alliances, of levy taxes, without the confent of the provincial itates, nor could thefe determine any point of importmee, without the confent of each of the citiss that had a voice in their affembly. The ftadthoider exercifed a confiderable part of the executive power, though in later times his power became very limited. The grand penfionaty was properly a minitter or fervant of the provimes; and though be poffefied great influence, being a perpetual member of the ftates-genera', and of the fecret committee, the was confidered as inferior in rank to all the deputies.
The leading features in the conflitution of the king. dom of Holland are, the guarantee of the payment of the public debt; the free and unqualified exercife of teligion ; the predominant authority vefted in the king; the eftabliftment of the Salique law, excluding females from the throne; the declaration that the minority of any future king flatl expire on his attaining his \(i 8\) ih year; that only natives fhall be cligible 10 any offices of fate, exclufive of thofe immediately appertaining to the king' hourehold; that the yearly revenue of the king thall be \(2,000,000\) florims, and that the royal refidences fhall be the palaces of the Hague, in the Wood, and at Soeft dyke. The council of ftate is to confitt of 13 members; the general government of the kingdom is to be coummitted to four minifters of flate; and the * Playfait', legiflative bndy is to be compofed of 38 menibers chofen Gerginpbl, for five years *.

The revenues of the United Provinces arofe princi-Rcycruse \({ }^{42}\) pally from taxcs improfod on cach province and city, ac.

\section*{U Y N i［：579］UN I}

United cording to their ability．There confined chielly of a geneérul excife，a lavd tax，a poll－tax，and hearth mo－ ney；and ase fuppofed to have amounted to \(3,000,0001\) ． fterling．

Hicfore the Erensh revolution，the Dutch maintained a peace eftablithment of 30,000 men，which in war was augnented to above 5,000 ，chictly by mercenary troups from Germany．Their naval eftablifhment was highly refpectable；and at the end of the 17 th century it exceeded that of any other maritime porver in Eu－ rope．Before the late war they could mufter 40 fail of the line， 40 frigates，and so cutters．Since the ce－ lebrated engagement off the Dogger Bank during the American war，the Dutch have been fcarcely able to cope with the Englifl at fea；an：d the victory off Cam－ peidown in October 1797，with the fubfequent lofs of the Texel fleet in 1799，proved the deathblow to the naval power of Holiand．
Before the late change of government，the eftablinh－ ed religion of Holland was Preblyterianifm，according to the doctrines of Calvin；though all fects of Chriati－ ans were tolerated．The church was governed by con－ filtories，claffes，and lynods，from whicl there was an appeal to one great national fynod，fubject to the con－ troul of the ftates－general．

The Dutch language is a dialect of the German，and in many refpeets bears a confiderable refemblance to the Old Englifh and Lowland Scotch．The literature of the United Provinces has long been refpettable；and the univerfities of Leyden，Utrecht，Groningen，Har－ derwyck，and Franeker，have produced many eminent and celebrated men in almof every department of fci－ ence．Grotius，Erafmus，Boerhaave，Leuwenhoeck， Swammerdam，Groevius，Burrman，Hooguween，\＆c． are names mentioned with admiration and refpect in the annals of literature．
The Dutch manufactures confint principally of fine li－ vens，earthen ware，chiefly manufactured at Delft，efpc－ cially white and painted tyles，tobacco－pipes，borax，oil， farch，paper，leather，woollen and cotton cluths，fnuff， tobaceo，and gin．
47 The commerce of the Dutch was formerly more ex－ commerce．temfive than that of any other country in Europe．They carried on a trade with every quarter of the globe，and in patticular their Ealt India Company was perhaps the richeft fociety of merchants in the world．Holland was almoft the exclufive centre of the fpice trade；and the extenfive fifheries on the coaft of Greeniland and in the North fea，fupplied the greater part of Europe with whale oil and herrings．Befides this external commerce， they carried on a confiderable inland traffic with the in－ terior of Germany，from which they brought immenfe quan ities of timher．Vaft rafts of trees，many hundred feet in length，fet out annually from the foretts of An－ dernach，and other places on the Rhine，and proceeding down the river under the direction of a great body of Labourers，that formed a village of huts on the furface of the raft，failed down the Rline and the Waal to Durt，where the timber was difpofed of，and where one raft has been foid for 30,000 ．fierling．\｛ All the foreign
trade of Helland may now be coulfidered as ann：inifsted but the inland tranic in wood and Spitits fall con－ tinues．

The inland commerce of the United Provinces is greatly promoted by the facility of conveyance from one part of the country to another，by means of the nume－ rous canals．

The Dutch are，by confitution a cool，or rathe \(4^{3}\) phlegmatic people，laborions，patient，obblinate，and of the perfevering．When timulated by any predominant pala Dutch． fion，as avarice，or formerly love of liberty，they are capable ef great exertions．Econony and order in the management of their pecumiary concerns are common among all claffes，with whom it is an eftablifhed maxim to feend lefs than their income．Intereft and love of money regulate all their actions，and appear to fupplant in their breatts every noble and generous feeling．Thefe prominent features in the national character are，of courfe，modified by the rank or fituation of the different orders in fociety．The higher ranks value chendelves much on their diftinctions，are referved to 11 rangers， but affable and obliging to thofe with whom the；lave had an opportunity of becoming acquaisted；friendiy， candid，and fircere．The mercamile men and traders are，in general，fair and lioneft in their tranfactions； though their natural thirit of gain Cometimes tempts． them to deceive and overreach their cuftowers．＇I he lower rarks are ignorant，dull，and now of apprehen－ fion，but open to conviction，and patient of fatigue and
labour．

Drefs，among the Dutch，is regulated lefs by famion，ithanict Af than by an attention to climate and featon．The moiffate atio the ture and inconfancy of thefe require a greater quanlity ron of of clothing than is found neceffary in other counstiles under the fame latitude；and，among the ordinary ctal！ fes，broad hats，large breeches and thick boots and floes，are fill almoft univerfal．Mof of the women wear hats with low crowns and very broad rims，with jerkins and flort pe！ticoats；and，what appears exceed－ ingly ridiculous to ftrangers，the boys and girls wea： the fame drefs as the men and women．

A clofe attention to regularity and neataefs in the flreets and the interior of the houfes prevails throushowe the United Provinces，but is molt confpicuous in North Holland．This was at frift rendered necellary by the nature of the climate，to preveut ruft and mouldinefs from deftroying their utenfils and furniture，and has fince become a habit，conducive at once to comfort ard to health．The manner of living in Holland was，till of late，not a little grofs．Their diet confifted much of high－feafoncd and falted meats，butter，checfe，and fpi－ rituous liquors．In no country was gormandizing re－ duced more to a fytem．Convivial entertainments were extremely frequent；and the interval between the more fubttantial meals of dinmer，tea，and fupper，were filted up：with cakes，fruits，jellies，and ouber light things； not to mention fmoking and drimking，which fupplied the place of converfation（c）．If we may rely on the report of a late witer on the flatilitics of Holland＊，the＊

Unitred \({ }^{0}\) improved. Animal food is become extremely rare, and Provinctes, its \({ }^{3}\) place is fupplied by a greater proportion of gin, tea, Uniserfity. end coffee. The prevailing amulements in winter are \(\underbrace{-}\) dramatic entertainments and fatiting, in which latter they are exceedingly expert.

The Dutch tafte for formal gardens, ftraight walks, trees and hedges clipped into fantaftic thapes, and flower roots, has long been proverbial, and has been treated with more contempt and ridicule than it deferves. At wortt, thefe are but barmlefs propenfities; and, if indulged in moderation, are well fuited to relieve the famenefs and inactivity of a retirement from the bufy fcenes of trade and commerce.

UNITY, in Poetry. There are three unities to be obferved, viz. the unity of action, that of time, and that of.place. In the epic poem, the great, and aimoft the only, unity, is that of the action. Some regard indeed cught to be had to that of time; for that of place there is no room. The unity of character is not reckoned among the unities. See Poetry, Part II. Sect. 3.

UNIVElSAL, fomething that is common to many things; or it is one thing belonging to many or all things.

UNIVERSE, a collective name, fignifying the whole world ; or the affemblage of heaven and earth, with all things therein. See Astronomy and Geography.

UNIVERSITY, is the name of a corporation formed for the education of youth in the liberal arts and fciences, and authorized to admit fuch as have ftudied in it, to certain degrees in different faculties, which not only ferve as certificates of proficiency in fcience, but allo confer on thofe who obtain them confiderable privileges within the uiniverfity, as well as fome rank in the ftate without it. Univerfities generally comprehended within them one or more colleges : but this is not always the cafe; for the univerfity of St Andrev's was in being before either of its colleges was founded, and it would continue in being, with all its privileges, though both its colleges were levelled with the duft.

In every univerfity with which we are acquainted, there are four faculties, viz. Theology, Law, Phyffic, and the Atts and Sciences, comprehending mathematics, natural and moral philofophy, \&c.: and in Oxford, Cambridge, and fome other univerfities, Mufic is confidered as a fifth faculty. In each of thefe there are \(t\) wo degrees, thofe of Bachetor and Dector ; for though in the univerfties of Gieat Britain and Ireland we have no fuch degree as Doctor in Arts and Sciences, our Maf. ser of Arts'anfivers to the deyree of Doctor in Philo Jophy, which is conferred by many of the univerfities on the continent.

Univerfities in their prefent form, and with their prefent privileges, are inflitutions comparatively modern. They fprang from the convents of regulaz clergy," or from the chaptérs of cathedrals in the church of Rome, where young men were educated for holy orders, in that dark period when the clergy poffeffed all the little eniditoon which was left in "Europé, Thefe convents were feminaties of learning probably from their firf inflitution ; and we know with certainty, that in Old Aber-
deen there was a montaftery in which youth wera influctryniverits ed in theology, the canon law, and the follool plitlofowhy, at leaft 200 years vefore the univerfity and King's College were founded. The fame was doubtlefs the cafe in Oxford and Cambridge, and probably in every town in Eurupe, where there is now a univerfity which has any claim to be called ancient; for, it was not till the more eminent of the laity began to fee the importarce of literature and ficience, that univerfties diftinct frum convents were founded, with the privilege of admitting to degrces, which conferred fome rank in civil fociety. Thefe univeifities have long been confidered as lay corporations; but as a proof that they had the ecelefiaftical origin which we have affigned to them, it will be fufficient to obferve, that the pope arrogated to himfelf the right of vefting them with all their privileges; and that, prior to the Reformation, every univerfity in Europe conferred its degrees in all the faculties by authority derived fiom a papal bull.

It is perhaps no improbable conjecture, that the church of Rome denived her idea of academical honours from the Jews, among whom literary diftinctions extremely finilar fubfifed before the nativity of our Saviour. Among them, the young fludent, with refpect to his learning, was called a difciple; from his minority a junior; and the chofen or clected, on account of his election into the number of difciples. When he had made fome progrefs in knowledge, and was deemed worthy of a degree, he was by impofition of hands made 7 ח, a companion to a Rabbi, the perfon who officiates ufing this form, I afociate thee, or, Be thou affociated; and as foon afteruards as he was thought worthy to teach others, the affociate was raifed to the rank of Rabbi. Whether this procel's fuggefled the idea or not, it has certainly fome refemblance to that by which a young man in our univerfities pafies through the degree of Bachelor to that of Mafer of Arts or Dochor.

The moft ancient univerities in Europe are thofe of: Oxford, Cambridge, Paris, Salamanca, and Bologna; and in the two Englifh univerfitics, the firt colleges are thofe of Univerfity, Baliol, and Merion, in the former, and St Peter's in the latter. Oxford and Cambridge, however, were univerfities, or, as they were then called, fludies, fome hundreds of years before colleges or fchools were built in them ; for the former flourithed as a feminary of learning in the reign of Alfred the Grear, and the other, could we believe its partial partizans, at a period fill earlier. The univerfities of Scotland are four, St Andrew's, Glasgow, Aberdeen, and Edinburgh. In Ireland there is but one: univerfity, viz. that of Dublin, founded by Queen Elizabeth, and very richly endowed.

An idle controverfy has been agitated, whether the conflitution of the Englifh or of the Scotch univerfities be beft adapted to anfwer the ends of their inflitution; and, as might be expected, it has been differently decid. ed, according to the partialities of thofe who have written on the fubject. Were we to hazard our own opinion, we fhould fay; that each has its, advantages and difadvantages; and that while the:Englifh univerfities, aided

\footnotetext{

}
\[
\mathrm{VIO} \mathrm{O}
\]
dring iaided by theit great fchools; to wbich we have nothing That: can be eompared, are unqueftiunably. fitted to carry their young membersl fartheft in the knowledge of the leatried languages, the mode of teaching in our own univerfities is better adapted to the promotion of arts and fciences, and the communication of that knowledge which is of mof importance in active life.

Univerasiti:Courts, in England. The two univerfities enjosy the fole jurifdiction, in exclufion of the king's courts, over all civil actions and fuits whatfoever, where a fcholar or privileged perfon is one of the parties; excepting in fuch cafes where the right of freehold is concerned. And then by the univerfity charter they are at liberty to try and determine, either according to the common law of the land, or according to their own local cullons; at their diferetion; which las generally led them to earry on their procefs in a courfe nuch conformed to the civil law. ?

This privilege, fo far as it relates to civil caufes, is exerciled at Osford in the chancellor's court ; the judge of which is the vice-chancellor, his deputy, or affeffor. From his fentence an appeal lies to delegates appointed by the congregation; from thence to other delegates of the houfe of convocation; and if they all three concur in the fame fentence, it is final, at leaft by the flatutes of the univerfity, according to the rule of the civil law. But if there be any difcordance or variation in any of the three fentences, an appeal lies in the laft refort to judges delegates appointed by the crown, under the great feal in chancery.

As to the jurifdietion of the univerfity courts in criminal matters, the chancellor's court at Oxford, and probably alfo that of Cambridge, hath authority to try all offences or mifdemeanors under the degree of treafon, felony, or mayhem; and the trial of treafon, felony, and mayhem, by a particular charter, is committed to the univerfity jurifdiction in another court, namely, the court of the lord high fteward of the univerfity.

The procefs of the trial is this. The high fleward iffues one precept to the dheriff of the county, who thereupon returns a panel of 18 freeholders; and another'precept to the bedells of the univerfity; who thereupon return a panel of 18 matriculated laymen, faicos privilegio univer \(\sqrt{t i t a t i s}\) gaudentes: and by a jury formed de needietate, half of freeholders and half matriculated perfons, is the indictment to be tried; and that in the guildhall of the city of Oxford. And if execution be necefiary to be awarded in confequence of finding the party guilty, the Theriff of the county mut execute the univerfity procefs; to which he is annually bound by an oath.

VOCABULARY, in Grammar, denotes the collection of the words of a language, with their fignifications, otherwife called a diffionary, lexicon, or nomesslature. See Dictionary. ghs izwi of Loner je itod

A vocabulary is properly a fraller kind of dictionary, which does not enter fo minutely into the origin and different acceptations of words: बI TTI . Bgidut aft an

VOCAL, fomething ihat relates to the voice or fpeech ; thus vocal mufic is that fet to vords, efpecially verfes, and to be performed by the voice; in contradiftinction to inftrumental mufic, compofed only for inflruments, without finging.

VOCATIVE, in Gnammar, the fifth fle or cafe of nouns. See Grimmar.

सno3mit

VOETIUS or Voet, Gisbert, an eminent divine Voeties*s of the 16 th century, was profeflor of divinity and the Oriental tongues at Utrecht, where he was alfo minifier. He aflited at the fynod of Dort; and died in 1676 ,
 aged 87 . He wrote a great number of works; and was the declared enemy of Des Cartes and his philofophy. His followers are called Voetians. Voetius had two fons, Danicl and \(P_{\text {Pul }}\), both authors. John Voetius, the fon of Paul, was doctor and profeffor of law at Her. born, and wrote a commentary on the Pandects,
VOICE, a found produced in the throat and mouth of an animal, by peculiar organs.

Voices are either articulate or inarticulate. Articulate voices are thofe whereof ieveral confpire together to form fome alfemblage or little fyllem of founds: fuch are the voices exprefing the letters of an alphabet, numbers of which joined together form words. Inarticulate voices are fuch as are not organized, or affembled into words; fuch is the barking of dogs, the braying of affes, the hiffing of ferpents, the finging of birds, \&c.

For a defcription of the organs of the voice, fee Ana. tomy; fee alfo Pinsionocy Index.

Voice, in Grammar, a circumfance in verbs, whereby they come to be confidered as either active or pafive, i.e. either expreffing an action impreffed on another fubjech, as, I beat; or receiving it flom another, as, \(I\) am beaten. See Grammar.
Voice, in matters of election, denotes a vote or fuf. frage.
Voice, in Oratory. See Declamation; Reading, \(\mathrm{N}^{\circ}\) 5.; and Oratory, \(\mathrm{N}^{0}{ }^{129-131 .}\)

VOLAN', in Heraldry, is when a bird, in a coat of arms, is drawn flying, or having its wings fpread out.
VOLATILE, in Phyfics, fomething that is eafily diffipated by fire or heat.

Volatile alkali. See Ammonid, Chemistix Index.

VOL ATILISATION, the art of rendering fised. bodies volatile, or of refolving them by fire into 3 yapour.

VOLCANO, a name given to burning mountains, or to vents for fubterraneous fires. See Geology Index, たtha, Hecla, \&ec.
VOLERY, a bird-cage, of fuch a fize that the birds have room to fly up and down in it.

VOLGA, the largelf river in Europe, derives its origin from two fmall lakes in the foreft of Volkionki a bout 85 miles from Tver, a town in Ruffa. It is navigable a few miles above that town. This noble river vaters fome of the fineft provinces in the Rulfian empire: and at laft falls into the Cafpian fea by feveral mouths, below Atracan.

The Volga is fubject to annual inundation. In the year- 8774 , the inundations exceeded the lowell watermark by nearly 40 feet, fince which period they have been rather on the decline; for in \(\mathbf{7 7 . 7 5}\), they rufe only to 39 feet 2 inches above that mark; in 1782 , they rofe to 26 feet; in 1785 , to 25 feet 2 inclies; and in the yearing1, their, height was the fame. Pallas is of opinion that this phenomenon may have originated from the diminifhed quantity of foow and rain which had fallen in the higher countries; frons the greater evaporation of the Cafpian fea, and the gradual extenfion of the different mouths of the river, or perhaps from the joint operation of all thefe caufes,
, viodamian voltiniont,

\section*{YO I [582] VO L}
volution VOLYTION, the act of willing. See MetaphyII.

Voltaire. sics.
\({ }^{2}\) VOLIEX, a military falute, made by difcharging a great number of fire arms at the fame time.

VOLONES, in Roman antiquity, faves who in the Punic war voluntarily offered their fervice to the fate, which is the reafon of the appellation; upon which they were admitted to citizentlip, as none but freemen could be foldiers.

TOL'l', in the manege, a round or circular tread; and hence, by the plirafe to make volis, is underfood a gate of two treads, made by a horfe going fidewife round a centre, in fuch a manner that thefe two treads make parallel track, ; one larger, made by the fore-feet, and another fmaller maje by the hind-feet; the croup approaching towards the centre, and the fhoulders bearing out.

VOLi'AIRE, Francis Arouet df, a celebrated Erench author, was born at Paris, February 20. 1694. His father, Francis Arouet, was ancien notaire au ChaBelet, and treafurer of the chamber of accounts; his mother, Mary-Miargaret Draumart. At the birth of this extraordinary man, whe lived to the age of 85 years and fome months, there was little probability of his being reared, and for a confiderable time he continucd remarkably feeble. In his earlieft years he difplayed a ready wit and a Pprightly imagination; and, as he faid of himfelf made verfes before he was out of his cradle. He was educated, under Father Poré, in the college of Louis the Great ; and fuch was his proficiency, that many of his effays are now exifting, which, though written when he was between 12 and 14 , flow no marks of infancy. The famous Ninon de l'Enelos, 10 whom this ingesious boy was introduced, left him a legacy of 2000 livres to buy him a library. Having been fent to the equity fchools on his quiting college he was fo difgufted with the drynefs of the law, that he devoted himfelf entircly to the mufes. He was admitted into the company of the abbe Cheaulicu, the mare muis de la Fare, the duke de Sully, the grand prior of Vendone, marhal Villars, and the chevalier du Bouil. lon; and canght from them that eafy tafte and delicate humour which diftinguifned the court of L.ouis XIV. Voltaire had early imbibed a turn for fatire; and, for fome philiopics againft the government, was imprifoned almoft a year in the Banile. He had before this period produced the tragedy of Oedipue, which was reprefented in 1718 with great fucceefs; and the duke of Orleans happering to fee it performed, was fo delighted, that he obtained his releafe from prifon. The pret waiting on the duke to return thanks; "Be wife (faid the duke), and I will take care of you." "I an infinitely obliged (replied the young man); but I intreat your royal bighnefs not to trouble yourfelf any farther sbout my' lodging or board."

He began his Henriade before he was 18 . Having ene day read feveral cantos of this poem when on a vifit to his intimate friend, the young prefident de Maifons, he was is teafed with ohjections, that he loft patience, and threw his mamfeript into the fire. "The prefident Henaut with diffoulty refcued it. "Remember (faid Mr Henaut to him, in one of his letters) it was I that faved the Henriade, and that it con mc a handfome pair of ruffics." Some years after, feveral copies of this poem having got abroad, while it was
only a feetch, an edition of it was publihed, with many chafms, under the title of The League. Infead' of fame and friends, the author gained only encnies and mortification, by this firf ecition. The Ligots took fire at sit, and the poet was confidered as highly criminal for praifing Admiral Coligny and Qucen Elizabeth. Endeavours here even ufed to get the piece fupprefied; but this Itrange defign proved abortive. His chagrin, on on this occafion, firf infpired him with the thought of vifiting England, in order to finith the work, and re: publifh it in a land of liberty. He was right; for King George I. and more particulatly the princels of Wrales, afterwards queen of England, railed an immenfe fub. fription for him. Their liberality laid the foundation of his fortune; for on his return to France in 1728 , ha put his money into a loticry eltablifhed by M. Desfortes, comptroller-general of the finances. The adventurets received a rent charge on the Hathade-Ville for their tickets; and the prizes were paid in ready money; fo that if a fociety had talien all the tickets, it would have gained a million of livres. He joined with a numerous company of adventurers, and was fortunate.

His Lettres Philofophiques, abounding in bold expref. fions and indecent witticifms againf religion, laving been burnt by a decree of the parliament of Paris, and a warsant being iffued for apprehending the author in 1733, Voltaire prudently withdrew; and was theltered by the marchionefs du Chatelet, in her caftle of Cirey, on the borders of Champagne and Lorraire, who entered with him on the ftudy of the fyltem of Leibaiz, and the Prineipia of Newton. A gallery was built, in which Voliaire formed a good collection of natural hiftory, and made an infinite number of experiments on light and e. lectricity. He laboured in the mean time on his Elements of the Newtonian Philofophy, then totally unknown in France, and which the nemerous admircrs of Dis Cartes were little defirous hould be known. In the midft of.thefe philofophic purfuis he produced the tragedy of jlizira. He was now in the meridian of his age and genius, as was evident from the tragedy of Mahonow, firlt ached in \(174^{1}\); but it was reprelented to the procureur-general as a performance offerfive to religion; and the author, by order of Cardinal Fleury, witfirew it from the fage. Micrope, played two years after, 1743, gave an idea of a fpecies of tragedy, of which few models had exifled. It was at the reprefentation of this tragedy, that the pit and boxes were clamorcus for a fight of the author; yet it was feverely criticifed when it came from the prefs. He now became a fawourite at court, through the intereft of Madame d'Etiole, afterwards marchionefs of Pompadour. He was appointed a gentleman of the bed-chamber in ordinary, and hiforiographer of France. He had frequently attempted to gain admittance into the Academy of Sciences, f ut conld not obtain his wifh till 1746 , when he was the firf who broke though the ablurd cultom of filling an inaugural freech with the fulfome adulation of Richelicu; an cx. ample foon followed by other academicians. From the fatires occafioned by this imnovation he felt fo much uneafinels, that be was glad to retive with the marrhionefs du Cliatelet to Luneville, in the neighhourhood of King Stan:Unus. The marchionets dying in 1749. Toltaire returned to Paris, where, his, llay was, but hoort. The king of Prumpa noiv gave Foltaire an invitation to live with him, which he accepted towards the end, of \(\Lambda_{1}\) gun
aire. Sult 2750 . On his arrival at Berlin, he was immediately, prefented with the Order if Mrin, the key of chainubrbin, and a pexfon of 20,000 livers. Trom the particulir refpect that was paid to him, his time was now fpent in the molt agrecable manner ; his apartments were under thole of the king,', whom he was allowed to vifit at Pated hours, to read with him the beft works of either ancient or modern authors, and to affit his majefly in the literary productions by which he relicued the cares of government. But a difpute which arofe betwees him and Maupertuis foon brought on his difgrace. Maupertuis was at fome pains to have it reported at court, that one day while General Manfein happened to be in the apartments of M. de Voltaire, who was then tranfiating into French the Memoirs of Ruflia, compoed by that officer, the' king, in his ufual manner, fent a copy of verfes to be examined, when Voltaire faid to Mantlein, " L.et us \(^{5}\) leave off for the prefent, niy friend; you lee the king has fent me his dirty linen to wath, I will wafh your's another time." A fingle word is fonctimes fufficient to ruin a man at court; Maupcrtuis imputed fuch a word to Voltaire. and fucceeded. It was about this very time that Maupertuis publifhed his very Arange Philofophical Letters; and M. de Voltaire did not fail to heighten, with his utmoft potwers of raillery, every thing which he found, or could make, ridiculous, in the projects ci M. Mapertuis, who was careful to unite his own caufe with that of the king ; Voltaire was confidered as having failed in refpect to his majenty; and therefore, in the moff refpectful manner, he returned to the king his chamberlain's key, and the crofs of his Order of Merit : accompanied with four lines of verfe; in which he, with great delicacy, compares his fituation to that of a jealous lover, who fends back the picture of his mif. trefs. The king returned the key and the ribbon; but they were not followed by an immediate reconciliation. Voltaire fet out to pay a vifit to her highnefs the duchefs of Gotha, who honoured him with her friendfhip, as long as fle lived. While he remained at Gotha, Maupertuis employed all his batteries againit him : Voltaire was arreited by the king's orders, but afterwards releafed.

He now fettled near Gereva; but afterward being obliged to quii that republic, be purchafed the cafte of Ferney in France, about a league from the lake of \(G=-\) neva. It was here that he undertook the defence of the celebrated family of Calas; and jt was not long before he had a fecond opportunity of vindicating the innocence of another condemned family of the name of Sirvin. It is fomewhat remarkable, that in the year 1774 , he had the third time a fingular opportunity of employing that fame zeal which he had the good fortune to difplay in the fatal cataftrophe of the farmilies of Calas and Sirven.

In this retreat Mr. Voltaire continued lone to enjoy the pleafures of a rural life, accompanied with the admiration of a valt number of wits and philofophers thrcughout all Eutope. Wearied at length, however, pith his fituation, or yiclding to the importunities of friends, he came to Paris about the beginning of the year \(17 \%\) 最, where he wrote a new tragedy called Irene. By this time his underttanding feems to bave been im: paired, either through the infirmities of age, or continued intoxication by 'the flatery' of others; and he fidicun loufly fuffered himfelf to be crowned in public with lau. rct, in teftirany of his great poetical merit.' He did not
long furvive this farce: for having overreated himfelf with receiving vifis, and exhaufied his fpirits by fupply. ing a perpetual fund of converfation, he was firt feized with a fpitting of bloorl; and at laft becoming reflefo in the night-lime, he was obliged to ufe a fuporific medicine. Of this he muluchily one night took fo large a dofe, that he flept 36 hours, and expired a very flort time after awakening from it.

VOLUME, in matlers of literature, a book or writing of a juft bulk to be bound by itfelf. The name is derived from the Latin volvere, "to roll up;" the ancient manner of making up books being in rolls of bark or parchment. Sce Book.

VOLUNTAliY, in Mufic, a piece played by a mufician extempore, according to his fancy. This is often ufd before he begins to fet himfelf to play any particular compofition, to try the infrument, and to lead hins into the key of the picce he intends to perform.

VOLUNTEERS, perfons who, of their own accord, for the fervice of the prince or ftate, ferve in the army without being enlifted, to gain honour and preferment.

VOLVOX, a genus of animals belonging to the ver. mes infuforia. Sec Heinantholocy Index.

VOLUSENUS. See Wilso:r.
VOLUTA, a genus of facll-fin. See Conchórog\% Indes:

VOLUTE, in Archisecture, a kind of fpiral fcroll ufed in Ionic and Compofite capitals, whereof it makes the principal charackeriftic and ornament.

VOMICA, in Mcdicine, an abfcefs of the lungs. See Medicine, \({ }^{0} 186\).

Nux Vonica, in Pharmacy. See Materia Medica Index.

Vomit. See Emetic, Materia Medicá Indes.
VOMITTING; a retrourade fafmodic motion of the mufcular fibres of the cefophagus, flomach, and intellines, attended with firong convulfions of the mufcles of the a'domen and diaphragm ; which when gentle, create a naufea; when violent, a vomiting.

VOORN, one of the illands of Holland, boundèd by the river Maes, which divides it from the continent and the illand of Iflemunde, on the north; by the fea called Bies-bofch, on the ealt; by another branch of the Maes, which divides it from the iflands of Goree and Overflackee, on the fouth; and by the German fea on the welt; being about 24 miles long, and five broad.

VORTEX, in Meteorology, a whirlwind, or fudden, rapid, and violent motion of the air in circles; or that motion of the water called an eddy or whirlpool.

Vortex, in the Cartefian philofophy, is a fyltem or collection of particles of matter moving the fame way, and round the fame axis.

VORTICELLA, an animalcule. See Microscopl.
VOSSIUS, John Grrard, a moft learned and lahorious writer of the 17:h century, was of a confiderable family in the Netherlands; and was born in 1577 , in the Palatinatc, near Heidelberg, at a place wherc his father, John Vofius, was minifler. He was made dit. rector of the college of Dort, and afterwards profeflor of cloquence and chronology at L.ryden, from whence he was called in 1633 to Anoferdam, to fill the chair of profeflor of hittory. He died in \(\mathbf{5} 6_{4} 9\).

YOTE, the fuffrage or refolve of eash of the men:bers of an aftembly, r:here and"affair is to be carried bo

 \(\square\) \(\square\) ( -\(\square\)
a majority; but more particularly ufed for the refolves of the members of either houfe of parliament.

VOTIVE medals, thofe on which are expreffed the vows of the people for the emperors or empreffes. See Medal.

VOW, a folemn and religious promife or oath. See Олтн.

The ufe of vows is found in moft religions. They make up a confiderable part ef the Pagan worfhip, being made either in confequence of fome deliverance, under fome preffing neceffity, or for the fuccefs of fome enterprife. Among the Jevw, all vows were to be voluntary, and made by perfons wholly in their own power; and if fuch perfon made a vow in any thing lawful and poffible, he was obliged to fulfil it. If he appointed no particular time for accomplihing his vow, he was bound to do it inftantly, left by delay he fhould prove lefs able, or be unwilling, to execute his promife. Among the Romanifts, a perfon is conftituted a religious by taking three vows ; that of poverty, chaftity, and obedience.

Vows, among the Romans, fignified facrifices, offerings, prefents, and prayers made for the Cæfars, and emperors, particularly for their profperity and the continuance of their empire. Thefe were at firf made every five years, then every 15 , and afterwards every 20 , and were called quinquennalia, decennalia, and vincennalia.

VOWEL, in Grammar, a letter which affords a complete found of itfelf, or a letter fo fimple as only to need a bare opening of the mouth to make it heard, and to form a diftind voice. The vowels are fix in number, viz. A, E, I, O, U, Y.

Vowel, John. See Hooker.
UPHOLSTER, UPholsterer, or Upholder, a tradefman that makes beds, and all forts of furniture thereunto belonging, \&c.

UPLAND, denotes high ground, or, as fome call it, terra firma, by which it flands oppofed to fuch as is moorifh, marfhy, or low.

UpLand, a province of Sweden, bounded on the north-eaft by the Baltic fea, on the fouth by the fea of Sudermania, and on the weft by Weftmania and Geitricia, fiom which it is feparated by the river Dela. It is about 70 miles in length and 45 in breadth, and contains mines of iron and lead. Stock holm is the capital.

UPSAL, a rich and confiderable city of Sweden, in Upland, with a famous univerfity, and an archbifhop's fce. The town is pretty large, and as fraight as a line; but moft of the houles are of wood, covered with birch bark, with turf on the top. On an eminence, to the fouth of the town, is a ruined cafle. Thofe that view the town from hence would take it to be a garden, whofe ftreets reprefent the alleys; and the houfes, which are covered with turf, the grafs-plots. It was formerly the refidence of the kings, and is now the ufual place where they are crowned. It is feated on the river Sala, over which there are two bridges. It is 26 miles north-weft of Stockholm. E. Long. 17.48. N. Lat. 59. 52.

UPUPA, a genus of birds belonging to the order of picer. See Ornithology Index.

UR, in Ancicnt Geograply, a citadel of Me.fopotamia, fituated between the Tigris and Nifibis; taken by fome for \(\mathrm{U}_{r}\) of the Chaldees, the refidence of Abraham. What feems to conlirm this is, that from Ur to Haran, the other refidence of the patriarch, the road lies direct1y for Paleftine. And it is no objection that \(U_{5}\) is faid
to be in Mefopotamia ; becaufe the parts next the Tigris were occupied by the Chaldeans, as leems to be confirmed from Acts vii. 2, 4. It is called Orche, in Strabo; Orchoe, in Ptolemy.

UliALIAN CHALN, a range of mountains which form patt of the boundaries of Atia, and anciently known by the name of Riphaci Mantes. See Riphei Montes, and Geolocy Index.

URANIA, in fabulous hiftory, one of the nine Mufes, was fuppofed to prefide over aftronomy. She is commonly reprefented in an azure robe, crowned with flars, and fupporting a large glebe with both hands.

URANIUM, one of the lately difcovered metals. See Chemistry and Mineralogy Index.

URANOSCOPUS, a genus of fifbes belonging to the order of jugulares. See Ichtiryology Index.

Raphael d’urbino. See Raphael.
Ufichin, or Hedgehog. See Erinaceus, Mammalia Index.

Sea Urchin. See Echinus, Helminthology Index.

UREA. See Chemistry.
URETERS. See Anatomy, No ior.
URETHRA. See Anatomy, N \({ }^{0} 107\).
Uric Acid. See Chemistry Index.
URIM and Thummim, among the ancient Hebrews, a certain oracular manner of confulting God, which was done by the high-prieft dreffed in his robes, and having on his pectoral or breaft-plate.

Various have been the fentiments of commentators concerning the urim and thummim. Jofephus, and feveral others, maintain, that it meant the precious fones fet in the high-prief's breaft-plate, which by extraordinary luftre made known the will of God to thofe who confulted him. Spencer believes that the urim and thummim were two little golden figures flut up in the peftoral as in a purfe, which gave refponfes with an articulate voice. In fhort, there are as many opinions concerning the urim and thummim as there are particular authors that wrote about them. The fafeft opinion, according to Broughton, feems to be, that the words urim and thummin fignify fome divine virtue and power annexed to the breaft-plate of the high-prieft, by which ail oraculous anfwer was obtained from God when he was confulted by the high-prieft ; and that this was called urim and thummim, to exprefs the clearnefs and perfection which thefe oracular anfwers always carried with them ; for urim fignifies " light," and thummim " perfection :" thefe anfwers not being imperfect and ambiguous, like the heathen oracles, but clear and evident. The ufe made of the urim and thummim was to confult God in dificult cafes relating to the whole fate of Ifrael; and fometimes in cafes relating to the king, the fanhedrim, the general of the army, or fome other great perfonage.

URINAL, in Medicine, a vefiel fit to receive and hold urine, and ufed accordingly for the convenience of fick perfons. It is ufually of glafi, but fometimes of metal.

URINE, a fluid, feparated from the blood, and carried by the emulgent arteries to the kidneys, from whence it defcends to the bladder by the uterus, and is from time to time emitted thence by the canal of the urethra. See Anatomy, No \(10 \%\). Por the properties of urime, fee Chemistry Index.

URN, a kind of vafe, of a roundifl form, but bigoch in the middle, like the common pitchers; now teldom ufed but in the way of ornament over chimney-pieces, in bufiets, \&e. The great ufe of urns among the ancien:s, was to preferve the afthes of the dead alice they were burnt; for which reafon they were called cincraria, and urrececineratic, and were placed fometimes under the tombitone whereon the epitaph was cut; and fometimes in vanlts in their own houfcs. Uins wete alfo uled at their facrifices to dut liquid things in.
uliogallus. See Tetrao, Ornithology Index. URSA, in Afloonomy, the namie of two confellations in the northern hemifphere.
URSULINES, in church hiflory, an order of nuns, fourded originally by St Angela of Brefcia, in the year 1537 ; and fo called frum St Urfut?, to whom they were dedicated.
- URSUS, the Bear, a genus of quadrupeds belong. ing to the order of forf. See Mammalia Index.

URTICA, a genus of plants of the clafs of mol:cecia; and in the natural fyltem claffed under the 53 d order, Scaliride. See Botany Index.

Urytcat Marina. See Animal. Fiower.
USANCE, in Commerce, is a determined time fived for the payment of bills of exchange, reckoned either from the day of the bills being accepted, or from the day of their date ; and thus called becaule regulated by the ufage and cultom of the places whereon they are drawn.

USE, in Law, the profit or bencfit of lands and tenements; or a truit and confidence repofed in a perfon for the holding of lands, \&cc. that he to whofe ufe the truft is made fhall rective the profits.

USH \(\triangle N^{\prime} 1\), an ifland of France, is miles weft of the coaft of Britanny, at the entrance of the Britifh channel.

Usher, an officer or fervant who has the care and direction of the door of a court, hall, chamber, or the like.

Usher of the Black Rod, the eldefl of the gentlemen whers, daily waiters at court, whofe duty is to bear the rod before the king at the fealt of St George, and other folemnities.

USK, a xiver of Wales, which rifes on the weft of Brecknock thire, and runs fouth-eaft through that county and Monmoutlifhise, falling into the mouth of the Severn.

USQUEBAUGH, a ftrong compound liquor, chiefly taken by way of dram.
There are feveral different methods of making this liquor ; but the following is efteemed one of the beft: To two gallons of brandy, or other fpirits, put a pound of Spanifh liquorice, half a pound of raifins of the fun, four ounces of currants, and three of ficed dates; the tops of baum, mint, favory, thyme, and the tops of the flowers of rofemary, of each two ounces; cinnamon and mace, well bruifed, nutmegs, anifeeds, and coriander Seeds, bruifed likewife, of each four ounces; of citron or lemon, and orange-peel, (craped, of each an ounce : let all thefe infufe 48 hours in a warm place, often flaking them together; then let them Ifand in a cool place for a week: after which the clear liquor is to be decanted off, and to it is to be nut an equal quanlity of neat white port, and a gallon of canary ; after which it is to be fweetened with a fufficient quantity of double refined fugar.

Yox. XX. Part II.
}

USTION, in Pharmacy, the preparing of certain fubfancers by burning them.

USUFRU'Y', in Che Civil/ Law, the ufe or enjoyment of any lands or tenements; or the right of rece:ving the fruits and profits of ato inheritance, or other thing, without a power of alenating or changing the property theresef.

USUliER, a perfon charged with a habit or at of ufury.

USURIOUTS CONTRACT, is any bargain or contrace whereby a man is obliged to pay more interett for money than the flatute allows.
USURPIIION, in Law, is an irjurious ufing or enjoyment of a thing for continuance of time, that belon ; of right to anoliter.

USURY, an unlan ful contraet unon the loan of money, to receive the lame again with c.vorbitant increafe. Under the article Jnterest, it was obferved, that by flatute 37 Hen . VIII. c. g. the rate of interelt was fixed at 101 . per cent. per annum: which the flatute 13 Eliz. c. 8. confirms, and ordains, that all brokers fhail be guilty of a premunnire who tranfact any contracts for more, and the fecurities themfelves fhall be void. The ffatute 21 Jac. I. c. 17. reduced intereft to 81 . per cent.; and it having becn lowered in 1650 , duting the ulurpation, to 6 per cent. the fame reduction was re-enacied after the Refloration by flatute 12 Car. IF. c. 13. and, Jafly, the ftatute 12 Annox, fl. 2. c. 16. has reduced it to 5 per cent. Wherefore not only all centrads for taking more are in themfelves totally woid, but alfo the lender hhall forfeit treble the money borrowed. Alfo if any frrivener or broker take more than 5 s. per cent. procuration money, or more than 12d. for making a bond, he fhall forfeit 201. with cofts, and frall fuffer imprifonment for half a-year.

UTERUS. See Anatomy, No 108.
UTICA, in Alcient Geography, a town of Africa Prupria, on the Mediterranean : a Tyrian colony, and older than Carthage, (Sil. Italicus) ; its name, according to Bochart, denoting old: reckoned fccond to it; but after the deffruction of Cat thage, became the capital and centre of all the Roman tranfactions in Africa, according to Strabo; who adds, that it food on the fame bay with Carthage, at one of the promontories called Apollonium, bounding the bay on the weft fide, the other to the eaft called Hermeia, being at Carthage. It became famous by the death of Cato, who thence was called Uticenfis.

UTRECHT, one of the feven United Provinces or States of Holland, wholly furrounded, by Hollarid and Guelderland, excepting a fmall part of it that borders on the Zyyder Zee. Its greateft length is about 32 miles, and breadth about 22. It enjoys a good air; and in moft places the foil is fruitful, but in fome fandy, or what is called turf-ground, and in others cverrun with wood. It is watered by the Jeck, Rhine, Vtcht, and other finaller rivers, befides icveral canals ; of which that extending from the village of Vreefwy to Utrecht is one of the chicf.

Utrecht, in Latin Ulirajefium, Trajeçun veetus or inferius, or Trajectum: Rheni, capital of a province of the fame name, fo called from its ancient ferry or paffage here over the Rhine; the wo:d being comnounded of trock!, which in Dutch fignifies "a ferry," and oud 4 E

\section*{V U L}
or cit, i. e. "old." It is a fair, large, and populous city, fituated 19 miles from Amfterdam, 25 from Rotterdam, and 27 from Leyden. Here is a tately townhoufe, with a commandery of the Teutonic order, and a celebrated univerfity, which was founded in 1630 , fince which it hath flourihed greatly, though it has not all the privileges of mof other univerfities; being wholly fubject to the magitrates of the city. The mall without the town, having five rows of lofty limes on each fide, is very pleafant : and the phyfic-garden belonging to the univerfity is extremely curious. There are five churches here that have chapters; but the members of thefe purchafe the places, of which fome coft 6000 or 7000 guilders. The ftrcams which run through feveral of the Atreets, contribute much to the beauty and cleanlinefs of the town; and the canal that is cut from the Leck, and paffes through it to Amfterdam, will carry thips of any burden. Pope Adrian VI. was a native of this city. Here, in 1579, the memorable union was formed between the feven provinces; and, in 1713 , the celebrated peace concluded between France on the one part, and the allies on the other. The Papifts have a nominal archbihop of this city; and there is a filk manufactory carried on in it, which employs a number of hands. The inhabitants are fuppofed to amount to 30.002. E. Long. 5. 8. N. Lat. 52. 7.

UTRICULARIA, a genus of plants of the clafs of diandria; and in the natural fyftem arranged undet the \(24^{\text {th }}\) order, Corydales. See Botaxy Index.

UVA ursi. See Arbutus, Botany Indek.
VULCAN, in Pagan woithip, the god of fubterrancous fire and metals, was the fon of Jupiter and Juno; and was faid to be fo remarkably deformed, that his father threw him down from heaven to the inle of Lemnos, in which fall he broke his leg, and there he fet up his forge, and taught men how to foften and polifh brafs and iron. Thence he removed to the Liparian intes, near Sicily, where, by the affiftance of the Cyclops, he made Jupiter's thunderbolts, and armour for the other gods. Notwithftanding the deformity of his perfon, he had a paffion for Minerva, and by Jupiter's confent
made his addrefles to her, but without fuccefs. He was, however, more fortunate in his fuit to Venus; who, after marriage, chofe Mars for her gallant ; when Vulcan expofed them to the ridicule of the other gods, by taking them in a net.

VULGATE, a very ancient Latin tranflation of the Bible, and the only one acknowledged by the church of Rome to be authentic. See Bible.

VULNERARY, in Medicinc, an epithet formerly given to remedies fuppofed to poffefs virtues for the cure of wounds and ulcers.

VULTUK, a genus of birds belonging to the order of Accipitres. Sce Ornithology Index.

VULVA. See Axatomy, \(N^{0} 132\).
UVULA. See Anatony, No 102.
UZ, or UTZ, the country and place of refidence of Job. In the genealogy of the patriarchs there are three perfons called \(U_{z}\), either of which might give this diftrict its name. The firf was the grandlon of Sern, by his fon Aram (Gen. xxii. 23.), who, according to Jofephus, occupied the Irachonitis, and Damafcus, to the north of Paleftine : but Job was among the fons of the Eaft. Another \(U_{z}\) was the fon of Nahor, Abraham's broller (Gen. x. 21.), who appears to have removed, after palfing the Euplirates, from Haran of Mefopotamia to Arabia Deferta. The third \(U_{Z}\) was a Horite, from Mount Seir (Gen. xxxvi. 28.), and thus not of Eber's pofterity. Now the queftion is, from which of thefe Job's country, Uz, took its name : Nat from the firlt, as is already fhown; nor from the fecond, becaufe his country is always called Scir, or Edom, never \(U_{z}\); and then called a fouth, not an eaff, country, in Scripture. It therefore remains, that we look for the country and place of refidence of Job in Arabia Defeita; for which there was very probable reafons. The plunderers of Job are called Chaldeans and Snbeans, next neighbours to him. Thefe Sabeans came not from \(A\). rabia Felix, but from a nearer Sabe in Arabia Deferta (Piolemy); and his friends, except Eliphaz the They manite, were of Arabia Deferta.

UZBECK Tartary. See Tartary.

Wor \(w\), is the 2 It letter of our alphabet; and is , compofed, as its name implies, of two v 's. It was not in ufe among the Hebrews, Grecks, or Romans; but chielly peculiar to the northern nations, the 'Teutones, Saxons, Britons, \&c. But fill it is not ufed by the French, Italians, Spaniards, or Portuguefe, except in proper names, and other terms borrowed from languages in which it is originally ufed, and even then it is founded like the fingle v. This letter is of an ambiguous nature; being a confonant at the heginning of words, and a vowel at the end. It may ftand before all the vawels except \(u\); as zuatcr, wedge, winter, wonder: it may alfo follow the vowels \(n, e, \theta\), and unites with them into a kind of double vowel, or diphthong; as in
fave, fow, cow, \&zc. It alfo goes before \(r\), and follows \(\int\) and th; as in wrath, fwear, thiwart: it goes before \(/ 4\) 3lfo, though in reality it is founded after it; as in when, what, \&c. In fome words it is obfcure, as in /hadou, widow, \&c.
'WA AG, a river of Hungary, which rifes in the Carpathian mountains, and falls into the Danube oppofite to the infand of Sclut.

WAAL, a river of the United Netherlands, being one of the brancles of the Khine, which runs from eaft to weft, through Guelderland; palling by Nimeguen, Tiel, Bommel, and Gorcum; and, uniting with the Maes, falls into the Gcrman fea below the Briel.

WACHENDORFIA, a genus of plants of the clafs

\section*{W A [ [ 587\(]\) W, A K}

Wadd, of triandria; and arranged in the natural method under the Geh order, Enfitce. See Botany Index.
WVADI; or WADDING, is a fopple of paper, lray, fraw, or the like, forced into a gun upon the powder, to keep it clofe in the chamber; or to put up clofe to the fhot, to kecp it from rolling out.

WADSE'l', in Scots Law. See Law, N \({ }^{0}\) clxix. I.
IVAFERS, or Sealing \(W_{\text {AFERS }}\), are made thus: Take very fine flour, mix it with glair of eggs, ilinglals, and a little yeat; mingle the materials; beat them well together; fpread the batter, being made thin with gumwater, on even tin plates, and diy them in a flove; then cut them out for ufe.

You may make them of what colour you pleafe, by tinging the paite with brafil or vermilion for red; indigo or verditer, \&c. Cor blue ; fafiron, tumeric, or gamboge, \& c. for yellow.

WAGER of L.AF. See (Wager of) L.tw.
WhGER of Baltel. See (lVager of) Battel.
WAGGON, a whecl-carriage, of which there are various forms, accommodated to the different ufes they are intended for. The common waggon confilts of the Ahafts or rods, being the two pieces wbich the hind horfe bears up; the welds; the flotes, or crofs pieces, which hold the flafts togrether ; the bollter, being that part on which the fore-wheels and the axle-tree turn in wheeling the waggon acrofs the road ; the cheif or body of the waggon, having the tlaves or rails fixed thereon; the bales, or hoops which compure the top; the tilt, the place covered with cloth, at the end of the waggon. Sce Mechanics, Sect. iv.

WagTAIL. See Motacilla, Ornithology Index:

WAIFS, Bona Waviata, are goods Itolen, and waived or thrown away by the thief in his Alight, for fear of being apprebended. Thefe are given to the king by the law, as a punifhment upon the owner for not himfelf purfuing the felon, and taking away his goods from him. And therefore if the party sobbed do his diligence immediately to follow and apprehend the thief (which is called making freflo fuit), or do convict him afterwards, or procure evidence to convict him, he thall have his goods again. Waived goods do allo not belone to the king till feized by fomebody for his ufe ; for if the party roblued can feize them firf, though at the difance of 20 years, the king thall never have them. If the goods are hid by the thief, or left anywhere by him, fo that he had them not about him when he fled, and therefore did not throw them away in his night; thefe alfo are not bona waviata, but the owner may have them again when he pleafes. The goods of a foreign merchant, though ftolen and thrown away in flight, hall never be waifs: the reafon whercof may be, not only for the encouragement of trade, but alfo becaufe there is no wilful default in the foreign merchant's not purfuing the thief, he being generally a ftranger to our laws, our nfages, and our language.'

WAIGATS sTRAITS, fituated between Nova Zembla and Ruflia, through which the Dutch failed to the north, \({ }^{\text {a }}\) as high as \(75^{\circ}\), in order to difcover a north-eaft paffage to China and the Eaft Indies.

WAINSCOT, in 'building, the timber-work that ferves to line the walls of a room, being ufually made in pannels,'and painted, to ferve inftead of hangings. If. " 2 " WAIVE, in \(=\) Law, a woman thet isput aut of the.
protection of the law. Slre is called waive, as being forlaken of the law ; and not oulaw as a man is; by reafon women cannot be of the decema, and are not

Wraive, Wake. fiworn in lects to the king, nor to the law, as men are; who are therefore within the law; whereas women ate not, and fo cannot be outlawed, fince they never were nithin it.

WAKE, the print or track impreffed by the courfe of a thip on the furface of the water. It is formed by the re-union of the body of water which was feparated by the hip's bottom whilt moving through it; and may be feen to a confiderable ditance belind the flers, as fmoother than the refl of the fea. Hence it is ufual. ly obferved by the compats, to difcover the angle of lee-way.

A fhip is faid to be in the wake of another when the follows her on the fame track, or a line fuppofed to be formed on the continuation of her keel.

Two dillant objects oblerved at fea are called in the wake of each other, when the view of the farthef is intercepted by the nearell ; fo that the obferver's eye and the twe objects are all placed upon the fame light line.

Wake is the eve-feaft of the dedication of churches, which is kept with feafting and rural divenfons.

Mr Whitaker, in his Hiltory of Mancheter, has given a particular account of the origin of waises and fairs. He obferves, that every church at its confecration received the name of fome particular laint: this cuflom.was practifed among the Roman Britons, and continued among the Saxons; and in the council of Cealchythe, in 816 , the name of the denominating faint was exprefsly required to be infcribed on the altars, and allo on the walls of the church, or a tablet within it. 'ihe feal of this faint became of courfe the feftival of the church. Thus Chriftian feflivals :vere fubflituted in the room of the idelatrous anniverfaries of heathenifm: accordingly, at the firf introduction of Chriftianity among the lutes of Kent, Pope Gregory the Grcat advifed, what had been previoufly done among the Britons, viz. Chriftian fellivals to be inflituted in the room of the idolatrous, and the fuffering day of the martyr whofe relics were repofited in the church, or the day on which the building was actually dedicated, to be the eflablifhed fcalt of the parifh. Both were appointed and obferved; and they were clearly diftinguift. ed at firt among the Saxons, as appears from the laws of the Confeffor, where the dies dedicationis, or deficatio, is repeatedly difciminated from the propria fefivias fanti, or celcbratio fancti. 'They remamed equally diItina to the Reformation; the dedication-day in 1536 being ordered for the future to be kept on the firf Sunday in Odober, and the fellival of the patron faint to be celebrated no longer. The latter was, by way of pre-eminence, denominated the church's holiday, or its peculiar fellival; and while this remains in many parithes at prefent, the other, is fo utterly annihilated in all, that Bifhop Konnet. (fays Mr Whitaker) kne:v nothing of its diftinct exiftence, and has attibuted to the day ot dedication what is true only concerning the faint's day. Thus inflituted at firt, the day of the tutelar faint was oblerved, wolt probably by the Britons, and certainly by the Sisons, with great devotion. And the evening before every faint's. day, in the Saxon Jevifh method of reckoning the hours, being an actual how of the day, and therefore like that appropriated to the duties of public religion, as they reckoried Sunday from the firt to commence at the funfet of Saturday ; the evening precoding the church's holyday would be obferved with all the devotion of the fertival. The people actually repaired to the church, and joined in the fervices of it \(;\) and they thus fpent the evening of their greater fellivities in the monafterics of the North, as carly as the conclufion of the feventh century.
Thefe fervices were naturally denominated from their late hours wexcan or wakes, and digils or cves. That of the anniverfary at Kippon, as early as the commencement of the eighth century, is exprefsly denominated the vigil. But that of the church's holiday was named cyric wacan, or church-wake, the church-vigil, or church eve. And it was this commencement of both with a wake, which has now caufed the days to be generally preceded with vigils, and the church-holiday particularly to be derominated the church-wake. So religioufly was the eve and feltival of the patron faint obferved for many ages by the Saxons, even as late as the reign of Edgar, the former being fpent in the church, and employed in prayer. And the wakes, and all the other holidays in the year, were put upon the fame footing with the Olaves of Chriftmas, Eafter, and of Pentecoft. When Gregory recommended the feltival of the patron faint, he advifed the people to erect booths of branches about the church on the day of the feflival, and to fealt and be merry in them with innocence. Accardingly, in cvery parifh, on the returning anniverfary of the faint, little pavilions were conftructed of boughs, and the people indulged in them to hofpitality and mirth. 'The fealling of the faint's day, however, was foon abufed; and even in the body of the church, when the people were affembled for devotion, they began to mind diverfions, and to introduce drinking. The growing intemperance gradually ftained the fervice of the rigil, till the feftivily of it was converted, as it now is, into the rigcur of a faft. At length they too jufly fcandalized the Puritans of the laft century, and numbers of the wakes were difufed entirely, efpecially in the eaft and fome weftern parts of England; but they are commonly obferved in the noths, and in the midjand counties.

This cuffom of celebrity in the neighbourhood of the rhurch, on the days of particular faints, was introduced into Engiand from the continent, and mult have been familiar equally to the Britons and Saxons; being obferved among the cllurclies of Afia in the fixth century, and by thofe of the weft of Europe in the feventh. And equally in Afia and Europe, on the continent and in the inlands, thefe celebrities were the caufes of thofe commercial marts which we denominate fairs. The people reforted in crowds to the feftival, and a confiderable provifion would be wanted for their entertainmont. The profpect of intereft invited the little traders of the country to come and offer their warcs; and thus, among the many pavilions for hofpitality in the neighbourliood of the church, various booths were crected for the fale of different commoditics. In larger towns, furrounded with populous difricts, the refort of the people to the wakes would be great, and the attendance of traders numerons; and this refort and attendance conntitute a fair. -Bafil expreisly mentions the numerous appearance of traders at thefe fettivals in Afia, and Gregory notes
the fame cuftom to be common in Europe. And as the feftival was obferved on a feria or holiday, it naturally afiumed to itfelf, and as naturally communicated to the mart, the appellation of feria or fair. Indeed feveral of our mott ancient fairs appear to have been ufually held, and have been continued to our time, on the original church-holidays of the places: befides, it is obfervable, that fairs were generally kept in church-yards, and even in the churches, and alfo on Sundays, till the indecency and fcandal were fogreat as to need reformation.

Wake-Robin. See Arum, Botany Index.
WALACHIA, a province of Turkey in Europe, bounded on the north by Moldavia and Tranfylvania, on the eaft and fouth by the river Danube, and on the welt by Tranfylvania. It is 225 miles in length, and 125 in breadth; and was ceded to the Turks by the treaty of Belgrade, in 1 739. It abounds in good horfés and cattle; and there are mines of feveral kinds. The foil is fo fertile, that it is capable of producing any thing; and there are good paftures, with wine, oil, and all manner of European fruits. The inhabitants are chiefly of the Greek church.

WALCHEREN, an illand of the Low Countries, and one of the principal of thofe of Zealand; feparated from Dutch Flanders by the mouth of the Scheldt. It is about nine miles in length, and eight in breadth; and though it lies low, has good arable and pafture land. The chief town of this illand and the whole province is Middleburgh. But ti:: principal fea port is Fluhing, which is ftrongly fortified. Walcheen was taken by the Britifh forces in Augult 1809 ; but it foon after was abandoned, the troops having fuffered feverely by ficknefs.

WALDEN, a town of Effex, commonly called Saf fron Walden, with a market on Saturdays, and two fairs on Midlent Saturday for hories, and November if for cows. It is remarkable for the plenty of faffron that grows about it. This town was incorporated by Edward VI. and is governed by a mayor and 24 aldermen. It is 27 miles north-wen-by-north of Chelms. ford, and 43 nortli.caft of London. E. Long. O. 20. N. Lat. 52. 4.

WALDENSES. See Waldo.
WALDO, a merchant of Lyons in the latter part of the I 2th century, who applying himfelf to the fudy of the Scriptures, and finding no warrant there for feveral of the Romilh dodrines, particularly that of tranfubflantiation, publicly oppofed them. His followers, who from him were called Walderfes, being chafed from Lyons, fpread over Dauphiné and Provence; upon which Philip II. is faid to have razed 300 gentlemen's feats, and deftroyed feveral walled towns to ftop their growth: but this, inftead of fuppreffing, fipread them over a great part of Europe. The articles of their faith, which they drew up and dedicated to the king of France, agrced in moft points with thofe of the prefent Proteftaits. In the year 1200 , thofe of them who dwelt in the province of Alhigeois in Languedoc, from whence they were called Albigenfes, flood upon their defence; upon which Pbilip drove them into Bohemia, Savoy, and England. The crulade againft them is faid to have confifted of 500,000 men, who wore their croffes on their breafts, to diflinguilh themfelves from thofe who went to the HolyLand, and wore them on their fhoulders.

WALES, a countsy fituatcd in the fouth-wof part
of Britsin, into which the ancient Britons relired from tho perfecution of the Saxons. Anciently it was of greater extent than it is at prefent, and comprehended all the country beyond the Severn, that is, befides the 12 counties included in it at prefent, thofe of Herefordflime and Monmouthflire, which now ane reckoned a patt of England, were then inhabited by three different tribes of the Britons; namely, the Silures, the Dimetr, and the Ordovices. The Romans were never able to fubdue them, till the reign of Vefpafian, when they were reduced by Julius Frontinus, who placed garrilons in their country to keep them in awe. 'Ihough the Saxons made themfelves mafters of all England, they never could get poffefion of Wales, except the counties of Monmouthhire and Herefordflire, formerly a part of Wales. About the year 870, Koderic king of Wales divided it among his three tons; and the names of thefe divifions were, Demeita, or Soulh-Wales; Povefia, or Powis-Land; and Vencdotia, or North Wales. Another divifion is mentioned afterwards in the records, viz. North Wales, South Wales, and Weft Wales; the lait comprelending the counties of Monmouth and Hereford. ' Whe country derived the name of Wales, and the inhabitants that of Wel/b, from the Saxons, who by thofe terms denote a counlry and people to which they are ftrangers; for the Welfl, in their own language, call their country Cymry, and their language Cymraeg. Lhey continued under their own princes and laws from the above-mentioned period, and were never entirely fubjected to the crown of Fngland till the reign of Edward I. when Llewellin ap Gryfith, prince of Wales, loit both his life and dominions. Edward, the better to fecure his conqueft, and to reconcile the WVell to a foreign yoke, fent his queen to lie in at Caernarvon, where flic was delivered of a prince; to whon the Wellh, on that account, the more readily fubmitted. Ever fince that time, the eldeft fons of the kings of England have commonly been created princes of Wales, and as fuch enjoy certain revenues from that country.

As to the character of the Welih, they are faid to be a brave, hofpitable people; and though very jealons of affronis, paflionate, and hafly, yet are ealily reconciled. 'Ihe common people look with a fufjicious eye on ftrangers, and bear a hereditary grudge to the Englifh nation, by whon their anceftors were expelled from the fineft parts of the inland. The gentlemen are apt to value themfelves upon the antiquity of their families; and with fome reafon, as they can generally trace them mucl higher than the inhabitants of moft other countıies.

All the betier fort, both in town and country, can fpeak Englith, efpecially in the counties bordering upon England. The common people, in general, only preak their own language, which is the ancient Britifh; and not only difiers entirely from the Englifh, but has very little allinity with any of the weftern tongues, unlefs we fiould except the Gaelic, Erfe, or Inifl. It is faid to be a dialcen of the ancient Celtic, and in many refipects to refemble the Hebrew. Nlof of the clergy are natives of the country, and underftand Linglifh fo well, that they could exercife their functions in any part of Britain. The public worhip, however, is as often performed in Weifh as in Englith, excepting in the towns,
where the latter is the prevailing language. The inhabitants are computed at about 320,000 .

Ihe country, though mountainous, efpecially in North Wales, is far from being harren or unfruitful; the hills, befides the metals and minerals they contain, feeding valt herds of finall black cattle, deer, flieep, and goats, and their valleys abounding in com, as their feas and rivers do in fith. Here are alfo wood, coal, and turf for fuel, in abundance.

Wales is bounded on all fides by the fea and the Severn; except on the eal, where it juins to the counties of Cheller, Salop, Hereford, and Monmouth. Its length, from the louthernmoft part of Glamorganfhire to the extremily of Ilinthire north, is computed at abnut It.3 riles; and its greaten breadth, from the river Wye catt to St David's in Pembrokellire wen, is nearly of the fame dimenfions, being about 90 miles.

After the conquett of Wrales by Edward I. very materid alterations wore made in their laws, fo as to reduce them nearer to the Englith flandard, elpecially in the forms of their judicial proceedings: but they ftill retained very much of their original polity, particularly their rule of inheritance, viz. that their lands werc divided equally among all the iflue male, and did not defcend to the eldelt fon alone. Hy other fubfequent flatutes their provincial immunities were fill farther abridged: but the finilhing froke to their dependency was given by the ftatute 27 Hen. VIII. c. 26 . which at the fame time gave the utmof advancement to their civil profesity, by admitting them to a thorough communication of laws with the fubjects of England.-Thus were this brave people gradually conquered into the enjoyment of trus liberty; being infenfibly put upon the lame footing, and made fellow-citizens, with their conquerors.

It is enacted by the 27 Hen. VIII. 1. That the do. minion of Wales flall be for ever united to the kingdom of England. 2. That all Welfimen born thall have the fame liberties as other king's fubjects. 3. That lands in Wales thall be inheritable according to the Englifh tenures and rules of defcent. 4. That the lasws of England, and no other, flall be ufed in Wales: befides many other regulations of the police of this principality. And the 34 and \(35 \mathrm{Hen}\). VIII. c. 26 . confirms the fame, adds farther regulations, divides it into 12 fhires, and, in thort, reduces it into the fame order in which it flands at this day; differing from the kingdom of England in only a few particulars, and thofe too of the nature of privileges (fuch as having courts within itlelf, independent of the procels of Weflminfter-hall), and fome other immaterial peculiarities, hardly more than are to be found in many counties of England itfelf.

When a wall is making, after being raifed to a certain height, it is allowed time to pitch or fettle before the work is refumed. Some value themfelves on their fkill in building with this compolition; the price, when materials are found, is generally in Devonfhire 33. per perch of \(16 \frac{1}{\frac{1}{2}}\) feet; but a fone foundation colts more. Houfes built with this, being covered with thatch, are very dry and warm; a cob wall, if in a good fituation, will laft 50 or 60 years or more. When pulled down, they are ufed as manure, and new earth employed to retuild with.

Wallace, Sir Willitam, a gallant geacral of the Scots, who endeavoured to refcue his country from the Englifh yoke ; but being taken prifoner, he was unjurly tried by the Englifh laws, condemned, and executed as a traitor to Edward I. in 1304. See ScotL.ind, \(\mathrm{n}^{\circ} 103\), et feq.

Wallachia. See Walachin.
WALLER, EdMuxd, a celebrated Englifh poet, was the fon of Robert Waller, Efq. of Agmondetham in Buckinghamhire, by Anne, the filter of the great Hamdell who diffinguifhed himfelf fo much in the beginning of the civil wars. He was born in 1605 ; and his father dying when he was very young, the care of his cducation fell to his mother, who fent him to Eton fchool. He was aftervards fent to King's college in Cambridge, where he munt have been very affiduous in his fulies, fince, at fixteen or feventeen years of age, he was cliofen into the laft parliament of King James I. and ferved as burgefs for \(A\) gmondefhain. He began to exercife his poctical talent fo early as the year 1623 ; as appears from his verfes "upon the danger his majefty (being prince) efcaped in the road of St Andero;" for there Prince Charles, returning from Spain that year, had like to have been calt away. It was not, however, Mr Wallcr's wit, his fine parts, or lis poetry, that fo much occafioned him to be firl? publicly known, as his carrying of the daughter and fole heirefs of a rich citizen, againt a rival whofe inteceft was efpoufed by the count. It' is not known at what time he married his firt lady; but he was a widower before he was 25 , when he began to have a paffion for Sachariffa, whicly was a fictitious name for the lady Dorothy Sidney, daughter to the eal of Leic fter, and afterwards wife to the earl of Sunderland. He was now known at court, careffed by all who had any relifh for wit and polite literature; and was one of the famous club of which Lord Falkand, Mr Chillingworth, and other eminent men, were members. He was returned burgefs for Ag mondefhan in the parliament which met in April 1640. An interniffion of parliaments having difguffed the nation, and railed jealoufies againgt the defigns of the court, which would be fure to difcover themfelves whencuer the king came to afk for a fupply, Mr. Waller was one of the firt tho condemned the preceding meafures. He flowed himfifelf in oppofition to the court, and made a fpeech in the houle on this occafion; from which we may cather fome uotion of his general principles in government; wherein, howerer, he afterwards proved very variable and inconflant. He oppdifed the conrt alfo in the loug parliament which met in November following, and was chofen to impench Judge Crawley, whicla'he Sid in a warm and eloquent feech, July IGth 16,75 .
pies of it were fold in one day. In 1642 , he was one of the commifirioners appointed by the' parlianient to prefent their propofitions of peace to the king at Osford. In 1643, he was deeply engaged in a defigm to reduce the city of London and the tower to the fervica of the king; for which he was tried and condenned, tegether with Mr 'Tomkins his brother-in-lati, and Mr Challoner. The two latter fuffered death; but Mr Waller obsained a reprieve: he was, however, fentenced to fuffer a year's inpuifonment, and to pay a fine of 10,0001 . After this, he became particularly attached to Oliver Cromwell, upon whom he wrote a very handfome panegyiic. He allo wrote a noble puem on the death of that great man.

At the Rettoration, he was treated with great civility by Charles II. who always made him one of the party in his diverfions at the duke of Buckingham's and other: places. He wrote a panegyric upon his majefty's return; which being thought to fall much thort of that he had before written on Oliver Cromwell, the king one day afsed him in raillery, "How is it, Waller, that you wroie a better encomium on Cromwell than on me?" "Nay it pleafe your majelty," anfwered he, we poets generally fucceed bell in fiction." He fat in feveral parliaments after the Reftoration, and continued in the full vigour of his genius to the end of his life, his natural vivacity bearing him up, and making his company agreeable to the laft. He died of a droply in 1687 , and was interred in the churchyard of Beaconsficld, where a monument is erected to his memory. Mr Waller has been honoured as the moft clegant and harmonious verfifier of his time, and a great refiner of the Englifh language. The beft edition of his works, containing poems, fpeches, letters, \&c. is that publithed in quarto by Mr Fenton, to 1730 .

WALLIS, Dr Johs, a celebrated mathematician, was celucatcd at Cambridge; where he became fellow of Queen's college, and continued fo till, by his marriage, he vacated his fellowhip. In 1640 , he received holy orders, and bccame chaplain to the lady Vere. While he lived in this family, he cultivated the art of deciphering ; and it i, faid, that the elector of. Branden:burg, for whom he explained feveral letters written in ciphers, fent him a gold chain and medal. In 1643 he publified, "Tiruth tried; or Animadverfions on the Lord Brooke's treatife, called The Nature of Trath, \&ic." The next year he was chofen one of the fcribes or fecretaries to the afiembly of divines at Weftmintler. Dr Peter Turner, Savilian profefior of geometry in Oxford, being eje\&ted by the parliament-vifitors in 1649, Mr Wallis was appointed to fucceed him in that place. In 1653 he publifhed at Oxford a Grammar of the Englifh Tongue in Latin. In 1655 be entercd the lifts with Mr Hobbes; and their controverfy lafled a confiderable time. In 1657 the Doftor publifhed his Mathematical Works. Upon the death of Dr Langbaine, he was chofen cullos archivorum of the univerfily. After the Reflotation he met with great refped. the king himfelf entertaining a favourable opinion of him on account of fome fervices he had done both to his royal father and himfelf. He was therefore confirmed in his places, admitted one of the king's chaplains in ordinary, and appointed one of the divines empowered to review the book of common prayer. He complied with the
terms of the act of uniformity, and continusd a fteady conformift till his death. He was one of the firf members of the Royal Society, and correfponded with many learned men. In 1697, the curators of the univerity prefs at Oxford thought it for the honour of the univerfity to collect the mathematical works of the Doctor, which had been printed feparately, fome in Latin, fome in Englifi, and publithed them all together in the Latin tongue, in three vols, folio. He died in 1703 . He fpeaks of himfelf thus: "It hath been my endeavour all along to act by moderate principles, being willing whatever fide was uppermoft, to promete any good defign for the true interen of religion, of learning, and of the public good." Befides the works above-mentioned, he publifhed many others.
WALLOONS, a name for the inhabitants of a co:Ifiderable part of the Netherlands, viz. Artois, Hainault, Naum, Luxemburgh, and part of Flanders and 3rabant.

IWAlnut-tref. See Juglans, Botany Index.
WidPOLE, Sir hobert, earl of Orford, was born at Houghton in Norfolk, September 6th, 1674 , and educated on the foundation at Eton fchool. Thence he was elected to King's College in Cambridge; but, fucceeding to the family eflate by the death of his clder brother, he refigned his fellow flhip. In 1700 he was chofen member of parliament for King's Lym, and reprefented that borough in feveral facceeding parliaments. In 1705 , he was nominated one of the council to Prince George of Denmark, lord high admiral of England; in 1707 , appointed fecretary at war; and, in 1709, treafurer of the navy. In 1710, upon the change of the minithry, he was removed from all his pofts, and held no place afterwards during the queen's reign. In 1711 he was expelled from the hnufe of commons for what they called notorious corruption in his office as fecretary at war. The borough of Lynn, however, re-elected him ; and, though the houfe declared the election void, yet they perfited in the choice. In the well-known debate relating to Steele for publifh. ing the Crifis, he greatly diftinguifhed himfelf in behalf of liberty, and added to the popularity he had before acquired.

Oa the death of the queen, a revolution of politics took place, and the Whig party prevailed both at court and in the fenate. Walpole had before recommended himfelf to the houfe of Hanover by his zeal for its caufe, when the commons confidered the fate of the nation with regard to the Proteflant fuccefion: and he had now the honour to procure the affurance of the houfe to the new king (which attended the addrefs of condolence and congratulation), "That the commons would make good all parliamentary funds." It is therefore not to be wondered at, that his promotion foon took place after the king's arrival; and that in a few days be was appointed receiver and pay-matter general of all the guards and garrifons, and of all other the land forces in Great Britain, paymafler of the royal hofpital at Chelfea, and likewife a privy counfellor. Oa the opening of a new parliatnent, a committee of fecrecy was chofen to inquire into the conduct of the late miniltry, of which Walpole was appointed chairman ; and, by his management, articles of impeachment were read agaiint the earl of Oxford, Lord BoLingbroke, the duke of Ormond, and the earl of Straf-
ford. The eminent fervice he was thought to hare Walpole. done the crown, by the vigorous profecution of thofe minillers who were deemed the chict infruments of the peace, was foon rewarded by the extraordinary promotions to the offices of firt commiffioner of the treafury, and chancellor and under treafurer of the exchequer.

In two years time he refigned all his offices, on account of a mifunderfanding which took place between lim and the reft of the miniftry about certain fupplies demanded for the fupport of his majefly's German dominions. On the day of his refignation he brought in the famous finking-fund bill, which he prefented as a country gentleman, faying, that he hoped it would not fare the worfe for having two fathers; and that his fuectior Mr Stanhope would bring it to perfection. His calling hinfelf the father of a project, which hath fince been fo often employed to other purpufes than were at firf \(\mathrm{c}:=\mathrm{lared}\), gave his enemies frequent opportunity for fatire and ridicule; and it hath been farcafiically oblerved, that the father of this fund appeared in a ve:y bad light when viewed in the capacity of a nuife. In the nest fifion of parliament, Walpole oppofed the minitry in every thing; and even Wydham or Shippen did not exceed him in patriotifn. Upon a mution in the houfe for continuing the army, he made a lyeech of abore an hour long, and difplaycd the danger of a ftanding army in a fiee country, with all the puwers of eloquence. Early in 1720 the sigour of the parriot began to foften, and the complaifance of the courtier 10 appear; and he was again appointed paymatler of the forces, and feveral of his friends were found foon after in the lift of promotions. No doubt now remained of his entire converfion to court mealures; for, before the cod of the year, we find him pleading as flrongly for the forces required by the war-office as he bad before declaimed againf them, even though at this time the fame preten:ces for liceping them on foot did not exin.

It was not long before he acquired full miniferial power, being appointed fift lord commifioner of the treafury, and chancellor of the exchequer; and, when the ling went abroad in 1723 , he was nominated one of the lords juffices for the adminiftration of government, and was fworn fole fecretary of Atate. About this time he received another difinguifled mark of the royal favour; his clieft fon then on his travels being created a peer, by the title of Baren Walpole of Walpole. In 1725 he was made knight of the Bath, and the year after knight of. the Garter. The meatures of his adminiftration, during the long time he remained prime or sather fole miniller, have been often canvafied with all the feverity of critical inquiry. It is difficult to difcern the truth through the exaggerations and mifreprefentations of party. He has indeed been accufed of employing the firking fund for the purpofes of corruption, of which it was long the faflion to call hima the father; but the man who reflects on the tanfactions of Charles II. and his infamous cabal, will acquit him of the latter part of this charge. He was an enemy to war, and the friend of commerce; and becaufe he did not refent fome petty infults of the court of Spain fo fuddenly as the fiery part of the nation thought he fhould have done, a formidable oppofition was formed againft him in the koufe, which had infuence cmough

\section*{W A L}

Walpote. to employ in its caufe almoft all the wit of the nation. Pulteney and Pitt were the great leaders of the party in the houfe of commons; while Bolingbruke and Pope and Johnfon, and almoft every man of genius, exerted themfelves without doors to culighten, by pamphlets in profe and werfe, the minds of the people, and thow the neceflity of a Spanifl war. This lie flrcnuoully oppofed, becaufe he knew that the foreign fetlements of that power are very remote, and in a climate delfructive to Engliflmen; and that fuch of them as we might be able to take, we could not pofibly retain. The oppofition however prevailed. The nation was indulged in a war, of which it furely had no caufe to boatt of the fuccefs; and it is now univerfally known, that the greater: part of thofe who with honef intentions harl, either in parliament or out of it, been engaged to run down the minifter, lived to repent of their conduct, and do juftice to the man whom they had fo pertinacioully vilitîed.

In order to encourage commerce and improve the revenue, Sir Robert projected a fcheme for an extenfion of the excife, as the only means of putting a fop to the frauds of merchants and illicit traders. This was another ground of clamoar to the orators sithin, and the wits without, doors; and while the oppofition reprefented it as a meaiure big with public milchief, Swift and Pope occafionally alluded to it as an oppreffion calculated to deprive private life of all its comforts. The mininter was therefore obliged to abandon the fcheme; but in a fucceeding adminifration it was partly carried into execution, at the exprefs folicitation of the principal perfons concerned in that article of trade which it was fuggefted would be moft affected by it ; and afterwards the mof popular minifter that ever direfted the councils of this country declared in full fenate, that if a time fhould ever arrive which was likely to render the project feafible, he would himfelf recommend an extenfion of the excife laws as a meafure of the greatelt advantage to commerce, to the revenue, and to the general interefts of the kingdom.

In \(17 t^{2}\) the oppofition prevailed; and Sir Robert being no loager able to carry a majority in the houfe of commons, refigned all his places, and fled for thelter behind the throne. He was foon afterwards created earl of Orford; and the king, in confideration of his long and faithful fervices, granted him a penfion of 42001 . per annum. The remainder of lis life he fpent in tranquillity and relirement, and died, in 1745, in the \(7^{10}\) year of his age.

He has been feverely, and not urjufly, cenfured for that fyftem of corruption by which he almolt avowed that he governed the nation; but the objects which he had in vie:s are now acknowledged to have been in a high degree praife worthy. Johnfon, who in the eal lier part of his life liad joited the other wits in writing againf his meafures, after*ards honoured this memory for the placability of his temper, and for keening this country in peace for fo many vears; and Mr Burke
* Letters on a Recsicade Pcace. has * declared, that his only defect as a minifter was the want of fuflicient firmnefs to treat with contempt that popular clamour, which, by his yielding to it, hurried the nation into an expenfive and unjuft war. But his rancorous profecution of Atterbury bifhep of Rochefer (fe Attmrbury), by a bill of pains and penalties, may be confidered as fomething worfe than a de-
fect : it was a fault for which no apology can be made; becaufe, whether that prelate was innocent or guilty, of his guilt no legal proof ever appeared. In that inftarce the conduct of the minilter was the more xtraurdinary, that on other occations he chofe to gain over the dilatfected by mildnefs and beneficence, even when the had futhicnt proofs of their guitt. Of this the Following anecdote, communicated by Lord North to Dr Johrafon, is a fufficient proof. Sir liobert haring got into his hands fome trcafurable papers of his inveterate enemy Shippen, Fent for him, and burnt them before lis eyes. Sume time afterwards, vilile Shippen was taling the caths to the government in the houfe of commons, Sir liobert, who tood next to him, and knew his principles to be the fame as ever, fmiled; upon which Shippen, who had obferved time, faid "Egad, hubin, that's hardly fair."

To whatever ol jections his minilerial conduet may be liable, in his private character he is univerfally allowed to have had aniable and benevolent qualities. That he was a tender parent, a kind mather, a beneficent patron, a firm friend, an agreeable companion, are points that have bcen feldom dilputed; and fo calin and equal was his temper, that Pulleney, his great rival and opponent, faid, he was fure that Sir Robert Walpole never folt the bitterel invectives againft him for half an hour.

About the end of Queen Anne's reign, and the beginning of George I's, he wrote the following pamplılets. 1. The Sovereign's Anfwer to the Gloncelterfhire Addrefs. The Sovereign meant Charles duke of Somerfet, fo micknamed by the Whigs. 2. Anfwer to the Reprefentation of the Houfe of Lords on the State of the Navy, 1709. 3. The Dcbts of the Nation flated and confidered, in four Papcrs, 1710. 4. The Thirtyfive Millions accounted for, 1710. 5. A Letter from a foreign Minilter in England to Monfieur Pettecum, 1710. 6. Four Letters to a Friend in Scotland upon Sacheverell's Trial; falfely attributed in the General Diclionary to Mr Maynwaring. 7. A Short Hiftory of the Parliament. It is an account of the lant feffion of the queen. 8. The South-Sea Scheme confidered. 9. A Pamphlet againft the Peerage Bill, 1719. 10. The Report of the Secret Comniitee, June gith, 1715.

\section*{Walrus. Sce Trichecus, Mammalia Index.}

WALSH, William, an Englifh critic and poet, the fon of Jofeph Walih, Efq. of Abberley in Worcellerfhire, was born about the year 1660. He became a gentleman commoner of Wadham college, Oxford, but left the univerfity without taking a degiee. His writings are frinted among the works of the Minor Poets, printed in 1749. He was made gentleman of the horfe in Queen Anne's scign; and died in 1708. He was the friend of Mr Dryden and of Mr Pope; the former of whom cheemed him the belf critic then living; and \(M_{1}\) Pupe has celebrated his character in the Efray on Criticirm.

WAISINGIIAM, a town of Norfolk, with a market on Fridays, and a fair on Whit-Monday, for horres and pedlars ware; it is feated not far from the fea; and in former times was famous for its college of canons, and was greatly frequented by pilgrims who went to pay their devotions to the image of the Virgin Mary at the chapel, where there are two fue fprings, called

\section*{WA L}
sifing- the Virgin Mary's wells. Not many years ago there ham. were found here by a hullandman, 100 urns full of allies, which were fuppofed to be thole which the Romans filled with the allies of the dead. It is 22 miles northweft of Norwich, and \(1 \times 7\) north-north-cafl of London. E. Long. O. 53. N. Lat. 52. 56.

WALSINGHAM, Thomas, an Englifh Benedictine monk of the monallery of St Alban's, who lived about the year 1440. He applied himfelf to the hillory and antiquity of his country, in quality of historiographer to the king; and comported the Hillory of King Henry VI. with other works.
Walsingham, Sir Francis, miniver and fecretary of fate during the reign of Queen Elizabeth, and one of the greatelt politicians of lis time, was defended from a noble and ancient family at Chiflehurft. After having made great progrefs in his studies at Camber' age, he was twice font ambaffador to France, and at his return to England was employed in the mot important affairs, became fecretary of fate, and was one of the commiffioners for the trial of Mary queen of Scotland. Sir Francis was undoubtedly one of the mont refined politiclans and molt penetrating flatefman that any age ever produced. He had an admirable talent, both in diffcovering and managing the ferret recefles of the heart. He had his fries in molt courts in Chriftendom, and allowed them a liberal maintenance; for it was his maxim, That knowledge can o ot be bought too dear. In \(\times 587\) the king of Spain having made vat preparalions, which furprifed, and kept all Europe in fufpenfe, Walfingham employed his utmott endeavours for the dilcovery of that important fecret; and accordingly procured intelligence from Madrid, that the king had informed his council of his having difpatched an exprefs to Rome, with a letter written with his own hand to the pope, acquainting him with the true deign of his preparations, and begging his bleffings upon him; which for forme reafons he could not difclofe till the return of the courier. The ferret being thus lodged with the pope, Walfingham, by means of a Venetian prieft, whom he retained at Rome as a fey, got a copy of the original letter, which was flolen out of the pope's cabinet by a gentleman of the bed-chamber, who took the key out of the pope's pocket while he slept. After this, by his dexterous management, he caufed the Spaniards bills to be protefted at Genoa, which mould have fupplied them with money for their extraordinary preparations and
by this means he happily retarded this formidable invar. Walling. fin for a whole year. In thorn, he fen lis whole time and faculties in the lervice of Queen Elizabeth; on which account her majetiy was heard to fay, "I hat in diligence and fagacity he exceeded her expectations." However, after all his eminent fervices to his country, this man gave a remarkable proof at his death, which happened on the Goth of April 1590 , how far he presfared the public intereft to his own; he being fo poor, that excepting his library, which was a very fine one, he had fcarcely effects enough to defray the expense of his funeral. His principal works are, 1. Memoirs and Incl ructions for the ute of Ambaffudors, with his Letters and Negotiations. 2. Political Memoirs.

WALTHERIA, a genus of plants in the clays monadelphia, and in the natural fyltem arranged under the 37 th order, Columnifera. See Botany Index.

WALTON, Bryan, Bifhop of Chefter, a learned Englifh divine, who gained great reputation by his cedition of the Polyglot bible, with his Prolegomena in the beginning; which is more exact, fays Father Simon, than any other which had been publilted on that fubjet. He died in 1661.

WAMPUM, the money ufed by the North American Indians. It is much ufed in all their treaties as a fymbol of friendship. It is made of 4 hell of a particular species of Venus.

WAPENTAKE, is the fame with what is called a hundred; efpecially fed in the north counties beyond the river Trent. The word feems to be of Danith ortginal, and to be fo called for this reafon: When frt this kingdom, or part thereof, was divided into wapentakes, he who was the chief of the wapentake or hundied, and who is now called a high conflable, as foo as he entered upon his office, appeared in a field on a cesstain day on horfeback with a pike in his hand, and all the chief men of the hundred met him there with their lances, and touched his pike; which was a figs that they were firmly united to each other by the touching their weapons. But Sir Thomas Smith fays, that anciently mutters were made of the armour and weapons of the feveral inhabitants of every wapentake; and from thofe that could not find fufficient pledges for their good abearing, their weapons were taken away and given to others; from whence he derives the word.

\section*{W A R.}

\section*{INTRODUCTION.}

IN treating the fubject of war, we may confider it frt in a political and moral point of view, as one of those powerful engines employed by civil governments, to bring about forme ends which they deem beneficial to the community over which they prefide; and fecondly, in a theoretical and practical point of view, as a Science or an art, which the neceffities or the follies of mankind have rendered an important object of confideration, not only to certain individuals, but in lome reeafure to fopiety at large.

Fol. XX. Part II.

From the numerous calamities incident to war, it Political! Should be prefumed that no wife or good government objects and would have recourfe to means fo dangerous and expen cures of five, till after all other means of producing the ends war. they have in view had failed of fuccefs. The oftenfible objects for which a nation or community engages in a war, are ufually to prevent or repel the afiaults, encroachments, or invalions of its neighbours; to revenge forme infult or injury which the community, its allies, or dependents, may have fuftained; to compel fame other nation or community to refpect what are called the la ty of nations, and the rights of civil fociety; or to
preserve
-Introdic- preferve that due and cquable bniance of power among tion. mouring flates, which has of late been confidered as an effential point in the political economy of civilized nations. We fay that thefe are ufually the offonfible oljeets of war ; for though it will fcarcely be denied that ambition, avarice, religious bigotry, a defire of durainion, and a thirft of military fame, have been the real caufes of many of thofe long and bloody wars which have defolated the face of nature, and heap.d mifery and wretchednefs on millions of human beings, we believe few heroes and conquerors, either of ancient or modern times, have had the honelly or effrontery to avow thefe as the real motives of their militasy expeditions. Yet, if we examine the pages of hiftory, we flall fearcely find a war, from the Battle of the Kings secorded by the facred hiftorian, to the prefent contert which has for 17 years involved all Europe in confufion and bloodhed, and reduced many of iis faireft flates and provinces under the fubje Ction of a fingle monarch, in which one or other of theie latter motives has not, at leaf to one party, been a principal inducement.

Among the political objects of war, we muft not omit 10 mention one which, though perhaps lefs openly avowed than any-other, has, in monarchical and ariltocratical governments, always formed a material part of the flate policy;-we mean the object of preventing tumults and comrations among the people, by engaging them in a foreign war. It was long ago oblerved by a good judge of human nature *, "that ro bedy can be healthful without exercile, neither natural body nor politic;" and that "to a kingdom or a flate, a juft and honourable war is the true exercife." That politicians have often atted on thefe principles, is certain. On the jultice of the principles themfelver, we prefume not to decide, though we may fafely exprefs a doubt whether the cemedy be not worfe than the difeafe, and whether thefe popular commotions might not te prevented with erqual eafe, and with more advantage to the nation, by employing the populace in fuch works of improvement as may adeance the manufictures, commerce, or internal comforts of the ftate.
An able and ingenious writer confiders a redundance of population as one of the chief primary caufes of war. "One of its firft caufes and mof powerful impulfes, was undoubtedly an infufficiency of room and food; and, greatly as the circumflances of mankind have changed fince it firt began, the fante caufe flill continues to operate, and to produce, thorght in a fmaller degree, the fame effects. The ambition of princes would want inflruments of deftruction, if the diffrefies of the lower claties did not drive them under their flandards. A recruiting ferjennt always prays for a bad harvelt, and a want of emoloyment, or, in other words, + Mantrizs a redundant population \(\dagger\)." This redundance he prosin Porne lation Edit. 180.3 p.
500.
pofes to obviaic, and thus to counteract one of the prin. cipal caules of war, hy throwing obflacles in the way of marriage. Without calling in queftion the jullnefs of his pofition, we do not fee the neceffity of the remedy which te propofes. We mull acknowled ourfelves fuch friends the the incrafe of population as to think that every enconragement ought to be given to it, inflead of throwing obflacles in its way. There are ferv countries fo populous, or fo completely cultimated, as to render it nerefiry to plunge them into wars, in order to diminifh the number of inhabitants, which might be
abundantly fupported, were agriculture encouraged, and introd glationy repreffed.
(Whatever may be the objeds for which a nation goes to war; whatever the caules which have induced her Impooic to have recourfe to fuch an expedient, we may venture, war. from hifory and experience, to affirm that the will gain little folid advantage by the conteft. She may drive an invading enemy from her dominions, and purfue hin to his own ; fle may acquire plunder and territory, and may raile her name among the netghbouring ftates by her victories and prowefs; but all thefe, except the firft, will fcarcely compenfatc for the blood and treafure which the has expended, and for the check given to her agriculture, manufactures and commerce, by drawing off many of the labouring part of the community to fupply the tleets and armies of the ftate. 'I hefe are the inevitable confequences even of a fuccefful war; and thould it prove otherwife, the calamities and diftrefles of the vanquifhed may readily be conceived. Even to the eftablifhed government of a flate, war, while it appears to ftrengthen their hands and increale their influence, is franght with difficulty and danger. No fituation of affairs is fo well calculated to fhow the abilities or infuticiency of a cabinet as this, ard melancholy is the fate of that nation whofe adminiltration is then conducted by a weak, inexperienced, or profligate miniftry; but be they ever fo able or fo upright, flill the want of fuccefs, or a reverfe of fortune, will lower them in the opinion of the people, and will compel them at laft to conclude a difadvantageous, perhaps a difthonourable peace, or quit their pofts and leave the tafk to a more popular or fucceffful adminiftiation.

The evils of war do not terminate on the return of peace. Many of the burdens which it had impofed on the people muft ftill continue, to difcharge the debt contracted by the ftate; while the fudden difbanding of the fleets and armies pours into the community numbers of idle and diflipated men, averfe to labour, and accuftomed to fceres of confurion, flaughter and rapine. At no time are robberies, murders, or feditions fo frequent as on the termination of a long protracted war; at none are the internal peace and quiet of a nation in fo much danger.

On the moral evils of war we furely need not en- Moral evi large. In itfelf, when undertaken without neceffity, it of war. is an act of the molt criminal and atrocious nature; and the aggreffors are accountable for all the herrid confequences which may attend it. "The pomp and circumftance of glorious war", may form a deffrable fubject for the pott and the hiforian ; but the Chrititan and the philofopher muft regard it with horror and deteltation, as the greateft evil with which providence has bcers pleafed to arm the hands of its miniflers to punifl and afflict mankind. A late amiable and learned prelate war \({ }^{6}\) arace has laboured to prove that "the frequency, duration, ly lefis treand cruely of wars (in Chriftendom) are lels now than quent now in ancient times ;" * but we think that ncither his rea- than formfoining nor his examples are capable of eftablifting the firf part of this pofition. If we take the laf \(7<0\) years, and compare it with an cqual period of acient Sennons, hillory; if we recollect the crufades, the almoft continual Atruggles between France and Britain, the civil diffenfions in both thefe mighty empires, the wars between the Ruflians and their neighbours, the 'Turks, the Poles, and the Swedes; if we advert to the reigns of

Edward
croduc- Ed.vard III. of England, Charles V. and Philip If. of tion.

Chatles XII. of Swelen, Frederick II. of Prufia, and Cotherine II. of Ruffia; and latlly, if we turn our attention to the long and ruinous contelts which dittinguilh cur own times, we thall find little caufe to boadt of having profited by the pacific leffons of our Saviour, whofe great object was to promote " peace on earth," and good will and brotherty love amons the craildren of men.

There is indeed one confolatory circumfance with refpect to the modern lyltem of warfare, that our wars are now lets fanguinary than thofe of ancient times. The immenfe ilnughter which attended fome of the battles in the Greek and Roman wars, where the greater part of the vanquilhed army was frequently put to the fiword, is familiar to our claflical readers; but in modern waffare, even of the lirge armies that have appeared in the field on the continent of Europe, we liel. do:n find fo many as 30,000 killed and wounded on both fides, a number vallly inferior to what fell of the Romans at Canne, and by no means equal to the lofs of the Corthaginians at the battle of Zana. This diminthed ilugkter is attributed, and we believe with juftice, to the ure of firearms; and it is computed that in this mode of firthing not more than one mufket ball in 40 tikes effect, and not more that one in 402 proves fatal. The introduction of thefe weapons, therctore, however it may be declaimed againft by theorifts, muit be confide: d as a real improvement in the art of war; and it is fincerely to be regretted that the ufe of the'n thould be hid afide. If, however, the prefent practice of deciding battics by the bayonet and the labre be continued, it is to be feared that we fhall foon rival the ancients as much in the fanguinary nature of our wars as in their frequency.

After, what we have faid on the impolicy of war, and the moral evils which attend it, it will fcarcely be ex. peeted that we flould allow it to be juntifiable, except in cafes of neceffity. Indeed we think that war can be jultified only on the principles of felf-defence. When a nation is invaded, or attacked in relation to her undoubted rights and principles, it is then, and then only, that the has a pretence for war. We will not, indere, go fo far as to affiert, that the ought to await the attack. While the takes the heft methods for defending her territories at home, it is doubtlefs prober, efpecially for a maritime ftate, to meet the enemy half-way, and by a timely and firited refiftance, endeavour to avert thofe greater evils which would attend a fyllem of pufillanimicy and neglect.

Ia the prefent Itate of human naturc, war muft be regarled as a nereflary evil, and as it is fometimes unavoidable, the principles and pratice of it mult be fludied by thofe who are to fuperintend or to conduct its onerations. It is this neceffity that has given occafion to the art of war, the practice of which is to form the fubject of the prefent artic'e.

Before we enter on the immed ate object of this eflay, however, it may not be improper to enumerate thofe bunches of knowledge which confitute the principles of the military art, and of which no officer who expeets to have a princinal command in military onerations fhould be ignorant. We thall firt mention thofe ficnces which fould form a part of the education of every command-
ing officer, whelter military or 1.27 al ; and we flall Introwte. then dillinguith between thole which are molt appicaHion. ble to the land and the fea fervice.

A mong the firit branches of a militasy cdacation mu? be enumerated the modern languages of Fiench and German; grograpiy, by wbich we would underfland, not metely the delcription of countriss, 1lates, and kingdoms, but a knowledge of their political contilitution, relourses, and productons, and of the manners, cuftotns, and character of their inhabitan!s; bistory, elpecially that of modern Europe, and of the Grecks and Roman. Amone particular hillories se would recommend thofe of Polybius, Xenophon, I'acitus, with the Commentaries of Cafar, in ancient. hifory; and Divile's account of the civil uars of France, Guicciardmis hiltory of the Italian ware, the hiltory of the feven years war by Frederick the Grear, with a particular attention to the beft historics of his own country, and of the wars in which the has been engaged. After thefe preliminaty tranches follow the rudiments of mathematics, including common and logarithmic Arithanetic, the clements of theoretical and practical geometry, plane and fpherical trigonomitry, the principles of surveyisig. conic sections, and their application to frojectures; certain parts of natural philofophy, efpecially mechs. NiCS; and the principles of drawinc plans, maps, and charts.

Belides thefe, a military officer fhould be inftruted in fortification and gunnery, the nature of military excrciles, and the duties of the various officers attached to an army; while the naval officer hould particularly attend to AStRoNOMy, HYDRODYNAMESE, Nsvigation, the principles of seamazsutp, and of shipbulliding.

There is perhaps no art or profeffion, in the practice Practice ce of which the fuperiority of example over precept is more war. apparent than in war, infomuch that we may lay it down as an axiom, that no man can be a foldier or a failor from theory alone. It is not from books that we are to learn the art of war, though there is no doubt that they may greatly afiitt and improve the fkill and exserience acquired in the field or on the ocean. In thefe active feenes have been formed the great com. manders, whofe lives and actions are perufed with fo much avidity; and the only method of luccefsfully imi. tating their exploits, and emulating their fame, is to encounter the dangers and the hardfhips to which they were expoled, and to learin how to command, by fifit learning to obey. A confiderable thare of the mecha. nical part of war may be acquired in a well-regulated military or naval fchool; but the experience neceflary for a commander is to be gained only in ątual fervice.

The praftical part of war is ufually divided into military tactics, and naval tactics: a divifon which we thall here adopt, though we have thought proper to bring the whole under one article. As the fnace, which we had originally allotted to there futjects, has unavoid. ably been reduced one half, we fh.ll be able to give little more than a general outline. efperially of miliary tactics, referving the fuller difcuffion for nseal inctics, which, to a nation whofe chief dependence is on her flects, muft be the moft ufeful and the mof interefting part of the fubject.

It would be vain for us to attermpt any liftorical ac. \({ }_{4} \mathrm{~F}_{2}\)
count

Introduc tion.
\(\qquad\)
count of the progrefive improvements that have been made in the art of war. Indeed this would be to repeat much of what has already been detailed under the principal hiftorical articles of this work; for the hiftory of nations, as it is commonly treated, is little more than a hillory of their wars. We might, no doubt, bring forward much curious information refpecting the offenfive and defenive weapons of different ages and countries, and the character and organization of their armies; but for thofe and other matters of a fimilar nature, we may refer our-readers to the following refpectable authorities: Vegetius De re militari; Polybius's Hifory, with the Commentaries of Folnrd; Salmafius De re milutari Romanorum ; 'Tacitus's Vita Agricolar ; Rollin's Ancient HiRary; Potter's Grecian Antiquities; Kennet's and Adam's Roman Antiquities; Goguet's Origin of Larus, Arts, doc.; Danicl. Hifoire de la Milice Frangoife; Gough's Sepulchral Monuments; Afcham's Toxophilus, and Grofe's Hy/lory of the Englyf Army, and Fiflay on Ancient Armour.
- At a period like the prefent, when the two greatent powers of Europe are ffruggling for glory and dominion, it will not be thought unisterefting, or irrelevant to the futject of the prefent article, if we offer a comparative flatement of the prefent military and naval eftablishments of thefe two mighty empires, with a fketch of the military character of their armies; and with thefe we fhall conclude our preliminary oblervations.
Prefent mihitary eftabiuhment of the Erench.

Edin. Revicts, tol "in. p. \(4: 5\)

According to a flatement made to the French government at the commencement of 1805 , the grand total of the French armics confifted of 570,964 men; viz. infantry of the line, 341,412 ; light infantry, 100,130 ; cavalry, 77:488; artillery, 46.489; engincers, 5445 . Since that time, more than 100,000 have been added, and, according to the beft authority, the prefent total dues not fall fhort of 700,000 men *. This vaft body is divided into companies for both cavalry and infantry ; a certain number of companies forming a battalion of infantry, or a fquadron of cavalry. The deno- mination of regiment is appropriated to the cavalry and artillery; while a fimilar body of infantiy is called a half brigadc. The commanding officer of a regiment is called colonel; but the commander of a large body of infantry is called chief of brigade. The names of lieu-tenant-colovel and major are changed for thofe of clief of a battalion and chief of a fquadion. Thofe general officers which in other armies are called major-generals, are, in the Frencla fervice, denominated generals of brigade, and lieutenant-generals are there generals of divifion.

The corps of engineers has for its officers 8 infpeftors general, 34 directors, 124 captains of the firft clafs, 117 captains of the fecond clafs, 33 lieutenants of the firt clafs, 21 of the fecond clafs, and 20 pupils under the lieutenants. Attached to this corps are 6 companies of minere, commanded by a clief of battalion. Each company is officered by a captain-commandant, a fecond captain, firft and fecond lieutenant. Twelve battalions of miners; cach battalion, containing 8 companies, forming in all 1606 men, including officers. The battalion flaff is compoled of a chief of battalion, all adjutant major, and an adjutant. Each company is officered by a captain, a lieutenant, and fublieutcnant.

To raife and recruit this great military force, the

\section*{A R .}

French govemment has, fince the year 1798, had re. Introde, courfe to one of the moft tyrannical mealures which was ever adopted by a defpotic monatchy, we mean that of confoription, by which every man within 3 certain age, is made liable, under circumtlances of the greatett rigour, to ferve in the armies of the ftate. '1his fyltem of confcription is exceedingly complex; but we are enabled, from a refpectable periodical publication, to prefent luch a fummary of it as will be readily underftood. France is divided into about 30 military governments, fubject to a general of divifion and his ftaff, to which commiffaries are attached as executive officers. The civil divition confifts of 122 departments; 24 of which have been acquired fince the overthrow of the mo. narchy, exclufive of Tufcany, not included in any part of this ftatement. The departments are divided into difrich or arrondiffements, from three to five in number; the arrondifements into cantons, and the cantons into municipalities, amounting to about 55,000 . Fach department is governed by a prefect and his council, compofed of a commiflary of police, a mayor, and certain infpectors, denominated counfellors of prefecture; the diftrict or arrondifement, by a fubpretect and his council, of a fimilar formation. The cantons and municipalities are under the fupervifion of an adminitration, compofed of the civil authorities, with a prefident at their head. A mayor, a commiffary of police, and two officers of the government, Alyled adjuncts, are allotted to each divifion having a population above 5000 fouls. Thefe feveral authorities are in ffrift, fubordination to each other, and at the controul of the prefects and fubprefects, who, themfelves, are charged with a weighty and inflexible refponfibility as to the military levies.

By the code de la confcription, all Frenchmen, between the ages of 20 and 25 , are liable to ferve. They are divided into five claffes, from which the municipal adminiftration draws up the lifts for the ballot. Thefe are tranfmitted to the prefects, by whom they are fent to the war minifter, and when properly adjufted, the fubprefect proceeds to the drawing of the quota impofed on each diftrict. The conferipts drawn are formed into three divifions, the firl called confcripts for actual fervice, the fecond the referve, and the third fupplemcnta\(r y\) confcripts. They are marched in companies of 100 men, to the places which are eftablifhed as depots, where they are furnifhed with their arms and clothes. After this they are trained and exercifed, fo as to be inured to unremitting labour and fatigue.

What gives peculiar energy to the French military fyltem, is the circumftance that their officers rife by merit and experience, and not by intereff. By a law of the directory, no perfon (with the exception of engineers) could become officers, who had not ferved three years in a fubordinate capacity. The revolution naturally opened the way to merit; and, feconded by this admirable policy, has fillcd all the pofts of their army with men, who unite in themfelves the qualities of the foldier, with the excellencies that qualify for command. It is not lazarding too much to affert, that nine-tenths. of the prefent French officers have fprung from the ranks. Educated in diftant camps, they know no other country, and, habituated by long devotion to the trade of war, it has become their element and their paffion. Their whole fortune is ftaked on the fword; and their attachment is therefore neceflarily fecured, under the surpicious.
rodoc- auppicious influence of a leader, whofe indefatigable am. sion. bitoon occupies them in their favourite purluits, and whofe liberal impartiality feeds the hape of preferincnt, and divides the fruits of conqueft. To their credit and example is due much of that firit, which, notwithflanding the caufes of alienation hitherto obferved, feems to animate the whole frame of the army; and no fmall flare of that portentous luccefs which has attended the courle of the French arms. Of the eighteen marechaux d'empire, fourteen have either emerged from the ranks, or afcended from the loweft employments. Moft of the generals of divifion, and others who hold the principal commands, have the fame origin, and fufficiently prove, that war is an experimental feience, and that military renown is not the prerogative of birth, but the harvelt of toil, or the bounty of fortune *.
We have no certain means of afcertaining the prefent naval effablifhment of the French empire, though, as it may be faid to have the command of the navies of Holland, Ruflia, and the remains of that of Devmark, it muft ftill be regarded as of no trifing flrength. The principal fleets are indeed kept blocked up by thofe of Britain, in the harbours of Breft, Rochefort, Toulon, the Scheldt, and the Texel ; but the efcape of any of thefe might be the means of conveying a confiderable military force to the remaining colonies, or to the lefs powerful allies of France. In 1791, the French fleet confifted of 73 thips of the line, 67 frigates, 19 corvettes, and 67 fimall craft, making a total of 226 . Since that time, however, have taken place the great naval victories of Howe, St Vincent, Duncan, and Nelfon, by which the greater part of that havy has been carried into Britifh ports.

In eftimating the military eftablifhment of Britain, we fhall, for the fake of more accurate comparifon, firft take the fame period of 1805 . The Britifh land forces then confited of 21,223 cavalry, 124,878 infantry (including 20,747 men for limited fervice, and 21,208 belonging to foreign and provincial corps in Britifh pay), 89,809 militia, 8559 artillery, befides ahout 430,000 volunteers, making a total of 674,469 . To thefe mult be added the royal artillery, the horle brigade, the brigade of gunners and drivers, and companies of fereign artillery, amounting to 16,670 , and the corps of artificers and labourers, including 704 men. Thus the whole military force of Britain, in 1805 , amounted to
91,843 †.
Since the paffing of Mr Windham's act, this number is fomewhat diminifhed, though our military force is now probally more effective. At the end of 1808 it Rood as follows. Two regiments of life-guards, one regiment of royal horfe-guards, 7 of dragoon guards, 25 of dragoons, 3 battalions of riftemen, 7 battalions of foot-guards, 5 of light infantry, \({ }_{17} 6\) battalions of infantry, a corps of royal horfe artillery, a regiment of royal foot artillery, a corps of royal engineers, a brigade of artillery drivers, and a waggon train. The dragoons, independent of the royal life and horfe guards, amounted to 19,200 ; the battalions of riflemen and light infantry to 8000 ; the infantry of the line to 149,600 ; the king's German legion to about 20.000 ; exclufive of about 96,000 regular militia, 250,000 local militia, and about 50,000 volunteers; making an effective force of about 580.000 men.

Each regiment of not more than 500 men is officer-
ed by a colonel, a lieutenant-colonel, a major, 10 cap. Introductains, ro lieutenants, ' 8 enfigns, an adjutant, quarter- tion. mafter, paymafter, a furgeon and affiftant furgeon;:a fergeant major; a quartermafter-lergeant, with 30 ordinary fergeants, 30 corporals, a dtum-major and 20 drummers. If the regiment amount to 750 men, it has ufually an addition of fecond lieuterant-colonel, a fecond major, 10 fergeants, and 10 corporals.

The gradation of rank among the officers of the Britill army is as follows. Under the king, who coramands the whole as caplain-general, is the commander. in chief, then follow the field-mar/bals, generals, lieu. tenant-generals, major-generals, brigadier-generals, colonels, lieutenant-colonels, majors, captains, and fubalterns. The different departments of the army are under the fuperintendence of an adjutant-general, a quar-termafer-seneral, a barrack-mafer general,'a comm! (Varygeneral, a paymafer-seneral, a board of ordnance, and a medical board. See Adjutant, Quartermaster, \&c.

The army of the line is recruited by enliftment; the recruits receive a bounty, and are engaged to ferve for a limited period, or for life. The militia is filled up by ballot, in the feveral counties to which it belongs, and alfo receives recruits by enliftment or by proxy. Hence the Britilh foldier, while he confiders himfelf as the fervant of the king and the flate, jufly boafls of partaking in the general liberty of the fubject. He is protected by fixed and definite laws, againft the diferctionary power of his commanding officer, and is encouraged to perform his duty by the liberality of his country; and not, as in France, compelled to it by the fear of punifhment. His difcipline indeed is ftrift ; but he feels none of that fevere and tyrannical coercion which feems to be the firlt principle of motion in the armies of Napoleon.

In its naval eltabliflıment, Britain jufly boafts of be- Naval efan ing fuperior to every nation in the world. The number blifhment. of her leets, and the courage and difcipline of her feamen, have given her the unrivalled dominion of the feas, of which it would be difficult for the whole combined navy of Europe to deprive her. In 1809, the naval force of Britain confifted of 157 hips of the line, 19 from 50 to 44,184 frigates, 181 floops, 308 brigs, making a total of 849 in commiffion; befides 56 of the line, 1250 's, 56 figates, 44 floops, 24 brigs, total 192 in ordinary and refitting; and 50 fhips of the line, 20 frigates, 20 noops, 10 brigs, total 100, building: making a grand total of 1141 .

The progreflive advance of our navy will appear by attending to the foliowing recital of its tonnage at different periods, from the reign of Henry VIII. to the prefent time.

It appears, however, that notwith fanding the vaft increafe of our navy, not a fingle dockyard has been added to it fince the reign of William III. about 109 years ago, at which time the tonnage of the naval force of this kingdom amourted to neally 160,000 tons; it is now nearly 820,900 tons, or about five times as

Statement by Lord Me? भi!lc.

15
Military claracter of the Erench army.
large *.
In fketching the military character of the French and Bitith armies at the commencement of the 19th century, we fhall avail ourfelves of the obfervations of an anonymous, but able and apparently impartial publication, which appeared foon after the peace of Amiens, entitled The Military Charactor of the Europenn Armies at the Peace of Amiens.

The aftonilling fuccefs which has attended the Fiench arms on the continent of Europe, is to be attributed partly to the regular organization and fevere difcipline eftablithed by the Code de la Confcription, but it is tlill more to be afcribed to the fkill, experience, and activity of their officers. The French generals early difcovered the advantages refulting from difpatch. The alertnefs of the foldiers, the lightnefs of their baggage, and their inattention to regularity in time of action, enabled them to execute their movements with a celerity which has frequently enfured fuccefs. In an open cous:try, lines could not be preferved without difficulty. The French armies were therefore formed in columns. Brigade fuccecded biggade, and when one divifion was repulfed, and fell back on the columns in the rear, thofe in their turn attacked the enemy, or fullained his nook, and freth troops perpetually came fonward, to fupply the place of thofe which had been defeated.

The French battalions have no ficld-pieces attached to 'hem; but this want is amply compenfated by their flying artillery, which is compofed of the flower of the french foldiers, and by its boldnefs and rapidity of movement, fupplies the place of that large train of artillery with which the other Eusopean armies are ufually burdencd. It is a conflant maxim in the French armies to have a body of referre, compofed of the'r belt troops, and under the command of an able general. If the main tody flould be beatch, the referre covers their retreat, and on mote than one occafion it has fiat ched the rictory from the liands of the enemy.

The French generals, like rich and bold gamifers. are inceffantly tempting fortunc. They lock upon their loffes as nothing, provided they fucceed in the end. The litule value at which they ellimate their men, the

A R.
certainty of being able to replace them; the perfonal Intrates, ambition of their chief, and the cultomary luperiority of their numbers, afford ihem an advamage which cannot be counteracted but by great \(\mathfrak{k i l l}\), conduct and activity.

The foldiets of Britain are as intrepid by land as hier Military failors by fea. Their want of fuccel's on the continent charater cannot be alcribed to their want of bravery, but rather of the Bri to the organization of the Britith annies, their inferiori- tifl army. ty of numbers, or the inexpericnce of the officers by whum they are commanded. Meft of their commanding officers, inilead of conforming to general regulations, follow their own particular plans and ideac, according to their feveral geniures, acquirements, and prejudices. In a nation, which from the fpirit of its conflitution and the habits of its people, is formed rather for naval than military operutions, a minittry, however enlightened, 〔carcely poffeffes that authority which is necuffay to give uniformity to the different departments of the army, to conflitute a regular and correfponding whole, and to furmount thofe obfacles which are thrown in the way of all uniformity of military fuftem, by the diffance and diftribution of the troops. The fmall numbers in wlich Britifh troops are general. ly compelled to act on the contincnt, and their mixture with thofe of other nations, to which they are fometimes even fubfervient, are circumfances extremely difadvantageous.

In a military life, good faith, honour, and courage, are the principal qualifications, and there are eminently confpicucus in the Brilifh army. Their military ardour is greater than what is feen in any other fervice, but this is in a great meafure damped among the officers by the difficulty of promotion. Interefl with minilters, and the neceflity of raifitig money to defray the expences of the different departments of the llate, though far from being the moft equitable, the here unhappily amorg the firft means of military promation.
The foldiers of the Britifh army are peffeffed of elements to enable them, under a commander of abilities and officers of experience, to be the beft tropps in the world. They require neither brandy nor felt-conceit to make them brave ; their courage is innate; it is a mational indinet. Their efficers too ufually poffers much greater information on general topics than thofe of all other Euronean riations, as chucation is more culivated in Britain than cllewhere. They are attached to their profefion, and follow it rather from generous motives and m:litary (pirit, than like mercenaries from a view of interef and profit.

\section*{part I. military tactics.}

SOME writers on the military art dilinguilh bactics from what they call frategy; underfanding ly the latter the fcience of milatary wovements when no in figlt
of the enemy. or at leant nut of the range of their hot; while they defribe the former to be the fcience of military movements in fight of an enemy, or wihin the
thitary range of camon haot. We do not fee the necefity of this diftinction; and under the head of milinary tactics we fall confider whatever relates to military operations on land.

It is not poffible for us, within the very fcanty limits to which we are now reduced, to give any thing l.ke a regular treatife on the military art. We thall therefore endeavour to felcet the muft ufeful and interefting topics, and fupply the place of diffuifition by numerous plates with appropriate cxplanations.
The fcience of military tactics comprehends the difpofition and arrangement of troops, whether on marches, in camps, or in line of battle; the attack and defence of pofs; the conftrusion and furerintendence of the works. by which they are to be defended; the condurting of fieges ; and the defence of befieged places. Thefe are the principal operations of a foldier, and thefe we fhall briefly confider nearly in the order in which we have enumerated them.
To direct the march of an army is not one of the leaft difficult parts of a general's doty. To do this with ability, he muft be well acquainted wih the mature of the country through which his troops are to pafs, with the obfacles which are likely to oppofe them in their progrefs, and with the difpofition of the inhabitants. Our bufinefs here is only with the firf of thefe confiderations. There are three defcriptions of countries which may become the theatre of war; an open country interfeted by rivers, a mountainous, and a woody country. The narch of an army through the firf, as far as refpects the face of the country alone, is feldom difficult, except in the paftage of rivers, which we thall confider by and bye; and the laft defeription of country is now to uncommon in Europe, that we need not dwell on it. A mountainous country, however, prefents numerous diffculties to call forth the abilities and experience of a commander, as in fuch a country, not only are the roads winding and difficuit of accefs, but the unever. nefs of the ground, and the intervals between the hills render it very ealy for an enemy with a finall force, to oppofe and diltefs a numerous army.

The plan in Plate DXLIV. is intended to illuftrate the march of an army through a mountainous country. At A is fhown the pofition of the army previous to its march, with the artillery and baggave?, drawn up under their proper efcorts, in front of the camp. At Pi are parties of huffars conflituting the advanced guard of the amny on its march; and at C are parties of infantry forming the advanced guard of the columns in which the army is difpofed. D reprefents the infantry forming the head of the columns; E the park of artillery and waggons attached to it; F, battalions of arfillery, \(G\) the cavalry, \(H\) the baggage of the army, and I their efcort. At \(K\) are parties of huflars, and at L, parties of dragons. M reprefents the infantry of the referve forming the rear guard, and N plattoons of infantry fent forsiard upon the heights, to cover the flanks of the principal columus. At O are villages in front of the polition where the army is to encamp, and which have been taken poffeffion of by the light infantry.
The number of columns into which the marching army is to be divided, will depend on the number of roads or acceffible approaches that lead to the pofition which it is to take up. In the prefent cafe there are
only two principal roads, each leading acrofs the river, and winding through the valleys to the principal heights, fo that the army mutt march in two divifions. The ufual dilpolition of the columns is as follows, Four or five brigades of infantry, according to the number which compoles the army, fhould be placed at the head of each column ; the fame partition thould be made with regard to the artillery, which mult follow the infantry; the cavaliy mufl march next, and the baggage of cach column, well efcorted by infantry, munt follow the cavalry, then the reft of the corps of light horfe which are not detached; and the dragoons are placed the laft, in order to dilmount, and fuftain the rear guard in cafe is fhall be attacked.

An aımy feldom proceeds far without encountering a of the profriver in its march, and as it commonly happens in a fuate of ticountry which has become the feat of war, that the bridges are deftroyed or rendered impaffable, the army muft crofs the river, either by fwimming, at fome ford, or by temporary bridges thrown over for the purpofe. It is molt advantageous to crofs a river at fome part where the flream is diviied by fmall iflands, unlefs the river be fo flatlow that it may be cafily forded. If it be neceflary to confruct a bridge, this is beft done by means of boats or pontoons, and all the neceffary njpparatus fhould be ready at the place of ciofling at in appointed hour, and every meafure fhould be taken to avoid confuion, and to be prepared for the enemy, who will probably difpute the paffage. The two heads of the bridge when conllructed foculd be entrenched, and well furnifhed with troops, and if poflible, the iflands in the neighbourhood flould be fortified by proper works, to prevent the enemy from deftroying the bridge, or incommoding the labourers employed in its conaruction.

If the river be narrow, it is beft to crofs at fome place where it makes an angle, efpccially if, as commonly happens, one of its banks be ligher than the oppofite bank: fo that the higher ground may be defended by a battery. If the river be fordable by infantry, care fhould be taken befure hand to clea: the bed at the ford, and render the banks eafy of accefs.
The lower figure of Plate DXLV. illuftrates the paffage of a river. AAA reprefent bridges of boats; \(B\), redoubts by which the bridges are protected; C , a batscry, under cover of which the infantry work at the conftruction of the redoubts; \(D_{2}\) a batlery to prevent the enemy from annoying the army, on its march; \(E\), the march of the army ; \(F\), the artillery diftributed a. mong the brigades of infantry; \(G\), infantry forming in columns to open on the oppofite fide through the intervals of the redoubts; \(H\), march of the columns in the front of the redoubts, where they halt to give time for a part of the cavalry to form upon its flanks; I, a battery erected to faciliate the forming of the cavalry; K , cavalry, which, in gaining the oprofte flore, forms in order of battle, and poffs itelf tupon the flanks of the infantry ; L, eight battalions in column upon the right wing of the army, to go and examine the village, and attack the enemy in it, in cafe he fhould be poffefied of it; M, huffars and dragoons, who have taken poffefion of the height which is on the left wing of the army ; N , a brigade of infantry pofled nest the height, covering the left wing of the cavalry; O , the difpofition of the army marching up to the enemy.

It is in general a very diflicult tafk to defend the paf.

Military Tactics.

31
To defend

\section*{the paffage} of a river.
fage of a river againa an arriy that is determined on croffing it. Indeed, if the river be of fucla a nature as to prefent feveral points by which an enemy can crofs, and if the defending army be not of fuch firength as to meet their opponents in the field, fuch a defence will bé alnoft impracticable. Where it can be attempted, however, and where fufficient notice can be procured of the enemy's approach, all the boats and barks found on the siver fhould be removed or deffroyed, to prevent the enemy from ufing them in conflructing his bridges. Both banks of the river flould be carefully reconnoitred, that the fords and other acceffible points of paflige may be fufficiently obfructed; and the ground which might protect the enemy's paffage, fhould in particular be attended to. Roads fufficiently wide to admit of many coJumns, fhould be made along the fide of the river to be defended, that a great number of troops may be advantageoully difpofed. It muft be confeffed, however, that if the acceffible points cxtend along a confiderable tract of country, and if the bank of the river next the enemy overhang that on the oppofite fide, a defence will be nearly impoffible.
Fig. I.
The upper figure of Plate DXLV. fhews the manner of difpofing the troops to defend the paffage of the river. A, the march of the main army in three parts to defend the river; \(B\), the camp of the light horfe, infantry, and dragoons, on the wings of the army; C, cafte and village, guarded by light infantry; D, a town occupied by the infantry belonging to the army; E, bridge broken down; \(F\), iflands occupied by infantry; G , pofts of infantry diftributed along the fide of the river ; \(H\), batteries eftablifhed along the fide of the river; I, pofts of cavalry, to keep the communication between the camps; K , bridges conflucted to preferve the communication of the iflands; \(L\), bridges for the communication of the camps.

Bafis of modem mi litary opesations.

Modern warfare is difinguifhed from that of the an. cients, not more with refpect to the arms which it employs, than the multitude of flores, ammunition, and proviíons neceflary for a campaign. The number of horfes notv employed for drawing the artillery, and the ammunition waggons, as well as to mount the great increafe of cavalry, confiderably adds to the quantity of military flores required by the troops. This has produced the neceffity for magazines, effablified in fuch mumber, and at fuch difances from each other, as may moft expedite the operations of the campaign; and thefe magazines require not only to be fortified themfelves, but to be Atrengthened by forts or redoubts in their vicinity. To thefe magazines modern writers on the art of war have appropriated the term of bafis of military operations, and the roads by which an army receives its fubfiftence from the magazines, are called lines of operation. The fituation of the principal magazine, and the length and direction of the lines of operation, are confidered as of the higheft importance. With refpect to the firt and fecond of thefe, we mult refer to 'I'emplehoff's Hiftory of the Seven Years War, where the quefion is confidered with great minutenefs and fcientific accuracy. The direction of a line of operations may he illufrated by the firf feven figures of Plate DXLVI. Fig. r. reprefents a line of operation forming the fegment of a circle, having a line of pofts ACB towards the enemy's country, and two principal fortrefles DE within the fegmeat. As this circular fegment is fup-

\section*{A R.}
pofed to furround a part of the enemy's territory, and is fliengthened by the two fortreffes AB , at the extremities of the bafis, it is efteemed the moft advantageous form. On the other hand, if the fegment had its circumference disected towards the enemy, as in fig. 2. it would form the worf poffible direction for a bafis; for here the fortrefles CD, placed in the circumference, are very much expofed, and might be eafily taken by detaciments from the columns E and F. The only way of preventing this would be to detach troops from \(A\) and \(B\) laterally, to incommode the columns F and F , and to take up a frong polition either at \(g\) or \(h\). The more the fegment approaches to the elliptical forna, as in fig. 3. it is the lefs fufceptible of defence, as is evident from the relative pofition of the three fortreffes \(\mathrm{A}, \mathrm{C}\), and B . : The line of operation reprefented by fig. 4. confifting of falient and obtufe angles, fuch as \(A \subset B, B d G\), confitutes an excellent form, as it refembles the outworks of a fortrefs, and it is as impracticable for an enemy to enter into the interior of this bafis, as to carry a curtain between two flanks. The two fortreffes \(c d\) are not nearly fo much expofed as C in fig. 3. as if one of them were attacked, it would be eafy to make a diverfion from the other into the enemy's country. If the points which terminate the bafis advance as in fig. 5 . it will be a favourable circurallance, efpecially if the moft advanced pof were bounded by the fea, or by a large river.

The bafis which we have been confidering confifts of curved or angular lines. Now, let us fuppofe two bafes, the one \(\mathrm{A} / \mathrm{B}\), fig. 6 . forming merely a fraight line, while the other \(\sigma e g d f\), has two of its lines ec and \(d f\) advanced towards the enemy. This latter is the more advantageous, as it expofes fo much more of the enemy's country. In general, it is a good rule to confruct fortreffes oppofite to thofe of the enemy, as here the fortrefs \(g\), if moderately frong, is capable of protecting the Whole line from \(e\) to \(d\), againf the three oppofite forts \(\mathrm{A} h \mathrm{~B}\). It is a great fault for any part of a bafis to recede, as \(d c\) from the line of the enemy AB fig. 7 . To as to form an angle with it, as here all the country be: tween \(A\) and \(c\) is expofed to the hoffile attacks of \(A\) and B ; but, if the line were parallel to that of the enemy, as \(d e\), it would be a good pofition.

Next to the eflablifhing of magazines, and providing Eftablifhe for their fecurity, and that of the lines by which they ment of are connefed, it is of the higheft importance for a ge- camps. neral when he takes the field, to felect the profer pofitions where he may encarap his army, fo as to be readily defended againf the attacks of a fuperior enemy, and have an enfy communication with his own poffs. In felecting fuch a fituation he muft be guided partly by the nature of the country, and partly by the fituation of the enemy; but if polible, be fhould chuofe a pofition which is rather elevated, and which may be proteged on the flanks or rear, either by the natural fituation of the ground, or by works throwis up for that purpofe. It thould not be too near the bank of a river, though it may be of advantage to have fuch an object in front. The encampment of an army in fuch a fituation is pointed out by Plate DXI.VII. ; where A is the c:imp of the main body of the army; B , an advanced camp, compoied of diagoons and huifiars, in order to cover the right of the army, to guard the paffes by which the enemy might make incurfions upon the flanks and rear of the army, moleft the convoys, and cut off the communications

Plate DXLVIII. reprefents a camp intrenched in an open country, without any peculiar advantages of defence. A, the main body of the army encamped behind its intrenchments; B , the camp of the troops of referve ; C, camp of the dragoons, to fecure the rear of the army; D, camp of huflars, to cover the ground on the right of the army; E , villages and redoubts guarded by the light infantry, to fecure the camp of the huffars; F , bridges built to fecure the communication of the army with the ground on the right, and to favour the retreat of the troops pofted on the oppofite fide; G, brigades of artillery dillributed on the flanks, and along the whole front of the army; H , the park of artillery; I, a bridge entrenched, to fecure the communication between the army and the ground on the left \(; \cdot \mathrm{K}\), villages and farm houfes, guarded by detachments of huffars and light infantry, to patrole in front of the army.

In Plate DXLIX, are fhown other methods of intrenching a camp in the neighbourhood of a town or village, and in fituations where the camp can be protected by inundations. Fig. I. reprefents an intrenched camp in the neighboarhood of a town. A, a deep marflyy valley, with an unfordable rivulet acrofs it. B, a redoubt confiructed on a mountain, by which the right wing is appuyed. C, a fmall wood in front of the mountain. D, a line which connects two fleches together at the foot of the mountain, where the village of Weilheim is fituated. E, a rivulet, over which are thrown bridges of communication, to facilitate an intercourfe between the camp and the redoubt on the hill. \(F\), an eminence with a gentle declivity, at the foot of which is the village of Mansfeld, furrounded by defiles and hollow roads. G, defiles and hollow roads. H , lines 'which run along the circumference of the heights about Weilheim, forroing a retrenchment. I, clofe works. L, a redoubt which maks the entrance
VoL. XX. Part II.
into Stemmern. M, a fmall wood, cut down in order to have a full view in front ot Stemmern. N, a thick wood which covers fome higli mountains by which the left wing is fupported. O, an ahaitis which is made acrofs the wood for greater fccurity. \(P\), infantry pickets. Q, a redoubt on a fmall eminence, confitructed for the purpofe of covering the openirg behind the left wing of the camp. \(R\), a line of communication from the laft redoubt to the left of the intrenclmint. S, feveral paffages \(3 \circ\) feet broad and clofed in by chevaux-de-frize, to afford an opportunity for the cavalry to advance, floould the enemy be foiled in his attack againft any part of the works. T, the infantry and cavalry encamped bchind the retrenchment; the infantry in the firit line, and the cavalry in the fecond. \(\mathrm{U}, \mathrm{X}, \mathrm{Y}\), Z, four roads behind the camp to facilitate the retreat of the army, thould it be preffed.

Fig. 2. and 3. reprefent an intrenched camp with in- Fiz, 2, \(\hat{3}\) undations in front. Fig. 1. \(a b\), two dykes 40 paces long, 5 broad, and as many high. CD two rows of ftakes from 4 to 5 inches thick. E, the coffin formed by means of liakes filled up. It is 8 feet broad. F, the adjacent country, inundated by the rivulet being forced out of its current by the laf dyke and by \(a\) and \(\bar{b}\). G and H , the outlets which the rivulet fecks, to continue its courfe. I, fmall creeks or ends of ditches dug about the ground. Fig. 3. reprefents the current of a rivulet, with a dyke to occafion inundations. Camp, with the feveral dykes in front, which are calculated to produce inundations. The fpaces between thefe dykes are called coffins, viz. 1, \(2,3,4,5\).

We have mentioned the works by which field pofts Conftrucare fortified, and which are ufually called redoubts. As tion of rethe conftruetion of redoubts is generally a work of the doubts. moment, and falls within the province of the commanding officer of a detachment, it is proper that we fhould here defcribe the moft ufeful and expeditious methods of raifing fuch works. Thefe methods are illuftrated by the plans in the upper part of Plate DL.

Fig. I. thows the plan of the ordinary fquare redoubt which is conftructed in the following manner: When a proper fpot has been chofen, a line a AE is drawn of a fufficient length, and at one extremity \(a\) is drawn \(a \mathrm{C}\) perpendicular to it. Then from \(a\) towards \(C\) and \(E\) are fet off the dimenfions propofed fur each fide of the parapet within the fort, allowing 2 or \(2 \frac{1}{2}\) fathoms for 30 men, 4 fathoms for 50 , and fo in proportion for a greater rumber. Thefe lines being afcertained, a picket is placed at C , with a cord attached to it , and with the length \(a \mathrm{C}\) is defcribed an arch, and from the point E , with the fame difance, another arch is defcribed, interfecting the former in F . Then joining EF and CF, the fquare forming the inner parapet is completed. Within this fquare, at the diflance of 2 or 3 feet, is defcribed another fquare I, L, M, N, having its fides parallel to thofe of the former. This marks the breadth of the banquette, where the men are to be drawn up. Again, on the outfide of the firit fquare at about \(S\) or 9 feet diftance is drawn a third fquare \(\mathrm{O}, \mathrm{P}, \mathrm{O}, \mathrm{R}\), determining the outer fide and thicknefs of the parapet. This thicknefs is only calculated to refift mufket balls; as, if it is to fland agninft caunon, it ftculd be at leaft 18 feet. Laftly, at rather a greater diftance from this third fquare is drawn a fourth \(\mathrm{S}, \mathrm{T}, \mathrm{V}, \mathrm{X}\), marking the breadth of a disch that is tofurround the redouht. 4. G

The

\section*{Plate}
DL.

Fig. 1.

The lines being finifhed, fafcines or faggots of brufhwood are to be laid between the two innermoff fquares, as a foundation to fupport the earth of the banquette; a fecond range is laid on the lines \(\mathrm{AB}, \mathrm{GH}\), to lupport the infide of the parapet, and a third on the fquare \(\mathrm{O}, \mathrm{P}, \mathrm{Q}, \mathrm{R}\), to Afrengthen the outfide of the parapet, leaving a fpace through all the fafcines to the ditch, on the fide leaft expofed to the enemy, as at \(B\), for an entrance. It is fometimes convenient to make this entrance take a wiuding direetion, as is fhown at T, fig. 2.

Fig. 3. exhibits a fection of thefe works, where AR is the breadth of the ditch at the top; MN its breadth at the botiom; FN its flope, on a line with the oulfide of the parapet, called the fcarp, and GM its flope towards the open country called the counterfcarp. AL and ID reprefent the fafcines forming the outer and inner flopes of the parapet, the interval between them being filled with earth trodden down hard. At E is the banquette. DC is the thicknefs of the parapet below, and IL its thicknefs above, which forms a flope for the more convenient firing of mulketry.

In this fquare redorbt it is evident that the men mult fire flraight forward in lines perpendicular to the dides Tig. 4. of the iquares, as in fig. 4. As it is often of great confequence that the directions of firing thould crofs each other, the better to lank the enemy, the banquette
Fig. s. is fometimes formed with angles, as in fig. 5 . fo that the men may fland two together in little rcdans. As, howewer, fuch a conflruction takes up too much time and labour for ordinary occafions, M. Le Cointe paffers a circular redoubt, fuch as is reprefented at fig. 6 . where the men may fire from every part of the circumference. The confruction of fuch a redoubt is extremely fimple, and differs only in its firft fep, viz. defcribing the concentric circles, which is done with a cord faftened at one end by a picket at a central point \(C\).

The frength of the redoubt will be much increafed, if the ditch can be filled with water, as by turning into it the Aream of a rivulet. See Q. fig. 7. If the ground be uneven, fo that the water will not run equally into every part of the ditch, dams mult be raifed, as C , to keep up the water in the higher parts, whence it may run to the lower, after the former are full.

Fig. 7. reprefents a plan of the fquare redoubt, with a wet ditch, when completed. A, the inner ground of the redoubt; B , the bottom of the ditch; CDE , the dam of earth; F a dam of boards, planks or fafcines; \(G\) the upper part of the redoubt, made with fafcines or with earth thrown out of the ditch; \(H\), the lower part of the redoubt cut into the earth; I, the berme or fpace left at the outer bottom of the parapet, to keep up the earth; L, the entrance of the redoubt ; 'M, the infide of the parapet ; N , the ou fide of the parapet ; O , the bar.quette; P , the glacis; Q , the river introduced to fill the ditch with water.

The attack and defence of polts are among the moft important departments of what the French call la petiter zuerre, and in a country where fortified towns are rare, conflitute a confiderable part of field operations. We flall confider them rather more at lage than we have the preceding parts of military tactics.

When an officer is detached either to atlack or to guard a poft, he fhould provide himelf with a cord regularly divided, for the purpofe of defcribing lines, and
raifing temporary works, and fiould procure a kilful and confidential guide, frem whom the may derive the requifite information refpecting the nature of the coun. try, and the breadtls and goodnefs of the roads. He thould difpofe his party in fuch a manner that an ad. vanced guard of cavalry, as A, fig. 8. Plate DL, thould fet out firf, preceded by a fmail detachment of about fix horfemen, leeaded by a corporal, as \(\mathrm{B}, \mathrm{C}, \mathrm{C}\); two horfemen in the middle, and two on each fide. While the main body is moving along the principal road, as from H to F , a detachment of about 8 or 12 horfemen, according to the flrength of the corps, ihould be fent about 50 paces on each fide, by way of wings, as DD; and from each of thele wings 2 men fhould keep 50 paces farther out, as at EE, by which means the country will be properly examined, and furprifes from the enemy prevented. On coming near a wood, as at NN, the cavalry fhould tpread, the betcer to fcour the outfirts and the wood ittelf. When the corps is numerous, the cavalry ftould be formed into fquadrons, as G, G, G, and the infantry into platoons, as F, F, F, marching alternately along the road.

If, on the march, the advanced guard come to a crofs road, or the entrance of a hollow way, as at I, I, where it is likely they may be met by a party of the encmy, they fhould immediately prepare for in attack; and if the commander of the main body oblewe his advanced guard in action, he fhould immediately draw off his platoons of infantry, and form them on the fide of the road, as at L, L., L, or on fome neighbouring height, as at M, M, that they may be out of the way of the enemy's cavalry, and ready to engage if occafion fhould require it.

On the march the party fhould carefully avoid vil. lages, and rather halt or refrefh his men in a wood, or fome other concealed (pot.

The commander of a detached party muft take the on reoos. fafelt and moft effectual methods to reconnoitre the notring. country through which he is to pafs, without being obferved or fufpected by the enemy. The method of doing this recommended by M. Jeney will frequently fucceed, and is as follows: He fuppofes himfelf with his party at Soelt in Weftphalia A (fig. 2. Plate DLI), and the enemy polted at Bervick \(B\), two leagues from him. To know the fituation of this place without firing from Soeft, he takcs the map of the country; and from Soelt as the centre, he draws a circle, whofe circumference paffes half a league beyond Bervick. He draws a circle of the fame fize upon a leaf of paper, to make his plan, as in fig. 2. and then places Soeft in the centre A, and marks all the villages which he finds in the map near the circumference upon his plan, with the diftances and bearings as they are reprefented in the map, making ufe of a pencil to mark the places DDD, fo as to correct the errors more eafily which the map may have led him to make.

Having thus formed his plan, with a fcale of two leagues, he goes to the burgomafter of the town of Soeft, where he caufes fome of the moft intelligent inhabitants to come, and fpeaking to them freely and openly, induces them to communicate all the information for which he has occafion.

The better to conceal his defigns, he begins his reconnoitring by Brocklufen, a village diftant from the enemy. He alks the diftance from Soeft to Brockhufen;
fen'; if they fay it is a league and three-fourths, he corrects the diflance of his plan, which made it two leagues; then he informs himfelf of all that is to be found on the road from Soefl to Brockhufen, chapels, houfes, woods, fields, orchards, rivers, rivulets, bridges, mills, \& c. If they fay that a league from Soeft they pals the village of Kinderking, he marks that place upon his plan. He afks if the road from Soeit to Kinderking be croffed by any other road; if there be any morafs or heath; if the road be inclofed, paved, or ftraight; if there be any bridges to pafs, and at what dittance. He takes care to mark every thing on his plan, forgeting nothing, even to inills, bullies, gibbets, gullies, fords, and every thing that can be got from their information; which will probably be perfect, becaufe one always knows more than another. He continues his queftions from Kinderking to Brockhufen, and advancing by little and little, obferves the fame method on the roads of the other villages round, marked DDD. In this manmer he caunot fail to acquire an entire linowledge of all the places; befides, he finds himfelf imperceptibly inflructed in the pofition of the enemy, by feeing the different routes by which he can approach with the greateff fecurity.

For the attack of an enemy's porf, fuch men fhould be feleced as are brave, cool, and experienced; or if the aftair require a confidcrable number, the detachment fhould be divided into platoons, fome compofed of picked men for the real attack, and others of ordinary foldiers for feints. The men fhould be provided, befides their arms, with fuch inftruments as may be neceffary for pulling down or fcaling the enemy's works, fuch as hovels and pickaxes for fafcine parapets; batchets or pallifadoes, for chevaux de frize, and fcaling ladders for ftone or brick work. Having made the proper difpofition for his attack, and procured the neceffary guides, the commander of the detachment flould fet out in the night, fo as to be at the place of attack two or three hours before daybreak, taking care to march with as little noifc or parade as poffible.

If the poit to be atlacked be an ordinary redoubt, fuch as we have defcribed in \(\mathrm{N}^{\circ} 25\). on hearing the fignal previoufly agrect on, all the divifions are to rife at once from the place where they fhould have lain concealed; the firf ranks thould leap into the ditch, and foon after the fecond hould follow, and both together affif in undermining the angles of the fcarp, or cutting away the fakes which may impede their progrefs. If the parapet be faced with ftone or brick work, care flould be taken that the ladders be not too fhort, and great expedition fhould be ufed in mounting them, and efpecially in following the leading men in the affault, if they fhould be knocked down by the fire of the enemy.

Should the ditch be filled with water, and too deep to be waded, it may be croffed on temporary bridges made of planks, fupported on empty calks, or the ditch may be filled up with cafks full of earth. If, as ofien happens, the ground be obftructed with caltrops, thefe
muft be fwept away by dragging trees witl (heir leaver Milizary and branches over the ground (A).

In attacking polls of coufidcrable magnitude, fuch as villages, it is beft to divide the attack, and to mahe a feint on thofe parts which feem belt defonded, while the true attacks are rcferved for thofe fituations which feem moll difficult of accels, and where confequently, the enemy is lealt upon his guard. As foon as part of the village has been carried, fome divifions of the detachinent fhould haflen to flrengthen their pofition, by polfefling themfelves of fome church, or ligh grourd, from which they annoy the enemy.

When a poll is once occupied, if it be thought of Defence of fufficient confequence to retain it, the belt methodspofts. thould immediately be taken to proted it againft an attack of the enemy. The infantry to remain under arms is the middle of the ploce, the cavalry to patrole without, while the commanding officer, efcorted by a dozen horfemen, goes to examine the environs to make his arrangements; having fent feveral fmall detachments before, to cover him in tine of reconnoitring.

Having remarked the places proper for his guard, defence and retreat, as well as the dangerous ones by which the enemy can make approaches fecretly to furprife him, he fhould choofe the moft convenient in the front of his poit to fix his grand guard D, (fig. 1. Plate DLI.), which mult face the enemy. He mult mark the heights for this guard to place their vedettes EEEE, and regulate the number according to the exigencies of the fituation. In a covered country you muft not be fparing of then, and muft reinforce every guard. At 50 paces from the front of the grand guard a noncommiffioned officer with eight horfemen flould be always ready to fet out at \(K\), to go and reconnoitre, when the vedettes have obferved any party.

If the poft to be defended be merely a redoubt, it will be proper to keep in readinefs a number of trees cut down with their branches, to Nop up any breaches made by the enemy's fhot. The men employed in the defence fhould ftand in three ranks, the front and centre ranks with fixed bayonets, and the third rank provided with long pikes, fo as to project as far as the bayonets of the front rauk. On the enemy's approach, the men fhould referve their fire till the enemy come up to the glacis, and the rear rank thould be furnihed with hand grenades, or lighted faggots, to throw among the enemy, when they attempt to fcale the parapet.

In the defence of a village or fmall town, guards flould be pofted at the entrance of the principal fireets; trenches fhould be cut acrofs the ftreets, and cannon planted behind them, while a detachment of cavalry Thould occupy the market place, or broadefl fireet, to attack the enemy, if they force an entrance. If the advanced guards are driven in, they bould retire with coolnefs and deliberation, defending their pofls from houfe to houfe, till proper fupport can be given them from the body of the detachment.
If there be any dangerous place capable of covering the approaches of the enemy in the environs of the poilt, 4 G 2
and
and out of the circuit of the patroles, there fhould be a guard placed there, more or lefs Arong according to the importance of the place, and care flould be taken to preferve the communication. The guards and picquets being placed, the detachment that was fent out on the roads mult be called in, and then go to work to lodge the party in the gardens that open upon the country, and the commanding officer's quarters ; , beating down hedges, filling up ditches, and levelling a pifce of ground large enough to dratv up the whole corps. The horfes to be put under cover in barns contiguous to the gardens; but in cafe there are no barns, they may fubstitute theds open an one fide, that the horfes may go out together in cafe of an alarm. The officers fhould occupy the houfes in the neighbourhood of the theds, and one of each company remain day and night with the company, to prevent any of the men from entering the village without leave, upon any pretence. The commanding officer muft acquaint the officers of his having chofen the place M for the rendezvous in cafe of a retreat ; which ought to be at fome diftance from the village, and on the fide he judges moft convenient for retiring to the army. At funfet the grand guard are to return to the poit and join the picquet, the half of each to mount alternately till daybreak, and then the grand guard to return to the place which they poffefled the day before. The fentries and redeties fhould be doubled, and all the paffages fhut up with waggons placed in two rows, except one for fallying out at in cafe of a retreat, made wide enough for the pallage of the patroles or the whole cavalry.

The corporals of the ordinary guard thould lead the relief of the vedettes every hour, fetting off together; but when they come to the paflage of the poft \(\AA\), they mult feparate into two parties, the one to the right to relieve the vedettes BBB , the other to the left for the vedettes CCC; then each of them with the parties they have relieved fhould go on at their head a quarter of a league by the two routes pointed out in the plan, to examine the environs, fuppofing an hour to each. Befides this reconnoitring, the captain of the grand guard fhould fend two patroles in the night. To fill up the intervals, they thould fet one about half an hour after the corporals, and make the fame round.

In defenfive operations in an open ceuntry, the fortifying of a village or a church-yard may often prove of importance, as fuch poffs well defended may obllruct the movements of the enemy, and give time for a fuffcient force to collect to meet them in the field. We thall therefore defcribe the moft approved mode of flrengthening thefe pofitions.

When it is propofed to fortify a village, inquiry flould firt be made refpecting the furrounding country, whether there are woods, hills, or rivers near the village, whether the roads be acceffible, whether provifions can be cafily obtained, \&c. If the village is to be occupied as a poft of defence merely, the woods, rivers, ravines, or heights, may afford advantageous outpofts or fituations for batteries or ambufcades; but if it is to be poffefied as an advanced poft on the eve of a battle, the woods next the army thould be cut down, the hollows filled up, and every thing removed which may obfruct the freef communication between the village and the main army; while on the \(\mathrm{f} \bullet\) : of the eneroy, every obftruction by works, tres, \&c. Should be
thrown in the way of his approach. The roads fhould be broken up or interfected with deep ditches.

If there be good hedges or deep roads parallel to the village, or in fuch a fituation as to front the enemy, thefe will ferve as brealtworks, and for thelter. The hedges fhould be cut down to within four feet of the bottom, their tops floping towards the country, and deep ditches hould be dug in front. If the roads are deep, banquettes or תeps muf be thrown up next the hedge to raife the men to the proper height for firing. For want of fuch natural means of defence, it will be neceflary to throw up intrenchments on the fide next the enemy and on the ilanks.

Fig. I. Plate DLII. will explain the method of doing this in a village, under ordinary circumftances. The village ftands in a plain, and in front of the army, which is diftant from it about 600 paces, \(a\). The front of the intrenchment confifts of thiee fleeches or arrows, \(b, c, d\), joined together by lines. There are wolf-holes before the works that cover the left flank \(e\) : the line \(g\), which crofles fome fwampy grounds, is broken in feveral places \(i\); and the grove of wood \(l\), is cut down, to prevent the enemy from approaching under cover of it. As the right flank, confifting of a level plain, is more expofed than any other quarter, in addition to the works made of earth, which are thrown up at \(m\), trees are collected, and heaped up in the form of an abattis, \(n\). Thefe are defended by a difcharge of mufquetry from the intrenchments, whofe lines are raifed as bigh as poffible behind the growing hedges \(o\), which inclofe the gardens. It has however been judged neceffary to throw the works up in a forward pofition \(p\), and to have an interval between them and the hedges, left the houfes fhould be fet on fire by the enemy, and the troops be expofed to it. Every thing is left clear and open at the back of the village, in order to fecure a free intercourfe with head-quarters.

Other meafures, however, mult be adopted in the fortifying of villages which lie at fo great a diftance from the camp, that the enemy might furprife and take poffeffion of them before any fuccours could be fent; for in that cafc, intrenchments mult be thrown up throughout the whole of their circumference. If, on the contrary, one of the wings of the army fhould be fupported by fuch a poft, it would be more judicious to put the flank in a flate of defence, and to lengthen the works in that quarter, to prevent the enemy from turning it.

If it thould be judged expedient, under the circumflances of the army being cantoned, to fortify a village which lies in a plain, other means mult be ufed; for in that cafe there would not be troops enough to defend it. Should there be a fufficiency of men, intrenchments mult be thrown up in the manner we have defrribed, and fleeches muft be adopted to cover them behind, with lines to connect the vacant intervals; but if there be a fcarcity of foldiers, nothing but what is abfolutely neceffary muft be done; for it is highly impolitic to attempt more than can be eafily defended. Under thefe circumftances you muft be fatisfied with erecting fmall works, or ufing barricadoes to malk the entrances; here and there likewife fleeches muft be confructed, whe \({ }^{\text {fo }}\) communication will be kept up by the garden hedges. If the village fhould fland on an eminence, it
máy be fortified with more facility, and many things may be omitted, as the natural fituation is itfelf a 1 c fpectable poft.

Should there be a very great difproportion between the extent of the village, and the number of men intended for its defence, and the latter fhould be too fmall, a part only mult be fortified, and the remainder of the houfes mult be fecured by lines. Sometimes indeed it is found neceflary to burn or deftroy them, to prevent the enemy from approaching the fortified parts, under cover of the buildings.

But if the garrifon thould not be fufficiently flrong even to defend a part of the village, you nut be contented with fortifying the church and church-yard, or the caftle, if there be one. If any of thefe pofts be thought defenfible, troops muft occupy them on the firlt alarm; but this mult be done in perfect fafety, and without the foldiers being expofed to be cut off on their march. This precaution is above all others neceffary where villages are fo long and open that the cavalry may enter them at every opening. On this account the ordinary roads and avenues muft not only be obftructed, but the garden hedges mut be repaired, and every opening muft be clofed, which may be eafily done by driving flakes into the earth, and nailing boards acrofs them, which will prevent any fudden irruption of the cavalry, from which alone any danger is to be apprehended on occafions of this fort; for the infantry would fcarcely advance, except by furprife, before the garrifon could occupy its fation. If any apprehenfions are formed of an attack, the foldiers muft not be abfent from their poft, either in the dulk of the evening, or at night ; they muft, on the contrary, be affembled in the intrenchments during that period, to be ready in the neighbouring houfes, always clothed and accoutred.

A church and church-yard afford an admirable poft of defence, efpecially if, as ufually happens, they are feated on an elevation. In fortifying fuch a poft, we fhould firf block up every road and bye way leading to it, by means of waggons or carts, with their wheels taken off and loaded with dung or earth ; trees laid acrofs, or chevaux de frize. The narrow paths may be barricadoed with rails, with their points ftanding upwards, and a little outwards, having behind them thick branches of trees, or logs of wood, with a ditch in front. Thefe previous precautions being taken, the doors of the church fhould be pierced in feveral places, about eight feet from the bottom, with, holes large enough to admit the muzzle of the mufquet, and platforms hould be raifed with theps within for the men to fire from. Other loop holes fhould be made at the bottom of the doors, juft above the level of the ground, and a ditch muft be dug within, about three feet deep, fo as to admit of men fring from thence through thefe lower loop-holes. See fig. 2. The doors muft alio be fecured by barricadoes, confifting of pallifades driven feveral feet into the ground, and fet extremely thick, fome being deeper than others, fo as to leave faces between them and the top for loop-holes. See \(a a\), fig. 3 . This barricado is technically called tambour. The wills of the church mutt alfo be pierced in various places as diregtd for the doors, fee fig. 3. and ditehes muft be dug within them, and fcaffolding ereeted as before.
Again, on the outide of the church, a ditch is to be

\section*{A R.}
dug as clofe to the walls as is confiftent with fafety to the foundation, about 12 feet in breadth at the top, and four in depth; and from the further fide of this ditch country. Through the main door of the church an opening floould be made about two feet above the ground, fufficiently large to admit of one man paffing through without much difficulty, fo that when the churchyard becomes untenable, the garrifon may retreat into the clurch.

It mult not be forgotten to fecure the means of a crofo fire. If the church be built in the form of a crofs, crofs firings may be eafily procured through the proper loop-holes; but when this is not the cafe, loop-lioles fhould be made through every falient angle of the building, or tambours, fuch as reprefented in fig. 3. mull be formed wherever it can be conveniently done.

Men muft be diftributed in the upper part of the building. Thefe men will take out the tiles or flates in different places, in order to obferve the approaches of the enemy, and to fire upon him when he comes within mukket-hot. The lower windows of the tower or fteeple mult likewife be barricadoed, and have loopholes made in them. The pavement of the church mult be taken up, and the ftones or bricks be carried to the top of the building, to enable the befieged to let them drop upon the enemy, when he gets fufficiently near. In order to render the defence as practicable as poffible, you muft alfo collect fome large barrels or tubs, and keep them conftantly at hand filled with water, for the purpofe of extinguifhing any fire which might break out in the church, or be effected by the enemy's fhells.

Fig. 4. hows a plan of the church and church-yard Fig. 4. thus fortified. \(a, a, a, a\), the wall of the church-yard; \(b, c\), tambour work in front of the entrances; \(d\), the church; \(e, f\), tambour work conftructed oppofite the doors ; \(g\), the facrifly or veltry.

Connected with the attack and defence of pofts of ambur is the fubject of ambuicades, which we mult now briefly cades. confider.

Aambulcads may be formed in any place where a party may lie conceated, to furprife the enemy in paffing. They are eafily carried into execution in woods, hollow places, and large deferted buildings; but the placing of an ambufcade in any fituation requires previous accurate information with refpect to the movements of the enemy. When the commander of a party has been directed to form an ambufcade, to furprife a convoy of artillery, baggage, or provifions, or a body of recruits going to reinforce the enemy, he flould firt make every neceffary inquiry refpecting the route which the enemy is to take; the fituation of the places near which he is to pals, and the poft to which be is about to march. He muft alfo inquire with feeming anxiety about the roads which lead in an oppofite direction, on which he fhould feem more intent than on his main object. Having concerted his plan, he fhould fet out at the head of his detachment if poffible, and leaving his poft on the fide oppofite to his true route, the better to conceal his defign. If the place where he intends. to plant his ambufcade be not far diftant, he flould come into his true route about half way, and there place halt his infantry in ambufh to favour his retreat. But whe: the country where he propofes going is diftant, and the march:

Military march requires at leaft two nights, he munt conduct his Tractics. party by meandring from wood to wood, if there be any. He muft not forget to provide neceffary refreftiments for the day, which mult be paffed in fome concealed place where he may not be perceived, and mut caufe three rations of oats to be carried for each horfe.

Proper precantions having been taken to guard any crofs road or bridge that may lie near the place of ambufcade, the commanding officer thould take care to be at leaft two hours before the enemy, and to place the ambufcade on that fide, by which, if worfted, he may retire with the greatelt fafety.
